2006-2009 LINCOLN MKZ SERVICE & REPAIR MANUAL

GENERAL INFORMATION

Commonly Used Abbreviations

* PLEASE READ THIS FIRST *

NOTE: **This article is intended for general information purposes only. This information may not apply to all makes and models. Not all abbreviations are covered as manufacturers add new ones every day.**

"A"

A

Amperes

ABS

Anti-Lock Brakes

ABRS

Air Bag Restraint System

AC

Alternating Current

A/C

Air Conditioning

ACCS

A/C Cycling Switch

ACCUM

Accumulator

ACCY

Accessory

ACT

Air Charge Temperature Sensor

ADJ

Adjust or Adjustable

ADV

Advance

AFS

Airflow Sensor

AI

Air Injection

AIR or A.I.R.

Air Injection Reactor

AIS

Air Injection System

Alt.

Alternator or Altitude

Amp./amp/amps

Ampere

ASCS

Air Suction Control Solenoid

ASD

Auto Shutdown

ASDM

Air Bag System Diagnostic Module

ASV

Air Suction Valve

A/T

Automatic Transmission/Transaxle

ATC

Automatic Temperature Control

ATDC

After Top Dead Center

ATF

Automatic Transmission Fluid

ATS

Air Temperature Sensor

Aux.

Auxiliary

Avg.

Average

AXOD

Automatic Transaxle Overdrive (Ford Models Only)

"B"

BAC

By-Pass Air Control

BAP

Barometric Absolute Pressure Sensor

BARO

Barometric

Batt.

Battery

Bbl.

Barrel (Example: 4-Bbl.)

BCM

Body Control Module

BHP

Brake Horsepower

BMAP

Barometric and Manifold Absolute Pressure Sensor

BOO

Brake On-Off Switch

B/P

Backpressure

BPS

Barometric Pressure Sensor

BPT

Backpressure Transducer

BTDC

Before Top Dead Center

BTSI

Brake Transmission Shift Interlock

BTU

British Thermal Unit

BVSV

Bimetallic Vacuum Switching Valve

"C"

° C

Celsius (Degrees)

Calif.

California

CANP

Canister Purge

CARB

California Air Resources Board

CAT

Catalytic Converter

CB

Circuit Breaker

CBD

Closed Bowl Distributor

cc

cubic centimeter

CCC

Close Coupled Catalyst

CCC

Computer Command Control

CCD

Computer Controlled Dwell

CCOT

Cycling Clutch Orifice Tube

CCW

Counterclockwise

CDI

Capacitor Discharge Ignition

CEC

Computerized Engine Control

CID

Cubic Inch Displacement

cm

Centimeter

CMP

Camshaft Position Sensor

CO

Carbon Monoxide

CO_2

Carbon Dioxide

Cont.

Continued

CONV

Convertible

CP

Canister Purge

CKP

Crankshaft Position Sensor

CTS

Coolant Temperature Sensor

Cu. In.

Cubic Inch

CVC

Constant Vacuum Control

CV

Check Valve or Constant Velocity

CW

Clockwise

CYL or Cyl.

Cylinder

C^3 I

Computer Controlled Coil Ignition

C^4

Computer Controlled Catalytic Converter

"D"

"D"

Drive

DC

Direct Current Or Discharge

DDD

Dual Diaphragm Distributor

Def.

Defrost

Defog.

Defogger

DERM

Diagnostic Energy Reserve Module

DFI

Digital Fuel Injection

Diag.

Diagnostic

DTC

Diagnostic Trouble Code

DIC

Driver Information Center

DIS

Distributorless Ignition System

DIST

Distribution

DLC

Data Link Connector

DOC

Diesel Oxidation Catalyst

DOHC

Double Overhead Cam

DOT

Department of Transportation

DPF

Diesel Particulate Filter

DRB-II

Diagnostic Readout Box

DVOM

Digital Volt-Ohmmeter

"E"

EACV

Electric Air Control Valve

EATX

Electronic Automatic Transaxle

EBCM

Electronic Brake Control Module

EBL

Electronic Back Light

ECM

Engine Control Module

ECT

Engine Coolant Temperature Sensor

EDIS

Electronic Distributorless Ignition System

EEC

Electronic Engine Control

EECS

Evaporative Emission Control System

EEPROM

Electronically Erasable PROM

EFE

Early Fuel Evaporation

EGO

Exhaust Gas Oxygen Sensor

EGR

Exhaust Gas Recirculation

EOT

Engine Oil Temperature

ESA

Electronic Spark Advance

ESC

Electronic Spark Control

EST

Electronic Spark Timing

EVAP

Fuel Evaporative System

EVIC

Electronic Vehicle Information Center

EVP

EGR Valve Position Sensor

EWMA

Exponentially Weighted Moving Average (MODE 6)

Exc.

Except

"F"

° F

Fahrenheit (Degrees)

F/B

Fuse Block

Fed.

Federal

FI

Fuel Injection

FICU

Fuel Injection Control Unit

FIPL

Fuel Injector Pump Lever

FLI

Fuel Level Indicator

FPR-VSV

Fuel Pressure Regulator Vacuum Switching Valve

Ft. Lbs.

Foot Pounds

FWD

Front Wheel Drive

"G"

g

grams

Gals.

gallons

GND or GRND

Ground

"H"

HAC

High Altitude Compensation

HC

Hydrocarbons

H/D

Heavy Duty

HO2S

Heated Exhaust Gas Oxygen Sensor

Hg

Mercury

Hgt.

Height

HLDT

Headlight

HO

High Output

HO2S

Heated Oxygen Sensor

HP

High Performance

HSC

High Swirl Combustion

HSO

High Specific Output

HTR

Heater

Hz

Hertz (Cycles Per Second)

"I"

IAC

Idle Air Control

IACV

Idle Air Control Valve

IAT

Intake Air Temperature

IC

Integrated Circuit

ID

Identification

I.D.

Inside Diameter

IFS

Independant Front Suspension

IFS

Inertia Fuel Shutoff (Ford)

Ign.

Ignition

IMRC

Intake Manifold Runner Control

In.

Inches

INCH Lbs.

Inch Pounds

in. Hg

Inches of Mercury

Inj.

Injector

IP

Instrument Panel

IRS

Independant Rear Suspension

ISC

Idle Speed Control

IVD

Interactive Vehicle Dynamics (Ford)

IVSV

Idle Vacuum Switching Valve

"J"

J/B

Junction Block

"K"

KAPWR

Keep Alive Power

k/ohms

kilo-ohms (1000 ohms)

kg

Kilograms (weight)

kg/cm^2

Kilograms Per Square Centimeter

KM/H

Kilometers Per Hour

KOEO

Key On, Engine Off

KOER

Key On, Engine Running

KS

Knock Sensor

kW

Kilowatt

kV

Kilovolt

"L"

L

Liter

lbs. (Lbs. when used in table)

Pounds

LCD

Liquid Crystal Display

L/D

Light Duty

LDP

Leak Detection Pump (Part of EVAP system.)

LED

Light Emitting Diode

LH

Left Hand

"M"

mA

Milliamps

MA or MAF

Mass Airflow

MAFS

Mass Airflow Sensor

MAP

Manifold Absolute Pressure

MAT

Manifold Air Temperature

Mem.

Memory

MEM-CAL

Memory Calibration Chip

mfd.

Microfarads

MFI

Multiport Fuel Injection

MICU

Multiplex Integrated Control Unit (Acura/Honda)

MIL

Malfunction Indicator Light

MPI

Multi-Point (Fuel) Injection

mm

Millimeters

MPH

Miles Per Hour

mV

Millivolts

"N"

NA

Not Available

NAC

NOx Adsorber Catalyst

NCA

No Color Available (Wiring Diagrams)

NGS

New Generation Star

N.m

Newton Meter

No.

Number

Nos.

Numbers

NOx

Oxides of Nitrogen

"O"

O_2

Oxygen

OBD

On-Board Diagnostics

OC

Oxidation Catalyst

OD

Overdrive

O.D.

Outside Diameter

OHC

Overhead Camshaft

OSS

Output Speed Sensor

O/S

Oversize

oz.

Ounce

ozs.

Ounces

"P"

"P"

Park

P/C

Printed Circuit

PCM

Powertrain Control Module

PCS

Purge Control Solenoid

PC-SOL

Purge Control Solenoid

PCV

Positive Crankcase Ventilation

PFI

Port Fuel Injection

PGM-FI

Programmed Fuel Injection

PID

Parameter Identification

PIP

Profile Ignition Pick-up

PNP

Park Neutral Position Switch

P/N

Park/Neutral

PRNDL

Park Reverse Neutral Drive Low

PROM

Programmable Read-Only Memory

psi

Pounds Per Square Inch

P/S

Power Steering

PSPS

Power Steering Pressure Switch

PTC

Positive Temperature Coefficient

PTO

Power Take-Off

Pts.

Pints

Pwr.

Power

"Q"

Qts.

Quarts

"R"

RABS

Rear Anti-Lock Brake System

RECIRC

Recirculation

RH

Right Hand

RPM

Revolutions Per Minute

RWAL

Rear Wheel Anti-Lock Brake

RWD

Rear Wheel Drive

"S"

SAS

Steering Angle Sensor

SBC

Single Bed Converter

SBEC

Single Board Engine Controller

SDARS

Satellite Digital Audio Radio Service

SES

Service Engine Soon

SFI

Sequential (Port) Fuel Injection

SIL

Shift Indicator Light

SIR

Supplemental Inflatable Restraint

SOHC

Single Overhead Cam

SOL or Sol.

Solenoid

SPFI

Sequential Port Fuel Injection

SPK

Spark Control

SPOUT

Spark Output

SRI

Service Reminder Indicator

SRS

Supplemental Restraint System (Air Bag)

STAR

Self-Test Automatic Readout

STO

Self-Test Output

SUB-O_2

Sub Oxygen Sensor

Sw.

Switch

Sys.

System

"T"

TAB

Thermactor Air By-Pass

TAC

Throttle Actuator Module

TAD

Thermactor Air Diverter

TBC

Body Control Module (General Motors)

TBI

Throttle Body Injection

TCC

Torque Converter Clutch

TDC

Top Dead Center

Temp.

Temperature

TFI

Thick Film Ignition

THERMAC

Thermostatic Air Cleaner

TPM

Tire Pressure Monitor

TPMS

Tire Pressure Monitor System

TPS

Throttle Position Sensor/Switch

TS

Temperature Sensor

TV

Thermovalve

TWC

Three-Way Catalyst

"V"

V

Valve

Vac.

Vacuum

VAF

Vane Airflow

VAPS

Variable Assist Power Steering

VCC

Viscous Converter Clutch

VCRM

Variable Control Relay Module

VIN

Vehicle Identification Number

VM

Vacuum Modulator

Volt.

Voltage

VOM

Volt-Ohmmeter (Analog)

VRV

Vacuum Regulator Valve

VSS

Vehicle Speed Sensor

VSV

Vacuum Switching Valve

"W"

W/

With

W/O

Without

WAC

Wide Open Throttle A/C Switch

WOT

Wide Open Throttle

EMISSION CONTROL ABBREVIATIONS

Gasoline & Diesel

"A"

A/C

Air Conditioning

A/C-ISUS

A/C Idle Speed-Up Solenoid

A/F

Air/Fuel

AAI

Air Assist Injector

ACL

Air Cleaner (Thermostatic Air Cleaner)

ACL-BMS

ACL Bimetallic Sensor

ACL-CKV

ACL Check Valve

ACL-DV

ACL Delay Valve

ACL-PVS

ACL Ported Vacuum Switch

ACL-RDV

ACL Reverse Delay Valve

ACL-RDVS

ACL Reverse Delay Valve (Single)

ACL-TCV

ACL Thermal Control Valve

ACL-TS

ACL Temperature Sensor

ACL-TSOV

ACL Temperature Sensor Override Valve

ACL-TVS

ACL Thermal Vacuum Switch

ACL-TVV

ACL Thermal Vacuum Valve

ACL-VCDV

ACL Vacuum Control Delay Valve

ACL-VCV

ACL Vacuum Control Valve

ACL-VM

ACL Vacuum Motor

ACL-WP

ACL Wax Pellet Type Motor

ADS

Anti-Dieseling Solenoid

AFR

Air/Fuel Ratio Sensor

AFS

Air/Fuel Ratio Sensor

AIH

Air Intake Heaters

AIH-TS

AIH Temperature Sensor

AIR

Air Injection System

AIS

Air Injection System

AIS-ACV

AIS Air Control Valve

AIS-AMV

AIS Air Management Valve

AIS-ASV

AIS Air Switching Valve

AIS-BPV

AIS By-Pass Valve

AIS-CC

AIS Computer Controlled

AIS-CKV

AIS Check Valve

AIS-CSV

AIS Control Solenoid Valve

AIS-CV

AIS Combination Valve

AIS-DV

AIS Diverter Valve

AIS-IMCV

AIS Intake Manifold Change-Over Valve

AIS-MCV

AIS Manifold Change-Over Valve

AIS-PAF

AIS Pulse Air Feeder

AIS-PM

AIS Pump Motor

AIS-PV

AIS Pneumatic Valve

AIS-RV

AIS Relief Valve

AIS-SAV

AIS Secondary Air Valve

AIS-SOL

AIS Solenoid

AIS-SV

AIS Solenoid Valve

AIS-VCV

AIS Vacuum Control Valve

AIS-VSV

AIS Vacuum Switching Valve

AIS-VT

AIS Vacuum Tank

AIS-VCV

AIS Vacuum Control Valve

AIS-VSV

AIS Vacuum Switching Valve

AIV

Air Injection Valve

AIV-SOL

Air Injection Valve Solenoid

ALVW

Adjusted Loaded Vehicle Weight

AMV

Air Management Valve

AP

Air Pump Injection System

AP-ACV

AP Air Control Valve

AP-AMV

AP Air Management Valve

AP-ASRV

AP Air Switching Relief Valve

AP-ASS

AP Air Switching Solenoid

AP-ASV

AP Air Switching Valve

AP-BPV

AP By-Pass Valve

AP-CKV

AP Check Valve

AP-CS

AP Control Solenoid

AP-DCTO

AP Dual Coolant Temperature Override

AP-DLY

AP Delay Valve

AP-DV

AP Diverter Valve

AP-EADV

AP Electric Air Control Diverter Valve

AP-EAMR

AP Electric Air Management Relay

AP-EAMS

AP Electric Air Management Solenoid

AP-EAP

AP Electric Air Pump

AP-EC

AP Electromagnetic Clutch

AP-ERLY

AP Electric Air Pump Relay

AP-RDV

AP Reed Valve

AP-RV

AP Relief Valve

AP-SOL

AP Solenoid

AP-SOV

AP Shut-Off Valve

AP-SV

AP Solenoid Valve

AP-SWV

AP Switchover Valve

AP-TV

AP Transmitting Valve

AP-VCS

AP Vacuum Control Solenoid

AP-VCSV

AP Vacuum Controlled Air Shut-Off Valve

AP-VCV

AP Vacuum Control Valve

AP-VSV

AP Vacuum Switching Valve

A/T

Automatic Transmission

ATCV

Air Temperature Control Valve

"B"

BP/EGR

Backpressure EGR System

BP/EGR-BPS

BP/EGR Backpressure Sensor

BP/EGR-BPT

BP/EGR Backpressure Transducer

BP/EGR-BPV

BP/EGR Backpressure Valve

BP/EGR-BS

BP/EGR Bleed Solenoid

BP/EGR-BVSV

BP/EGR Bimetallic Vacuum Switching Valve

BP/EGR-C

BP/EGR Controller

BP/EGR-CLR

BP/EGR Cooler

BP/EGR-CS

BP/EGR Control Solenoid

BP/EGR-CTO

BP/EGR Coolant Temperature Override

BP/EGR-CV

BP/EGR Control Valve

BP/EGR-DCTO

BP/EGR Dual Coolant Temperature Override

BP/EGR-DS

BP/EGR Diagnostic Solenoid

BP/EGR-DSOL

BP/EGR Duty Solenoid

BP/EGR-DTVSW

BP/EGR Distributor Thermal Vacuum Switch

BP/EGR-DV

BP/EGR Delay Valve

BP/EGR-EET

BP/EGR Electric Transducer

BP/EGR-EPV

BP/EGR External Pressure Valve

BP/EGR-FDV

BP/EGR Forward Delay Valve

BP/EGR-LC

BP/EGR Load Control Valve

BP/EGR-PS

BP/EGR Position Sensor

BP/EGR-PT

BP/EGR Pressure Tranducer

BP/EGR-PVS

BP/EGR Ported Vacuum Switch

BP/EGR-RES

BP/EGR Reservoir

BP/EGR-RST

BP/EGR Restrictor

BP/EGR-SOL

BP/EGR Solenoid

BP/EGR-TCTVS

BP/EGR Torque Converter Thermal Vacuum Switch

BP/EGR-TCV

BP/EGR Thermal Control Valve

BP/EGR-TCVLV

BP/EGR Temperature Control Valve

BP/EGR-TS

BP/EGR Temperature Sensor

BP/EGR-TVS

BP/EGR Thermal Vacuum Switch

BP/EGR-TVV

BP/EGR Thermal Vacuum Valve

BP/EGR-VCV

BP/EGR Vacuum Control Valve

BP/EGR-VM

BP/EGR Vacuum Modulator

BP/EGR-VRV

BP/EGR Vacuum Regulator Valve

BP/EGR-VS

BP/EGR Vacuum Switch

BP/EGR-VSOL

BP/EGR Vent Solenoid

BP/EGR-VSV

BP/EGR Vacuum Switching Valve

"C"

C-4

Computer Controlled Catalytic Converter

CAC

Charge Air Cooler

CAS

Clean Air System

CB

Crankcase Breather

CB-VC

Crankcase Breather-Vapor Canister

CBPS

Coasting By-Pass System

CBVC

Crankcase Breather Vapor Canister

CCIEV

Coolant Controlled Idle Enrichment Valve

CCS

Controlled Combustion System

CCV

Closed Crankcase Ventilation

CD-REGVLV

Crankcase Depression Regulator Valve

CDRV

Crankcase Depression Relief Valve

CEAB

Cold Engine Air Bleed

CEAB-TVS

CEAB Thermal Vacuum Switch

CEAB-TVV

CEAB Thermal Vacuum Valve

CEC

Computerized Engine Controls

CESS

Cold Engine Sensor Switch

CETS

Cold Engine Temperature Switch

CFI

Continuous Fuel Injection

CMH

Cold Mixture Heater

CNG

Compressed Natural Gas

CO

Carbon Monoxide

CO2

Carbon Dioxide

CPI

Central Port Injection

CRV

Coasting Richer Valve

CSI

Central Sequential Injection

CTAVS

Cold Temperature Activated Vacuum System

CTOX

Continous Trap Oxidizer

"D"

DCLV

Deceleration Valve

DCS

Deceleration Control System

DDI

Direct Diesel Injection

DFI

Direct Diesel Injection

DI

Direct Injection

DKV

Deceleration Kick Valve

DMCV

Deceleration Mixture Control Valve

DMS

Dual Manifold System

DOC

Diesel Oxidation Catalyst

DOHC

Dual Overhead Cam

DPF

Diesel Particulate Filter

DPFE

Differential Pressure Feedback EGR Valve

DPFEGR

Differential Pressure Feedback EGR Valve

DTM

Deceleration Throttle Modulator

"E"

EAIR

Electric Air Injection System

EAIR-DV

EAIR Diverter Valve

ECM

Electronic Control Module

ECU

Electronic Control Unit

EDC

Electronic Diesel Control

EDS

Electronic Diesel System

EEC

Electronic Engine Control

EFE

Early Fuel Evaporation

EFE-CKV

EFE Check Valve

EFE-CV

EFE Control Valve

EFE-DTVS

EFE Delay Thermal Vacuum Switch

EFE-HTR

EFE Heater

EFE-HCV

EFE Heat Control Valve

EFE-OTS

EFE Oil Temperature Switch

EFE-PTC

EFE Positive Temperature Coefficient (Intake Heater Grid)

EFE-PVS

EFE Ported Vacuum Switch

EFE-SOL

EFE Solenoid

EFE-TVS

EFE Thermal Vacuum Switch

EFE-TVV

EFE Thermal Vacuum Valve

EFE-VSV

EFE Vacuum Switching Valve

EFI

Electronic Fuel Injection

EFI-MA

EFI Mass Airflow Sensor

EFI-MAF

EFI Mass Airflow Sensor

EGR

Exhaust Gas Recirculation System

EGR-BCS

EGR Boost Check Solenoid

EGR-BPBV

EGR By-Pass Backpressure Valve

EGR-BPT

EGR Backpressure Transducer

EGR-BPV

EGR By-Pass Valve

EGR-BS

EGR Bleed Solenoid

EGR-BSSV

EGR Boost Sensor Solenoid Valve

EGR-BVSV

EGR Bimetallic Vacuum Switching Valve

EGR-C

EGR Controller

EGR-CC

EGR Coolant Controlled

EGR-CLR

EGR Cooler

EGR-VSOL

EGR Vacuum Solenoid

EGR-CKV

EGR Check Valve

EGR-CS

EGR Control Solenoid

EGR-CSOL

EGR Cut-Off Solenoid

EGR-CSV

EGR Control Solenoid

EGR-CTO

EGR Coolant Temperature Override

EGR-CTS

EGR Charge Temperature Sensor

EGR-CTSW

EGR Charge Temperature Switch

EGR-CTTS

EGR Coolant Temperature Thermoswitch

EGR-CV

EGR Control Valve

EGR-CVCV

EGR Constant Vacuum Control Valve

EGR-CVS

EGR Control Vent Solenoid

EGR-DC

EGR Digital Control

EGR-DCTO

EGR Dual Coolant Temperature Override

EGR-DPFE

Differential Pressure Feedback EGR Sensor

EGR-DPFS

EGR Differential Pressure Feedback Sensor

EGR-DS

EGR Diagnostic Solenoid

EGR-DSOL

EGR Duty Solenoid

EGR-DTVS

EGR Delay Thermal Vacuum Switch

EGR-DTVSW

EGR Distributor Thermal Vacuum Switch

EGR-DV

EGR Delay Valve

EGR-EPRS

EGR Exhaust Pressure Regulator Solenoid

EGR-EPRV

EGR Exhaust Pressure Regulator Valve

EGR-EPV

EGR External Pressure Valve

EGR/EVAP-CSV

EGR/EVAP Control Solenoid Valve

EGR-EVR

EGR Vacuum Regulator

EGR-EVRV

EGR Electronic Vacuum Regulator Valve

EGR-FDV

EGR Forward Delay Valve

EGR-FJS

EGR Floor Jet System

EGR-FPS

EGR Feedback Pressure Sensor

EGR-LCV

EGR Load Control Valve

EGR-MAP

EGR Manifold Absolute Pressure Sensor

EGR-PFE

EGR-PFE Sensor

EGR-PS

EGR Position Sensor

EGR-PSW

EGR Pulse Switch

EGR-PVS

EGR Ported Vacuum Switch

EGR-REG

EGR Regulator

EGR-RES

EGR Reservoir

EGR-RST

EGR Restrictor

EGR-SC

EGR Signal Converter

EGR-SEC

EGR, Secondary

EGR-SEN

EGR Sensor

EGR-SOL

EGR Solenoid

EGR-SU

EGR Switchover Valve

EGR-SUB

Sub-EGR Valve

EGR-SVV

EGR Solenoid Vacuum Valve

EGR-T

EGR Temperature Sensor

EGR-TC

EGR Transmission Controlled

EGR-TCTVS

EGR Torque Converter Thermal Vacuum Switch

EGR-TCV

EGR Thermal Control Valve

EGR-TCVLV

EGR Temperature Control Valve

EGR-TRANS

EGR Transducer

EGR-TS

EGR Temperature Sensor

EGR-TSW

EGR Temperature Switch

EGR-TVD

EGR Throttle Valve Diaphragm

EGR-TVS

EGR Thermal Vacuum Switch

EGR-TVSOL

EGR Throttle Valve Solenoid

EGR-TVV

EGR Thermal Vacuum Valve

EGR-VA

EGR Vacuum Amplifier

EGR-VCV

EGR Vacuum Control Valve

EGR-VM

EGR Vacuum Modulator

EGR-VR

EGR Vacuum Regulator

EGR-VRS

EGR Vacuum Regulator Solenoid

EGR-VRSV

EGR Vacuum Regulator Solenoid Valve

EGR-VRV

EGR Vacuum Regulator Valve

EGR-VS

EGR Vacuum Switch

EGR-VSDV

EGR Vacuum Switch Dump Valve

EGR-VSEN

EGR Vacuum Sensor

EGR-VSOL

EGR Vent Solenoid

EGR-VSS

EGR Vacuum Switching Solenoid

EGR-VST

EGR Vacuum Surge Tank

EGR-VSV

EGR Vacuum Switching Valve

EGR-VVCS

EGR Venturi Vacuum Control System

EGRB

EGR Boost Sensor

EGRC

EGR Control Solenoid

EGRC-BPT

EGR Control Backpressure Transducer

EGRC-SV

EGR Control Solenoid Valve

EHOC

Electronically Heated Oxidation Catalyst

EHTWC

Electronically Heated Three-Way Catalyst

EI

Electronic Ignition System

EIS

Electronic Ignition System

ELB

Electronic Lean Burn

EPR

Exhaust Pressure Regulator

EPR-SOL

EPR Solenoid

ESA

Electronic Spark Advance

EVAP

Fuel Evaporative System

EVAP-AAC

EVAP Auxiliary Air Control

EVAP-BPSV

EVAP By-Pass Solenoid Valve

EVAP-BVSV

EVAP Bimetallic Vacuum Switching Valve

EVAP-CAV

EVAP Canister Air Valve

EVAP-CCV

EVAP Control Canister Close Valve

EVAP-CCVSV

EVAP Control Canister Vent Shut Valve

EVAP-CCVVSV

EVAP Closed Canister Valve Vacuum Switching Valve

EVAP-CDCV

EVAP Canister Drain Cut Valve

EVAP-CKV

EVAP Check Valve

EVAP-CPCS

EVAP Canister Purge Control Solenoid

EVAP-CPCSV

EVAP Canister Purge Control Solenoid Valve

EVAP-CPCV

EVAP Canister Purge Control Valve

EVAP-CPRV

EVAP Canister Purge Regulator Valve

EVAP-CPSV

EVAP Canister Vent Shut Valve

EVAP-CPT

EVAP Canister Purge Timer

EVAP-CPTVS

EVAP Canister Purge Thermal Vacuum Switch

EVAP-CPV

EVAP Canister Vent Valve

EVAP-CPVCSV

EVAP Canister Purge Volume Control

EVAP-CPVCV

EVAP Canister Purge Volume Control Valve

EVAP-CPVDV

EVAP Canister Purge Vacuum Delay Valve

EVAP-CPVR

EVAP Canister Purge Valve Resonator

EVAP-CS

EVAP Control Solenoid

EVAP-CSPS

EVAP Control System Pressure Sensor

EVAP-CST

EVAP Canister Surge Tank

EVAP-CT

EVAP Catch Tank

EVAP-CVCS

EVAP Canister Vent Control Solenoid

EVAP-CVCV

EVAP Canister Vent Control Valve

EVAP-CVS

EVAP Canister Vent Solenoid

EVAP-CVSV

EVAP Carburetor Vent Switching Valve

EVAP-CVV

EVAP Canister Vent Valve

EVAP-DCTO

EVAP Dual Coolant Temperature Override

EVAP-DF

EVAP Drain Filter

EVAP-DPS

EVAP Differential Pressure Sensor

EVAP-DV

EVAP-Drain Valve

EVAP-EV

EVAP Emission Valve

EVAP-FBVV

EVAP Fuel Bowl Vent Valve

EVAP-FBVS

EVAP Fuel Bowl Vent Solenoid

EVAP-FCV

EVAP Fuel Cut Valve

EVAP-FLS

EVAP Fuel Level Sensor

EVAP-FOLV

EVAP Fuel Overflow Limiter Valve

EVAP-FS

EVAP Flow Switch

EVAP-FSV

EVAP Flow Switchover Valve<

EVAP-FTEV

EVAP Fuel Tank EVAP Valve

EVAP-FTPCSV

EVAP Fuel Tank Pressure Control Solenoid Valve

EVAP-FTPS

EVAP Fuel Tank Pressure Sensor

EVAP-FTS

EVAP Fuel Temperature Sensor

EVAP-FVCV

EVAP Fuel Vapor Control Valve

EVAP-FVS

EVAP Fuel Vapor Separator

EVAP-FVTS

EVAP Fuel Vapor Temperature Sensor

EVAP-FVV

EVAP Fuel Vent Valve

EVAP-FVVV

EVAP Fuel Vapor Vent Valve

EVAP-IVS

EVAP Inner Vent Solenoid

EVAP-LDP

EVAP Leak Detection Pump

EVAP-LDPAF

EVAP Leak Detection Pump Air Filter

EVAP-LDPF

EVAP Leak Detection Pump Filter

EVAP-LDPVV

EVAP Leak Detection Pump Vent Valve

EVAP-LSEP

EVAP Liquid Separator

EVAP-NVLD

EVAP Natural Vacuum Leak Detection

EVAP-ORVR

Evaporative On-Board Refueling Vapor Recovery System

EVAP-ORVRCV

Evaporative On-Board Refueling Vapor Recovery Check Valve

EVAP-ORVRFTVRV

EVAP-ORVR Fuel Tank Vapor Recirculation

EVAP-OVCV

EVAP Outer Vent Control Valve

EVAP-OWV

EVAP One-Way Valve

EVAP-PCDV

EVAP Purge Control Diaphram Valve

EVAP-PCSV

EVAP Purge Cut-Off Solenoid Valve

EVAP-PFS

EVAP Purge Flow Sensor

EVAP-PFSVVSV

EVAP Purge Flow Switching Valve Vacuum Switching Valve

EVAP-PRRV

EVAP Pressure Relief Rollover Valve

EVAP-PSVVSV

EVAP Pressure Switching Valve Vacuum Switching Valve

EVAP-PSOL

EVAP Purge Solenoid

EVAP-PSSV

EVAP Pressure Switching Solenoid

EVAP-PSVVSV

EVAP Pressure Switching Valve Vacuum Switching Valve

EVAP-PV

EVAP Purge (Frequency) Valve

EVAP-PVS

EVAP Ported Vacuum Switch

EVAP-RV

EVAP Rollover Valve

EVAP-RV/FTPS

EVAP Rollover Valve/Fuel Tank

EVAP-RVSV

EVAP Rollover Vapor Separator Valve

EVAP-SNR

EVAP Canister Sensor

EVAP-SOL

EVAP Solenoid

EVAP-SOV

EVAP Shutoff Valve

EVAP-SSV

EVAP Shut-Off Solenoid Valve

EVAP-SV

EVAP Solenoid Valve

EVAP-TC

EVAP Trap Canister

EVAP-TS

EVAP Temperature Switch

EVAP-TPBPV

EVAP Tank Pressure By-Pass Valve

EVAP-TPCS

EVAP Tank Pressure Control Solenoid

EVAP-TPCV

EVAP Tank Pressure Control Valve

EVAP-TRWV

EVAP Tree-Way Valve

EVAP-TV

EVAP Thermal Valve

EVAP-TVS

EVAP Thermal Vacuum Switch

EVAP-TVV

EVAP Thermal Vacuum Valve

EVAP-TWV

EVAP Two-Way Valve

EVAP-VC

EVAP Vapor Canister

EVAP-VCAT

EVAP Vapor Canister Air Tank

EVAP-VCF

EVAP Vapor Canister Filter

EVAP-VCSV

EVAP Vapor Canister Shut-off Valve

EVAP-VCTV

EVAP Vacuum Control Valve

EVAP-VCV

EVAP Vacuum Canister Valve

EVAP-VCVS

EVAP Vapor Canister Vent Solenoid

EVAP-VM

EVAP Vacuum Motor

EVAP-VPS

EVAP Vapor Pressure Sensor

EVAP-VPSVSV

EVAP Vapor Pressure Sensor Vacuum Switching Valve

EVAP-VS

EVAP Vacuum Sensor

EVAP-VSOL

EVAP Ventilation Solenoid

EVAP-VSOL/LDP

EVAP Ventilation Solenoid/Leak Detection Pump

EVAP-VST

EVAP Vacuum Surge Tank

EVAP-VSV

EVAP Vacuum Switching Valve

EVAP-VV

EVAP Ventilation Valve

EVRS

EGR Vacuum Regulator Solenoid

"F"

FBC

Feedback Carburetor

FCOV

Fuel Change Over Valve

FF

Flex Fuel

FF-CKV

Fuel Fill Check Valve

FF-FCV

Fuel Tank Fuel Cut-Off Valve

FF-FLVV

Fuel Tank Fill Limit Vent Valve

2008 ENGINE PERFORMANCE

Acceleration Control - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Accelerator pedal and sensor assembly nuts	9	80

DESCRIPTION AND OPERATION

ACCELERATION CONTROL

The acceleration controls consist of an accelerator pedal and sensor assembly.

The engine management system electronically operates the accelerator of the engine in response to accelerator pedal movements initiated by the driver. In the event of a system failure, the engine management system provides a "limp home" mode which allows the vehicle to be driven with limited performance.

DIAGNOSTIC TESTS

ACCELERATION CONTROL

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

ACCELERATOR PEDAL AND BRACKET

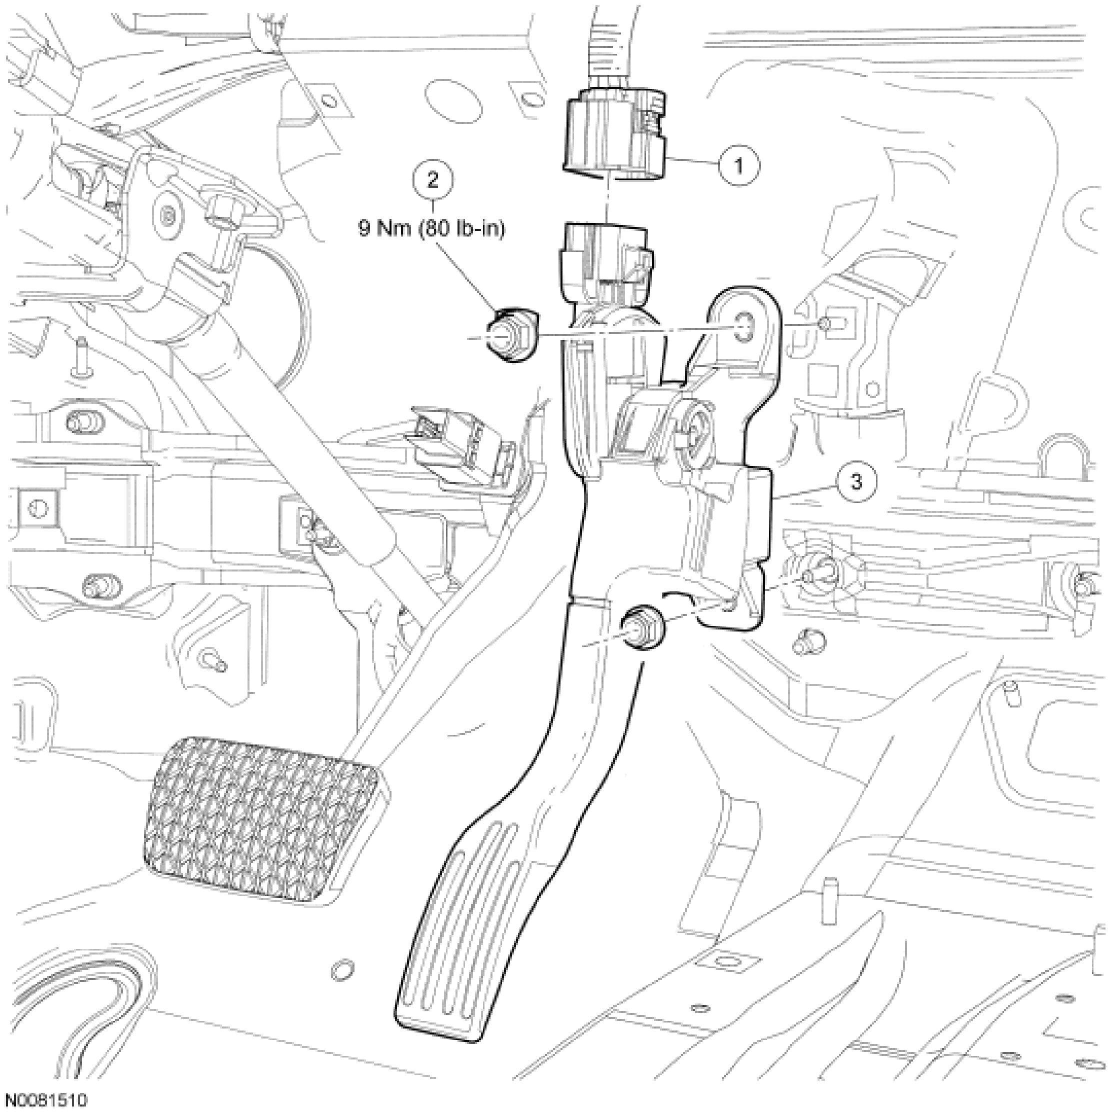

Fig. 1: Exploded View Of Accelerator Pedal & Bracket With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Accelerator pedal sensor electrical connector
2	W706131	Accelerator pedal and sensor assembly nut (2 required)
3	9F836	Accelerator pedal and sensor assembly

REMOVAL AND INSTALLATION

1. Disconnect the accelerator pedal sensor electrical connector.
2. Remove the 2 nuts and the accelerator pedal and sensor assembly.
   - To install, tighten to 9 Nm (80 lb-in).

3. To install, reverse the removal procedure.

Accessory Drive - 3.5L - Fusion, Milan & MKZ

SPECIFICATIONS

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Accessory drive belt	6 ribs
Power steering pump drive belt	4-ribbed

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Accessory drive belt tensioner bolts	11	97

DESCRIPTION AND OPERATION

ACCESSORY DRIVE

This vehicle is equipped with the following components:

- V-ribbed serpentine accessory drive belt
- Automatic drive belt tensioner
- V-ribbed power steering pump drive belt

The accessory drive system provides power to operate components which power other systems. These could include components such as the generator, power steering pump and A/C compressor. Each of these components is equipped with a pulley which is driven by the accessory drive belt. The accessory drive belt is driven by the engine crankshaft pulley. The automatic belt tensioner maintains correct belt tension and compensates for component wear and changes in system load. System load changes can be caused by the A/C compressor clutch engaging or disengaging or demand changes on other systems powered by the accessory drive belt. To maintain correct operation of this system, it is critical that the correct length drive belt be installed. The pulleys must also be correctly aligned and kept clean.

Accessory Drive Belt Routing

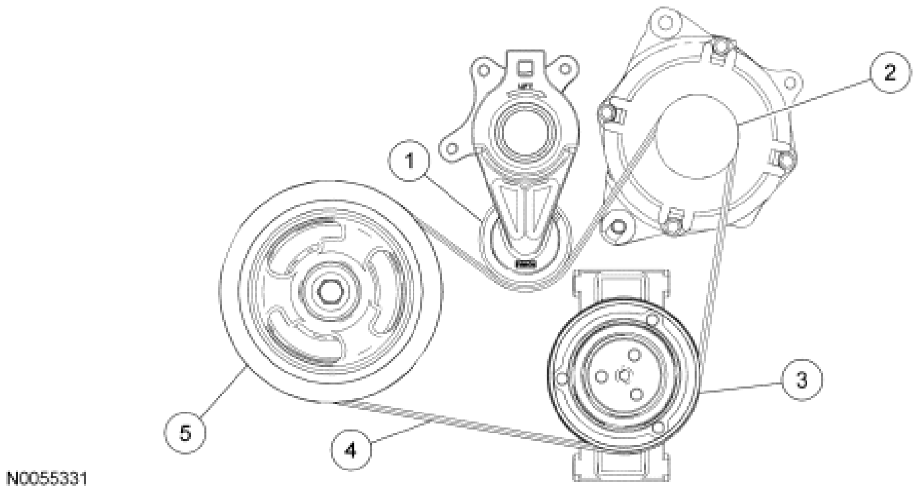

Fig. 1: Accessory Drive Belt Routing & Components (Front)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	6B209	Accessory drive belt tensioner pulley
2	10300	Generator pulley
3	19D784	A/C clutch pulley
4	8620	Accessory drive belt
5	6316	Crankshaft pulley

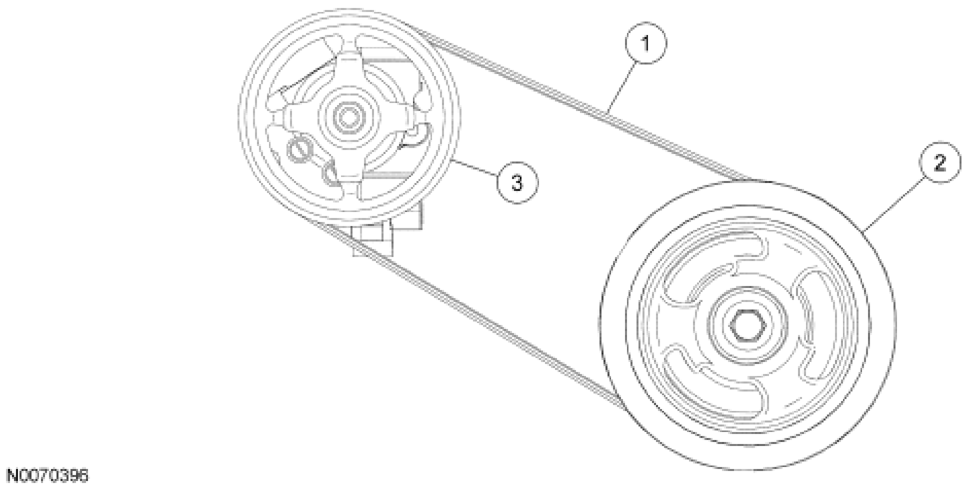

Fig. 2: Accessory Drive Belt Routing & Components (Power Steering Pump)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	6C301	Power steering pump drive belt
2	6316	Crankshaft pulley
3	3D639	Power steering pump pulley

Belt Tensioner

Automatic tensioners are calibrated to provide the correct amount of tension to the belt for a given accessory drive system. Unless a spring or damping band within the tensioner assembly breaks or some other mechanical part of the tensioner fails, there is no need to check the tensioner for correct tension.

DIAGNOSTIC TESTS

ACCESSORY DRIVE

Inspection and Verification

NOTE: **Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.**

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrect accessory drive belt • Incorrectly routed accessory drive belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing) • Loose accessory drive belt • Damaged pulleys • Tensioner arm misalignment

NOTE: **Modular engine (without A/C) belt tensioner shown, others similar.**

NOTE: **Belt tensioner is shown in the free-state position against the arm travel stops.**

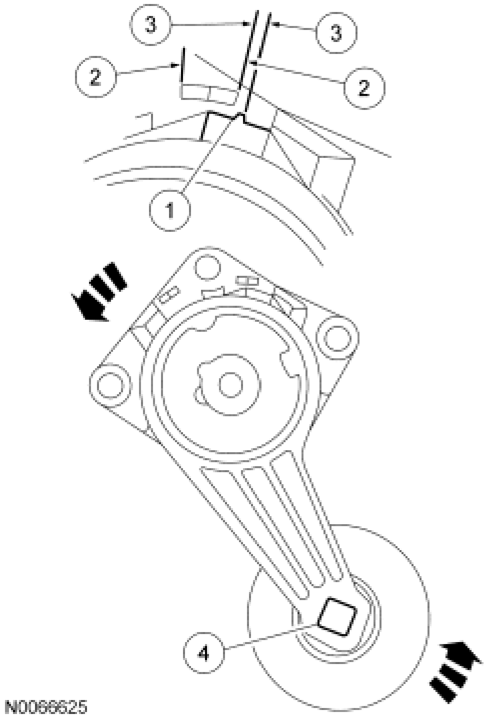

Fig. 3: Belt Tensioner With Belt Length Indicator
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Belt length indicator
2	-	Acceptable belt installation and wear range
3	-	Belt replacement range
4	-	Belt tension relief point

3. Check that the belt length indicator, if equipped, on the belt tensioner is in the acceptable belt installation and wear range. If the indicator is in the belt replacement range, either an incorrect belt is installed or the belt is worn beyond the service limit. Install a new belt as necessary.
4. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, A/C slugging noise, power steering cavitations at low temperatures, Variable Camshaft Timing (VCT) tick or generator whine.
5. If a concern is found, correct the condition before proceeding to the next step.

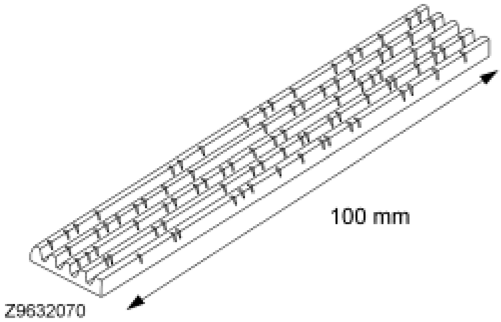

Fig. 4: V-Ribbed Serpentine Drive Belt With Cracks Across Ribs
Courtesy of FORD MOTOR CO.

6. Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.

NOTE: Piling is an excessive buildup in the V-grooves of the belt.

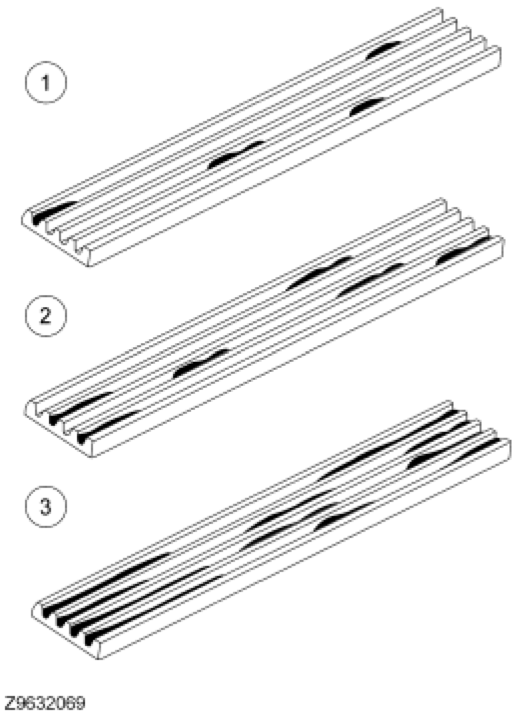

Fig. 5: Identifying V-Ribbed Serpentine Belt With Piling
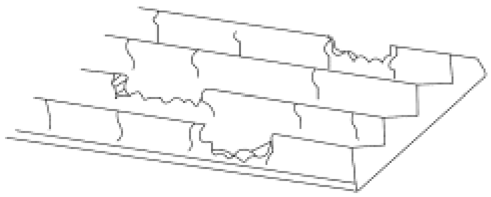
Courtesy of FORD MOTOR CO.

7. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
   1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
   2. Longer deposit areas building up to 50% of the rib height. This is not considered a durability

concern, but it can result in excessive noise. If noise is apparent, install a new belt.

3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.



A0002723

Fig. 6: Identifying V-Ribbed Serpentine Belt With Chunks of Rib Missing
Courtesy of FORD MOTOR CO.

8. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.
9. If the concern is not visually evident, verify the symptom and Go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• Accessory drive belt cracking (over 15 cracks in a rib over a distance of 100 mm [4.0 in])	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to **Inspection and Verification**. INSTALL a new accessory drive belt as necessary.
• Accessory drive belt chunking	• Accessory drive belt	• INSPECT the accessory drive belt. REFER to **Inspection and Verification**. INSTALL a new accessory drive belt as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
• Accessory drive belt noise, squeal, chirping	• Defective/worn or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged or worn accessory	• REFER to **Drive Belt - Noise/Flutter**. REPAIR or INSTALL new parts as

or flutter	drive component or idler • Fluid contamination of accessory drive belt or pulleys	necessary.
	• Damaged or worn accessory drive belt tensioner	• REFER to **Belt Tensioner - Mechanical** and **Belt Tensioner - Dynamics**. INSTALL a new accessory drive belt tensioner as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.
	• Accessory drive component failure	• CHECK the accessory drive components. INSTALL new components as necessary.
	• Accessory drive belt idler pulley bearing failure	• INSPECT the accessory drive belt idler pulley for freedom of rotation and damage. INSTALL a new accessory drive belt idler pulley as necessary.
• Premature accessory drive belt wear	• Defective or incorrect accessory drive belt • Misaligned pulley(s) • Pulley runout • Damaged accessories • Incorrectly installed drive belt • Fluid contamination	• REFER to **Drive Belt - Noise/Flutter** and **Drive Belt - Incorrect Installation**. REPAIR or INSTALL new parts as necessary.
	• Damaged pulley grooves	• INSPECT the accessory drive belt pulley grooves for damage. INSTALL a new pulley or component as necessary.

Component Tests

Drive Belt - Noise/Flutter

NOTE: Under no circumstances should the accessory drive belt, tensioner or pulleys have any fluids or belt dressing applied to them as damage to the belt material and tensioner damping mechanism may occur.

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start up and shut down or during very rapid engine acceleration and decelerations, such as:

- Wide Open Throttle (WOT) 1-2 and 2-3 shifts or 2-3 and 3-4 back-out shifts on automatic transmissions.
- WOT 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or reoccurring drive belt squeal can occur:

- if the A/C discharge pressure goes above specifications:
  - the A/C system is overcharged.
  - the A/C condenser core airflow is blocked.
  - the A/C anti-slugging strategy executes after a long hot heat soak.
- if the A/C off equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories or idler pulley(s) are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.

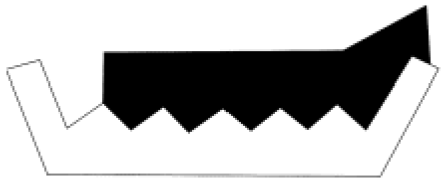
NOTE: The accessory drive belt tensioner arm should rotate freely without binding.

- Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Drive Belt - Incorrect Installation

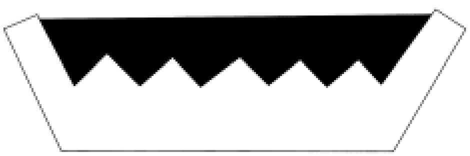
NOTE: Incorrect accessory drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the pulleys.

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.



N0017169

Fig. 7: Identifying Incorrect Drive Belt Installation
Courtesy of FORD MOTOR CO.



N0017168

Fig. 8: Identifying Correct Installation Of Drive Belt
Courtesy of FORD MOTOR CO.

With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage and wear, especially the mounting pad surface and arm alignment. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. If the tensioner arm is worn, the arm will be out of alignment. Either of these conditions will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to

specification. Recheck the accessory drive belt tracking.

Belt Tensioner - Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine off, check routing of the accessory drive belt. Refer to the illustrations under **Accessory Drive** in the Description and Operation portion of this section.

NOTE: The accessory drive belt tensioner spring is very strong and requires substantial force to release.

2. Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt from the tensioner. Carry out the following tests:
   - Using the release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.
   - Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition.
   - Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks.
3. If the accessory drive belt tensioner does not meet the criteria in the previous step, install a new tensioner. If the accessory drive belt tensioner meets the criteria in the previous step, proceed to testing the tensioner dynamically.
4. If the tensioner is saturated with oil and grease internally, install a new tensioner.

Belt Tensioner - Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the A/C clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without A/C clutch cycling or engine acceleration, check belt ride out. Excessive belt ride out (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check ride out condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

REMOVAL AND INSTALLATION

FRONT END ACCESSORY DRIVE (FEAD) - EXPLODED VIEW

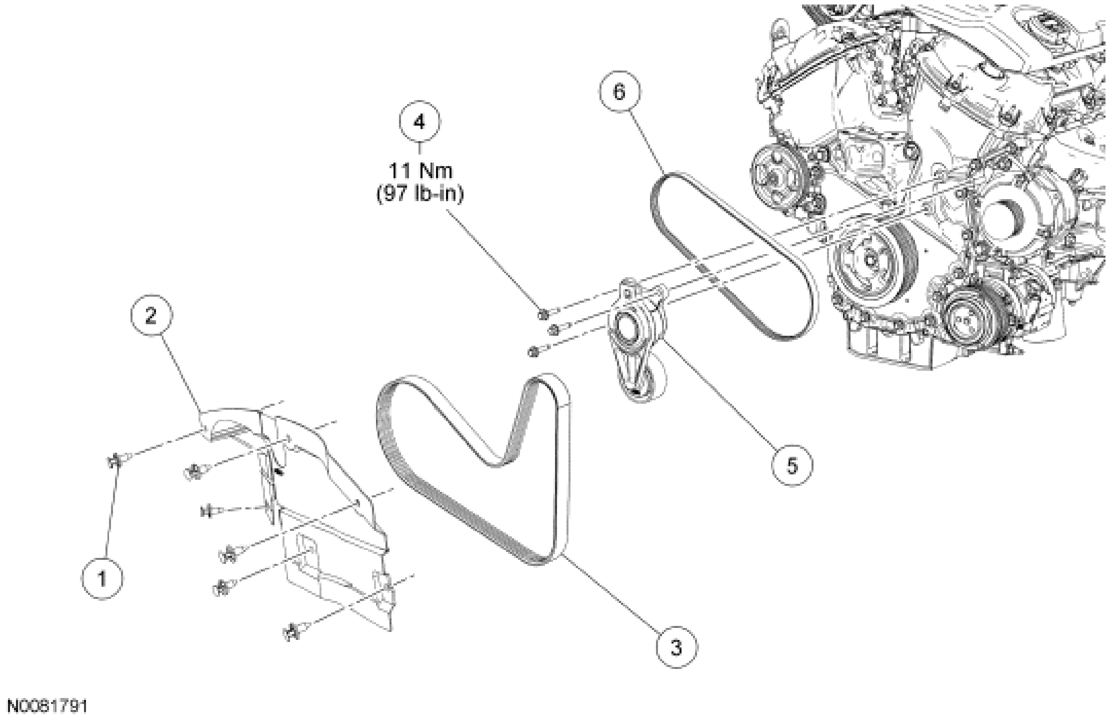


Fig. 9: Exploded View Of Front End Accessory Drive (FEAD) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N807389	Pin-type retainer (6 required)

3	8620	Accessory drive belt
4	W503278	Accessory drive belt tensioner bolt (3 required)
5	6B209	Accessory drive belt tensioner
6	6C301	Power steering pump drive belt

1. For additional information, refer to the procedures.

ACCESSORY DRIVE BELT

REMOVAL

NOTE: Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.
3. Remove the 4 screws and position the RH fender splash shield aside.

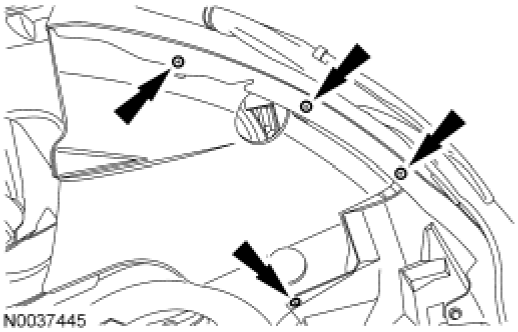

Fig. 10: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

4. Remove the 6 pin-type retainers and the RH splash shield.
5. Working from under the vehicle, remove the accessory drive belt.

INSTALLATION

1. Working from under the vehicle, position the accessory drive belt on all pulleys, with the exception of the generator pulley.

NOTE: After installation, make sure the accessory drive belt is correctly seated on all pulleys.

2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt on the generator pulley.
3. Install the RH splash shield and the 6 pin-type retainers.
4. Position the RH fender splash shield and install the 4 screws.

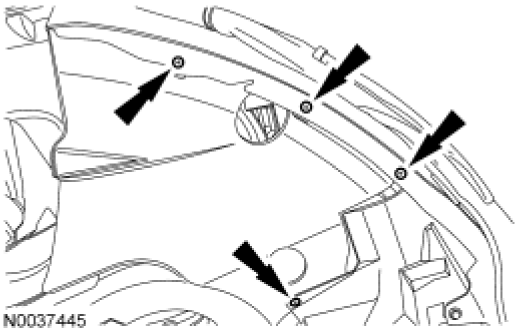

Fig. 11: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

ACCESSORY DRIVE BELT TENSIONER

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.
3. Remove the 4 screws and position the RH fender splash shield aside.

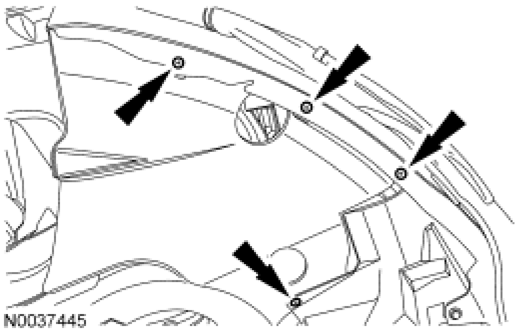

Fig. 12: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

4. Remove the 6 pin-type retainers and the RH splash shield.
5. Remove the 3 bolts and the accessory drive belt tensioner.

INSTALLATION

1. Install the accessory drive belt tensioner and the 3 bolts.
   - Tighten to 11 Nm (97 lb-in).

NOTE: After installation, make sure the accessory drive belt is correctly seated on all pulleys.

2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt on the generator pulley.
3. Install the RH splash shield and the 6 pin-type retainers.
4. Position the RH fender splash shield and install the 4 screws.

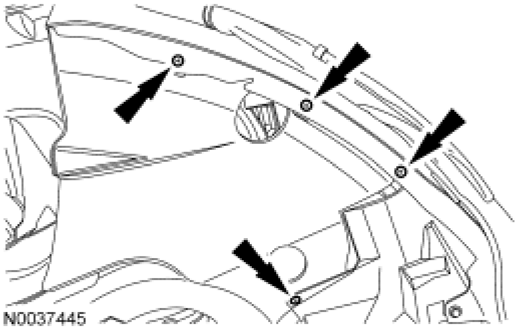

Fig. 13: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

POWER STEERING PUMP BELT

Special Tools

Illustration	Tool Name	Tool Number
	Power Steering Belt Installation Tool	303-1252/2
	Power Steering Belt Removal Tool	303-1252/1

REMOVAL

NOTE: Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and remove the accessory drive belt from the generator pulley.
3. Remove the 4 screws and position the RH fender splash shield aside.

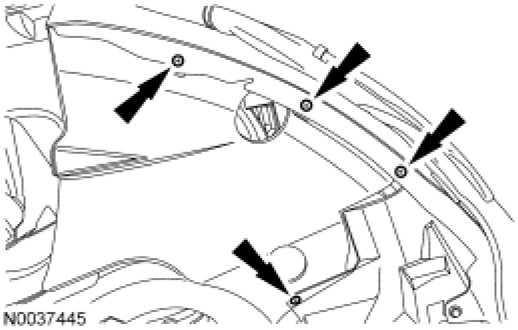

Fig. 14: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

4. Remove the 6 pin-type retainers and the RH splash shield.
5. Position the accessory drive belt off the crankshaft pulley.
6. Install the Power Steering Belt Removal Tool between the power steering pump belt and pulley, turning the crankshaft bolt clockwise to remove the power steering belt.

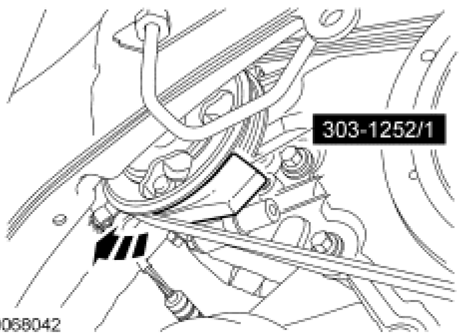

Fig. 15: Installing Removal Tool (303-1252/1) Between Belt & Pulley & Turn Crankshaft Bolt Clockwise
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Install the power steering belt on the crankshaft pulley.

NOTE: After installation, make sure the belt is correctly seated on the crankshaft and power steering pulleys.

2. Position the power steering belt around the Power Steering Belt Installation Tool and the power steering pulley. Make sure the belt is engaged with the power steering pulley and rotate the crankshaft clockwise to install the power steering belt.

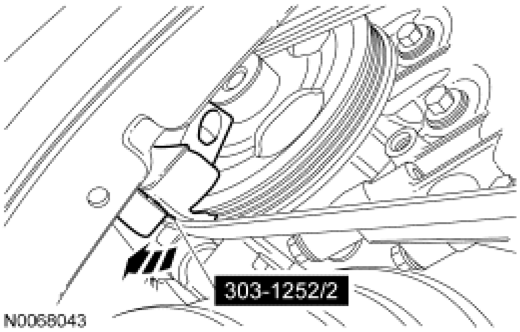

Fig. 16: Installing Power Steering Belt Onto Power Steering Pump Pulley Using Special Tool (303-1252/2)
Courtesy of FORD MOTOR CO.

3. Position the accessory drive belt on the crankshaft pulley.

NOTE: After installation, make sure the accessory drive belt is correctly seated on all pulleys.

4. Working from the top of the vehicle, using a suitable belt tensioner release tool, rotate the accessory drive belt tensioner clockwise and install the accessory drive belt on the generator pulley.
5. Install the RH splash shield and the 6 pin-type retainers.
6. Position the RH fender splash shield and install the 4 screws.

2008 ACCESSORIES & BODY, CAB

Anti-Theft - Passive Anti-Theft System (PATS) - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

ANTI-THEFT

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

The passive anti-theft system (PATS) consists of the following components:

- Anti-theft indicator (located in the instrument cluster [IC])
- Encoded ignition integrated key head transmitter (IKT) PATS key(s) (the key contains a transponder and a remote keyless entry [RKE] transmitter)
- Encoded (the key contains a transponder) ignition PATS keys (not factory equipped, but may be used in place of IKT keys)
- PATS transceiver
- IC
- PCM

PATS uses radio frequency identification technology to deter a drive-away theft. Passive means that it does not require any activity by the user.

The vehicle is equipped with 2 IKT PATS keys. The IKTs operate as a standard PATS key with an RKE transmitter incorporated into the key head. The IKTs require batteries for the RKE transmitter to operate. A maximum of 4 IKT keys can be programmed to operate the vehicle. If more than 4 IKT keys are programmed, the RKE portion of the additional keys do not operate and the SJB and the IC set a memory full DTC (B1138 - Memory Full). These additional keys will start the vehicle, but will not operate the RKE system. If additional PATS keys are desired, a standard PATS key (a non-IKT key) can be used. For the purposes of this part, the PATS portion of the IKT key is referred to as a PATS key.

PATS Function

NOTE: If the IC or the PCM (or both) is replaced, the parameters must be reset in both modules or the vehicle will experience a PATS no-start. Refer to <u>Passive Anti-Theft System (PATS) Parameter Reset</u>.

The PATS function is controlled by the IC. The PATS uses the IC to carry out all of the PATS functions such as receiving the identification code from the PATS key, issuing a signal to the PCM to control the starter and fuel injectors enable, and initiating the key interrogation sequence when the ignition key is turned to the ON or START position. Because of the interaction between the IC and the PCM, there are parameters that must be set if the IC or the PCM (or both) are replaced. Refer to **<u>Passive Anti-Theft System (PATS) Parameter Reset</u>**. If the IC must be replaced for any reason (PATS concerns or an IC concern), the PATS keys also must be

programmed into the new IC. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. All elements of PATS must be functional before the vehicle will start. If any of the components are not working correctly, the vehicle will not start.

PATS is active only for a few seconds when the vehicle is starting. It is not a PATS concern if the vehicle stalls after it has been running for a minimum of 3 seconds. PATS will not disable a running vehicle.

PATS may cause a vehicle no start due to either the fuel injectors or the starter not operating (starter relay does not close) or both. Always check for PATS DTCs from the IC and DTCs from the PCM when a no-crank or no-start condition exists. A low state of charge (SOC) in the vehicle battery may cause the PATS to allow starter operation, but prevent the fuel injectors from operating.

If the theft light does not prove out (it may be either flashing or glowing steadily) and one (or both) of the previous conditions (fuel injectors and/or starter inoperative) are present, it may be due to a PATS issue. If the theft light proves out, it may not be a PATS issue. If the theft light does not illuminate at all, it may be an IC issue. Go to **Symptom Chart**.

PATS is not compatible with aftermarket remote start systems, which allow the vehicle to be started from the exterior of the vehicle. These systems may reduce the security of the vehicle, and also may be the cause of no-start concerns. Remote start systems must be removed from the vehicle before any PATS-related no-start concerns are investigated.

Unlimited Key Mode

PATS contains a feature called unlimited key mode. This feature allows a customer to program more than 8 vehicle keys, if requested. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same mechanically cut keys. For an individual customer, any randomly selected security key that has been previously mechanically cut and electronically programmed to the vehicle is acceptable.

If unlimited key mode is enabled, a maximum of 4 IKT keys can be programmed to the vehicle for RKE functionality. If more keys are required, they should be standard PATS keys. If more than 4 IKT keys are programmed to the vehicle, the SJB and the IC will set DTC B1138 (memory full) and only 4 IKT keys will have RKE functionality, however, all of them will start the vehicle, if programmed correctly. Refer to **Spare Key Programming - Unlimited Key Mode**.

DIAGNOSTIC TESTS

ANTI-THEFT

Special Tools

Illustration	Tool Name	Tool Number
	73III Automotive Meter	105-R0057 or equivalent

 ST1137-A		
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

Anti-Theft Indicator

NOTE: Replacement of the passive anti-theft system (PATS) transceiver does not require the PATS keys to be programmed into the instrument cluster (IC) again.

NOTE: Make sure any aftermarket remote start systems have been removed from the vehicle before any PATS-related no-start concerns are investigated.

NOTE: A minimum of 2 PATS keys must be programmed into the IC before the vehicle will start. They do not need to be integrated key head transmitter (IKT) keys. Either 2 IKT keys, or 2 standard PATS keys, or a combination of an IKT key and a standard PATS key will be sufficient for the vehicle to start.

NOTE: If the IC or the PCM is being replaced (or both), the parameters must be reset in both modules or the vehicle will experience a PATS no-start. Refer to Passive Anti-Theft System (PATS) Parameter Reset .

NOTE: When using a standard (non-IKT) PATS key to start the vehicle, an IKT key (from another vehicle) on the same key ring may possibly be programmed into the vehicle for remote entry functionality, resulting in the IKT key being able to operate the lock and unlock functions of the vehicle (but the IKT key can not start the vehicle). This should not cause a PATS no-start of either the first or the

second vehicle, but the IKT key may be able to operate the lock and unlock functions of both vehicles. The IKT key will be able to start the original vehicle to which it is programmed and will not be able to start the second vehicle. At this time, it will be necessary to carry out an Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment procedure and then to make certain the IKT key for the second vehicle is removed from the key ring in order to prevent this issue from occurring again. Also, if an IKT key is used to start the vehicle, the vehicle will only read the IKT in the ignition lock cylinder and will not read the second IKT on the key ring. Using an IKT key to start both vehicles, rather than standard PATS keys, will prevent the second IKT from being programmed into the first vehicle.

NOTE: **Some Fusion and Milan vehicles built with a 2.3L engine may exhibit an intermittent crank no start along with a PATS light flashing during cranking and various codes stored in memory. The root cause has been found to be related to radio interference due to a shopping cart anti-theft device installed at some store parking lots. Refer to all Technical Service Bulletins (TSB) that pertain to the concern and follow the procedure(s) outlined.**

PATS uses a visual anti-theft indicator located in the IC. The indicator proves out for 3 seconds when the ignition key is in the ON or START position under normal operation. If there is a PATS concern, this indicator either flashes rapidly or glows steadily when the ignition key is turned to the ON or START position. PATS also flashes the anti-theft indicator every 2 seconds when the ignition key is in the OFF position to act as a visual theft deterrent. Refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article for additional information on the anti-theft indicator.

Encoded PATS Keys

PATS uses a special ignition key, called an integrated key head transmitter (IKT) key that is larger than a conventional ignition key. It contains a permanently installed electronic device called a transponder and also has the remote keyless entry (RKE) transmitter integrated into the key head. Each transponder contains a unique encrypted identification code which is one of a very large number of combinations. The addition of this transponder to the key makes it an "encoded" key. The PATS key does not require batteries and should last the lifetime of the vehicle. The transmitter portion of the IKT key has a battery. Each PATS key must be programmed into the IC before it can be used to start the vehicle. A maximum of 4 IKT keys can be programmed to start the vehicle and also operate the RKE functions. If more than 4 IKT keys are programmed, the RKE portion of the additional IKT keys do not operate and the smart junction box (SJB) sets a memory full DTC (B1138 - Memory Full). These additional keys will start the vehicle, but will not operate the RKE system. If additional PATS keys are desired, a standard PATS key (a non-IKT key) can be used. There are specific general procedures described that must be carried out if a new PATS key is necessary. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment** or **Key Programming Using Two Programmed Keys**.

PATS Transceiver

The PATS transceiver is located under the steering column shroud and communicates with the encoded ignition key. During each vehicle start sequence, the PATS transceiver reads the encoded ignition key identification

code and sends data to the IC. The IC validates the code, and if it is the correct code, will send a message to the PCM to ground the starter relay solenoid coil and to also allow the fuel injectors to operate. Refer to **Passive Anti-Theft System (PATS) Transceiver**.

PATS Operation

The PATS function is controlled by the IC. With this type of PATS, there are parameters that need to be reset if either the IC or the PCM (or both) are replaced. Refer to **Passive Anti-Theft System (PATS) Parameter Reset**. When the PATS key is turned to the ON or START position, the IC initiates the key interrogation sequence by sending a voltage signal to the PATS transceiver. The transceiver then uses its antenna to bounce a signal off the transponder in the PATS key. This process "reads" the PATS key identification code and sends the key identification code back to the IC, which interprets it and determines if it matches one of the stored key codes. If it does match one of the stored key codes, the IC will send a message to the PCM to ground the starter relay solenoid coil and to also allow the fuel injectors to operate. If it does not match one of the stored key codes, or it is only a partial key read or no key read, the IC will send a message to the PCM to not ground the starter relay solenoid coil and not allow fuel injector operation. The anti-theft indicator in the IC will flash (or may glow steadily) and the IC will store one or more DTCs. All elements of PATS must be functional before the vehicle will start. If any of the components are not working correctly, the vehicle will not start. If the IC must be replaced for any reason (PATS concerns or instrument cluster [IC] concerns), the PATS keys must also be programmed into the new IC. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**.

PATS disables the vehicle from starting if there is:

- a damaged PATS key.
- a non-programmed PATS key.
- a non-PATS key (key has no electronics).
- damaged wiring.
- a damaged transceiver.
- a damaged IC.
- a damaged PCM.

PATS PIDs

Monitoring the PATS PIDs can be very useful in determining which diagnostic steps to follow. Viewing the MASTERKEY (master key) PID with both keys will determine if the key is a programmed key and may also be used to prove out the transceiver, circuitry and the IC. A master key is a key that is programmed into the IC. Viewing the MIN_KEY (minimum number of keys) PID (this PID does not change) determines the minimum number of keys that must be programmed into the IC. There must be at least 2 keys programmed into the IC in this type of PATS before the vehicle will start. Viewing the N_KEYCODE (number of keys programmed) PID will determine if the minimum number of keys have been programmed into the IC. If the N_KEYCODE PID reads 0 or 1, additional key(s) will need to be programmed into the IC in order to meet the minimum of 2 keys. If the N_KEYCODE PID reads 0 or 1, and the MASTERKEY PID reads NOTPREST, that particular key must be programmed into the IC. If the N_KEYCODE PID reads 1, and the MASTERKEY PID reads PRESNT, that particular key is already programmed into the IC. In this particular case, though, there are not enough keys programmed (a minimum of 2 are needed before the vehicle will start) into the IC and at least 1 more key will need to be programmed before the vehicle will start. Refer to **Integrated Key head Transmitter (IKT) Key**

Programming Using Diagnostic Equipment.

Also, if the unlimited key mode has been enabled, the N_KEYCODE PID will always read 2, after the first 2 keys are programmed into the IC, regardless of how many additional keys are added.

If the IC was replaced, the parameters in the IC, and the parameters in the PCM will need to be reset. When the parameters in the IC are reset, it clears (erases) the PCM ID from the IC. A PCM parameter reset will cause the PCM to send a PCM ID to the IC that is necessary for the system to operate. Make sure to cycle the key at least once, then turn the key ON and make an attempt to start the vehicle for 3-5 seconds before attempting more procedures. If only a PCM parameter reset occurs, the ID stored in the IC will not match the ID being sent by the PCM, and may cause a PATS-related no-start. Carry out a PATS parameter reset, then turn the key ON and make an attempt to start the vehicle for 3-5 seconds before attempting more procedures.

If the PCM ID (PCM id status) PID reads STORED, the IC has a PCM ID stored. If it reads NOTSTRD, a parameter reset of the PCM may resolve this issue. If the PATSENABL (vehicle enable status) PID reads DISABLED, and the N_KEYCODE PID reads 2 or more and the MASTERKEY PID reads PRESNT, the IC, and the PCM will need to have their parameters reset. Refer to **Passive Anti-Theft System (PATS) Parameter Reset**.

If the PATSENABL PID reads DISABLED, and the N_KEYCODE PID reads 1 and the MASTERKEY PID reads PRESNT, or if the N_KEYCODE PID reads 0 and the MASTERKEY PID reads NOTPRESNT, a minimum of 2 keys will need to be programmed into the IC. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**.

If the MASTERKEY PID continues to read NOTPRESNT after programming, this may indicate a defective key. The SPAREKEY PID is defaulted to ENABLED. With the SPAREKEY PID displaying ENABLED, the IC will accept more than 2 keys (up to a maximum of 8) being programmed into the IC using **Key Programming Using Two Programmed Keys**. It can be toggled to DISABLED if the customer wants to disable the customer spare key programming function. Refer to **Key Programming Switch State Control**. This switch state control does not affect the Key Programming Using Diagnostic Equipment procedure.

In summary, for the PATS PIDs and their correct state in order for the vehicle to start:

PID	Normal State
N_KEYCODE	must read 2 or more
MASTERKEY	must read PRESNT
PATSENABLE	must read ENABLED
PCM_ID	must read STORED

Unlimited Key Mode

PATS contains a feature called unlimited key mode and uses the UNL_KEY_ID PID. This feature allows a customer to program more than 8 keys to their vehicle if they request it. Each vehicle in unlimited key mode is set up with a special unlimited transponder security key code. This allows all the customer vehicles to share the same keys, but no other keys from outside can be used to operate the vehicles. For an individual customer, any randomly selected security key is acceptable. Refer to **Spare Key Programming - Unlimited Key Mode**.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Large metallic objects, a second passive anti-theft system (PATS) key on the same key ring as the PATS key, or electronic devices on the key ring that can be used to purchase gasoline or similar items • Ignition lock cylinder • PATS key • Use of a non-PATS key or incorrect PATS key • More than one PATS key on key ring • Remote start system installed	• Smart junction box (SJB) fuse(s): ○ 13 (7.5A) ○ 23 (7.5A) ○ 26 (7.5A) • Wiring, terminals or connectors • PATS transceiver • Ignition switch • Instrument cluster (IC) • PCM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.

- Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.

7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the IC.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

NOTE: The smart junction box (SJB) is also known as the generic electronic module (GEM).

INSTRUMENT CLUSTER (IC) DTC CHART

DTC	Description	Action
B1137	Data Not Programmed	The integrated key head transmitter (IKT) data has not transferred from the instrument cluster (IC) into the smart junction box (SJB). PROGRAM the IKT keys. CARRY OUT the **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment** in this article. CLEAR the DTCs. REPEAT the self-test. If DTC B1137 is retrieved again, REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1138	Memory Full	The SJB has 4 IKTs stored in memory and cannot program any more IKTs into the memory. A maximum of 4 IKT keys can be programmed to start the vehicle and also operate the RKE functions. If more than 4 IKT keys are programmed, the RKE portion of the additional IKT keys do not operate and the SJB sets a memory full DTC (B1138 - Memory Full). These additional keys will start the vehicle, but will not operate the RKE system. If additional PATS keys are desired, a standard PATS key (a non-IKT key) can be used.
B1139	Invalid Transmitter Identification Code	REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	If DTCs B1600, B1601, B1602, B1681 or B2103 are present, they must be addressed first. If DTC B1213 is the only DTC present, PROGRAM additional keys. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment** in this article. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
B1342	ECU is Faulted	CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. PROGRAM the PATS keys into the IC. REFER to **Integrated Key head Transmitter (IKT) Key**

		Programming Using Diagnostic Equipment in this article. CYCLE the ignition. REPEAT the self-test.
B1600	PATS Ignition Key Transponder Signal is Not Received	No PATS key has been read by the IC. Go to **Pinpoint Test B**.
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	There is an unprogrammed PATS key. Go to **Pinpoint Test C**.
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	Only a partial PATS key was read. Go to **Pinpoint Test D**.
B1681	PATS Transceiver Module Signal is Not Received	The IC did not receive the PATS transceiver signal. Go to **Pinpoint Test E**.
B2103	Antenna Not Connected	There has been a PATS transceiver antenna failure. Go to **Pinpoint Test A**.
B2141	NVM Configuration Failure	There is no PCM ID stored in the IC. CARRY OUT a parameter reset of the IC and PCM, then CYCLE the ignition and make an attempt to start the vehicle. REFER to **Passive Anti-Theft System (PATS) Parameter Reset** in this article.
B2431	Transponder Programming Failed	The ignition key was not programmed. Attempt to RE-PROGRAM the key. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment** in this article. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
U0100	Lost Communication With ECM/PCM	**NOTE:** **If DTCs U0100 and U2510 are both present, address DTC U2510 first.** Go to **Pinpoint Test G**.
U2510	CAN - Invalid Data for Vehicle Security	CARRY OUT a parameter reset of the IC and the PCM and CYCLE the ignition 3-5 times, making an attempt to start the vehicle each key cycle. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.
U2511	CAN - Data Mis-Match (Receive Data Does Not Match Expected)	**NOTE:** **If DTCs U2510 and U2511 are both present, address DTC U2510 first.** Go to **Pinpoint Test G**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

PCM DTC CHART

DTC	Description	Action

P1260	Theft Detected, Vehicle Immobilized	If there are any PATS DTCs present, ADDRESS them first. This DTC may also indicate a CAN issue. Be sure to verify if there are any communication issues/DTCs with any modules. If DTC P1260 is the only DTC present, there may be a power or ground concern with the PCM. REFER to the **Introduction - Gasoline Engines** article.
All other DTCs	-	REFER to the **Introduction - Gasoline Engines** article.

Symptom Chart

NOTE: Some Fusion and Milan vehicles built with a 2.3L engine may exhibit an intermittent crank no start along with a PATS light flashing during cranking and various codes stored in memory. The root cause has been found to be related to radio interference due to a shopping cart anti-theft device installed at some store parking lots. Refer to all Technical Service Bulletins (TSB) that pertain to the concern and follow the procedure(s) outlined.

Symptom Chart

Condition	Possible Sources	Action
• No communication with the instrument cluster (IC)	• Fuse(s) • Wiring, terminals or connectors • IC	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The anti-theft indicator is always/never on	• IC	• Go to **Pinpoint Test F**.
• The vehicle does not start	• Starting system concern • PATS concern	• Go to **Pinpoint Test H**.

Pinpoint Tests

Pinpoint Test A: DTC B2103 - Antenna Not Connected

Normal Operation

The passive anti-theft system (PATS) transceiver reads the PATS key when the key is turned to START or ON.

- DTC B2103 (Antenna Not Connected) - sets when there has been a PATS transceiver antenna failure. The PATS transceiver may need to be replaced.

This pinpoint test is intended to diagnose the following:

- PATS transceiver

PINPOINT TEST A: DTC B2103 - ANTENNA NOT CONNECTED

A1 INSPECT THE PATS TRANSCEIVER FOR CORRECT INSTALLATION

NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the instrument cluster (IC) again.

- Key in OFF position.
- Verify the PATS transceiver is correctly installed. Refer to **Passive Anti-Theft System (PATS) Transceiver**.
- Connect the diagnostic tool.
- Key in ON position.
- Clear the IC DTCs.
- Key in OFF position.
- Key in ON position.
- Retrieve the IC DTCs.
- **Is DTC B2103 retrieved?**

  YES : INSTALL a new PATS transceiver. REFER to **Passive Anti-Theft System (PATS) Transceiver**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

  NO : The system is OK.

Pinpoint Test B: DTC B1600 - PATS Ignition Key Transponder Signal Is Not Received

Normal Operation

During each vehicle start sequence, the passive anti-theft system (PATS) transceiver reads the PATS key identification code and sends the data to the instrument cluster (IC).

- DTC B1600 (PATS Ignition Key Transponder Signal is Not Received) - sets when no PATS key has been read by the IC.

This pinpoint test is intended to diagnose the following:

- PATS key
- PATS transceiver
- IC

PINPOINT TEST B: DTC B1600 - PATS IGNITION KEY TRANSPONDER SIGNAL IS NOT RECEIVED

NOTE: Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key may cause a vehicle starting concern and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep

these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the key off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Ford, Rotunda, Strattec, and HUF are approved Ford PATS keys).

B1 RETRIEVE THE DTCs

- Key in OFF position.
- Connect the diagnostic tool.
- Key in ON position.
- Clear the IC DTCs.
- Key in OFF position.
- Key in ON position.
- Retrieve the IC DTCs.
- **Is DTC B1600 retrieved?**

  YES : Go to B2.

  NO : If DTCs other than PATS DTCs are retrieved, REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

  If no DTCs are retrieved, the system is OK.

B2 CHECK BOTH PATS KEYS

NOTE: **Make sure the new PATS keys are approved Ford encoded PATS keys. Unapproved PATS keys do not always operate correctly over various temperature ranges (PATS keys from Ford, Rotunda, Strattec, and HUF are approved Ford PATS keys).**

- Obtain both PATS keys from the customer and follow the procedure using one PATS key, then the other. If the customer only has one PATS key, it will be necessary to cut a new PATS key.
- If it is necessary to cut a new PATS key, program the new PATS key. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**.
- Key in ON position.
- Clear the IC DTCs.
- Key in OFF position.
- Key in ON position.
- Retrieve the IC DTCs.
- **Using all existing keys, then the newly programmed key, is DTC B1600 present?**

  YES : If DTC B1600 was present for both existing keys and the new key, go to B3.

If DTC B1600 was not present for all keys, the key may be damaged and should be replaced. CUT a new key to replace the damaged key. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

NO : If DTCs other than PATS DTCs are retrieved, REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

If no DTCs are retrieved, the system is OK.

B3 INSTALL A NEW PATS TRANSCEIVER

NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again.

NOTE: Do not use the PATS key that may have been programmed in Step B2.

- Key in OFF position.
- Install a new PATS transceiver. Refer to **Passive Anti-Theft System (PATS) Transceiver**.
- Key in ON position.
- Clear the IC DTCs.
- Key in OFF position.
- Key in ON position.
- Retrieve the IC DTCs.
- **Is DTC B1600 retrieved?**

  YES : Go to B4.

  NO : The system is OK.

B4 CHECK FOR CORRECT IC OPERATION

NOTE: When a new IC is installed, the PATS keys must be programmed into the IC.

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM.

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. PROGRAM the PATS keys into the new IC. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test C: DTC B1601 - PATS Received Incorrect Key-Code From Ignition Key Transponder

Normal Operation

During each vehicle start sequence, the passive anti-theft system (PATS) transceiver reads the PATS key identification code and sends the data to the instrument cluster (IC).

- DTC B1601 (PATS Received Incorrect Key-Code From Ignition Key Transponder) - sets when there is an unprogrammed PATS key. The concern is not with the PATS key itself, but the key must be programmed into the PATS memory (unless the maximum number of keys are already programmed).

This pinpoint test is intended to diagnose the following:

- PATS key
- IC

PINPOINT TEST C: DTC B1601 - PATS RECEIVED INCORRECT KEY-CODE FROM IGNITION KEY TRANSPONDER

NOTE:	**Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key may cause a vehicle starting concern and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition switch off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Ford, Rotunda, Strattec, and HUF are approved Ford PATS keys).**

NOTE:	**Only 8 PATS keys can be programmed into the IC during normal programming procedures (unless the unlimited key mode is enabled). If the N_KEYCODE PID reads more than 2 and less than 8, the concern may be the PATS key being used is an unprogrammed key. Verify this by also viewing the MASTERKEY PID. It must read PRESNT for the key to be valid.**

C1 RETRIEVE THE DTCs

NOTE: Follow this procedure using both PATS keys (using one at a time).

- If only one key is available, cut a new key and program the keys. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**.
- If both keys are available, program the keys. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**.
- Key in OFF position.
- Connect the diagnostic tool.
- Key in ON position.
- Clear the IC DTCs.
- Key in OFF position.
- Key in ON position.
- Retrieve the IC DTCs.
- **Is DTC B1601 retrieved for either of the PATS keys?**

  YES : If DTC B1601 is retrieved for one PATS key, REPLACE that key and PROGRAM all the keys. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

  If DTC B1601 is retrieved for both PATS keys, go to C2 .

  NO : The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to VERIFY all other PATS keys are programmed.

C2 CHECK FOR CORRECT IC OPERATION

NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC.

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM.

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER,**

AND WARNING CHIMES article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. PROGRAM the PATS keys into the new IC. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. REPEAT the self-test.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test D: DTC B1602 - PATS Received Invalid Format Of Key-Code From Ignition Key Transponder

Normal Operation

During each vehicle start sequence, the passive anti-theft system (PATS) transceiver reads the PATS key identification code and sends the data to the instrument cluster (IC).

- DTC B1602 (PATS Received Invalid Format of Key-Code From Ignition Key Transponder) - sets when only a partial PATS key was read. Remote starter equipment can also cause this DTC.

This pinpoint test is intended to diagnose the following:

- PATS key
- PATS transceiver
- IC

PINPOINT TEST D: DTC B1602 - PATS RECEIVED INVALID FORMAT OF KEY-CODE FROM IGNITION KEY TRANSPONDER

NOTE: **Large metallic objects, electronic devices on the key ring that can be used to purchase gasoline or similar items, or a second key on the same key ring as the PATS key may cause a vehicle starting concern and record DTCs under certain conditions. If a fault cannot be identified, examine the customer key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the ignition off and restart the engine with all other objects on the key ring held away from the ignition key. Check to make sure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Ford, Rotunda, Strattec, and HUF are approved Ford PATS keys).**

D1 RETRIEVE THE DTCs

NOTE: **Follow this procedure using both PATS keys (using one at a time).**

- If only one key is available, cut a new key and program the keys. Refer to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**.
- Key in OFF position.

- Connect the diagnostic tool.
- Key in ON position.
- Clear the IC DTCs.
- Key in OFF position.
- Key in ON position.
- Retrieve the IC DTCs.
- **Is DTC B1602 retrieved for one or both PATS keys?**

  YES : If DTC B1602 is retrieved for one key, REPLACE that key and PROGRAM the new key. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

  If DTC B1602 is retrieved for both PATS keys, go to D2.

  NO : The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to VERIFY all other PATS keys are programmed.

D2 INSTALL A NEW PATS TRANSCEIVER

NOTE: Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again.

- Key in OFF position.
- Install a new PATS transceiver. Refer to **Passive Anti-Theft System (PATS) Transceiver**.
- Key in ON position.
- Clear the IC DTCs.
- Key in OFF position.
- Key in ON position.
- Retrieve the IC DTCs.
- **Are any PATS DTCs retrieved?**

  YES : Go to D3.

  NO : The system is OK. CHECK all the customer PATS keys by attempting to start the vehicle with each key to VERIFY all other PATS keys are programmed.

D3 CHECK FOR CORRECT IC OPERATION

NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC.

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM.

- Disconnect the IC connector.
- Check for:

- corrosion
- damaged pins
- pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. PROGRAM the PATS keys into the new IC. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test E: DTC B1681 - PATS Transceiver Module Signal Is Not Received

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Passive Anti-Theft System for schematic and connector information.

Normal Operation

The passive anti-theft system (PATS) transceiver receives voltage from the SJB on circuit CBP18 (GY/OG) and is grounded on circuit GD116 (BK/VT). The PATS transceiver and the instrument cluster (IC) communicate on the TX and RX circuits VRT23 (VT/GY) and VRT24 (YE/OG). The IC compares the key code stored in memory and sends a message to the PCM to enable the starter and fuel injectors if the key code is correct.

- DTC B1681 (PATS Transceiver Module Signal is Not Received) - sets when the PATS transceiver signal is not received by the IC. This DTC can be caused by circuits between the PATS transceiver and the IC, or circuits to the PATS transceiver. This can also be caused by using the incorrect PATS transceiver part number.

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- PATS transceiver
- IC

PINPOINT TEST E: DTC B1681 - PATS TRANSCEIVER MODULE SIGNAL IS NOT RECEIVED

NOTE: **Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.**

E1 CHECK THE PATS TRANSCEIVER POWER CIRCUIT CBP18 (GY/OG) FOR VOLTAGE

- Key in OFF position.
- Disconnect: PATS Transceiver C252
- Key in ON position.

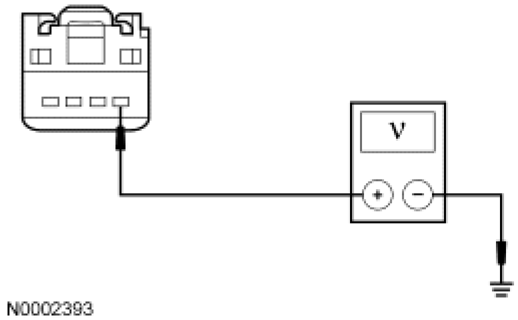

Fig. 1: Checking PATS Transceiver Power Circuit CBP18 (GY/OG) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PATS transceiver C252-1, circuit CBP18 (GY/OG), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to E2.

  NO : VERIFY the SJB fuse 26 (7.5A) is OK. If OK, REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

E2 CHECK THE PATS TRANSCEIVER GROUND CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.

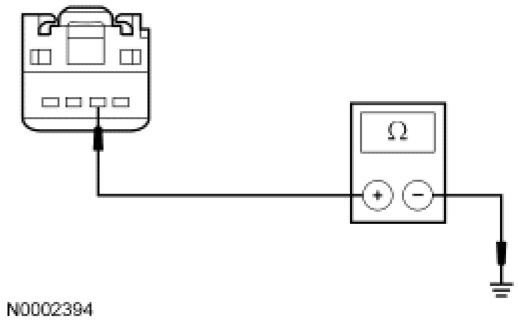

Fig. 2: Checking PATS Transceiver Ground Circuit GD116 (BK/VT) For An Open
Courtesy of FORD MOTOR CO.

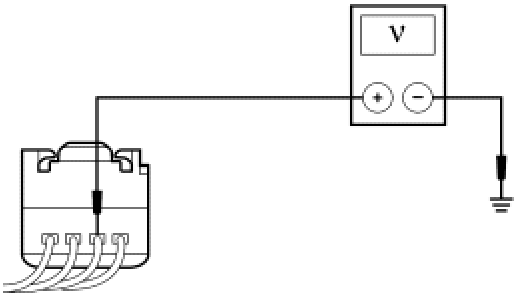
- Measure the resistance between the PATS transceiver C252-2, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E3.

  NO : REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

E3 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VRT24 (YE/OG) FOR VOLTAGE

- Connect: PATS Transceiver C252
- Key in ON position.



N0002395

Fig. 3: Checking PATS Transceiver Receive Circuit VRT24 (YE/OG) For Voltage
Courtesy of FORD MOTOR CO.

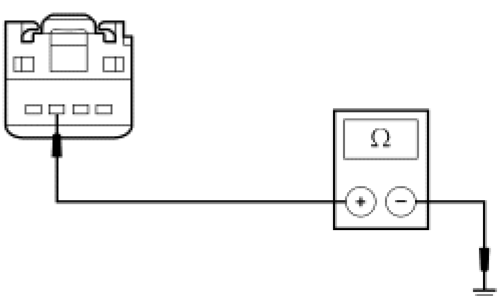
- Measure the voltage by backprobing between the PATS transceiver C252-3, circuit VRT24 (YE/OG), harness side and ground.
- **Is the voltage greater than 8 volts?**

  YES : Go to E6.

  NO : Go to E4.

E4 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VRT24 (YE/OG) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: IC C220
- Disconnect: PATS Transceiver C252



N0002396

Fig. 4: Checking PATS Transceiver Receive Circuit VRT24 (YE/OG) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the PATS transceiver C252-3, circuit VRT24 (YE/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E5.

  NO : REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

If DTC B1681 is retrieved again, go to E12 .

E5 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT VRT24 (YE/OG) FOR AN OPEN

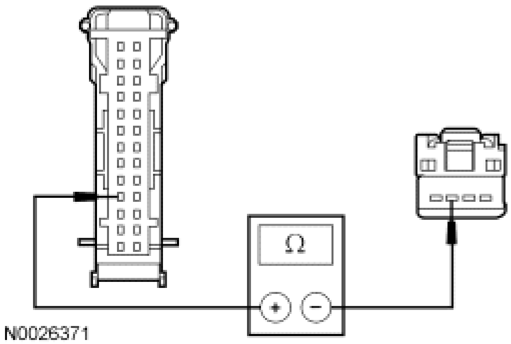


Fig. 5: Checking PATS Transceiver Receive Circuit VRT24 (YE/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-4, circuit VRT24 (YE/OG), harness side and the PATS transceiver C252-3, circuit VRT24 (YE/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to E12.

  NO : REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

E6 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT23 (VT/GY) FOR VOLTAGE

NOTE:	**Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again.**

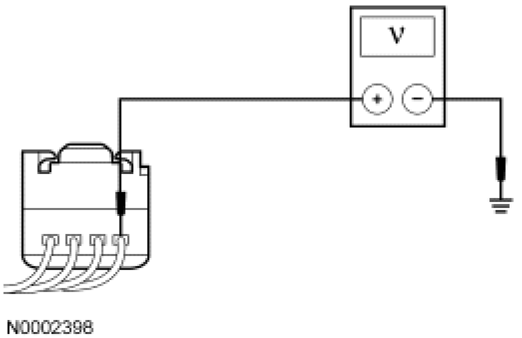

Fig. 6: Checking PATS Transceiver Transmit Circuit VRT23 (VT/GY) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage by backprobing between the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side and ground.
- **Is the voltage greater than 8 volts?**

  YES : INSTALL a new PATS transceiver. REFER to **Passive Anti-Theft System (PATS) Transceiver**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

If DTC B1681 is retrieved again, go to E12 .

NO : Go to E7.

E7 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT23 (VT/GY) FOR A SHORT TO GROUND WITH THE PATS TRANSCEIVER CONNECTED

- Key in OFF position.
- Disconnect: IC C220

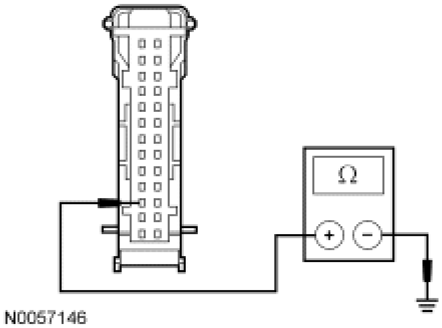

Fig. 7: Checking PATS Transceiver Transmit Circuit VRT23 (VT/GY) For A Short To Ground With PATS Transceiver Connected
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-3, circuit VRT23 (VT/GY), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to E9.

NO : Go to E8.

E8 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT23 (VT/GY) FOR A SHORT TO GROUND WITH THE PATS TRANSCEIVER DISCONNECTED

NOTE: **Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again.**

- Disconnect: PATS Transceiver C252

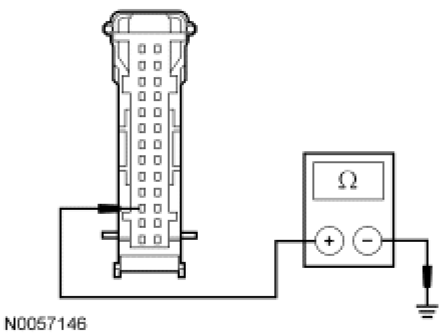

Fig. 8: Checking PATS Transceiver Transmit Circuit VRT23 (VT/GY) For A Short To Ground With PATS Transceiver Disconnected

Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-3, circuit VRT23 (VT/GY), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new PATS transceiver. REFER to **Passive Anti-Theft System (PATS) Transceiver**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

  NO : REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

E9 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT23 (VT/GY) FOR AN OPEN

- Disconnect: PATS Transceiver C252

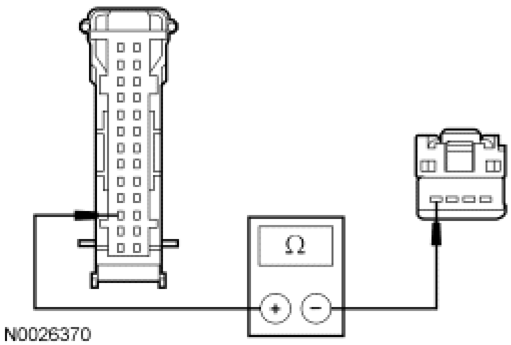

Fig. 9: Checking PATS Transceiver Transmit Circuit VRT23 (VT/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the IC C220-3, circuit VRT23 (VT/GY), harness side and the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to E10.

  NO : REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

E10 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT23 (VT/GY) FOR VOLTAGE

NOTE:	**Replacement of the PATS transceiver does not require the PATS keys to be programmed into the IC again.**

- Connect: PATS Transceiver C252
- Connect: IC C220
- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: IC DataLogger
- Trigger the IC active command Transmit Signal to on.

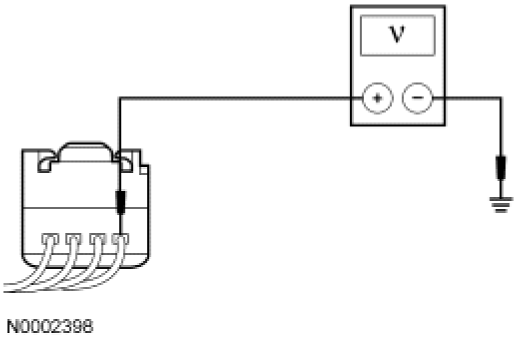

Fig. 10: Checking PATS Transceiver Transmit Circuit VRT23 (VT/GY) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage by backprobing between the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side and ground.
- **Is the voltage less than 5 volts?**

  YES : INSTALL a new PATS transceiver module. REFER to **Passive Anti-Theft System (PATS) Transceiver**. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

  NO : Go to E11.

E11 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT VRT23 (VT/GY) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: IC C220
- Disconnect: PATS Transceiver C252
- Key in ON position.

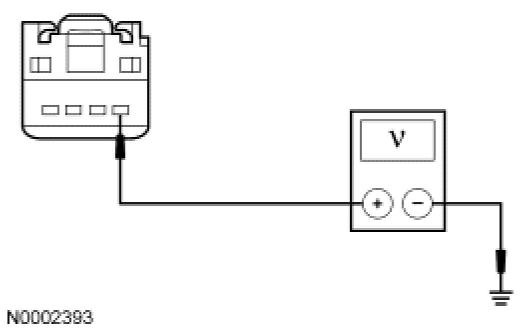

Fig. 11: Checking PATS Transceiver Transmit Circuit VRT23 (VT/GY) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the PATS transceiver C252-4, circuit VRT23 (VT/GY), harness side and ground.
- **Is any voltage indicated?**

  YES : REPAIR the circuit. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

  NO : Go to E12.

E12 CHECK FOR CORRECT IC OPERATION

NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC.

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM.

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. PROGRAM the PATS keys into the new IC. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test F: The Anti-Theft Indicator Is Always/Never On

Normal Operation

The passive anti-theft system (PATS) uses a visual anti-theft indicator located in the instrument cluster (IC). This indicator proves out for 3 seconds when the key is turned to the ON or START position under normal operation. If there is a PATS concern, this indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or the START position. PATS also flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the IC.

This pinpoint test is intended to diagnose the following:

- IC

PINPOINT TEST F: THE ANTI-THEFT INDICATOR IS ALWAYS/NEVER ON

NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC.

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM.

F1 CHECK THE ANTI-THEFT INDICATOR FOR CORRECT OPERATION

- Key in OFF position.
- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: IC DataLogger
- Trigger the active command ALL LAMPS to ON, then OFF.
- **Does the anti-theft indicator illuminate, then turn off?**

  YES : Go to F2.

  NO : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. PROGRAM the PATS keys into the new IC. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. CYCLE the ignition. REPEAT the self-test.

F2 CHECK FOR CORRECT IC OPERATION

- Disconnect the IC connector.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect the IC connector and make sure it seats correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. PROGRAM the PATS keys into the new IC. REFER to **Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment**. CYCLE the ignition. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test.

Pinpoint Test G: DTC U0100 and U2511 - CAN - Data Mis-Match (Receive Data Does Not Match Expected) & Lost Communication With ECM/PCM

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Module Communications Network for schematic and connector information.

Normal Operation

The passive anti-theft system (PATS) uses a visual anti-theft indicator located in the IC. This indicator proves out for 3 seconds when the key is turned to the ON or START position under normal operation. If there is a

PATS concern, this indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or the START position. PATS also flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the IC.

If DTC U2510 is present, refer to DTC Charts.

- DTC U0100 (Lost Communication With ECM/PCM) - sets in continuous memory only when the instrument cluster (IC) loses communication with the PCM and the fault may not be present at the time of testing. This DTC may be caused by a high speed controller area (HS-CAN) network circuit issue or by the IC or the PCM.
- DTC U2511 (CAN - Data Mis-Match [Receive Data Does Not Match Expected]) - sets in continuous memory only when the IC does not receive the expected response from the PCM over the HS-CAN network and the fault may not be present at the time of testing. The data sent by the PCM does not match the data expected by the IC and this DTC is set. This DTC can be caused by the HS-CAN circuits between the IC and the PCM or by either module. This DTC can also be set if the battery voltage is low.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Low battery state of charge (SOC)
- IC
- PCM

PINPOINT TEST G: DTC U0100 - LOST COMMUNICATION WITH ECM/PCM, DTC U2511 - CAN - DATA MIS-MATCH (RECEIVE DATA DOES NOT MATCH EXPECTED)

NOTE: **When a new IC is installed, the PATS keys must be programmed into the new IC.**

NOTE: **When a new IC is installed, the parameters must be reset in the IC and the PCM.**

G1 CHECK THE BATTERY STATE OF CHARGE (SOC)

- Key in OFF position.
- Check the battery state of charge (SOC) with the battery condition test. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Does the battery pass the battery condition test?**

  YES : Go to G2.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the low battery voltage condition.

G2 CHECK FOR MODULE COMMUNICATION ON THE HS-CAN

- Connect the diagnostic tool.
- Key in ON position.
- Carry out the network test using the scan tool.
- **Is the scan tool unable to communicate with any of the modules on the HS-CAN?**

YES : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the module that is not communicating with the scan tool.

NO : Go to G3.

G3 INSPECT THE HS-CAN CIRCUITRY

- Key in OFF position.
- Inspect all of the HS-CAN network, including the pin crimps, connector fit, corroded/bent/pushed-out/damaged pins and splice integrity in the 10 splices and 12 connections (6 connectors) between the IC and the PCM. This includes:
  - C220 (IC)
  - S220, S221
  - C3047
  - S333, S334
  - S331, S332
  - C219
  - S137, S138
  - C133
  - S105, S106
  - C138 (3.0L)
  - C133 (3.5L)
  - C175B (PCM)
- **Does the HS-CAN network pass the component inspection?**

  YES : Go to G4.

  NO : REPAIR the HS-CAN circuitry as necessary. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

G4 CHECK FOR CORRECT PCM OPERATION

NOTE: **When a new PCM is installed, the PATS keys do not need to be programmed into the IC.**

NOTE: **When a new PCM is installed, the parameters must be reset in the IC and the PCM.**

- Disconnect all the PCM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the PCM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.

- **Is the concern still present?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article or **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation. If the concern is still present, Go to G5.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

G5 CHECK FOR CORRECT IC OPERATION

NOTE: When a new IC is installed, the PATS keys must be programmed into the new IC.

NOTE: When a new IC is installed, the parameters must be reset in the IC and the PCM.

- Disconnect all the IC connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the IC connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new IC. REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article. RESET the parameters in both the IC and the PCM. REFER to **Passive Anti-Theft System (PATS) Parameter Reset**. PROGRAM the PATS keys into the new IC. REFER to **Spare Key Programming - Using Diagnostic Equipment**. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. CYCLE the ignition. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: The Vehicle Does Not Start

Normal Operation

The passive anti-theft system (PATS) uses a visual anti-theft indicator located in the IC. This indicator proves out for 3 seconds when the key is turned to the ON or START position under normal operation. If there is a PATS concern, this indicator either flashes rapidly or glows steadily (for more than 3 seconds) when the key is turned to the ON or the START position. PATS also flashes the anti-theft indicator every 2 seconds at key off to act as a visual theft deterrent. The anti-theft indicator operation is controlled by the IC.

This pinpoint test is intended to diagnose the following:

- Starting system concern
- PATS concern

PINPOINT TEST H: THE VEHICLE DOES NOT START

H1 CHECK FOR COMMUNICATION WITH THE PCM AND INSTRUMENT CLUSTER (IC)

- Connect the diagnostic tool.
- Key in ON position.
- Carry out the network test using the scan tool.
- **Does the scan tool establish communication with the PCM and the IC?**

  YES : Go to H2.

  NO : REFER to **MODULE COMMUNICATIONS NETWORK** article to diagnose the module that is not communicating with the scan tool.

H2 CHECK FOR INSTRUMENT CLUSTER (IC) DTCs

- Retrieve the IC continuous and on-demand DTCs.
- **Are any IC DTCs present?**

  YES : REFER to **DTC Charts**.

  NO : The no-start condition is not PATS-related. REFER to the **Introduction - Gasoline Engines** article to diagnose the cause of the no-start condition.

GENERAL PROCEDURES

KEY PROGRAMMING USING TWO PROGRAMMED KEYS

NOTE: **This procedure works only if 2 or more programmed ignition keys (they do not have to be integrated key head transmitter [IKT] keys) are present. If 2 programmed passive anti-theft system (PATS) keys are not available, refer to Integrated Key head Transmitter (IKT) Key Programming Using Diagnostic Equipment.**

NOTE: **The PID SPAREKEY must be enabled for this procedure to operate. If this PID is not enabled, refer to Key Programming Switch State Control, then select CUSTOMER SPARE KEY PROGRAMMING ENABLE and select the tick mark. The PID SPAREKEY is set to ENABLE when the vehicle is built.**

NOTE: **If the programming procedure is successful, the new key(s) will start the vehicle and the anti-theft indicator will prove-out for approximately 3 seconds. If the programming procedure is not successful and the new key(s) does not start the engine, leave the key in the ON position for at least 3 seconds, then turn the key off. Repeat the key programming procedure from Step 1. If the failure repeats, refer to Anti-Theft in the Diagnosis and Testing portion of this part to review the**

DTCs and carry out the appropriate pinpoint tests.

NOTE: **A minimum of 2 PATS keys must be programmed into the instrument cluster (IC) before the vehicle will start.**

NOTE: **If the vehicle is in unlimited key mode, this spare key programming procedure still functions. Any 2 keys that can start the vehicle can be used to program an additional unlimited key.**

NOTE: **If additional keys are to be programmed, and the remaining keys are with the customer, or are not available, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the PID SPAREKEY must be enabled.**

NOTE: **If the steps are not carried out as outlined, the programming procedure will end.**

NOTE: **Ignition keys must have a correct mechanical key cut for the vehicle and must be PATS encoded keys (contain a transponder). The key does not have to be an IKT key.**

NOTE: **This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IC.**

NOTE: **A maximum of 8 ignition keys can be programmed to a PATS vehicle, of which up to 4 can be IKTs. If an attempt to program more than 4 IKTs occurs, the smart junction box (SJB) and the IC set a memory full DTC (B1138), and the additional IKTs will not have any RKE function capability. If the vehicle is equipped with a message center, the IC displays the message INT KEY COULD NOT PROGRAM. The PATS portion of the additional key will function, but the RKE transmitter function will be inoperative.**

1. Insert a programmed ignition key (can be an IKT or a standard PATS key) into the ignition lock cylinder and turn the key from the OFF position to the ON position.
2. Leave the key in the ON position for 3 seconds, but not longer than 10 seconds.
3. Turn the key to the OFF position and remove the first key.
4. Within 10 seconds of turning the key to the OFF position, insert a second programmed ignition key (can be an IKT or a standard PATS key) into the ignition lock cylinder and turn the key from the OFF position to the ON position.
5. Leave the key in the ON position for 3 seconds, but not longer than 10 seconds.
6. Turn the key to the OFF position and remove the second key.
7. Within 20 seconds of turning the key to the OFF position, insert the unprogrammed ignition key (new PATS or IKT key) into the ignition lock cylinder and turn the key from the OFF position to the ON position. Leave the key in the ON position for a minimum of 6 seconds (this additional 3 second time

frame allows for the RKE data transfer to take place, if programming an IKT key).

NOTE: The new key will now start the vehicle and will also operate the RKE functions, if there are 4 or fewer IKT keys programmed to the vehicle (if it is an IKT key).

8. Attempt to start the vehicle.
9. If additional programmed keys are desired, repeat Steps 1-7.

INTEGRATED KEY HEAD TRANSMITTER (IKT) KEY PROGRAMMING USING DIAGNOSTIC EQUIPMENT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: This procedure is used when a customer needs keys programmed into the system and does not have 2 programmed ignition keys available. This procedure is also useful when a programmed ignition key(s) is lost or the ignition lock cylinder is replaced, and it is desired to erase key code(s) from the passive anti-theft system (PATS) memory.

NOTE: This procedure erases all programmed ignition keys from the vehicle memory and the vehicle will not start until 2 keys are programmed to the vehicle. This procedure also erases the integrated key head transmitter (IKT) identification codes (TICs) from the smart junction box (SJB), preventing the erased IKT from operating the remote keyless entry (RKE) functions on the vehicle.

NOTE: A minimum of 2 PATS keys must be programmed into the instrument cluster (IC) before the vehicle will start.

NOTE: Two PATS encoded (contains a transponder) keys (or IKTs) with the correct mechanical cut must be available to carry out this procedure. One or both of them may be the customer's original keys. One or both of them may be an IKT or a standard PATS key.

NOTE: If additional keys are to be programmed, refer to Key Programming Using Two Programmed Keys. If the remaining keys are with the customer and are not available with the vehicle, instruct the customer to refer to the Owner's Literature for instructions on programming the remaining keys. In this case, the

PID SPAREKEY must be enabled.

NOTE: This procedure is not necessary if only the PATS transceiver was replaced. Replacement of the transceiver does not erase the PATS key codes in the IC.

1. Turn the key from the OFF position to the ON position.
2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to **Anti-Theft Security Access**.
3. From the scan tool menu select: IGNITION KEY CODE ERASE. Press the tick mark.
4. Turn the key to the OFF position and disconnect the scan tool.

   NOTE: The RKE data transfer will take place between the key and the IC first. After both keys are programmed into the IC, then the RKE data will transfer from the IC to the SJB. Until the final data transfer takes place to the SJB, the RKE functions will not operate.

5. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for a minimum of 6 seconds (this additional 3 second time frame allows for the RKE data transfer to take place).
6. Remove the first PATS key from the ignition lock cylinder.
7. Insert the second PATS key into the ignition lock cylinder and turn the key to the ON position for a minimum of 6 seconds (this additional 3 second time frame allows for the RKE data transfer to take place).
8. Remove the second encoded key from the ignition lock cylinder.
9. The vehicle should now start with both ignition keys and the RKE transmitter portion of an IKT should function.
10. If it is desired to program additional key(s) (only up to 8 keys total can be programmed into the instrument cluster [IC]), refer to **Key Programming Using Two Programmed Keys** for each additional key that needs to be programmed.

KEY PROGRAMMING SWITCH STATE CONTROL

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: The spare key programming switch is a programmable switch which provides the capability to enable/disable the normal customer spare key programming

procedure detailed in the Owner's Literature. It must read ENABLE if more than 2 keys need to be programmed into the instrument cluster (IC). For additional information, refer to Key Programming Using Two Programmed Keys. This programmable switch is provided as a convenience for rental company fleets or other fleet purchasers who may not want the spare key programming procedure available to the vehicle driver.

NOTE: The spare key programming switch state can be viewed with the IC SPAREKEY PID.

NOTE: If the SPAREKEY PID reads ENABLE, up to 8 keys total can be programmed into the IC using Key Programming Using Two Programmed Keys. If the SPAREKEY PID reads DISABLED, the Key Programming Using Two Programmed Keys procedure will not function. This switch is set to ENABLE when the vehicle is built. This PID does not affect the Key Programming Using Diagnostic Equipment or the Spare Key Programming - Unlimited Key Mode procedures.

1. Insert a programmed passive anti-theft system (PATS) key (or integrated key head transmitter [IKT]) into the ignition lock cylinder and turn the key from the OFF position to the ON position.
2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to **Anti-Theft Security Access**.

   NOTE: The default setting on delivery of all new vehicles is ENABLED, when viewing the IC SPAREKEY PID.

3. From the scan tool menu select: CUSTOMER SPARE KEY PROGRAMMING ENABLE and press the tick mark.
   - CUSTOMER SPARE KEY PROGRAMMING ENABLE - spare key programming procedure is accessible.
   - CUSTOMER SPARE KEY PROGRAMMING DISABLE - spare key programming procedure is not accessible.

SPARE KEY PROGRAMMING - UNLIMITED KEY MODE

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Enabling Unlimited Key Mode

NOTE: Unlimited key mode is intended for use by those customers who need more than 8 keys for their vehicle.

NOTE: If unlimited key mode is enabled, a maximum of 4 IKT keys can be programmed to the vehicle for RKE functionality. If more keys are required, they should be standard PATS keys. If more than 4 IKT keys are programmed to the vehicle, the smart junction box (SJB) and the instrument cluster (IC) will set DTC B1138 (memory full) and only 4 IKT keys will have RKE functionality, however, all of them will start the vehicle, if programmed correctly.

NOTE: Before programming, the new key(s) must have the correct mechanical cut for the ignition lock cylinder.

NOTE: The unlimited key mode is set up by creating a special, unique unlimited transponder security key code and programming this key code into all of the vehicle keys so they contain the same key code.

1. The customer must choose an 8-digit number (except for 00000000 or 00000001) to be programmed to all of their vehicles. All customer vehicles need to use the same number. Valid digits are 0-9 and the letters A-F.

   NOTE: If the PID UNL_KEY_ID is not available, unlimited key mode is turned on, and must be turned off before viewing the stored code. At this time, unlimited keys may be programmed to the vehicle. To view/change the stored code, follow the procedure for disabling the unlimited key mode below.

2. Monitor the PID UNL_KEY_ID and compare its value against the code chosen in Step 1. It should not be the same key code.
3. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to **Anti-Theft Security Access**.
4. Once in security access, select: "program unlimited key code" and press the tick mark. Enter the 8-digit code chosen by the customer in Step 1 of this procedure and press the tick mark.
5. Select: "unlimited key mode ON" and press the tick mark.
6. Select: "Ignition Key Code Erase" and press the tick mark.
7. Disconnect the scan tool and turn the ignition switch to OFF.
8. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds if it is an IKT key).
9. Remove the first PATS key from the ignition lock cylinder.
10. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds if it is an IKT key).
11. If it is desired to program additional key(s), refer to **Key Programming Using Two Programmed Keys** for each additional key that needs to be programmed.

Disabling Unlimited Key Mode

NOTE: By disabling the unlimited key mode, the previous access code no longer operates the vehicle.

1. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to **Anti-Theft Security Access**.
2. Select: "unlimited key mode OFF" and press the tick mark.
3. Select: "Ignition Key Code Erase" and press the tick mark.
4. Disconnect the scan tool and turn the ignition switch to OFF.
5. Insert the first PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds if it is an IKT key).
6. Remove the first PATS key from the ignition lock cylinder.
7. Insert the next PATS key into the ignition lock cylinder and turn the key to the ON position for 3 seconds (6 seconds if it is an IKT key).

   NOTE: With the unlimited key mode turned off, a maximum of 8 keys can be programmed into the IC using the Key Programming Using Two Programmed Keys procedure. The PID SPAREKEY must be enabled.

8. If it is desired to program additional key(s), refer to **Key Programming Using Two Programmed Keys** for each additional key that needs to be programmed. The PID SPAREKEY must be enabled.

SPARE KEY PROGRAMMING - USING DIAGNOSTIC EQUIPMENT

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: This procedure is used when a customer needs to have an additional key programmed into the vehicle without erasing stored key codes, but does not have 2 programmed keys available. This procedure is also useful when attempting to determine if an ignition key is defective, as a new key can be installed without erasing keys or without having 2 programmed keys available.

NOTE: Before programming, the new key must have the correct mechanical cut for the ignition lock cylinder.

NOTE: If 8 keys are already programmed, this procedure does not allow any more

ignition keys to be programmed. The number of keys that are programmed into the passive anti-theft system (PATS) can be determined by viewing the N_KEYCODE PID.

1. Turn the new key to be programmed from the OFF position to the ON position.
2. From the scan tool, follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to **Anti-Theft Security Access**.

NOTE: Make sure the selection made is "PROGRAM". If "ERASE" selection is made, all of the keys will be erased from the system.

3. From the scan tool menu select: "Program additional ignition key".
4. Turn the key to the OFF position and disconnect the scan tool.
5. Start the vehicle with the new PATS key. The vehicle will now start with the new PATS key and also with the original PATS keys.

ANTI-THEFT SECURITY ACCESS

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: The anti-theft security access procedure is used to obtain passive anti-theft system (PATS) security access. PATS security access must be granted to erase ignition key codes, program ignition key codes, enable/disable unlimited key mode, set unlimited transponder key ID and enable/disable the spare key programming switch (PID SPAREKEY). The anti-theft security access procedure invokes a 10-minute time delay prior to granting security access during which the scan tool must remain connected to the vehicle. Once security access is granted, a security access command menu is displayed which offers various command options.

NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids an additional security access procedure and the associated 10 minute time delay.

1. From the scan tool, enter TOOLBOX. Select: BODY - SECURITY - PATS Functions, and follow the on-screen instructions to ENTER SECURITY ACCESS. This procedure takes approximately 10 minutes to carry out, during which time the ignition switch must be in the ON position and the scan tool must be

connected to the vehicle.

2. After the 10-minute security access procedure is completed, click on the tick mark and a new menu is displayed with command options. Select only those functions required before exiting out of this menu. Do not select more functions than the procedure calls for. Once exited out of this menu, the security access procedure must be repeated again to carry out additional commands.

PASSIVE ANTI-THEFT SYSTEM (PATS) PARAMETER RESET

Special Tools

Illustration	Tool Name	Tool Number
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: When using the IDS, the instrument cluster (IC) and the PCM parameters are reset at the same time.

NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids an additional security access procedure and the associated 10 minute time delay.

1. Turn the key from the OFF position to the ON position.
2. From the scan tool, enter TOOLBOX. Select BODY-SECURITY-PATS Functions and follow the on-screen instructions to ENTER SECURITY ACCESS. For additional information, refer to **Anti-Theft Security Access**.
3. From the scan tool, select: Parameter Reset and press the tick mark.

    NOTE: If the IC was replaced, follow Steps 4-9. If the IC and the PCM were replaced, follow Steps 4-9. If only the PCM was replaced, cycle the key off, then back on, to complete the procedure.

    NOTE: If steps 4-9 are followed, 2 keys must be present.

4. From the scan tool, select: Ignition Key Code Erase and press the tick mark.
5. Turn the key to the OFF position and disconnect the scan tool.

    NOTE: Integrated key head transmitter (IKT) keys require a 6-second programming time frame for the remote keyless entry (RKE) data transfer to take place, while standard PATS keys only require a minimum of 3 seconds.

6. Turn the key to the ON position for a minimum of 6 seconds (if it is an IKT key).
7. Turn the key to the OFF position and remove it from the ignition lock cylinder.
8. Insert the second key and turn it to the ON position for a minimum of 6 seconds (if it is an IKT key).
9. Both keys will now start the vehicle and will also operate the RKE functions of the vehicle (if they are IKT keys).

NOTE: The RKE data transfer will take place between the key and the IC first. After both keys are programmed into the IC, the RKE data will transfer from the IC to the smart junction box (SJB). Until the final data transfer takes place into the SJB, the RKE functions will not operate.

10. If more keys are required to be programmed, refer to **Key Programming Using Two Programmed Keys**.

REMOVAL AND INSTALLATION

PASSIVE ANTI-THEFT SYSTEM (PATS) TRANSCEIVER

NOTE: MKZ shown, Fusion and Milan similar.

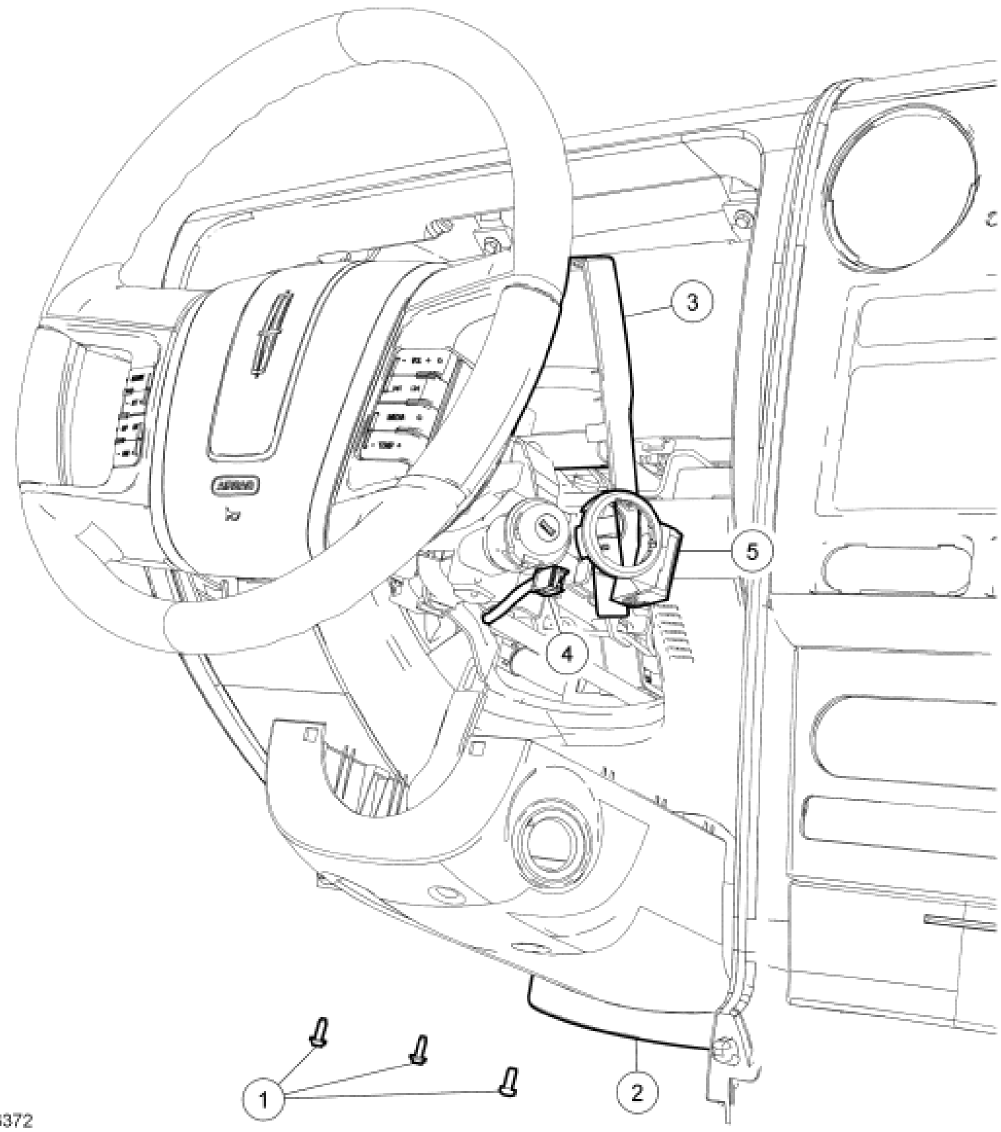

Fig. 12: Exploded View Of Passive Anti-Theft System (PATS) Transceiver
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Steering column shroud screws (3 required)
2	3530	Steering column shroud (lower)
3	3531	Steering column shroud (upper)
4	-	Passive anti-theft system (PATS) transceiver electrical connector (part of 14401)
5	15607	PATS transceiver

REMOVAL AND INSTALLATION

1. Remove the 3 screws and the lower steering column shroud.
2. Position the upper steering column shroud aside.
3. Disconnect the electrical connector and remove the passive anti-theft system (PATS) transceiver.

NOTE: **Replacement of the PATS transceiver does not require the PATS keys to be programmed into the instrument cluster (IC) again.**

4. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Anti-Theft - Perimeter - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

ANTI-THEFT

NOTE:	**The integrated key head transmitter (IKT) key is a standard passive anti-theft system (PATS) key with a remote keyless entry (RKE) transmitter incorporated into the key head. For additional information on PATS, refer to ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS) article. For additional information on RKE, refer to HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS article.**

NOTE:	**The smart junction box (SJB) is also known as the generic electronic module (GEM).**

The perimeter anti-theft system consists of the following:

- Door ajar switches
- Door disarm switch
- Exterior lamps
- Hood switch
- Horn
- Key-in-ignition switch
- Keyless entry keypad (if equipped)
- Luggage compartment lid disarm switch
- IKT key
- Smart junction box (SJB)

The perimeter anti-theft feature is controlled by the SJB. The alarm can be armed by using 1 of 3 commands:

- Pressing the LOCK button on the IKT key
- Pressing the door lock control switch to LOCK with the accompanying door open, then close the door
- Pressing the 7/8 and 9/0 buttons simultaneously on the keyless entry keypad (if equipped)

The SJB monitors the door ajar switches, the hood ajar switch, the door disarm switch and the luggage compartment lid disarm switch (all doors, hood, luggage compartment lid must be closed and the key must be out of the ignition switch). The SJB arms the perimeter alarm after all of the inputs are closed for 20 seconds. From the time each individual input is closed, to the time the perimeter alarm is armed for that particular input (approximately 20 seconds), is the "pre-arm phase". The pre-arm phase is separate for each individual input. If the door lock control switch is pressed to LOCK with the accompanying door open, all of the inputs that are closed (hood, luggage compartment lid) immediately begin their pre-arm phase. After the door that was open is closed, that door begins its pre-arm phase. This causes all other entry points to be armed a few seconds before

the last open entry point. The perimeter alarm arms in stages in relation to which input was closed first after the arming command was given. In the event of an unauthorized entry, the alarm will be activated by the SJB. When the alarm is activated, the SJB intermittently grounds the horn relay, causing the horn to sound in regular intervals, and intermittently powers the turn signals, causing the turn signals to flash in regular intervals.

The perimeter alarm can be disarmed only by:

- pressing the UNLOCK button on the IKT key.
- turning the door lock cylinder to the UNLOCK position.
- using a valid programmed key to turn the ignition switch to the ON position.
- entering the correct vehicle unlock code on the keyless entry keypad (if equipped).

The perimeter alarm can be deactivated (not disarmed), by pressing the PANIC button on the RKE transmitter. This action will not disarm the alarm, but will stop the alarm from activation (horn sounding and turn signals flashing). The perimeter alarm will continue to be armed.

DIAGNOSTIC TESTS

ANTI-THEFT

Special Tools

Illustration	Tool Name	Tool Number
	73III Automotive Meter	105-R0057 or equivalent
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
	Flex Probe Kit	105-R025C or equivalent

Principles of Operation

Perimeter Anti-Theft

NOTE:	**The smart junction box (SJB) is also known as the generic electronic module (GEM).**

The perimeter anti-theft system (integral to the SJB) provides for vehicle security through an audible and visual notification if the vehicle doors, luggage compartment lid, or hood is opened without the system being disarmed. The system arms when:

- the doors, the luggage compartment lid, and the hood are closed.
- the key is in the OFF position.
- the vehicle is electronically locked using the integrated key head transmitter (IKT) key, the keyless entry keypad (if equipped), or the driver door lock control switch (with a front door open, then closed).

There is a 20-second pre-arm delay after which each door, luggage compartment lid, and hood is armed. If a door, luggage compartment lid, or hood is open, the system still arms all the other closures. Only the open door, luggage compartment lid, or hood remains disarmed until it is closed. When the open entry point is closed, that entry point enters a 20-second pre-arm delay, then arms.

The hood switch and door ajar switches register as normally closed. The luggage compartment lid ajar switch registers as a normally closed switch. The SJB monitors the status of the hood switch, the luggage compartment lid ajar switch and door ajar switches. If these switches indicate an open entry point, the SJB energizes the horn and flasher relays, causing the horn to sound and the turn signal lamps to flash. The SJB disarms the perimeter alarm when it receives:

- an UNLOCK command through the keyless entry keypad (if equipped).
- an UNLOCK command through the IKT key.
- a disarm signal from the driver door disarm switch (part of the driver door latch) that is hardwired to the SJB.
- a network message from the driver door module (DDM) to the SJB that the driver door disarm switch (part of the driver door latch) was operated (if equipped with memory).
- a valid PATS ignition key is turned to the ON position.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Hood switch • Driver door disarm switch (part of the driver door latch) • Luggage compartment disarm switch	• Wiring, terminals or connectors • Door latches • Driver door module (DDM) (MKZ only) • Smart junction box (SJB)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before

proceeding to the next step.

NOTE: Make sure to use the latest scan tool software release.

4. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove-out confirms power and ground from the DLC are provided to the VCM.

5. If the scan tool does not communicate with the VCM:
   - Check the VCM connection to the vehicle.
   - Check the scan tool connection to the VCM.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
6. If the scan tool does not communicate with the vehicle:
   - Verify the ignition key is in the ON position.
   - Verify the scan tool operation with a known good vehicle.
   - Refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.
7. Carry out the network test.
   - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record the continuous memory DTCs.
8. Clear the continuous DTCs and carry out the self-test diagnostics for the SJB.
9. If the DTCs retrieved are related to the concern, go to DTC Charts. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
10. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

DTC Charts

SMART JUNCTION BOX (SJB) DTC CHART

DTC	Description	Action
B1520	Hood Switch Circuit Open	Go to **Pinpoint Test C**.
B2108	Trunk Key Cylinder Switch Failure	Go to **Pinpoint Test E**.
B2116	Door Driver Reset Switch Stuck Failure	Go to **Pinpoint Test A**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

DRIVER DOOR MODULE (DDM) DTC CHART

DTC	Description	Action

B2116	Door Driver Reset Switch Stuck Failure	Go to **Pinpoint Test A**.
All other DTCs	-	REFER to **MULTIFUNCTION ELECTRONIC MODULES** article.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• No communication with the smart junction box (SJB)	• Fuse(s) • Wiring, terminals or connectors • SJB	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• No communication with the driver door module (DDM)	• Fuse(s) • Wiring, terminals or connectors • DDM	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• The alarm system does not disarm - from the driver door	• Wiring, terminals or connectors • Driver door disarm switch (part of the driver door latch) • DDM (vehicles with memory feature) • SJB	• Go to **Pinpoint Test A**.
• The alarm system does not arm/disarm - using the integrated key head transmitter (IKT) key	• IKT key • IKT key battery • SJB	• Go to **Pinpoint Test B**.
• The alarm system does not arm/disarm - using the keyless entry keypad	• Keyless entry keypad • SJB	• REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
• The alarm system does not operate correctly - alarm does not activate with hood ajar/open	• Wiring, terminals or connectors • Hood switch • SJB	• Go to **Pinpoint Test C**.
• The alarm system does not operate correctly - flashers or horn do not cycle during anti-theft activation	• Turn signal lamps • Horn • SJB	• Go to **Pinpoint Test D**.

• The alarm system does not operate correctly - the alarm does not inhibit from the luggage compartment disarm switch	• Wiring, terminals or connectors • Luggage compartment disarm switch • SJB	• Go to **Pinpoint Test E**.

Pinpoint Tests

Pinpoint Test A: The Alarm System Does Not Disarm - From The Driver Door

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

On vehicles without the memory feature, the driver door disarm switch provides a ground signal to the smart junction box (SJB) through circuit CPL28 (VT/BN), the switch, and ground circuit GD126 (BK/WH) allowing entry without activating the alarm. The switch must operate before the mechanical lock unlocks. This is to prevent the anti-theft alarm from activating when it should have been disarmed.

On vehicles with the memory feature, the driver door disarm switch provides a ground signal to the driver door module (DDM) through circuit CPL28 (VT/BN), the switch, and ground circuit GD126 (BK/WH). The DDM sends a network message to the SJB, which allows entry without setting off the alarm. The switch must operate before the mechanical lock unlocks. This is to prevent the anti-theft alarm from activating when it should have been disarmed.

- DTC B2116 (Door Driver Reset Switch Stuck Failure) - sets when there is a short to ground in the circuit between the door lock actuator and the SJB (vehicles without memory), or the DDM (vehicles with memory), or the switch is stuck closed.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Driver door disarm switch (part of the driver door latch)
- DDM (vehicles with memory feature)
- SJB

PINPOINT TEST A: THE ALARM SYSTEM DOES NOT DISARM - FROM THE DRIVER DOOR

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK THE DRIVER DOOR DISARM SWITCH INPUT

- Key in OFF position.
- Disconnect: SJB C2280c (Vehicles Without Memory) or DDM C568b (Vehicles With Memory)

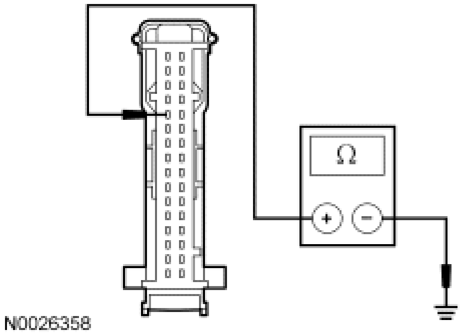

Fig. 1: Checking Driver Door Disarm Switch Input To SJB (1 Of 2)
Courtesy of FORD MOTOR CO.

- On vehicles without memory, measure the resistance between the SJB C2280c-5, circuit CPL28 (VT/BN), harness side and ground while turning the driver door lock cylinder to UNLOCK, and with the lock cylinder in the AT-REST position.

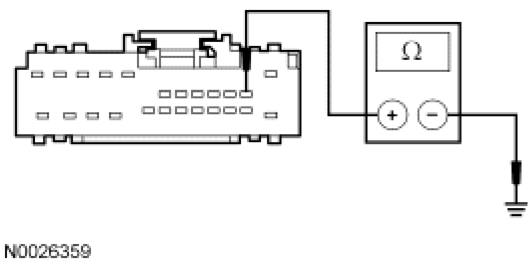

Fig. 2: Checking Driver Door Disarm Switch Input To SJB (2 Of 2)
Courtesy of FORD MOTOR CO.

- On vehicles with memory, measure the resistance between the DDM C568b-2, circuit CPL28 (VT/BN), harness side and ground while turning the driver door lock cylinder to UNLOCK, and with the lock cylinder in the AT-REST position.
- **Is the resistance less than 5 ohms with the door lock cylinder in the UNLOCK position and greater than 10,000 ohms with the door lock cylinder in the AT-REST position?**

  YES : For vehicles without memory, go to A6 .

  For vehicles with memory, go to A4 .

  NO : Go to A2.

A2 CHECK CIRCUIT CPL28 (VT/BN) FOR AN OPEN OR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Driver Door Latch C525

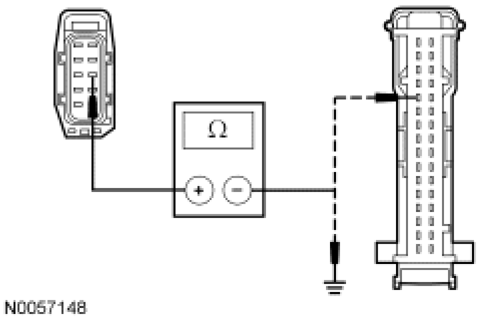

Fig. 3: Checking Circuit CPL28 (VT/BN) For An Open Or A Short To Ground (1 Of 2)
Courtesy of FORD MOTOR CO.

- On vehicles without memory, measure the resistance between the driver door latch C525-5, circuit CPL28 (VT/BN), harness side and the SJB C2280c-5, circuit CPL28 (VT/BN), harness side; and between the driver door latch C525-5, circuit CPL28 (VT/BN), harness side and ground.

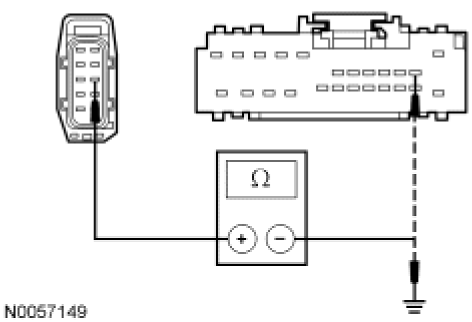

Fig. 4: Checking Circuit CPL28 (VT/BN) For An Open Or A Short To Ground (2 Of 2)
Courtesy of FORD MOTOR CO.

- On vehicles with memory, measure the resistance between the driver door latch C525-5, circuit CPL28 (VT/BN), harness side and the DDM C568b-2, circuit CPL28 (VT/BN), harness side; and between the driver door latch C525-5, circuit CPL28 (VT/BN), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to A3.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A3 CHECK THE DRIVER DOOR DISARM SWITCH GROUND

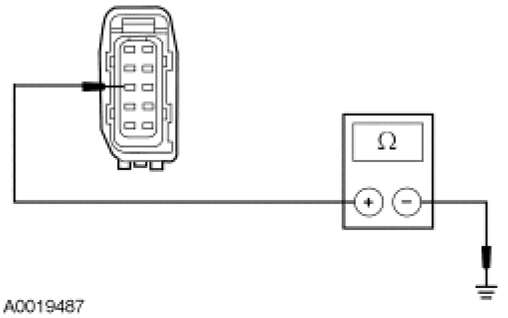

Fig. 5: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the driver door latch C525-6, circuit GD126 (BK/WH), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new driver door latch. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. CLEAR the DTCs. REPEAT the self-test.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

A4 CHECK THE SJB ALARM STATUS PID

- Connect: DDM C568b
- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: SJB DataLogger
- Monitor the SJB PID RESETSW (reset switch) while unlocking the door with the key.
- **Does the PID indicate active?**

  YES : Go to A6.

  NO : Go to A5.

A5 CHECK THE DDM FOR CORRECT OPERATION

- Disconnect all the DDM connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the DDM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new DDM. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. INFORM the customer that all memory feature settings have to be reset and the integrated key head transmitters (IKT) keys reset to the new memory feature settings. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose

or corroded connector. CLEAR the DTCs. REPEAT the self-test.

A6 CHECK THE SJB FOR CORRECT OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the remote keyless entry (RKE) function of the IKT key. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test B: The Alarm System Does Not Arm/Disarm - Using The Integrated Keyhead Transmitter (IKT) Key

Normal Operation

The smart junction box (SJB) receives lock/unlock commands from the IKT key. The SJB then arms/disarms the perimeter alarm system.

This pinpoint test is intended to diagnose the following:

- IKT key battery
- IKT key
- SJB

PINPOINT TEST B: THE ALARM SYSTEM DOES NOT ARM/DISARM - USING THE INTEGRATED KEYHEAD TRANSMITTER (IKT) KEY

NOTE: **All IKT keys must be present before diagnosing the remote keyless entry (RKE) system.**

B1 CHECK THE ALARM SYSTEM USING THE DRIVER DOOR DISARM SWITCH

- Arm the alarm system using the driver door lock control switch.
- Disarm the alarm system using the driver door disarm switch.
- **Does the alarm system arm and disarm correctly?**

  YES : REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article to continue the diagnosis of the IKT keys.

NO : Go to **Pinpoint Test A**.

Pinpoint Test C: The Alarm System Does Not Operate Correctly - Alarm Does Not Activate With Hood Ajar/Open

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The hood switch is a normally closed switch. The smart junction box (SJB) receives the hood switch status through circuit CPL25 (BU/OG), the hood switch, and the hood switch ground circuit GD123 (BK/GY). When the hood is open, the hood switch opens, removing the ground to the SJB.

- DTC B1520 (Hood Switch Circuit Open) - sets when there is an open in the circuit between the hood switch and the SJB, an open in the ground circuit to the hood switch, or the hood switch is stuck open during the on-demand self-test. If the hood is detected as always being open, the perimeter alarm will never arm for the hood.

This pinpoint test is intended to diagnose the following:

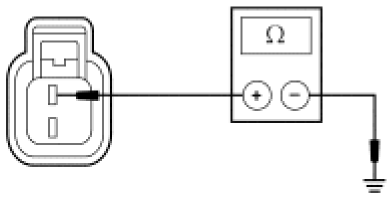
- Wiring, terminals or connectors
- Hood switch
- SJB

PINPOINT TEST C: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY - ALARM DOES NOT ACTIVATE WITH HOOD AJAR/OPEN

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

C1 CHECK THE HOOD SWITCH CIRCUIT CPL25 (BU/OG) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: SJB C2280a
- Disconnect: Hood Switch C127



A0024829

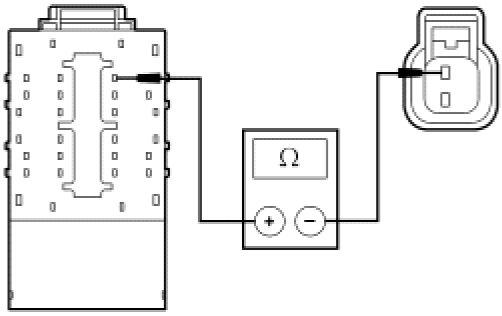
Fig. 6: Measuring Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between the hood switch C127-1, circuit CPL25 (BU/OG), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

YES : Go to C2.

NO : REPAIR the circuit. TEST the system for normal operation.

C2 CHECK CIRCUIT CPL25 (BU/OG) FOR AN OPEN



N0026365

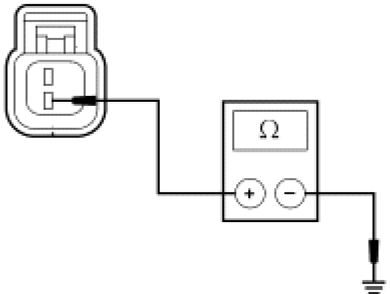
Fig. 7: Checking Circuit CPL25 (BU/OG) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the SJB C2280a-27, circuit CPL25 (BU/OG), harness side and the hood switch C127-1, circuit CPL25 (BU/OG), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to C3.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C3 CHECK CIRCUIT GD123 (BK/GY) FOR AN OPEN



A0096519

Fig. 8: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the hood switch C127-2, circuit GD123 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

YES : Go to C4.

NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

C4 CHECK THE HOOD SWITCH

- Connect: Hood Switch C127
- Make sure the hood is closed.

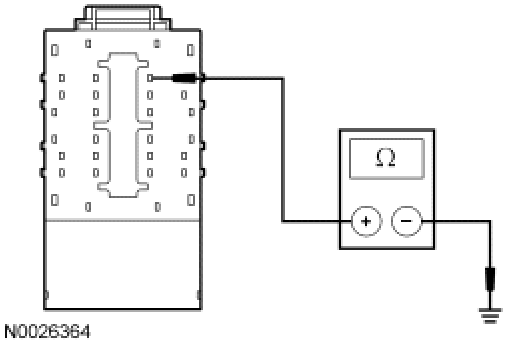


Fig. 9: Checking Hood Ajar Switch
Courtesy of FORD MOTOR CO.

- With the hood closed, measure the resistance between the SJB C2280a-5, circuit CPL25 (BU/OG), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to C5.

  NO : INSTALL a new hood switch. TEST the system for normal operation.

C5 CHECK THE SJB FOR CORRECT OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the remote keyless entry (RKE) function of the integrated key head transmitters (IKT) keys. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: The Alarm System Does Not Operate Correctly - Flashers Or Horn Do Not Cycle During Anti-Theft Activation

Normal Operation

When an alarm event occurs, the smart junction box (SJB) triggers the turn signals and the horn to signal an attempted theft.

This pinpoint test is intended to diagnose the following:

- Horn system concern
- Turn signals system concern
- SJB

PINPOINT TEST D: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY- FLASHERS OR HORN DO NOT CYCLE DURING ANTI-THEFT ACTIVATION

D1 CHECK THE ALARM ACTIVATION

- Roll down the driver window and arm the perimeter alarm. After the alarm is armed, open the driver door with the interior door handle to trigger the alarm.
- **Do the horn and turn signals cycle on and off?**

  YES : The alarm outputs are functioning correctly. TEST the system for normal operation.

  NO : If the turn signal lamps do not flash, go to D2.

  If the horn does not cycle, go to D3.

D2 CHECK THE TURN SIGNAL LAMPS OPERATION

- Key in ON position.
- Use the turn signal switch and observe the turn signal lamps.
- **Do the turn signal lamps operate correctly?**

  YES : Go to D4.

  NO : REFER to **EXTERIOR LIGHTING** article.

D3 CHECK THE HORN OPERATION

- Key in ON position.
- Operate the horn from the steering wheel.
- **Does the horn operate correctly?**

  YES : Go to D4.

  NO : REFER to **HORN** article.

D4 CHECK THE SJB FOR CORRECT OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.

- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the remote keyless entry (RKE) function of the integrated key head transmitters (IKT) keys. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test E: The Alarm System Does Not Operate Correctly - The Alarm Does Not Inhibit From The Luggage Compartment Disarm Switch

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Remote Keyless Entry and Alarm for schematic and connector information.

Normal Operation

The smart junction box (SJB) monitors the luggage compartment disarm switch on circuit CRT18 (YE/GY) for a ground signal. The luggage compartment disarm switch is a normally open switch. When the key is turned to the unlock position, the disarm switch completes the circuit to ground on circuit GD171 (BK/GY) signaling the SJB that an authorized entry to the luggage compartment is occurring. The SJB inhibits the alarm from activating until the luggage compartment lid is closed, then adds the luggage compartment lid to the protected entry points.

- DTC B2108 (Trunk Key Cylinder Switch Failure) - sets when there is a short to ground in the circuit between the luggage compartment disarm switch and the SJB, or the luggage compartment disarm switch is shorted closed internally.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Luggage compartment disarm switch
- SJB

PINPOINT TEST E: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY - THE ALARM DOES NOT INHIBIT FROM THE LUGGAGE COMPARTMENT DISARM SWITCH

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

E1 CHECK CIRCUIT CRT18 (YE/GY) FOR AN OPEN OR A SHORT TO GROUND

NOTE: The luggage compartment disarm switch does not disarm (only inhibits) the perimeter alarm system. Once armed, the perimeter alarm can only be

disarmed using the integrated key head transmitter (IKT) key, driver door disarm switch, the keyless entry keypad (if equipped), or if a valid passive anti-theft system (PATS) key is turned to the ON position.

- Key in OFF position.
- Disconnect: Luggage Compartment Disarm Switch C4320
- Disconnect: SJB C2280c

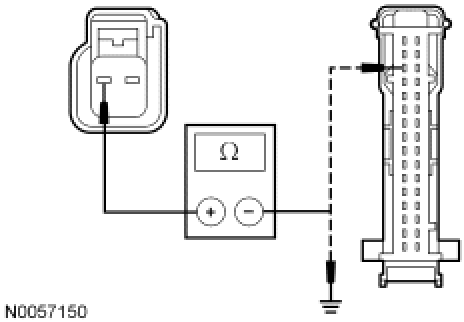

Fig. 10: Checking Circuit CRT18 (YE/GY) For An Open Or A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the luggage compartment disarm switch C4320-2, circuit CRT18 (YE/GY), harness side and the SJB C2280c-3, circuit CRT18 (YE/GY), harness side; and between the luggage compartment disarm switch C4320-2, circuit CRT18 (YE/GY), harness side and ground.
- **Is the resistance less than 5 ohms between the luggage compartment disarm switch and the SJB; and greater than 10,000 ohms between the luggage compartment disarm switch and ground?**

  YES : Go to E2.

  NO : REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E2 CHECK CIRCUIT GD171 (BK/GY) FOR AN OPEN

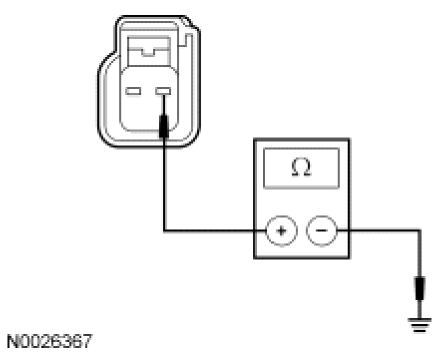

Fig. 11: Checking Circuit GD171 (BK/RD) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the luggage compartment lid disarm switch C4320-1, circuit GD171 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to E3.

  NO : REPAIR the circuit. TEST the system for normal operation.

E3 CHECK THE LUGGAGE COMPARTMENT DISARM SWITCH

- Connect: Luggage Compartment Disarm Switch C4320

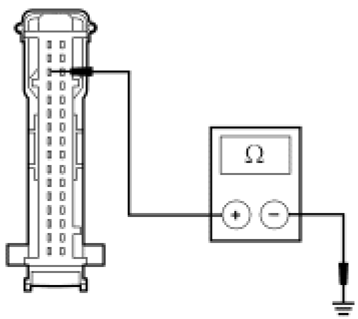

Fig. 12: Checking Luggage Compartment Disarm Switch
Courtesy of FORD MOTOR CO.

- While turning the key in the luggage compartment lid lock cylinder to the UNLOCK and AT-REST positions, measure the resistance between the SJB C2280c-3, circuit CRT18 (YE/GY), harness side and ground.
- **Is the resistance less than 5 ohms with the luggage compartment lid lock cylinder in the UNLOCK position; and greater than 10,000 ohms with the luggage compartment lid lock cylinder in the AT-REST position?**

  YES : Go to E4.

  NO : INSTALL a new luggage compartment disarm switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E4 CHECK THE SJB FOR CORRECT OPERATION

- Disconnect all the SJB connectors.
- Check for:
  - corrosion
  - damaged pins
  - pushed-out pins
- Connect all the SJB connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new SJB. REFER to **MULTIFUNCTION ELECTRONIC MODULES** article. CYCLE each key to the ON position for a minimum of 6 seconds to PROGRAM the remote keyless entry (RKE) function of the integrated key head transmitters (IKT) keys. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

REMOVAL AND INSTALLATION

ANTI-THEFT INHIBIT SWITCH - LUGGAGE COMPARTMENT

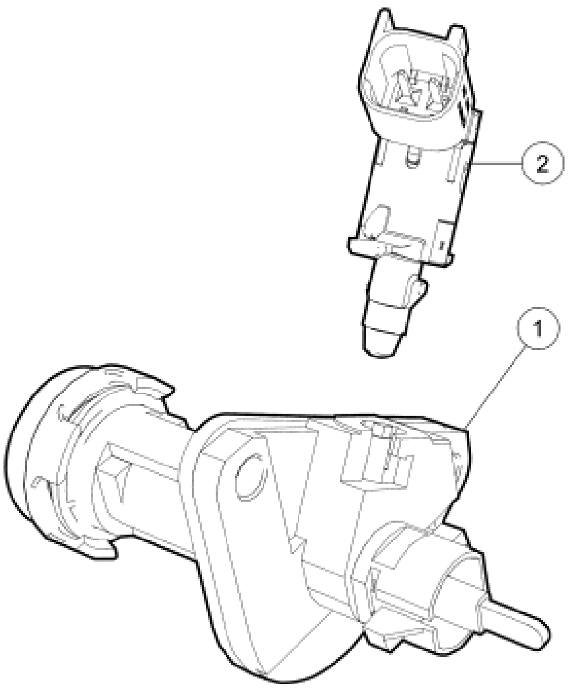

Fig. 13: Exploded View Of Luggage Compartment Anti-Theft Inhibit Switch
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5443262	Luggage compartment lid lock cylinder
2	-	Luggage compartment anti-theft inhibit switch

REMOVAL AND INSTALLATION

1. Remove the luggage compartment lid lock cylinder. For additional information, refer to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
2. Lift the retaining tabs, turn the switch clockwise and remove the luggage compartment anti-theft inhibit switch.
3. To install, reverse the removal procedure.

NOTICE: MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid and Motorcraft Continuously Variable Chain Type Transmission Fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage. Refer to the owner/schedule maintenance publication to determine the correct service interval for the specific vehicle.	
NOTICE: Do not use water-based cleaners to clean or flush the transmission fluid cooler tubes or transaxle damage will occur. Mineral spirits can be used to clean the transmission fluid cooler tubes, providing the transmission fluid cooler tubes are flushed with clean transmission fluid and blown dry with shop air. Use only clean transmission fluid designated for this transaxle.

DESCRIPTION AND OPERATION

TRANSAXLE DESCRIPTION

This transaxle is a compact, lightweight, next generation electronically controlled, 6-speed automatic transaxle that employs Ravigeneaux-type and one single planetary gear set.

This transaxle contains a high-precision clutch hydraulic control system for a smooth, highly responsive gear shift feel.

All hydraulic functions are directed by electronic solenoids to control:

- engagement feel.
- shift feel.
- shift scheduling.
- modulated Torque Converter Clutch (TCC) applications.
- engine braking, utilizing the coast clutch.

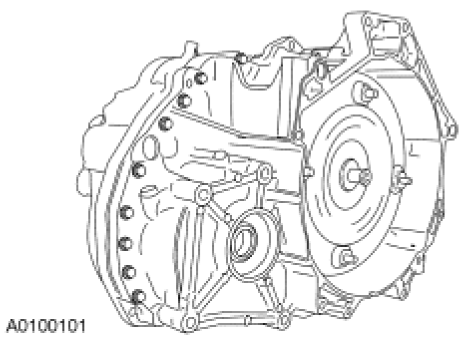

Fig. 1: Automatic Transmission
Courtesy of FORD MOTOR CO.

IDENTIFICATION TAGS

When servicing the automatic transaxle, use the bar code identification label located on side of the transaxle case.

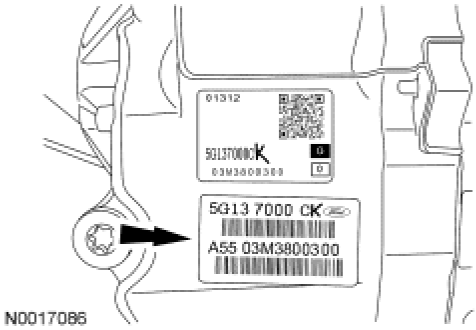

Fig. 2: Identifying Identification Tags
Courtesy of FORD MOTOR CO.

RANGE SELECTION

Fusion and Milan - This transaxle has 5 selector lever positions: P, R, N, D and L.

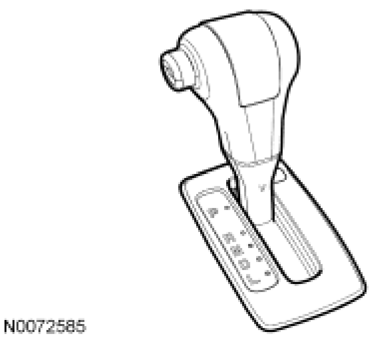

Fig. 3: Identifying Range Selection
Courtesy of FORD MOTOR CO.

MKZ - This transaxle has 5 selector lever positions: P, R, N, D (with an overdrive cancel button) and L.

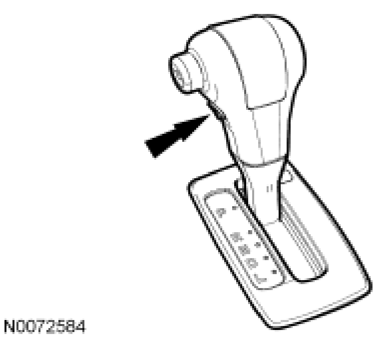

Fig. 4: Identifying Range Selection Overdrive Button
Courtesy of FORD MOTOR CO.

Park

In the PARK position:

- there is no powerflow through the transaxle.
- the parking pawl locks the final drive.
- the engine may be started.
- the ignition key may be removed.

Reverse

In the REVERSE position:

- the vehicle may be operated in a rearward direction, at a reduced gear ratio.
- engine braking will occur.
- the reverse lamps will be activated.

Neutral

In the NEUTRAL position:

- there is no powerflow through the transmission.
- the output shaft is not held and is free to turn.
- the engine may be started.

Drive

DRIVE is the normal position for the best fuel economy.

DRIVE provides:

- automatic shifts gears 1st through 6th.
- apply and release of the torque converter clutch.
- maximum fuel economy during normal operation.

Manual Low (L) Position

In this position the transaxle will upshift and downshift 1st through 4th gear with extended shift scheduling. Engine braking will occur in 1st through 4th gears.

This position:

- provides increased engine braking during downhill/mountain driving.
- provides extended shift scheduling, allowing both upshifts and downshifts at a higher overall rpm to provide optimum engine braking.
- is not intended for use under extended or normal driving conditions and results in lower fuel economy.

Overdrive Cancel

NOTE: When pressing the overdrive cancel button (engaged) and using manual low, the transaxle will actually operate in 1st - 3rd gears until either the selector lever is moved out of the manual low position or the overdrive cancel button is turned off (disengaged).

Pressing the overdrive off button on the selector lever handle will allow:

- automatic shifts, gears 1st - 4th.
- increased engine braking.

SHIFT PATTERNS

Based on signals from the sensors, the system controls gear shift lockup.

Downshifts

Under certain conditions the transaxle will downshift automatically to a lower gear range (without moving the selector lever). There are 3 categories of automatic downshifts:

- Coastdown
- Torque demand
- Forced or kickdown shifts

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. If applied, the transaxle will disengage the Torque Converter Clutch (TCC) to provide added acceleration.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size, engine and transmission calibration requirements.

TRANSAXLE OPERATIONAL STRATEGIES

Automatic Gearshift Control

In automatic gearshift control, based on each gearshift pattern, Shift Solenoid A (SSA) and Shift Solenoid B (SSB) turn ON or OFF and Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE) and Shift Solenoid F (SSF) are operated linearly according to information that includes vehicle speed, the degree to which the accelerator is open and brake signal.

Driver Adaptive Shift Control

This automatic transaxle does not have a driving mode selection switch that allows drivers to select a mode themselves. The vehicle is ordinarily in adaptive mode. However, when specific conditions are met, the Transmission Control Module (TCM) selects a shifting pattern appropriate to driving conditions from all of the shifting patterns and switches automatically.

- GREEN - Mode 1 - Switched from mode 2 to warm up the transmission fluid. This mode acts to protect the transaxle before the adaptive mode.
- GREEN - Mode 2 - After engine start-up, warm-up speed is increased for a certain period when transmission fluid temperature is low and the vehicle speed is 0.
- HIGH TEMP - When transmission fluid temperature becomes too high, this mode activates lock-up at an earlier timing to stop the temperature rise and lower the temperature.
- DOWN SLOPE - When driving down a slope, the TCM detects a down slope based on the engine control unit signal and output rpm. TCM switches to down slope mode to alleviate the load to the brake by downshifting.

Gear Shift Control

When the selector lever is moved from N to D or from N to R, after the engine is started, a shift control solenoid assembly SSC, SSD or SSE is used for the fluid pressure required by C1 clutch or C3 clutch and appropriately regulated fluid pressure is supplied to the clutch, engaging smoothly without shock.

Reverse Converter Control

If the selector lever is moved from N to R while the vehicle is moving forward and the transaxle shifts into REVERSE, the wheels will be locked, which is extremely dangerous. In order to avoid this, the TCM inhibits the transaxle from shifting into REVERSE while moving forward.

Torque Converter Clutch (TCC)

Based on output rpm signals, signals from the engine control unit (engine rpm and throttle opening) and vehicle speed, a smooth engagement is carried out through linear control of the Torque Converter Clutch (TCC) solenoid. Also, the slip rate is detected by adding input rpm signals and slip control is carried out.

- Engagement Control - control is carried out using a TCC solenoid. The TCC solenoid is linearly turned ON and OFF. The clutch inside the torque converter is operated and the pump impeller and turbine runner are connected. Through this, the engine and the transaxle are coupled and engine output is connected directly to the transaxle, eliminating transaxle loss and enhancing fuel economy
- Slip Control - control is carried out using a TCC solenoid. The TCC solenoid is linearly turned ON and OFF and the clutch within the torque converter is operated outside of the engagement range. The clutch slides without being in a completely coupled condition, increasing transaxle efficiency and enhancing fuel economy.

TORQUE CONVERTER

The torque converter transmits and multiplies torque by means of transmission fluid inside the torque converter. The torque converter is composed of the following:

- Converter case
- Pump impeller assembly
- Turbine assembly
- Stator assembly/one-way clutch
- Lock-up clutch

In addition, the use of the lock-up clutch is intended to improve fuel economy as a direct coupling between the engine and the transaxle.

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller sets the transmission fluid in motion.
- The turbine reacts to the transmission fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects transmission fluid going back into the impeller, providing for torque multiplication.
- The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

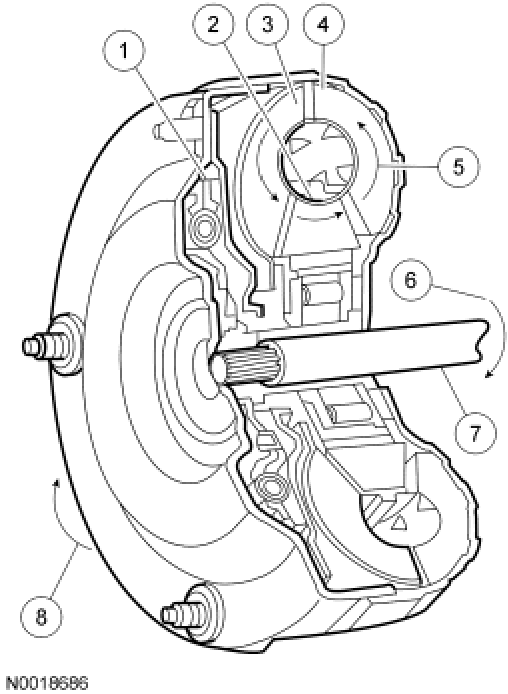

Fig. 5: Cut-Away View Of Torque Converter
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Converter clutch and damper (part of 7902)
2	-	Reactor (part of 7902)
3	-	Turbine (part of 7902)
4	-	Impeller (part of 7902)
5	-	Transmission fluid motion
6	-	Transmission input rotation
7	-	Input shaft
8	-	Engine rotation

GEARTRAIN

The geartrain consists of the planetary gearsets, apply components, final drive gearset and differential.

GEAR RATIO

Gear	Ratio
1st	4.148 to 1
2nd	2.370 to 1
3rd	1.556 to 1
4th	1.155 to 1
5th	0.859 to 1
6th	0.686 to 1
Reverse	3.394 to 1
Final drive	3.46 to 1

Differential

The differential allows the halfshafts and wheels to rotate at different speeds during cornering.

The differential assembly consists of the following components:

- Differential case (part of the final drive carrier)
- Two pinion gears supported by a pinion shaft
- Two side gears supported by the differential case and halfshafts

When driving in a straight line, both front wheels rotate at relatively the same speed. This means both side gears are rotating at the same speed, as well, while both pinion gears revolve (but do not rotate) with the side gears. During cornering, the wheel on the outside of the turn is forced to rotate faster than the wheel on the inside of the turn. Since the side gears must now rotate at different speeds, the pinion gears rotate on the pinion shaft allowing the drive axles to rotate at different speeds while still transferring output torque.

APPLY COMPONENTS

C1 Clutch

The C1 clutch connects the front planetary carrier to the rear sun gear of the rear planetary set. The C1 clutch is applied in 1st (typical operation during engine braking), 2nd, 3rd and 4th gears.

C2 Clutch

The C2 clutch connects the intermediate shaft to the rear planetary carrier. The C2 clutch is applied in 4th, 5th and 6th gears.

C3 Clutch

The C3 clutch connects the front planetary carrier to the middle sun gear of the rear planetary set. The C3 clutch is applied in 3rd and 5th gears, and also in REVERSE when the vehicle speed is 7 km/h (4 mph) or less.

B1 Brake

The B1 brake locks the middle sun gear of the rear planetary gear set. The B1 brake is applied in 2nd and 6th gears.

B2 Brake

The B2 brake locks the rear planetary carrier in REVERSE gear when the vehicle speed is 7 km/h (4 mph) or less.

F1 One-Way Clutch

The F1 one-way clutch locks the counterclockwise rotation of the rear planetary carrier during 1st gear operation (during both normal operation and engine braking).

Hydraulic Systems

Valve Body

The valve body supplies transmission fluid by switching the transmission fluid circuit for the hydraulic pressure that is generated by the transmission fluid pump. Based on the hydraulic pressure generated by the transmission fluid pump the Transmission Control Module (TCM) sends control signals to the solenoid valves in accordance with vehicle conditions. When the solenoid valve is activated, the control hydraulic pressure to the clutch and brakes is determined (according to the equilibrium with the obtained hydraulic pressure) and gear shift and lockup are accomplished. In addition, an appropriate amount of transmission fluid is supplied to the torque converter, planetary gears and lubricating parts.

TRANSAXLE ELECTRONIC CONTROL SYSTEM

Electronic System Description

The Transmission Control Module (TCM) and its input/output network controls the following operations:

- Shift timing
- Line pressure (shift feel)
- Torque Converter Clutch (TCC)

The transaxle control is separate from the engine control strategy in the PCM, although some of the input signals are shared between the TCM and PCM. When determining the best operating strategy for transaxle operation, the TCM uses input information from certain engine-related and driver-demand related sensors and switches supplied by the PCM.

In addition, the TCM receives input signals from certain transaxle-related sensors and switches. The TCM also uses these signals when determining transaxle operating strategy.

Using all of these input signals, the TCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch. It will also determine the best line pressure needed to optimize shift feel. To accomplish this the TCM uses output solenoids to control transaxle operation.

The following provides a brief description of each of the sensors and actuators used to control transaxle operation.

Transmission Control Module (TCM) Control Function

In automatic gear shift control, based on each gear shift pattern, Shift Solenoid A (SSA) and Shift Solenoid B (SSB) turn ON or OFF and Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE) and Shift Solenoid F (SSF) are operated linearly according to information that includes vehicle speed, the degree to which the accelerator is open and brake signals. For the gear and solenoid operation chart, refer to **SPECIFICATIONS**.

The Transmission Range (TR) sensor is built in the TCM, it detects the automatic transmission range information via the Hall-effect sensor and outputs the information to the TCM. The TCM reads the voltage and adjusts the automatic transmission range.

Brake Pedal Position (BPP)

The Brake Pedal Position (BPP) switch tells the PCM when the brakes are applied. The Torque Converter Clutch (TCC) disengages when the brakes are applied and the BPP switch closes when the brakes are applied and opens when they are released.

Transmission Fluid Temperature (TFT) Sensor

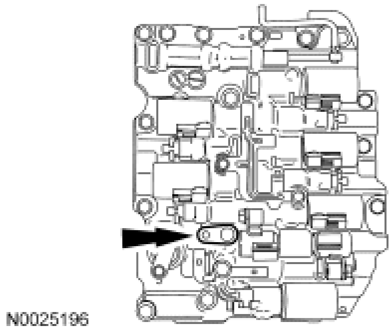

Fig. 6: Locating Transmission Fluid Temperature (TFT) Sensor
Courtesy of FORD MOTOR CO.

The Transmission Fluid Temperature (TFT) sensor, which is integrated within the transmission wiring, is installed on the front of the valve body. It directs the transmission fluid temperature within the hydraulic pressure control circuit and transmits a signal based on that temperature to the Transmission Control Module (TCM). Through this it controls gear shift, lockup and slip in response to changes in transmission fluid temperature for smooth shifting across wide fluid temperature zones.

Transaxle Shift Solenoids SSA, SSB

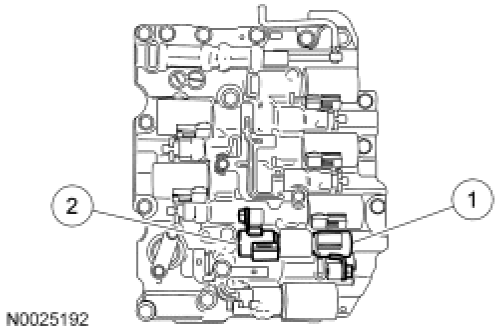

Fig. 7: Identifying Transaxle Shift Solenoids (SSA, SSB)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Shift Solenoid A (SSA)
2	-	Shift Solenoid B (SSB)

The transaxle SSA is installed on the middle valve body. The transaxle solenoid assembly SSB is installed on the front valve body. The solenoids turn ON and OFF in response to signals output from the TCM. According to the ON or OFF status of SSA or SSB, the 1st gear engine brake operates or the gear shifts into REVERSE. As a fail-safe function, if any transaxle solenoid assembly abnormality occurs, the TCM will disable the current to the solenoids.

Shift Control Solenoids (SSC, SSD, SSE, SSF)

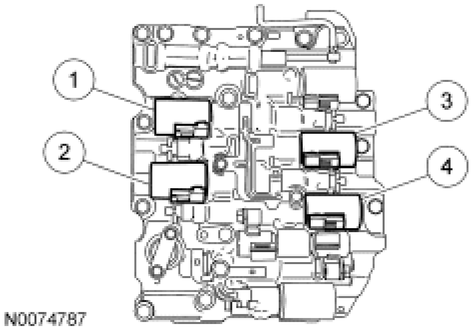

Fig. 8: Identifying Shift Control Solenoids (SSC, SSD, SSE, SSF)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Shift Solenoid C (SSC)
2	-	Shift Solenoid D (SSD)
3	-	Shift Solenoid E (SSE)
4	-	Shift Solenoid F (SSF)

The shift control solenoid assembly (SSC, SSD, SSE, SSF) is installed on the front valve body. The solenoids linearly control hydraulic pressure in response to signals, output from the TCM. Through this, it controls hydraulic pressure to the clutch (C1, C2, C3) and brakes (B1) for smooth shifting. According to the combination of ON or OFF status of the shift control solenoid assembly, the transaxle shifts from 1st gear into 6th gear and vice versa. As a fail-safe function, if any shift control solenoid assembly abnormality occurs, the TCM will disable the current to the shift control solenoids.

Pressure Control Solenoid A (PCA)

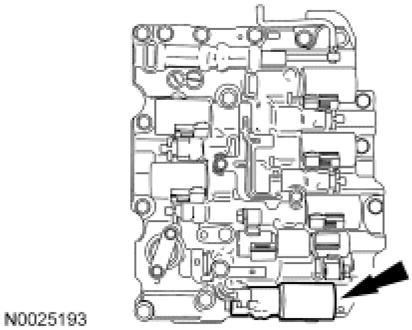

Fig. 9: Identifying Pressure Control Solenoid (PCA)
Courtesy of FORD MOTOR CO.

The Pressure Control Solenoid A (PCA) is installed on the front valve body. Based on a signal indicating the degree to which the throttle is opened, engine torque, and according to a duty ratio predetermined in the TCM, the solenoids control line hydraulic pressure by linearly changing the comparable throttle hydraulic pressure. Through this, it controls operating hydraulic pressure to the clutch and brakes for smooth shifting. As a fail-safe function, if any shift control solenoid assembly abnormality occurs, the TCM will disable the current to the shift control solenoids. The line pressure is maximized, if the shift control solenoid assembly current is disabled

when any abnormality other than locking occurs.

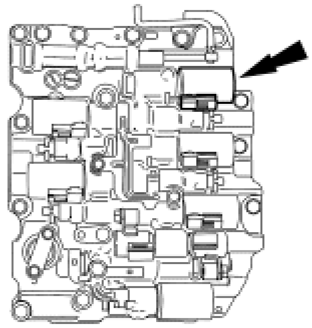
Speed Sensor

The 2 speed sensors are installed in the transaxle case. One speed sensor detects revolutions of the intermediate shaft's C2 drum as input shaft revolutions. The other speed sensor detects the counterdrive gear as output shaft revolutions. These signals are transmitted to the TCM. Based on these signals, the TCM controls engine torque, shift timing and lockup.

Adaptive Shift Control

The TCM has an adaptive learning strategy to electronically control the transaxle which will automatically adjust the shift feel. The first few hundred miles of operation of the transaxle may have abrupt shifting. This is a normal operation. If the battery has been disconnected for any reason it will need to be kept disconnected for approximately 20 minutes to reset the adaptive shift pressure strategy or use the scan tool to carry out the keep alive memory (KAM) reset.

Torque Converter Clutch (TCC) Solenoid



N0025194

Fig. 10: Locating Torque Converter Clutch (TCC) Solenoid
Courtesy of FORD MOTOR CO.

The Torque Converter Clutch (TCC) solenoid is used in the transaxle control system to control the application, modulation and release of the torque converter clutch.

The TCC control solenoid is installed on the front valve body. Based on engine rpm, throttle opening degree signals and speed sensor signals, it linearly controls clutch hydraulic pressure. Through this, engagement and slip are controlled. As a fail-safe function, if any control solenoid assembly abnormality occurs, the TCM will disable the current to the TCC solenoid.

Transmission Control (TC) Switch (MKZ)

The Transmission Control (TC) switch is a momentary contact switch that allows the driver to cancel operation of overdrive.

The TC switch is located on the selector lever.

When the driver initially presses the TC switch, a signal is sent to the PCM.

The PCM uses the shift solenoids to disengage/disable overdrive operation.

At the same time, the PCM illuminates the Transmission Control Indicator Lamp (TCIL) to notify the driver that overdrive is canceled.

When the TC switch is pressed again, overdrive operation is enabled, the converter clutch is released and the TCIL is turned OFF.

Whenever the ignition is cycled (vehicle shut OFF, then started again), the TC switch is turned OFF and overdrive will be enabled, even if the TC switch had been on when the ignition was shut off.

Transmission Control Indicator Lamp (TCIL)

The Transmission Control Indicator Lamp (TCIL) is located in the instrument panel and is labeled Overdrive OFF. It is illuminated in conjunction with the TC switch.

DIAGNOSTIC TESTS

DIAGNOSTIC STRATEGY

Troubleshooting an electronically controlled automatic transaxle is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take short cuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- **Introduction - Gasoline Engines** article
- TSBs
- Wiring Diagrams article

These publications provide the information required when diagnosing transaxle concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid levels and condition.
- Check for non-factory-installed items and verify correct installation
- Check selector lever linkages for correct adjustment.

- Check TSBs regarding the concern.
- Carry out Self Tests, both Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER).
- Record all codes.

Diagnostics

- Carry out on-board diagnostic procedures KOEO and KOER.
- Record all DTCs.
- Repair all non-transaxle codes first.
- Repair all transaxle codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes are obtained, proceed to the **Diagnosis By Symptom** for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

DIAGNOSTIC FLOW CHART

Special Tools

Illustration	Tool Name	Tool Number
 ST1438-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Prior to carrying out the flow test, the following items should be checked:

- Know and understand the customer concerns
- Check the transmission fluid level and condition
- Verify the concern by operating the vehicle
- Check for non-factory-installed items and verify correct installation
- Check the selector lever linkage adjustments
- Check technical service bulletins (TSBs) for vehicle concerns
- Carry out Self Tests, both Key ON Engine OFF (KOEO) and Key ON Engine Running (KOER)
- Record all codes
- Verify that the vehicle Transmission Control Module (TCM) is at the latest calibration release level

DIAGNOSTIC FLOW CHART

Test	Result	Action
1) DTCs recorded?	Yes	REPAIR all hard DTCs. FOLLOW the pinpoint

		tests. REFER to the **Introduction - Gasoline Engines** article first, then this workshop article, then Go to Step 2.
	No	REFER to **Diagnosis By Symptom**, then Go to Step 5.
2) Are any continuous test memory codes present?	Yes	CLEAR codes and CARRY OUT the drive cycle test.
	No	Go to Step 4.
3) Did the continuous test memory codes reappear?	Yes	REPAIR all continuous test memory codes. FOLLOW the pinpoint tests. REFER to the **Introduction - Gasoline Engines** article, then the transmission reference article, then this workshop article, then Go to Step 4.
	No	Go to Step 4.
4) Is the concern repaired?	Yes	CARRY OUT the final quick test to verify that no DTCs are present. CLEAR memory codes.
	No	REFER to **Diagnosis By Symptom**.
5) Was the transmission concern corrected when the scan tool was installed?	Yes	REFER to the **Introduction - Gasoline Engines** article, intermittent fault diagnosis part and use the scan tool to diagnose cause of concern in the processor, vehicle harness or external inputs (sensors or switches).
	No	REFER to the hydraulic and mechanical routine to diagnose the concern, then Go to Step 6.
6) Is the concern repaired?	Yes	CARRY OUT the final Self Test to verify that no DTCs are present. CLEAR memory codes.
	No	Concern should have been repaired. GO back through the diagnostic flow chart and REVIEW other components that may have contributed to the concern. CHECK and DIAGNOSE those components. GET assistance from other sources.

PRELIMINARY INSPECTION

Special Tools

Illustration	Tool Name	Tool Number
 ST1438-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Material

Item	Specification
Motorcraft Premium Automatic Transmission Fluid	

XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

The following items must be checked prior to beginning the diagnostic procedures.

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be required in order to begin to verify the concern. Understand the conditions as to when the concern occurs. For example:

- Hot or cold vehicle temperature
- Hot or cold ambient temperatures
- Vehicle driving conditions
- Vehicle loaded/unloaded

After understanding when and how the concern occurs, proceed to verifying the concern.

Verification of Condition

This part provides information which must be used in both determining the actual cause of customer concerns and carrying out the appropriate procedures.

The following procedures must be used when verifying customer concerns for the transmission.

Determine Customer Concern

NOTE: Some transaxle conditions may cause engine concerns. An Electronic Pressure Control (EPC) short circuit can cause engine misfiring. The Torque Converter Clutch (TCC) not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting
- Engagement (harsh or soft)
- Noise/vibration - check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent or temperature dependent

Check Transmission Fluid Level and Condition

NOTE: The vehicle should not be driven if the transmission fluid level indicator shows the transmission fluid below the DO NOT DRIVE mark or internal failure could result.

If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather or while pulling a trailer, the transmission fluid needs to cool down to obtain an accurate reading.

The transmission fluid level reading on the transmission fluid level indicator will differ depending on operating and ambient temperatures. The correct reading should be within the normal operating temperature range.

Transmission Fluid Level Check

NOTE: The transmission fluid should be checked at normal operating temperature 60°C-70°C (140°F-158°F) on a level surface. Normal operating temperature can be reached after approximately 32 km (20 mi) of driving.

Under normal circumstances, the transmission fluid level should be checked during normal maintenance. If the transaxle starts to slip, shifts slowly or shows signs of transmission fluid leaking, the transmission fluid level should be checked.

1. Using the scan tool, verify the correct Transmission Fluid Temperature (TFT) range.
2. With the transaxle in PARK, the engine at idle, foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever in the PARK position.
3. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
4. Wipe the transmission fluid level indicator with a clean cloth.
5. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the indicator. The transmission fluid level should be within the normal operating range.

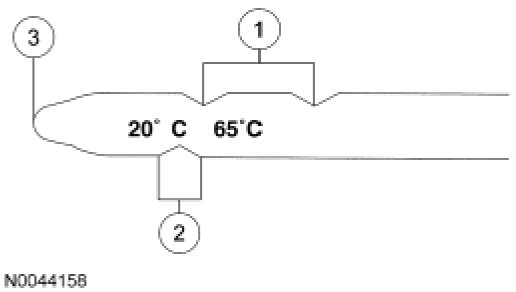


Fig. 11: Transmission Fluid Level Check
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
		Transmission fluid level at operating

1	-	temperature 60°C-70°C (140°F-158°F)
2	-	Transmission fluid level cold 15°C-25°C (59°F-77°F)
3	-	Do not drive mark

High Transmission Fluid Level

A transmission fluid level that is too high may cause the transmission fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of transmission fluid from the vent tube and possible transaxle malfunction and/or damage. If an overfill reading is indicated, refer to **Transmission Fluid Drain and Refill**.

Low Transmission Fluid Level

A low transmission fluid level could result in poor transaxle engagement, slipping, malfunction and/or damage. This could also indicate a leak in one of the transaxle seals or gaskets.

Adding Transmission Fluid

NOTE: The use of any other type of transmission fluid than specified could result in transaxle malfunction and/or damage.

If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid filler tube. Do not overfill the transmission fluid. For transmission fluid type, refer to **SPECIFICATIONS**.

Transmission Fluid Condition Check

1. Check the transmission fluid level.
2. Observe the color and the odor. The color under normal circumstances should be a dark red color, not brown or black or have a burnt odor.
3. Hold the transmission fluid level indicator over a white facial tissue and allow the transmission fluid to drip onto the facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If the stain is a foamy pink color this may indicate coolant in the transaxle. The engine cooling system should also be inspected at this time.
6. If transmission fluid contamination or transaxle failure is confirmed by the sediment in the bottom of the transmission fluid pan, install a new transaxle. If installing a new transaxle the transmission fluid cooler bypass valve, transmission fluid coolers and transmission cooler tubes should be cleaned.
7. Carry out diagnostic checks and adjustments. Refer to **Diagnosis By Symptom**.

Water in Transmission Fluid

To correctly repair an automatic transaxle that has had water or coolant introduced into the system, only install a new transaxle for the units that cannot be disassembled and cleaned. Prior to installing the transaxle, the transmission fluid cooler(s), transmission fluid cooler tubes and transmission fluid cooler hoses need to be

flushed and cleaned.

ROAD TESTING VEHICLE

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

The Shift Point Road Test and Torque Converter Operation Tests provide diagnostic information on shift controls and torque converter operation.

SHIFT POINT ROAD TEST

Special Tools

Illustration	Tool Name	Tool Number
 ST1438-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

NOTE: Shift speed ranges are approximate for all applications.

This test verifies that the shift control system is operating correctly.

1. Bring engine and transaxle up to normal operating temperature.
2. Operate vehicle with selector lever in D range.
3. Using the shift speed charts, apply minimum throttle and observe the speeds at which the transaxle upshifts. The transaxle will upshift 1st through 6th gears.
4. Press the accelerator pedal to the floor, Wide Open Throttle (WOT). The transaxle should downshift to the next lower gear depending on the vehicle speed. The Torque Converter Clutch (TCC) should release.

SHIFT SPEED MANUAL D POSITION 3.0L ENGINE (MINIMUM THROTTLE)

Manual D	km/h	mph
1-2 upshift	11-16	7-10
2-3 upshift	18-24	11-15
3-4 upshift	26-34	16-21
4-5 upshift	35-43	22-27
5-6 upshift	48-61	30-38

2-1 downshift	14-22	9-14
3-2 downshift	24-37	15-23
4-3 downshift	39-48	24-30
5-4 downshift	50-56	31-35
6-5 downshift	58-80	36-50

SHIFT SPEED MANUAL L POSITION 3.0L ENGINE (MINIMUM THROTTLE)

Manual L	km/h	mph
1-2 upshift	29-39	18-24
2-3 upshift	74-89	46-55
3-4 upshift	113-130	70-81
4-5 upshift	N/A	N/A
5-6 upshift	N/A	N/A
2-1 downshift	21-27	13-17
3-2 downshift	61-69	38-43
4-3 downshift	100-114	62-71
5-4 downshift	N/A	N/A
6-5 downshift	N/A	N/A

SHIFT SPEED MANUAL D POSITION 3.5L ENGINE (MINIMUM THROTTLE)

Manual D	km/h	mph
1-2 upshift	14-21	9-13
2-3 upshift	21-29	13-18
3-4 upshift	33-40	20-25

4-5 upshift	49-55	30-35
5-6 upshift	65-70	40-44
3-1 downshift	7-17	4-11
4-3 downshift	26-36	16-24
5-4 downshift	38-46	24-29
6-5 downshift	56-63	35-39

SHIFT SPEED MANUAL L POSITION 3.5L ENGINE (MINIMUM THROTTLE)

Manual L	km/h	mph
1-2 upshift	45-55	28-34
2-3 upshift	90-100	55-62
3-4 upshift	130-138	81-86
4-5 upshift	190-198	118-123
2-1 downshift	15-23	9-14
3-2 downshift	66-75	41-47
4-3 downshift	98-110	61-68
5-4 downshift	163-175	101-109

5. If the transaxle fails to upshift/downshift or the Torque Converter Clutch (TCC) does not apply and release, refer to **Diagnosis By Symptom** for possible causes.

TORQUE CONVERTER DIAGNOSIS

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent	

 ST1438-A	scan tool	

Prior to torque converter installation, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of new or remanufactured torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary Inspection
2. Know and Understand the Customer's Concern
3. Verify the Concern - carry out the torque converter operation test
4. Carry out Diagnostic Procedures:
    - Run On-Board Diagnostics. Refer to **Diagnostics**.
        - Repair all non-transaxle related DTCs first.
        - Repair all transaxle DTCs.
        - Rerun On-Board Diagnostic to verify repair.
        - Carry out Line Pressure Test. Refer to **Special Testing Procedures**.
        - Carry out Stall Speed Test. Refer to **Special Testing Procedures**.
        - Carry out diagnostic routines. Refer to **Diagnosis By Symptom**.
        - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and repair as required, before repairing the torque converter.

Torque Converter Operation Test

NOTE: The Torque Converter Clutch (TCC) will not engage if the Transmission Fluid Temperature (TFT) is below 0°C (32°F).

1. Using the scan tool, make sure that the TFT is within specification 43°C-47°C (109°F-117°F).
2. Accelerate the vehicle to 35-60 km/h (22-37 mph) and maintain a consistent speed.
3. Release the accelerator pedal to close the throttle and press the accelerator to partially open the throttle while monitoring the scan tool engine speed and TCCAMP_MES. The PID will read 0 when the Torque Converter Clutch (TCC) is released, and 1 when the TCC is applied. The engine speed will increase when the TCC is released and decrease when the TCC is applied.
4. If these actions do not occur, see torque converter operation concerns, refer to **Diagnosis By Symptom**.

VISUAL INSPECTION

This inspection will identify modifications or additions to the vehicle operating system that may affect

diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
    - A/C
    - Generator (alternator)
    - Engine turbo
    - Cellular telephone
    - Cruise control
    - CB radio
    - Linear amplifiers
    - Backup alarm signal
    - Computer
- Vehicle modification:
    - These items, if not installed correctly, will affect the PCM or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size or axle ratio changes.
    - Leaks. Refer to **Leakage Inspection**.
    - Correct selector lever linkage adjustments. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.

Selector Lever Linkage Check

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the selector lever linkage is not correctly adjusted. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article for selector lever linkage adjustment.

Check TSBs

Refer to all TSBs which pertain to the concern and follow the procedure.

Carry Out On-Board Diagnostics Key ON Engine OFF (KOEO), Key ON Engine Running (KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Self Test using the scan tool. Refer to the **Introduction - Gasoline Engines** article for diagnosis and testing of the powertrain control system.

DIAGNOSTICS

Special Tools

Illustration	Tool Name	Tool Number
	73 III Automotive Meter	105-R0057 or equivalent

 ST1185-A		
 ST1438-A	Vehicle Communication Module and Integrated Diagnostic System software with appropriate hardware, or equivalent scan tool	

Self Diagnosis Function

The Transmission Control Module (TCM) monitors the communication status of each sensor, electronic component and the PCM. If any malfunction should occur, the TCM function warns the driver and stores the malfunction as a diagnosis code.

Fail-Safe

With the fail-safe function, if any malfunction should occur in the transaxle system, the TCM will output a control signal, and control will be carried out to make traveling a minimum distance possible. If all shift solenoids malfunction, the TCM will cancel the output of control signals to the solenoids. If this happens, the automatic transmission gear shifting will be controlled by transmission fluid pressure circuits only and the gears will shift as shown in the following table.

Selector Lever Position	Gear Position
R	Reverse
D	3rd or 5th gear

On-Board Diagnostic With Scan Tool

NOTE: **For detailed instruction and other diagnostic methods using the scan tool or equivalent, refer to the scan tool tester article and the Introduction - Gasoline Engines article.**

These Self Tests should be used to diagnose the PCM and should be carried out in order.

- Self Test - Key ON Engine OFF (KOEO)
- Self Test - Continuous Memory Codes
- Self Test - Key ON Engine Running (KOER)
- Special Test Modes
  - Wiggle Test Mode
  - Output Test Mode
- PCM Reset Mode

- Clearing DTCs P1000
- On-Board Diagnostic (OBD) II Drive Cycle
- Other scan tool features

DIAGNOSTIC PARAMETERS IDENTIFICATION (PID) CHART

Special Tools

Illustration	Tool Name	Tool Number

PCA	PCA	Pressure (psi)
SSD_AMP	Shift Solenoid D (SSD)	Current (amps)
PCA_AMP	PCA	Current (amps)
TP_REL	Relative throttle position	Percentage
DTCTCM	Continuous codes	Number of DTCs
TCCSLPDSD	TCC slip desired	rpm
SHFTCTRL	Shift control	• 00 Economy mode • 01 Sport mode • 02 Up slope 1 mode • 03 Up slope 2 mode • 04 Down slope mode • 05 Hot 1 (over temperature 1) mode • 06 Hot 2 (over temperature 2) mode • 07 Cruise mode • 08 Traction mode • 09 l Position mode • 0A Tiptronic mode • 0B Coast shift • Flexible Fuel (FF) Invalid data
SSPCF_F	Shift Solenoid Pressure Control F (SSPCF) status	• 00 is not fault detected • 01 is short to ground • 02 is open circuit load • 04 is short circuit to battery power • 80 is general (non-specific) fault
SSFAMP_MES	Measured current Shift Solenoid F (SSF)	Current (amps)
SSFAMP_CMD	Commanded current SSF	Current (amps)

SSPCF_CMD	Commanded pressure SSPCF	Pressure (psi)
SSEAMP_MES	Measured current Shift Solenoid E (SSE)	Current (amps)
SSDAMP_MES	Measured current SSD	Current (amps)
SSCAMP_MES	Measured current Shift Solenoid C (SSC)	Current (amps)
TCCAMP_MES	Measured current for the TCC pressure control	Current (amps)
PCAAMP_MES	Measured current for PCA	Current (amps)
SSPCC_F	Shift Solenoid Pressure Control C (SSPCC) status	• 00 is not fault detected • 01 is short to ground • 02 is open circuit load • 04 is short circuit to battery power • 80 is general (non-specific) fault
SSPCC	SSPCC	Pressure (psi)
SSC_AMP	SSPCC current	Current (amps)
SSB_F	Shift solenoid 2 status	• 00 is not fault detected • 01 is short to ground • 02 is open circuit load • 04 is short circuit to battery power • 40 is stack failure • 80 is general (non-specific) fault
SSA_F	Shift solenoid 1 status	• 00 is not fault detected • 01 is short to ground • 02 is open circuit load • 04 is short circuit to battery power • 80 is general (non-specific) fault
TFT	Transmission Fluid Temperature (TFT)	Temperature (°C, °F)
TRAN_RAT	Transmission gear ratio	Ratio
TCC_F	TCC fault	• 00 is not fault detected • 01 is short to ground • 02 is open circuit load • 04 is short circuit to battery power • 80 is general (non-specific) fault

VSS	Vehicle Speed Sensor (VSS)	Speed (mph)
TFT	TFT	Voltage
TCC_RAT	Transmission slip ratio	Ratio
TC_SLIPACT	Torque converter slip actual TCCMACT	rpm
TR	Transmission Range (TR)	• P = 7 • R = 6 • N = 5 • D = 4 • L = 1
OSS	OSS	rpm
TSS	TSS	rpm
Gear	Gear commanded by module	Gear (1-6)
VPWRTCM	Module supply voltage VBAT	Voltage
RPMTCM	Engine revolutions per minute	rpm
TR_V	TR	Voltage

TRANSAXLE DRIVE CYCLE TEST

NOTE: Prior to carrying out the Transaxle Drive Cycle Test, make sure that the transaxle is full of transmission fluid or damage to the transaxle may occur.

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

After carrying out the Self Test, use the following Transaxle Drive Cycle Test for checking continuous codes:

NOTE: The Transaxle Drive Cycle Test must be followed exactly. Malfunctions must occur multiple times consecutively for shift error or Torque Converter Clutch (TCC) code to set.

NOTE: When carrying out the Transaxle Drive Cycle Test, see the solenoid operation chart for correct solenoid operation. Refer to <u>Pinpoint Tests - Non OSC Equipped Vehicle</u>.

1. Record and then erase Self Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With the selector lever in DRIVE, moderately accelerate from stop to 80 km/h (50 mph). This allows the transaxle to shift into 6th gear. Hold speed and throttle steady for minimum of 15 seconds. Brake to a stop

and remain stopped for minimum of 20 seconds.

5. Repeat Step 4 at least 5 times.
6. Carry out Self Test and record continuous codes.
   - If DTCs are present, refer to **Diagnostic Trouble Code (DTC) Charts**. Service all non-transaxle DTCs first as they can directly affect the operation of the transaxle. Repeat the Self Test and Road Test to verify the correction. Erase DTCs, carry out the Transaxle Drive Cycle Test, and repeat the Self Test after completing service on the DTCs.
   - If the continuous test passes (system pass) and a concern is still present, refer to **Diagnosis By Symptom** and check TSBs for diagnostic concern.

After On-Board Diagnostics

NOTE: The vehicle wiring harness, PCM and non-transaxle sensors may affect transaxle operations. Service these concerns first.

After the On-Board Diagnostic procedures are completed, service all DTCs.

Begin with non-transaxle related DTCs, then service any transaxle related DTCs. Refer to the **Diagnostic Trouble Code (DTC) Charts** for information on Condition and Symptoms. This chart will be helpful in referring to the correct article(s) and to aid in diagnosing internal transaxle concerns and external non-transaxle inputs. The pinpoint tests are used in diagnosing electrical concerns of the transaxle. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. Refer to the **Introduction - Gasoline Engines** article for diagnosing non-transaxle electronic components. The diagnostic routine hydraulic/mechanical charts will help in diagnosing internal transaxle concerns and external non-transaxle inputs.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the PCM wiring harness for correct connections, bent or broken pins, corrosion, loose wires, correct routing, correct seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Introduction - Gasoline Engines article.

NOTE: If a concern still exists after electrical diagnosis has been carried out, refer to Diagnosis By Symptom.

If DTCs appear while carrying out the on-board diagnostics, refer to the **Diagnostic Trouble Code (DTC) Charts** for the appropriate repair procedure. Prior to entering pinpoint tests, refer to any TSBs for transaxle concerns.

DIAGNOSTIC TROUBLE CODE (DTC) CHARTS

DIAGNOSTIC TROUBLE CODE (DTC) CHART

Five Digit DTC	Component	Description	Condition	Symptom	Action

P0562	Battery	System voltage low.	PCM detected a voltage level below 9 volts.	No engagements, no adaptive or self-learning strategy.	CHECK charging system, REFER to **BATTERY, MOUNTING AND CABLES** article.
P0563	Battery	System voltage high.	PCM detected a voltage level above 18 volts.	No adaptive or self-learning strategy.	CHECK charging system, REFER to **BATTERY, MOUNTING AND CABLES** article.
P0601	Transmission Control Module (TCM)	TCM Read-Only Memory (ROM) error.	TCM detected an internal software concern with ROM.	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM.
P0603	TCM	TCM Keep Alive Memory (KAM) error.	TCM detected an internal software concern with KAM.	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM.
P0604	TCM	TCM Random Access Memory (RAM) error.	TCM detected an internal software concern with RAM.	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM.
P0706	Transmission Range (TR)	TR sensor range or performance error.	TR sensor signal is out of normal range.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self learning strategy.	INSTALL a new TCM.
P0707	TR Sensor	TR sensor circuit low input.	TR sensor signal is below threshold of 0.127 volt, sensor/circuit electrical malfunction.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self learning strategy.	INSTALL a new TCM.
P0708	TR Sensor	TR sensor circuit high input.	TR sensor signal is above threshold of 4.87 volts, sensor/circuit electrical malfunction.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self learning strategy.	INSTALL a new TCM.
P0711	Transmission Fluid Temperature (TFT) Sensor	No change in TFT during operation.	PCM has detected no TFT change during operation. TFT value stuck at some normal reading.	TFT indicates 80°C (176°F) at all times, no self learning strategy, no Torque Converter Clutch (TCC) engagement.	Go to **Pinpoint Test B**.

P0712	TFT Sensor	200°C (329°F) indicated, TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature -43°C (-45°F).	TFT indicates 80°C (176°F) at all times, no self learning strategy, no TCC engagement.	Go to **Pinpoint Test B**.
P0713	TFT Sensor	-43°C (-45°F) indicated, TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature -43°C (-45°F).	TFT indicates 80°C (176°F) at all times, no self learning strategy, no TCC engagement.	Go to **Pinpoint Test B**.
P0716	Turbine Shaft Speed (TSS) Sensor	TSS range out of performance, insufficient input from TSS.	PCM has detected a loss or noisy TSS signal during operation.	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test D**.
P0717	TSS Sensor	No TSS signal.	PCM has not detected a TSS signal. No TSS signal when Output Shaft Speed (OSS) signal present.	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test D**.
P0721	OSS Sensor	OSS range out of performance, insufficient input from OSS.	PCM has detected a loss or noisy OSS signal during operation.	No adaptive or self learning strategy.	Go to **Pinpoint Test C**.
P0722	OSS Sensor	No OSS signal.	PCM has detected no OSS signal.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test C**.
P0729	Transaxle	6th gear ratio.	No 6th gear ratio detected by TCM.	No 6th gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0730	Clutch Control Solenoids or Internal Parts	Gear ratio error.	PCM has detected a gear ratio error.	No self learning strategy.	Go to **Pinpoint Test A**.
P0731	Solenoid or Internal Parts	1st gear ratio.	No 1st gear ratio detected by TCM.	No 1st gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0732	Solenoid or Internal Parts	2nd gear ratio.	No 2nd gear ratio detected by	No 2nd gear, no TCC engagements,	Go to **Pinpoint Test A**.

			TCM.	no adaptive or self learning strategy.	
P0733	Solenoid or Internal Parts	3rd gear ratio.	No 3rd gear ratio detected by TCM.	No 3rd gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0734	Solenoid or Internal Parts	4th gear ratio.	No 4th gear ratio detected by TCM.	No 4th gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0735	Solenoid or Internal Parts	5th gear ratio.	No 5th gear ratio detected by TCM.	No 5th gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0736	Transaxle	Reverse gear ratio.	No reverse gear ratio detected by TCM.	No reverse gear, no self learning strategy.	Go to **Pinpoint Test A**.
P0780	Solenoid or Valve Internal to Transaxle	Universal shifting (stuck valve).	Valve stuck.	Increase rpm during shifts. Slipping or erratic shifting.	Go to **Main Control Valve Body**.
P0817	TCM/PCM Starter Circuit	Starter disable circuit open or shorted to power/ground.	TCM detected a failure in the starter lock circuit, failed ON or OFF Ignition switch is ON, TCM and PCM communication is normal. No voltage is detected on the start lock circuit for more than 0.1 second or a continuous 12-volt output is detected for more than 0.1 second. Conditions present 2 times to set DTC.	DTC is set. Warning lamp is illuminated.	Go to **Pinpoint Test E**.
P0961	Pressure Control Solenoid A (PCA)	PCA circuit or solenoid failure.	PCA circuit or solenoid (SLT) failed during operation.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.

			Incorrect commanded current detected by TCM.		
P0962	PCA	PCA solenoid signal or grounded circuits either short or open, solenoid circuit failure.	Voltage through PCA (SLT) is checked. An error will be noted if tolerance is exceeded.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0963	PCA	PCA solenoid short to power circuit failure.	Voltage through PCA (SLT) is checked. An error will be noted if tolerance is exceeded.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0973	Shift Solenoid A (SSA)	SSA solenoid or circuit shorted to ground.	Voltage through SSA (S1) circuit is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0974	SSA	SSA or circuit shorted to power or open.	Voltage through SSA (S1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0976	Shift Solenoid B (SSB)	SSB solenoid or circuit shorted to ground.	Voltage through SSB (S2) circuit is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0977	SSB	SSB solenoid or	Voltage through	No engagements, no	Go to **Pinpoint Test A**.

		circuit shorted to power or open.	SSB solenoid (S2) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	adaptive or self learning strategy.	
P0978	Shift Solenoid C (SSC)	SSC circuit or solenoid failure.	SSC circuit or solenoid (SLC1) failed during operation. Incorrect commanded current detected by TCM.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0979	SSC	SSC solenoid signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSC (SLC1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0980	SSC	SSC solenoid or circuit shorted to power.	Voltage through SSC (SLC1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0981	Shift Solenoid D (SSD)	SSD circuit or solenoid failure.	SSD circuit or solenoid (SLC2) failed during operation. Incorrect commanded current detected	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.

			by TCM.		
P0982	SSD	SSD signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSD (SLC2) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0983	SSD	SSD or circuit shorted to power.	Voltage through SSD (SLC2) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0984	Shift Solenoid E (SSE)	SSE circuit or solenoid failure.	SSE circuit or solenoid (SLC3) failed during operation. Incorrect commanded current detected by TCM.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0985	SSE	SSE signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSE (SLC3) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0986	SSE	SSE or circuit shorted to power.	Voltage through SSE (SLC3) circuit is checked. An error will be	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.

			noted if tolerance is exceeded. Short to power failure or open circuit detected.		
P0997	Shift Solenoid F (SSF)	SSF circuit or solenoid failure.	SSF circuit or solenoid (SLB1) failed during operation. Incorrect commanded current detected by TCM.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0998	SSF	SSF signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSF (SLB1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P0999	SSF	SSF or circuit shorted to power.	Voltage through SSF (SLB1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P1573	Accelerator Pedal Position (APP) Sensor	APP sensor input error.	PCM has detected an input error from the APP sensor.	No adaptive or self learning strategy.	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not the TCM. Do not install a new TCM.** REFER to the **Introduction - Gasoline Engines** article.
P1657	TCM	TCM	Controller Area	No engagements, no	INSTALL a new TCM.

		communication link error.	Network (CAN) link error detected by PCM.	adaptive or self learning strategy. Limited fuel and spark.	
P1700	Transaxle	Drive engagement error.	TCM detected neutral in the DRIVE position.	No engagements, no adaptive or self learning strategy.	REFER to **Diagnosis By Symptom**.
P1701	Transaxle	Reverse engagement error.	TCM detected neutral in the REVERSE position.	No self learning strategy.	REFER to **Diagnosis By Symptom**.
P1719	PCM	Engine torque signal.	Torque engine accuracy from PCM inaccurate.	Firm shifts and no adaptive learning.	PERFORM self-test of PCM. REFER to the **Introduction - Gasoline Engines** article to diagnose any DTCs present. If no DTCs, IDENTIFY the driveability symptom present and REFER to the **Introduction - Gasoline Engines** article for further diagnosis.
P1919	Engine Coolant Temperature (ECT)	Sensor signal error.	PCM/TCM have detected an error in the CAN ECT information.	No TCC engagements, ECT set to 80°C (176°F).	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not, the TCM. Do not install a new TCM.** REFER to the **Introduction - Gasoline Engines** article.
P1920	Engine rpm	Engine rpm sensor signal error.	PCM/TCM have detected an error in the engine rpm information.	No adaptive or self learning strategy. Limited fuel and spark.	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not the TCM. Do not install a new TCM.** REFER to the **Introduction - Gasoline Engines** article.
P2544	PCM	Torque management request input signal A.	Data received from the PCM or engine components are	Transmission may enable limp-home strategies or increase pressures.	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not the**

			not correct for the vehicle operating conditions. Incorrect engine torque calculation may result.	Engine components and PCM may or may not set additional DTCs. P2544, fuel monitor error, ECT sensor failure and Mass Air Flow (MAF) sensor failures may be present. Malfunction Indicator Lamp (MIL) may illuminate.	**TCM. Do not install a new TCM.** REFER to the **Introduction - Gasoline Engines** article.
P2757	TCC Solenoid	TCC solenoid circuit failure, stuck OFF.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open, shorted or PCM driver failure during on-board diagnostic.	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P2758	TCC Solenoid	TCC solenoid circuit failure, stuck ON.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open, shorted or PCM driver failure during on-board diagnostics.	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P2762	TCC Solenoid	TCC circuit or solenoid failure.	TCC circuit or solenoid failed during operation. Incorrect commanded current detected by TCM.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
P2763	TCC Solenoid	TCC circuit shorted to power.	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.

			shorted to power.		
P2764	TCC Solenoid	TCC solenoid signal or grounded circuits either short or open solenoid circuit failure.	TCC solenoid circuit fails to provide voltage drop across solenoid.	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A**.
U0073	TCM CAN	TCM communication link error.	CAN link error detected by PCM.	No engagements, no adaptive or self learning strategy.	REFER to **MODULE COMMUNICATIONS NETWORK** article.
U0100	TCM CAN	TCM communication link error.	CAN link error detected by PCM.	No engagements, no adaptive or self learning strategy.	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not the TCM. Do not install a new TCM.** **A module cannot communicate with other modules on the communication network while being reprogrammed. CLEAR any network communication DTCs which may have been set in other modules during reprogramming.** CHECK CAN harness between TCM and other modules. For diagnostic information, REFER to the **Introduction - Gasoline Engines** article and REFER to **MODULE COMMUNICATIONS NETWORK** article.
U0101	TCM/PCM	TCM Communication error.	PCM lost communication with the TCM.	• Engine driveability concerns. • Will turn on MIL and driver warning	**NOTE:** **A module cannot communicate with other modules on the communication network while being reprogrammed. CLEAR any network**

				lamp.	**communication DTCs which may have been set in other modules during reprogramming.** CHECK CAN harness between TCM and other modules. For diagnostic information, REFER to the **Introduction - Gasoline Engines** article and REFER to **MODULE COMMUNICATIONS NETWORK** article.
U0121	ABS	TCM communication link error.	PCM/TCM have detected an error in the CAN wheel rpm information from the ABS system.	No engagements, no adaptive or self learning strategy.	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not the TCM. Do not install a new TCM.** REFER to **MODULE COMMUNICATIONS NETWORK** article.
U0401	PCM/TCM	Invalid data received from the PCM or engine components.	Data received from the PCM or engine components is not correct for the vehicle operating conditions.	Transmission may enable limp-home strategies or increase pressures. Engine components and PCM may or may not set additional DTCs. P2544, fuel monitor error, ETC sensor failure and MAF sensor failures may be present. MIL may illuminate.	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not the TCM. Do not install a new TCM.** REFER to the **Introduction - Gasoline Engines** article.
U0415	Wheel Speed Sensor	TCM communication link error.	PCM/TCM have detected an error in the CAN wheel rpm information from the ABS system.	No adaptive or self learning strategy.	**NOTE:** **If this DTC is displayed, a malfunction occurred in the vehicle not the TCM. Do not install a new TCM.** REFER to the **Introduction - Gasoline**

					Engines article.

B22	SSE ground	SSE ground (SLC3G)	-	-	-	-

PINPOINT TESTS - NON OSC EQUIPPED VEHICLE

Special Tools

Illustration	Tool Name	Tool Number

 ST1185-A	73 III Automotive Meter	105-R0057 or equivalent
 ST1438-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Anytime an electrical connector or solenoid body is disconnected, inspect the connector for pin condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install a new connector as required.

Prior to carrying out the pinpoint tests, check the following:

- Transmission fluid level
- Transmission fluid condition (burned, metal particles or discolored)
- Engine cooling system
- Other non-related transmission DTCs

Pinpoint Tests

Refer to **SYSTEM WIRING DIAGRAMS** for schematic and connector information.

PINPOINT TEST A: SHIFT SOLENOIDS

NOTE: Refer to the Transaxle Vehicle Harness Connector illustration Transaxle Connector Layouts.

A1 ELECTRONIC DIAGNOSTICS

- Check to make sure the transaxle harness connector is fully seated, pins are fully engaged in the connector and in good condition before proceeding.
- Key in OFF position.
- Connect the diagnostic tool.
- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs
- **Are there any transmission DTC faults present?**

  YES : For Shift Solenoid A (SSA) and Shift Solenoid B (SSB), go to A2 . For the Pressure Control Solenoid A (PCA), Shift Solenoid C (SSC), Shift Solenoid D (SSD), Shift Solenoid E (SSE), Shift Solenoid F (SSF) and Torque Converter Clutch (TCC), Go to A4 .

  NO : CLEAR all DTCs. ROAD TEST to verify if concern is still present. Concern could be

intermittent. If concern is still present or reappears, go to the appropriate pinpoint test steps: For shift solenoids SSA and SSB, go to A2 . For shift solenoids PCA, SSC, SSD, SSE, SSF and TCC, Go to A4 .

A2 CHECK RESISTANCE OF THE ON/OFF SOLENOID CIRCUIT

- Key in OFF position.
- Remove the Transmission Control Module (TCM).

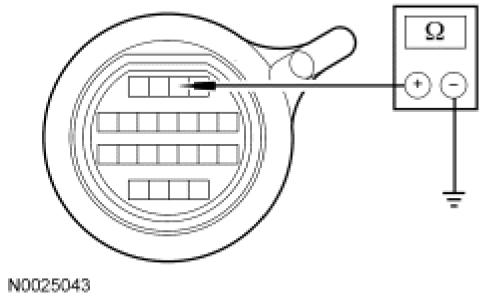

Fig. 15: Checking Resistance Of ON/OFF Solenoid Circuit (SSB)
Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 2 and ground for SSB.

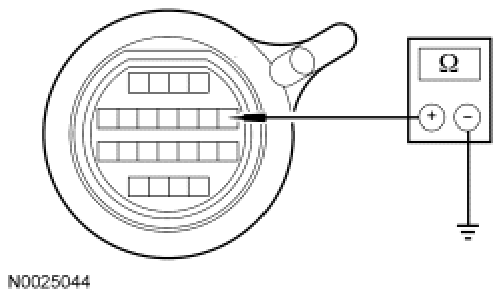

Fig. 16: Checking Resistance Of ON/OFF Solenoid Circuit (SSA)
Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 5 and ground for SSA.
- **Is the resistance between 11-15 ohms?**

  YES : INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to A3 .

  NO : Go to A3.

A3 CHECK RESISTANCE OF THE ON/OFF SOLENOIDS

- Remove the transaxle side cover.

- Remove the wiring connector from the affected solenoid (SSA or SSB).

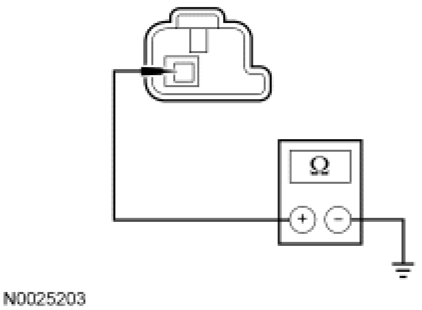

Fig. 17: Checking Resistance Of ON/OFF Solenoids
Courtesy of FORD MOTOR CO.

- Measure the resistance between solenoid pin 1 and ground of the affected solenoid.
- **Is each solenoid resistance between 11-15 ohms?**

  YES : INSTALL a new internal wire harness or REPAIR affected circuit.

  NO : INSTALL a new main control.

A4 CHECK LINEAR SOLENOID SHORT TO GROUND

- Key in OFF position.
- Remove the TCM.

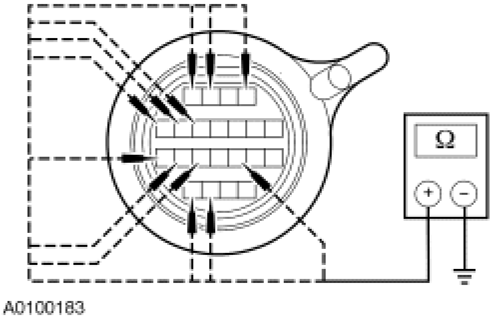

Fig. 18: Measuring Resistance At Transaxle Bulkhead Electrical Connector Between Pins And Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between the pins in the following chart:

TRANSAXLE BULKHEAD ELECTRICAL CONNECTOR

Pin Number	Circuit Function
1	Pressure Control Solenoid

	A (PCA) ground
3	PCA signal
4	Torque Converter Clutch (TCC) ground
9	TCC signal
10	Shift Solenoid C (SSC) ground
11	SSC signal
14	Shift Solenoid E (SSE) signal
16	Shift Solenoid F (SSF) ground
17	Shift Solenoid D (SSD) signal
18	SSD ground
21	SSF signal
22	SSE ground

- **Is each resistance greater than 10,000 ohms?**

  YES : Go to A5.

  NO : Go to A6.

A5 CHECK RESISTANCE OF THE LINEAR SOLENOID(S)

- Inspect both sides of the TCM for damaged or pushed-out pins, corrosion or damaged seals.

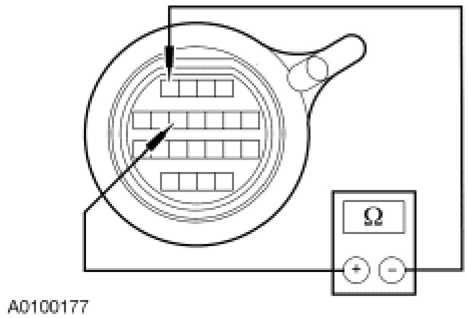

Fig. 19: Checking Resistance Of Linear Solenoid (TCC)
Courtesy of FORD MOTOR CO.

- For the TCC solenoid, measure the resistance between pin 4 and pin 9 at the transaxle.

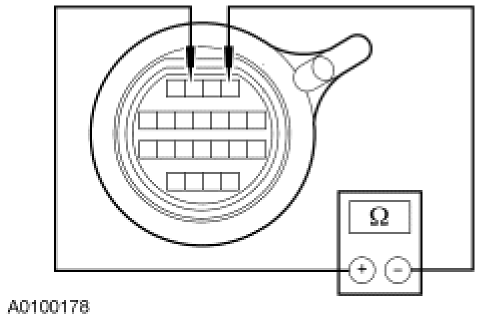

Fig. 20: Checking Resistance Of Linear Solenoid (PCA)
Courtesy of FORD MOTOR CO.

- For the PCA solenoid, measure the resistance between pin 3 and pin 1 at the transaxle.

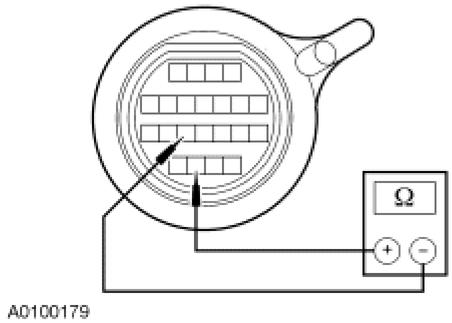

Fig. 21: Checking Resistance Of Linear Solenoid (SSF)
Courtesy of FORD MOTOR CO.

- For the SSF solenoid, measure the resistance between pin 21 and pin 16 at the transaxle.

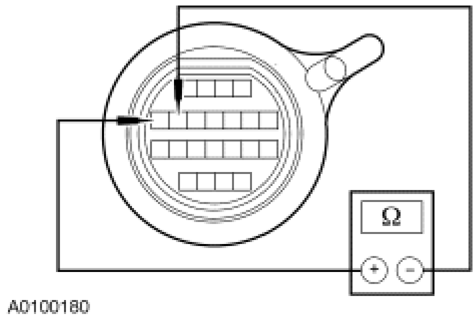

Fig. 22: Checking Resistance Of Linear Solenoid (SSC)
Courtesy of FORD MOTOR CO.

- For the SSC solenoid, measure the resistance between pin 11 and pin 10 at the transaxle.

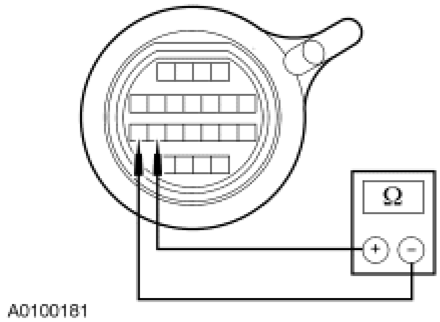

Fig. 23: Checking Resistance Of Linear Solenoid (SSD)
Courtesy of FORD MOTOR CO.

- For the SSD solenoid, measure the resistance between pin 17 and pin 18 at the transaxle.

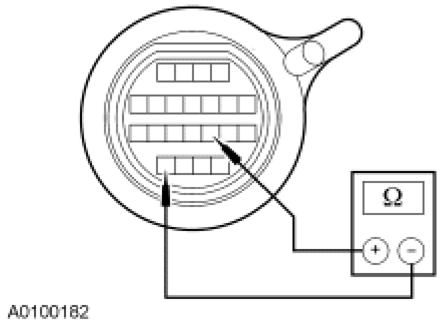

Fig. 24: Checking Resistance Of Linear Solenoid (SSE)
Courtesy of FORD MOTOR CO.

- For the SSE solenoid, measure the resistance between pin 14 and pin 22 at the transaxle.
- **Is the resistance between 5.0 - 5.6 ohms?**

  YES : INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still

present or reappears, go to A6 .

NO : Go to A6.

A6 CHECK CONTINUITY OF THE INTERNAL HARNESS

- Remove the transaxle side cover.
- Remove the wiring connector from the affected solenoid(s) (PCA, SSC, SSD, SSE, SSF and TCC).
- Measure the resistance between the bulkhead connector and the affected solenoid electrical connector.
- **Is each solenoid resistance less than 5 ohms?**

  YES : INSTALL a new main control.

  NO : INSTALL a new internal wire harness or repair affected circuit.

PINPOINT TEST B: Transmission Fluid Temperature (TFT) SENSOR

B1 ELECTRONIC DIAGNOSTICS

- Connect the diagnostic tool.
- Check to make sure the transaxle harness connector is fully seated, pins are fully engaged in connector and in good condition before proceeding.
- Key in ON position.
- Select Diagnostic Data Link.
- Select Transmission Control Module (TCM).
- Select PID/TFT.
- Enter the following diagnostic mode on the diagnostic tool: PIDs; TFT
- **Does the vehicle enter PID/TFT?**

  YES : Go to B2.

  NO : REPEAT procedure to enter PID. If vehicle did not enter PID, REFER to the **Introduction - Gasoline Engines** article.

B2 TEMPERATURE SIGNAL CHECK

- Key in ON position.
- Select Diagnostic Data Link.
- Select TCM.
- Select PID/TFT.
- Enter the following diagnostic mode on the diagnostic tool: PIDs; TFT
- Monitor the TFT PID. The temperature value should be within -55°C to 175°C (-65°F to 347°F).
- **Is the Transmission Fluid Temperature (TFT) within specified range?**

  YES : Go to B3.

  NO : Go to B4.

B3 WARM-UP/COOL-DOWN CYCLE

- While monitoring the TFT PIDs, carry out the following test: If transmission is cold, run transmission to warm it up. If transmission is warm, allow transmission to cool down.
- **Do the TFT PIDs increase as the transmission is warmed up, decrease as the transmission is**

cooled and does the TFT stay within the specified range?

YES : INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to B4 .

NO : Go to B4.

B4 SIGNAL RESISTANCE

- Remove the TCM.
- Inspect both sides of the TCM for damaged or pushed-out pins, corrosion or damaged seals.

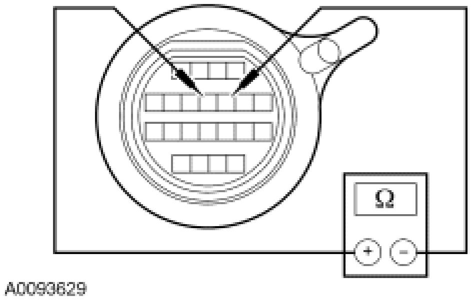

Fig. 25: Checking Signal Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between pins 7 and 8 at the transaxle bulkhead electrical connector. Refer to the following table.

TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR RESISTANCE

°C	°F	Resistance (Ohms)
10	50	6.445
25	77	3.5
110	230	0.247

- Record the resistance.
- **Is the resistance within range?**

YES : Go to B5.

NO : INSTALL a new internal harness and TFT assembly.

B5 SHORT TO GROUND

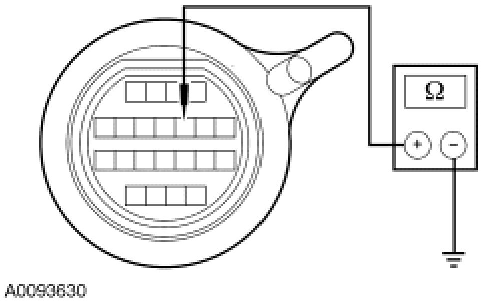

Fig. 26: Measuring Resistance Between Pin 7 & Ground At Transaxle Bulkhead Electrical Connector
Courtesy of FORD MOTOR CO.

- Measure the resistance between pin 7 and ground at the transaxle bulkhead electrical connector.

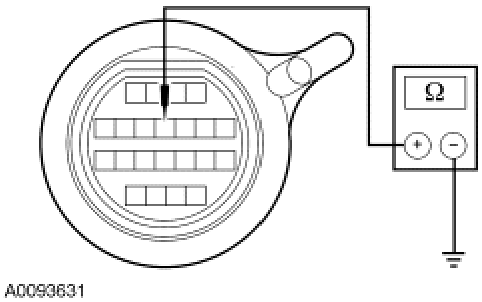

Fig. 27: Measuring Resistance Between Pin 8 & Ground At Transaxle Bulkhead Electrical Connector
Courtesy of FORD MOTOR CO.

- Measure the resistance between pin 8 and ground at the transaxle bulkhead electrical connector.
- Record the resistances.
- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new TCM and REFLASH to the latest level calibration.

  NO : INSTALL a new internal harness and TFT assembly.

PINPOINT TEST C: Output Shaft Speed (OSS) SENSORS

C1 ELECTRONIC DIAGNOSTICS

- Check to make sure the Transmission Control Module (TCM) connector is fully seated, pins are fully engaged in the connector and in good condition before proceeding.
- Connect the diagnostic tool.
- Key in ON position.
- Monitor the PID for the Output Shaft Speed (OSS) sensor.
- Monitor and record speed.

- **Does the OSS match the vehicle speed?**

  YES : CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to C2 .

  NO : Go to C2.

C2 CHECK OSS SENSOR RESISTANCE

- Remove the TCM.

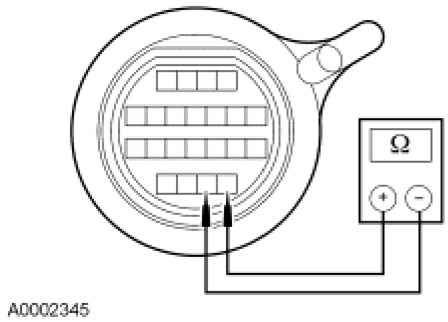

Fig. 28: Checking OSS Sensor Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 19 and 20.
- **Is the resistance less than 5 ohms?**

  YES : CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to C3 .

  NO : Go to C4.

C3 CHECK OSS SENSOR FOR SHORT TO GROUND

- Remove the TCM.

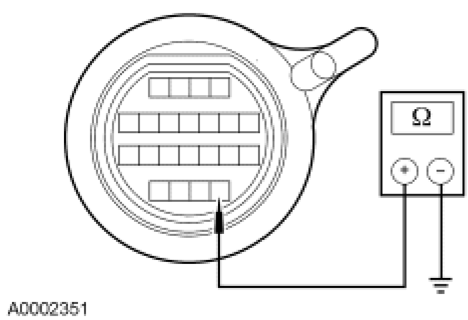

Fig. 29: Measuring Resistance At Transaxle Bulkhead Electrical Connector Between Pin 19 & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 19 and ground.

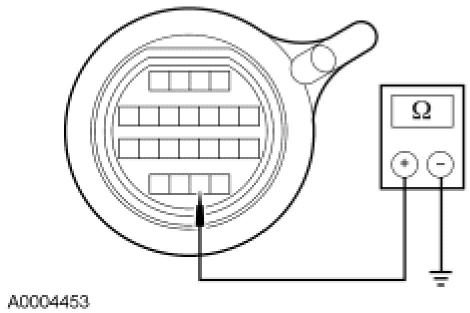

Fig. 30: Measuring Resistance At Transaxle Bulkhead Electrical Connector Between Pin 20 & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 20 and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to C4 .

  NO : Go to C4.

C4 CHECK OSS SENSOR RESISTANCE

- Remove the transaxle side cover.

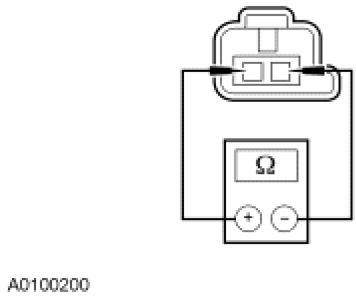

Fig. 31: Checking OSS Sensor Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance at the speed sensor electrical connector between pin 1 and 2.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new internal harness.

  NO : INSTALL a new transaxle assembly.

PINPOINT TEST D: Turbine Shaft Speed (TSS) SENSOR

D1 ELECTRONIC DIAGNOSTICS

- Check to make sure the Transmission Control Module (TCM) connector is fully seated, pins are fully engaged in connector and in good condition before proceeding.

- Connect the diagnostic tool.
- Key in ON position.
- Monitor the PID for the Turbine Shaft Speed (TSS) sensor.
- Monitor and record speed.
- **Does the TSS match the engine rpm?**

  YES : CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to D2 .

  NO : Go to D2.

D2 CHECK TSS SENSOR RESISTANCE

- Remove the TCM.

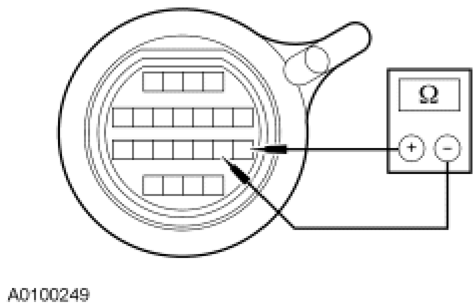

Fig. 32: Checking TSS Sensor Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 12 and 13.
- **Is the resistance less than 5 ohms?**

  YES : CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to D3 .

  NO : Go to D4.

D3 CHECK TSS SENSOR CIRCUIT FOR SHORT TO GROUND

- Remove the TCM.

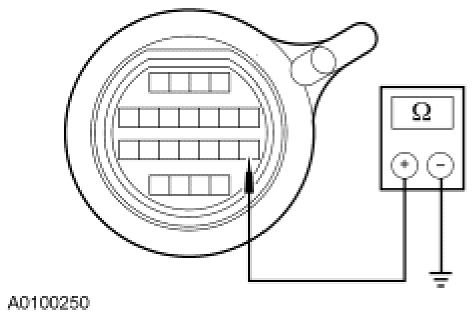

Fig. 33: Measuring Resistance At Transaxle Bulkhead Electrical Connector Between Pin 12 & Ground

Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 12 and ground.

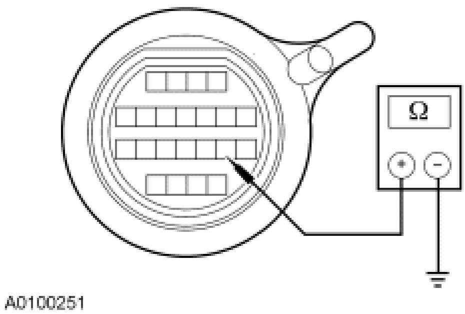

Fig. 34: Measuring Resistance At Transaxle Bulkhead Electrical Connector Between Pin 13 & Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance at the transaxle bulkhead electrical connector between pin 13 and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new TCM and REFLASH to the latest level calibration. CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, go to D4 .

  NO : Go to D4.

D4 ELECTRONIC DIAGNOSTICS

- Remove the transaxle side cover.
- Measure the resistance at the TSS sensor electrical connector between pin 1 and 2.
- **Is the resistance less than 5 ohms?**

  YES : CLEAR all DTCs. ROAD TEST to verify concern is not present. Concern could be intermittent. If concern is still present or reappears, INSTALL a new internal harness.

  NO : The sensor is defective, INSTALL a new TSS sensor.

PINPOINT TEST E: PARK NEUTRAL SIGNAL

E1 CHECK FOR VOLTAGE ON CIRCUIT CET40 (GN/OG)

- Disconnect: Transmission Control Module (TCM) C1533
- Key in ON position.
- Selector lever in PARK or NEUTRAL.

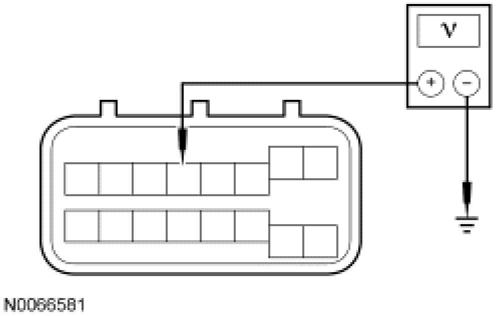

Fig. 35: Checking For Voltage On Circuit CET40 (GN/OG)
Courtesy of FORD MOTOR CO.

- Measure the voltage between C1533-5, circuit CET40 (GN/OG) and chassis ground.
- **Is the voltage between 0-0.8 volt?**

  YES : Go to E2.

  NO : Go to E3.

E2 CHECK FOR VOLTAGE ON CIRCUIT CET40 (GN/OG)

- Selector lever in REVERSE, DRIVE or LOW.

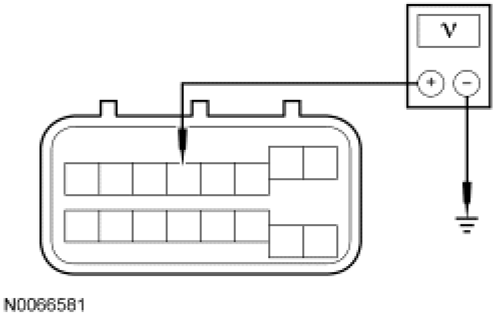

Fig. 36: Checking Voltage On Circuit CET40 (GN/OG)
Courtesy of FORD MOTOR CO.

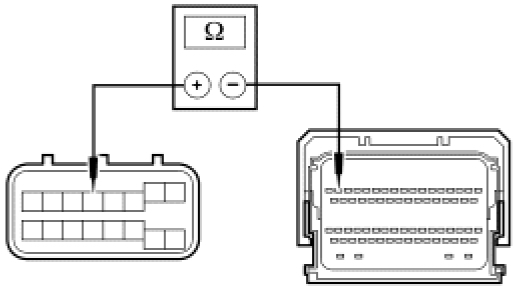
- Measure the voltage between C1533-5, circuit CET40 (GN/OG) and chassis ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new TCM. After installing the new TCM, VERIFY that the starting system is operating correctly. If not, REFER to **ENGINE COOLING** article to check starting system.

  NO : Go to E3.

E3 CHECK VEHICLE HARNESS CIRCUIT CET40 (GN/OG) FOR AN OPEN

- Disconnect: PCM C175B



N0073560

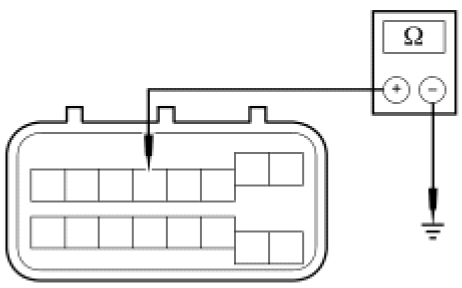
Fig. 37: Measuring Resistance Between C1533-5, Circuit CET40 (GN/OG) & C175B-16
Courtesy of FORD MOTOR CO.

- Measure the resistance between C1533-5, circuit CET40 (GN/OG) and C175B-16.
- **Is the resistance less than 5 ohms?**

  YES : Go to E4.

  NO : REPAIR circuit CET40 (GN/OG) for an open.

E4 CHECK VEHICLE HARNESS CIRCUIT CET40 (GN/OG) FOR A SHORT TO GROUND



N0066583

Fig. 38: Checking Vehicle Harness Circuit CET40 (GN/OG) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between C1533-5, circuit CET40 (GN/OG) and chassis ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : REPAIR circuit CET40 (GN/OG) for a short to ground.

  NO : INSTALL a new PCM. After installing the new PCM, VERIFY that the starting system is operating correctly. If not, REFER to **ENGINE COOLING** article to check starting system.

SPECIAL TESTING PROCEDURES

Special Tools

Illustration	Tool Name	Tool Number
	73 III Automotive Meter	105-R0057 or equivalent

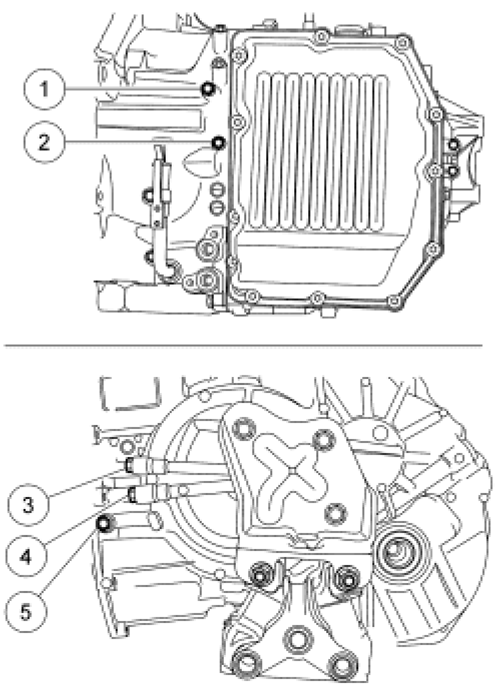
 ST1185-A		
 ST1341-A	Transmission Fluid Pressure Gauge	307-004 (T57L-77820-A)
 ST1438-A	Vehicle Communication Module and Integrated Diagnostic System software with appropriate hardware, or equivalent scan tool	

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portions of the transaxle.

Engine Idle Speed Check

Refer to the **Introduction - Gasoline Engines** article for diagnosis and testing of the engine idle speed.

Pressure Test



N0043352

Fig. 39: Pressure Tap Location
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Clutch C1
2	-	Clutch C3
3	-	Clutch C2
4	-	Lube circuit
5	-	Clutch B2

NOTE: If the pressure is low at stall, do not continue with the test or further transaxle damage will occur. Do not maintain Wide Open Throttle (WOT) in any transaxle range for more than 5 seconds.

This test verifies that the pressure is within specification.

1. Connect the Transmission Fluid Pressure Gauge to the appropriate pressure tap.
2. Start the engine and check the pressures, see the pressure charts to determine if the pressures are within specification.

CLUTCH AND BRAKE PRESSURE CHART

Clutch	Range	Pressure
C1	Drive (1st-4th)	196-1,372 kPa (28-199 psi)
C2	Drive (4th-6th)	196-1,372 kPa (28-199 psi)
C3	Drive (3rd-5th)	196-1,372 kPa (28-199 psi)
C3	Reverse	392-1,863 kPa (57-270 psi)
B2	Low manual (1st)	588-1,372 kPa (85-199 psi)
B2	Reverse	392-1,863 kPa (57-

		270 psi)

PRESSURE DIAGNOSTIC CHART

Test Results	Possible Source
Values of both DRIVE and REVERSE ranges are lower than the standards	• Pressure Control Solenoid A (PCA) • Primary regulator valve failure • Transmission oil pump failure • Leak from hydraulic circuit of DRIVE or REVERSE range
Only the value of DRIVE range is lower than the standards	• DRIVE range hydraulic circuit failure • C1 clutch failure
Only the value of REVERSE range is lower than the standards	• REVERSE range hydraulic circuit failure • C3 clutch failure • B2 brake failure

3. If the pressure is not within specification, install a new main control valve body.
4. If the pressures are OK, clear all DTCs. Test drive vehicle, code could be intermittent. If DTC returns, install a new valve body.

Stall Speed Test

WARNING: **Block all wheels, set the parking brake and firmly apply the service brake to reduce the risk of vehicle movement during this procedure. Failure to follow these instructions may result in serious personal injury.**

The Stall Speed Test checks:

- torque converter clutch operation and installation.
- holding ability of the forward clutch.
- reverse clutch (the low-reverse bands).
- planetary one-way clutch.
- engine driveability concerns.

Conduct this test with the engine coolant and transmission fluid at correct levels and at normal operating temperature.

Apply the parking brake firmly for each Stall Speed Test.

1. Find the specified stall rpm for the vehicle, see the Stall Speed Chart. Use a grease pencil to mark the rpm on the dial of a tachometer.

STALL SPEED

Engine	rpm
3.0L (4V)	1,878-2,678
3.5L	1,878-2,678

2. Connect a scan tool.

NOTE: If the rpm recorded by the scan tool exceeds the maximum limits, release the accelerator pedal immediately because clutch or band slippage is indicated.

3. In each of the following ranges REVERSE, DRIVE and LOW, press the accelerator pedal to the floor and hold it just long enough to let the engine get to Wide Open Throttle (WOT). While making this test, do not hold the throttle open for more than 5 seconds at a time.
4. Note the results in each range.
5. After each range, move the selector lever to NEUTRAL and run the engine at 1,000 rpm for about 15 seconds to cool the torque converter before making the next test.
6. Use the stall speed diagnosis chart for corrective actions.

NOTE: The stall speed in REVERSE will be lower.

7. If stall speeds were too high, see the Stall Speed Chart. If stall speeds were too low, first check engine idle speed and tune up. If engine is OK, remove torque converter and check torque converter clutch for slippage.

PRESSURE DIAGNOSTIC CHART

Test Results	Possible Source
Values of both DRIVE and REVERSE ranges are lower than the standards	• Insufficient engine power • Torque converter stator one-way clutch slipping
Only the value of DRIVE range is higher than the standards	• Low line pressure. Shift control solenoid assembly (SLT) failure, primary regulator valve failure • Valve body failure (SLC3 hydraulic pressure system) • C1 clutch slipping • One-way clutch F1 failure
Only the value of REVERSE range is higher than the standards	• Low line pressure. Shift control solenoid assembly (SLT) failure, primary regulator valve failure • Valve body failure (SLC3 hydraulic pressure system)

	• C3 clutch failure • B2 brake failure
Values of both DRIVE and REVERSE ranges are higher than the standards	• Low line pressure. Shift control solenoid assembly (SLT) failure, primary regulator valve failure • Primary regulator valve failure • Oil pump failure • Oil strainer clogging

LEAKAGE INSPECTION

Special Tools

Illustration	Tool Name	Tool Number
 ST1287-A	100W/12 Volt DC UV Lamp	164-R0751

Material

Item	Specification
Dye-Lite® ATF/Power Steering Fluid Leak Detection Dye 164-R3701 (Rotunda)	-
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

NOTE: **Do not try to stop the fluid leak by increasing the torque beyond specifications. This may cause damage to the case threads.**

Use the following chart to inspect and correct any external transmission fluid leaks.

EXTERNAL TRANSMISSION FLUID LEAKS

Description	Action
Leaks at the transmission fluid pan to case	Tighten to specification or install a new transmission fluid gasket.
Transmission fluid filler plug leaks	Install a new transmission fluid filler plug.
Transmission fluid cooler or fittings leaking	Tighten to specification or install new transmission fluid cooler tubes. Refer to **TRANSAXLE/TRANSMISSION COOLING** article.
Transmission fluid cooler nut to case fitting leaking	Inspect for damage or missing O-ring seals. Tighten to specification, install new transmission fluid cooler tubes or install new O-rings. Refer to **TRANSAXLE/TRANSMISSION COOLING** article.

Leaks at the transmission fluid cooler	Inspect the transmission fluid cooler for damage, if damaged, install a new transmission fluid cooler. Refer to **TRANSAXLE/TRANSMISSION COOLING** article.
Leaks at the manual control lever seal	Install a new manual control lever seal.
Leaks at the solenoid body harness connector	Install a new solenoid body harness connector O-ring seal, either on the harness end or the solenoid body.

External Sealing

The transaxle has the following parts to prevent external transmission fluid leakage:

- Gaskets
- Lip type seals
- O-ring seals
- Seal rings
- Seal grommets
- Thread sealant

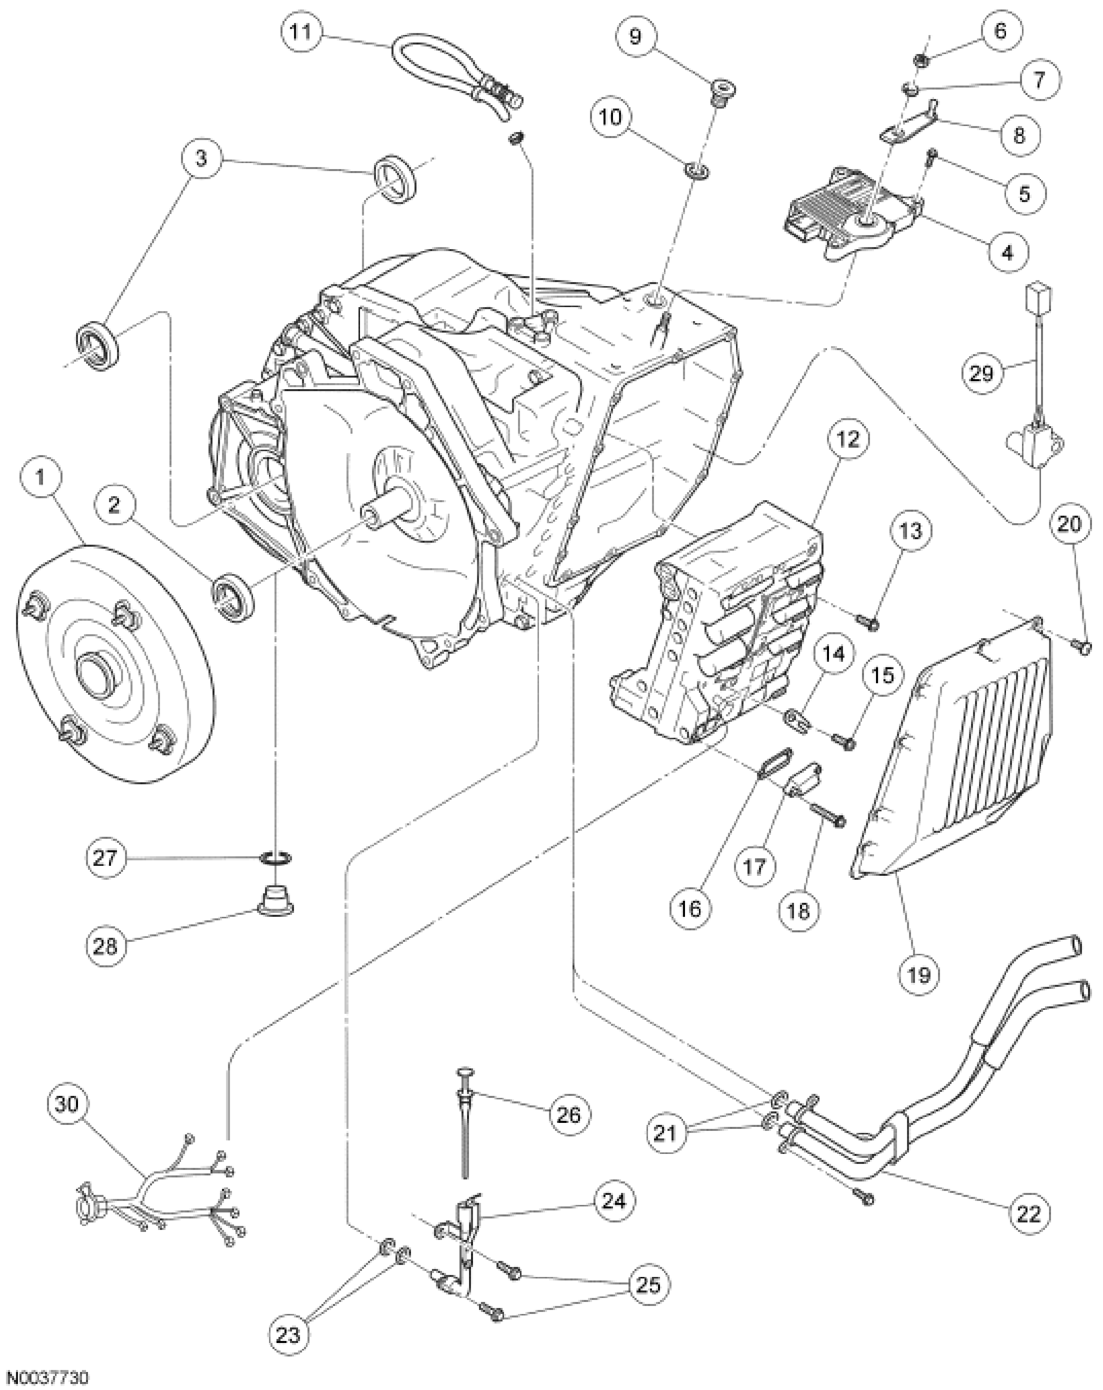


Fig. 40: External Sealing
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7902	Torque converter
2	-	Torque converter hub seal
3	1177	Axle shaft seals

4	-	Transmission Control Module (TCM)
5	-	TCM bolt
6	7045	Manual control lever shaft nut
7	7C208	Manual control lever shaft nut washer
8	7A256	Manual control lever
9	7A010	Transmission fluid fill plug
10	7E050	Transmission fluid fill plug O-ring
11	-	Breather hose
12	-	Main control valve body assembly
13	-	Main control valve body bolt
14	-	Lock plate
15	-	Lock plate bolt
16	-	Suction cover gasket
17	-	Suction cover
18	-	Suction cover bolt
19	-	Main control valve body side cover
20	-	Main control valve body side cover bolt
21	7J227	Transmission fluid cooler O-rings
22	7R081	Transmission fluid cooler tube
23	7E050	Transmission fluid level indicator tube O-rings
24	7A228	Transmission fluid level indicator tube
25	7A443	Transmission fluid level indicator tube bolts
26	7A228	Transmission fluid level indicator tube
27	7L101	Transmission fluid drain plug gasket
28	7A010	Transmission fluid drain plug
29	7M101	Turbine Shaft Speed (TSS) sensor
30	7G276	Internal wire harness and Transmission Fluid Temperature (TFT) sensor

Transmission Fluid Leakage in Torque Converter Area

Leakage at the front of transmission, as evidenced by transmission fluid around the torque converter housing part of the case, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of a leak before removing the transmission from the vehicle. The paths which the transmission fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The 5 numbers in the illustration correspond with the 5 flow path steps.

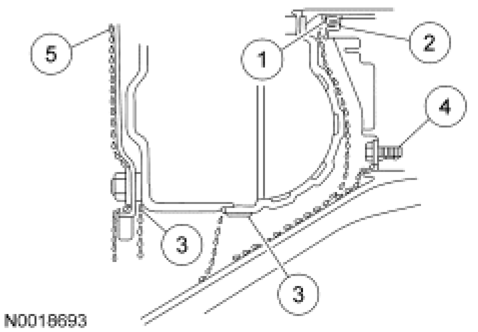

Fig. 41: Identifying Torque Converter Fluid Leakage Area
Courtesy of FORD MOTOR CO.

Leak Path	Symptom	Possible Source
1, 2 and 4	Leak at front of transmission	Torque converter hub seal
1, 2 and 4	Leak at front of transmission	Vent
1, 2 and 4	Leak at front of transmission	Converter hub weld
1, 2 and 4	Leak at front of transmission	External pump seal (large)
1, 2 and 4	Leak at front of transmission	Pump to case screws
1, 2 and 4	Leak at front of transmission	Pump gasket
3	Leak at front of transmission	Torque converter seal weld
3	Leak at front of transmission	Torque converter stud
5	Leak at front of transmission	Engine oil leak; rear main seal
5	Leak at front of transmission	Engine valve cover
5	Leak at front of transmission	Oil galley
5	Leak at front of transmission	Pump lip seal
5	Leak at front of transmission	Engine Oil Pressure (EOP) sensor

Leak Check Test With UV Lamp

Dye-Lite® ATF Steering Fluid Leak Detection Dye 164-R3701 or equivalent (specifically formulated for ATF) is used to detect a transmission fluid leak.

1. Add dye to the transmission fluid. Use 30.0 mL (1 oz) of dye solution for every 3.8L (4 qt) of transmission fluid.
2. Start and run the engine until the transaxle reaches its normal operating temperature. Observe the back of the cylinder block and top of the torque converter housing for evidence of fluid leakage. Raise the vehicle on a hoist and run the engine at fast idle, then at engine idle, occasionally shifting to the DRIVE and REVERSE ranges to increase pressure within the transaxle. Observe the front of the flexplate, back of the cylinder block (in as far as possible), and inside the torque converter housing and front of the case. Continue running the engine until fluid leakage is evident and the probable source of leakage can be determined.

DIAGNOSIS BY SYMPTOM

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73 III Automotive Meter	105-R0057 or equivalent
 ST1438-A	Vehicle Communication Module and Integrated Diagnostic System software with appropriate hardware, or equivalent scan tool	

The Diagnosis by Symptom charts give the technician diagnostic information, direction and suggest possible components, using a symptom as a starting point.

The Diagnosis by Symptom charts are divided into 2 categories: Electrical Routines, indicated by 200 series numbers, and Hydraulic/Mechanical Routines, indicated by 300 series numbers. The Electrical Routines list the possible electrical components that could cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that could cause or contribute to the symptom described.

Diagnosis by Symptom Chart Directions

1. Using the Symptom Index, select the concern/symptom that best describes the condition.
2. See the routine indicated in the diagnosis by Symptom Index.
3. Always begin diagnosis of a symptom with:
   1. Preliminary inspections.
   2. Verifications of condition.
   3. Checking the fluid levels.
   4. Carry out other test procedures as directed.

NOTE: Not all concerns and conditions with electrical components will set a DTC. Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the routine listed.

4. Begin with the routine indicated. Follow the reference or action required statements. Always carry out the on-board diagnostic tests as required. Never skip steps. Repair as required. These components are listed in the removal sequence and by the most probable cause. All components listed must be inspected to make sure of correct repair.

DIAGNOSIS BY SYMPTOM INDEX

Title	Routines
Engagement Concerns	

No forward and/or No reverse	207
Harsh	208
Soft	209
Torque Converter Clutch Operation Concerns	
Does not apply	240
Cycling/shudder/chatters	242
NVH	
Noise/vibration - forward or reverse	254
Other Concerns	
Transmission fluid level	286
Transmission fluid condition	287
Transmission control module software	288

Diagnostic Routines

ENGAGEMENT CONCERNS: NO FORWARD AND/OR NO REVERSE

Possible Component	Reference/Action
207 - ROUTINE	
No Forward, No Reverse, No Forward or Reverse	
Selector lever linkage damaged or out of position	Using a scan tool, check selector lever position. Refer to **AUTOMATIC TRANSAXLE/TRANSMISSION EXTERNAL CONTROLS** article.
Incorrect neutral switch position	Carry out neutral position learning. Refer to **Neutral Position Learning**.
	Disconnect the Transmission Control Module (TCM) electrical connector. If concern still exists, this indicates an internal mechanical problem. Connect the TCM and carry out pressure checks.
	If concern is resolved by disconnecting the TCM, this indicates an electrical concern. Install a new TCM. Refer to **Transmission Control Module (TCM)**. Check wiring harness (external and internal) valve body connections.
Halfshafts broken	Inspect for damaged or broken halfshafts. Refer to **FRONT DRIVE HALFSHAFTS** article.

ENGAGEMENT CONCERNS: HARSH

Possible Component	Reference/Action
208 - ROUTINE	
Harsh Engagements	
Initial learn values wrong	Carry out Transmission Control Module (TCM) initial learning procedure. Refer to **Transmission Control Module (TCM) Initial Learning**.
Damaged internal transaxle components causing high or low pressures	Carry out pressure test. Refer to **Special Testing Procedures**.

Damaged or malfunctioning solenoids	Carry out pinpoint test. Refer to **Pinpoint Tests - Non OSC Equipped Vehicle**.

ENGAGEMENT CONCERNS: SOFT

Possible Component	Reference/Action
209 - ROUTINE	
Soft Engagements	
Initial learn values wrong	Carry out Transmission Control Module (TCM) initial learning procedure. Refer to **Transmission Control Module (TCM) Initial Learning**.
Damaged internal transaxle components causing high or low pressures	Carry out pressure test. Refer to **Special Testing Procedures**.
Damaged or malfunctioning solenoids	Carry out pinpoint test. Refer to **Pinpoint Tests - Non OSC Equipped Vehicle**.

TORQUE CONVERTER CLUTCH OPERATIONS CONCERNS: DOES NOT APPLY

Possible Component	Reference/Action
240 - ROUTINE	
Torque Converter Does Not Apply	
Damaged or malfunctioning solenoid	Carry out pinpoint test. Refer to **Pinpoint Tests - Non OSC Equipped Vehicle**. Install a new main control valve body. Refer to **Main Control Valve Body**.
Damaged or disconnected wire harness	Inspect wire harness. Check connections to the Torque Converter Clutch (TCC) solenoid.
Damaged or malfunctioning torque converter	Install a new torque converter. Refer to **Torque Converter**.

TORQUE CONVERTER CLUTCH OPERATIONS CONCERNS: CYCLING/SHUTTER/CHATTERS

Possible Component	Reference/Action
242 - ROUTINE	
Torque Converter Cycling, Shudders or Chatters	
Damaged or malfunctioning Torque Converter Clutch (TCC) solenoid	Install a new main control valve body. Refer to **Main Control Valve Body**.
Damaged or disconnected wire harness	Inspect wire harness. Check connections to the TCC solenoid.
Damaged or malfunctioning torque converter	Install a new torque converter. Refer to **Torque Converter**.

NOTE: **NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to**

pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

OTHER CONCERNS: NOISE/VIBRATION - FORWARD OR REVERSE

Possible Component	Reference/Action
254 - ROUTINE	
Powertrain Control System	
Transmission Control Module (TCM) , vehicle wiring harnesses, Shift Solenoid A (SSA) and Shift Solenoid B (SSB).	Carry out on-board diagnostic tests. Refer to the **Introduction - Gasoline Engines** article for diagnosis and testing of the TCM. Go to **Pinpoint Test A**. Repair as required. Clear the DTCs, road test and rerun on-board diagnostic test.
Incorrect Transmission Fluid Level	
Transmission fluid level low/overfilled	Check the transmission fluid level. Adjust the transmission fluid level as necessary. Refer to **Preliminary Inspection**.
Torque Converter	
Worn or damaged torque converter	Refer to **Torque Converter Diagnosis**.
Transaxle Support Insulator	
Worn or damaged transaxle support insulator	Inspect the transaxle support insulator for damage. Install new as necessary. Refer to **Transaxle Support Insulator**.

OTHER CONCERNS: TRANSMISSION FLUID LEVEL

Possible Component	Reference/Action
286 - ROUTINE	
Low Transmission Fluid Level	
Axle shaft seal leaking	Install new axle shaft seals. Refer to **Differential Seals - LH**, **Differential Seals - RH, Front Wheel Drive (FWD)** and **Differential Seals - RH, All Wheel Drive (AWD)**.
Transmission fluid pan leaking	Reseal the transmission fluid pan.
Torque converter hub seal leaking	Install a new torque converter hub seal. Refer to **Torque Converter Hub Seal**.
Transmission fluid cooler tubes leaking	Install new transmission fluid cooler tube O-rings.
Manual control lever seal leaking	Install a new manual control lever seal. Refer to **Manual Control Lever Shaft and Seal**.
Transmission fluid drain plug leaking	Install a new transmission fluid drain plug seal.

OTHER CONCERNS: TRANSMISSION FLUID CONDITION

Possible Component	Reference/Action
287 - ROUTINE	
Transmission Fluid Burnt or Contaminated	
Internal components damaged (clutch plate	Install a new transaxle. Refer to **Transaxle - 3.0L** or

material)	**Transaxle - 3.5L**.

OTHER CONCERNS: TRANSMISSION CONTROL MODULE (TCM) SOFTWARE

Possible Component	Reference/Action
288 - ROUTINE	
Shifting and Driveability Concerns	
Transmission Control Module (TCM) not at current software level	Reflash the TCM to current software level.

GENERAL PROCEDURES

TRANSMISSION FLUID COOLER - BACKFLUSHING AND CLEANING

Material

Item	Specification
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

NOTE: **MERCON®, MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid and Motorcraft Continuously Variable Chain Type Transmission Fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage. Refer to the transmission fluid specification for the correct transmission fluid.**

1. Carry out backflushing with a suitable torque converter/fluid cooler cleaner. Test equipment to make sure that a vigorous transmission fluid flow is present before proceeding. Install a new system transmission fluid filter if flow is weak or contaminated.
2. To aid in attaching the cleaner to the transmission fluid cooler tube, connect 2 additional rubber hoses to the transaxle end of the transmission fluid cooler tube as follows:
    1. Connect the cleaner tank pressure tube to the transmission fluid cooler return tube.
    2. Connect a tank return hose to the transmission fluid cooler pressure tube. Place the outlet end of this hose in the transmission fluid tank reservoir.
3. Turn on the pump and allow the transmission fluid to circulate a minimum of 5 minutes (cycling switch on and off will help dislodge contaminants in cooler system).
4. Switch off the pump and disconnect the transmission fluid pressure hose from the transmission fluid cooler return tube.
5. Use compressed air to blow out the transmission fluid cooler and tubes (blow air into the transmission fluid cooler return tube) until all transmission fluid is removed.
6. Remove the rubber return hose from the remaining transmission fluid cooler tube.

TORQUE CONVERTER

1. A new or remanufactured torque converter must be installed if one or more of the following statements

are true:

- A torque converter malfunction has been determined based on complete diagnostic procedures.
- Converter stud(s), impeller hub or bushing are damaged.
- Discoloration of the torque converter (due to overheating).
- The torque converter is found to be out of specification when carrying out one of the following torque converter checks:
  - One-Way Clutch Check
  - End Play Check
  - Stator to Turbine Interference Check
  - Stator to Impeller Interference Check
  - Torque Converter Leak Check
- Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure modes:
  - Major Metallic Failure
  - Multiple Clutches or Clutch Plate Failures
  - Sufficient Component Wear which results in Metallic Contamination

TORQUE CONVERTER CONTAMINATION INSPECTION

Material

Item	Specification
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

1. If a new or remanufactured torque converter is not being installed, the following procedures must be carried out:
   - The torque converter must be thoroughly cleaned.
   - Torque converters with drain plugs can be cleaned by using a suitable torque converter/fluid cooler cleaner.
   - Torque converters without drain plugs can be cleaned by hand. Partially fill the torque converter using only recommended transmission fluid for the applicable transmission. Hand agitate the torque converter and then thoroughly drain the transmission fluid. Refill the torque converter with new transmission fluid specified for transmission and reinstall.

TRANSMISSION FLUID DRAIN AND REFILL

Special Tools

Illustration	Tool Name	Tool Number
	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent	

	scan tool	

Material

Item	Specification
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

NOTE: MERCON®, MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid and Motorcraft Continuously Variable Chain Type Transmission Fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.

Draining

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

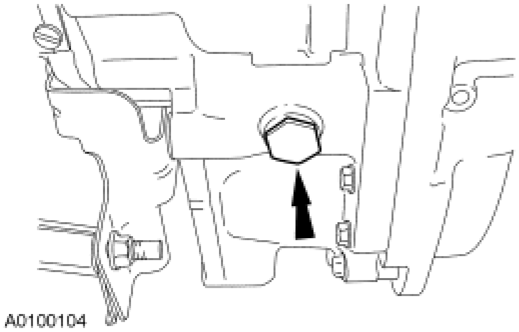

Fig. 42: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

Refill

3. Install the transmission fluid drain plug.
   - Tighten to 47 Nm (35 lb-ft).

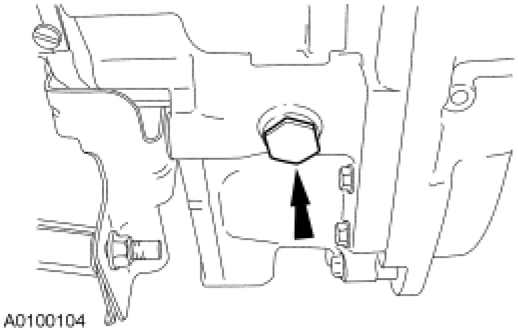

Fig. 43: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

4. Remove the transmission fluid fill plug.

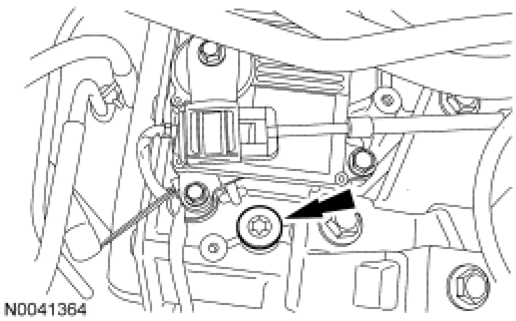

Fig. 44: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

5. Fill the transaxle with approximately 4.7L (5 qt) of clean transmission fluid.
6. Install the transmission fluid fill plug.
   - Tighten to 39 Nm (29 lb-ft).

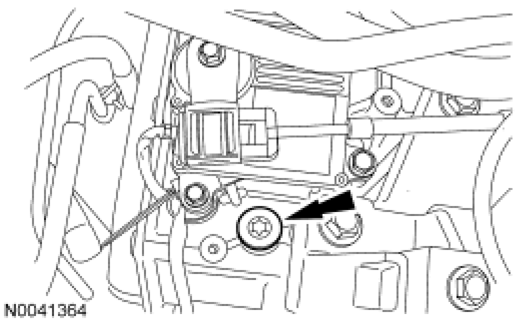

Fig. 45: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

7. With the selector lever in PARK, the vehicle should be on a level surface, the engine at idle (680-780 rpm), foot pressed on the brake, move the selector lever through each gear and allow engagement of each

gear. Place the selector lever back in the PARK position.

8. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
9. Wipe the transmission fluid level indicator with a clean cloth.

NOTE: In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.

10. If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid lever indicator. The transmission fluid level should be at the uppermost mark on the transmission fluid level indicator. Only fill to the uppermost mark on the transmission fluid indicator. Do not overfill. Damage to the transaxle will occur.

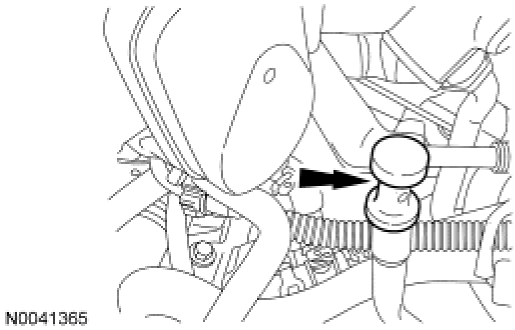

Fig. 46: Locating Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: The correct transmission fluid at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the fluid level indicator.

11. Fill the transaxle to the correct transmission fluid level.

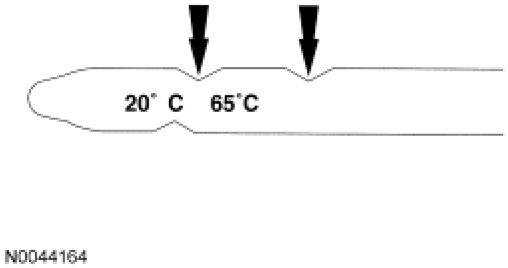

Fig. 47: Locating Temperature Marks On Fluid Level Indicator

Courtesy of FORD MOTOR CO.

NOTE: The correct transmission fluid level at cool operating temperature of 15°C-25°C (59°F-77°F), is at the bottom mark on the transmission fluid level indicator.

12. If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

Fig. 48: Locating Bottom Mark On Fluid Level Indicator

NEUTRAL POSITION LEARNING

Special Tools

Illustration	Tool Name	Tool Number
 ST1438-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

NOTE: When installing a new Transmission Control Module (TCM), the initialized learned values will need to be carried out.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Install the scan tool.
3. Turn the ignition ON.
4. The scan tool should indicate NEUTRAL.
   - If the scan tool does not indicate NEUTRAL, carry out TCM adjustment. For additional information, refer to **Transmission Control Module (TCM)**.
5. If NEUTRAL is indicated on the scan tool, move the selector lever to PARK and turn the ignition OFF.

6. Turn the ignition ON and move the selector lever from PARK to DRIVE.
    - The scan tool should indicate each PRNDL position.
7. If the diagnostic display indicates each PRNDL position, check for any DTCs.
8. If the diagnostic display does not indicate each PRNDL position, carry out **Transmission Control Module (TCM) Initial Learning**.

TRANSMISSION CONTROL MODULE (TCM) INITIAL LEARNING

Special Tools

Illustration	Tool Name	Tool Number
 ST1438-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS)	software with appropriate hardware, or equivalent scan tool

NOTE: **Do not raise the Transmission Fluid Temperature (TFT) by stalling the engine, internal transaxle damage will occur.**

NOTE: **Clear all DTCs first.**

NOTE: **When installing a new transmission, Transmission Control Module (TCM) or reflashing the TCM, the initialized learned values will need to be carried out.**

NOTE: **This procedure cannot be carried out if the transmission fluid is not within the correct temperature specification.**

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Install the scan tool.
3. Monitor and note the engagement and shift harshness on the scan tool.
4. With the engine idling, monitor the Transmission Fluid Temperature (TFT). The TFT should be between 66°C-110°C (151°F-230°F).
5. With your foot on the brake, move the selector lever to NEUTRAL and hold for 3 seconds. Then move the selector lever to DRIVE and hold for 3 seconds. Carry this out 5 times. Then move the selector lever to PARK.
6. With your foot on the brake, move the selector lever to NEUTRAL and hold for 3 seconds. Then move the selector lever to REVERSE and hold for 3 seconds. Carry this out 5 times. Then move the selector lever to PARK.
7. Drive the vehicle and monitor the scan tool.
8. Drive the vehicle with the throttle opening between 25-30%. Drive until the vehicle reaches 6th gear, not to exceed 80 km/h (50 mph). Then release the accelerator and coast to a stop within 60 seconds. Carry

this out 10 times.

9. The engagement and shift harshness have decreased.

IN-VEHICLE SERVICING

REMOVAL

NOTE: MERCON®, MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid and Motorcraft Continuously Variable Chain Type Transmission Fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the transmission fluid drain plug and allow the transmission fluid to drain.

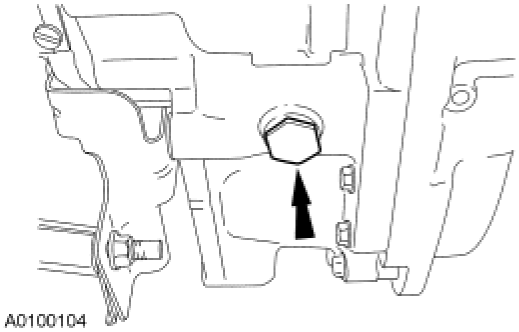

Fig. 49: Locating Transmission Fluid Drain Plug

Courtesy of FORD MOTOR CO.

3. Disconnect the transmission fluid cooler tubes at the transaxle and position the tubes aside.

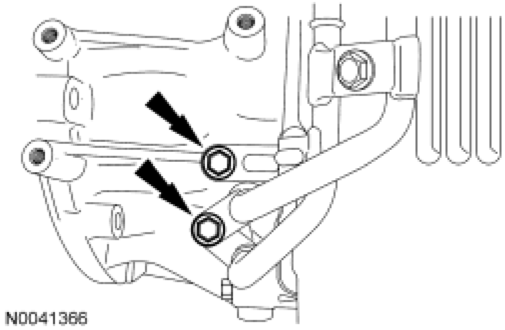

Fig. 50: Locating Transmission Fluid Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

4. Remove and discard the transmission fluid pan bolts and remove the pan.

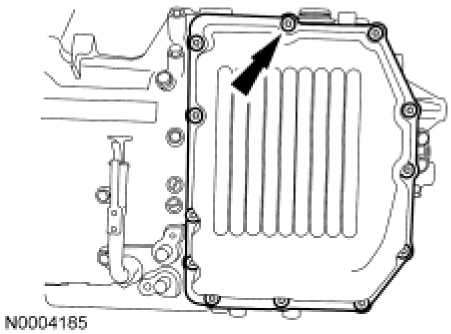

Fig. 51: Locating Transmission Fluid Pan Bolts
Courtesy of FORD MOTOR CO.

NOTE: When removing the sealer, use care not to damage the sealing surfaces.

5. Remove the sealer off the fluid pan.

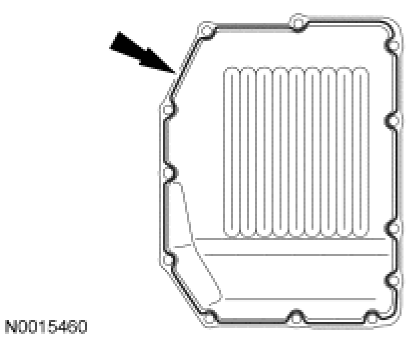

Fig. 52: Locating Fluid Pan Sealer

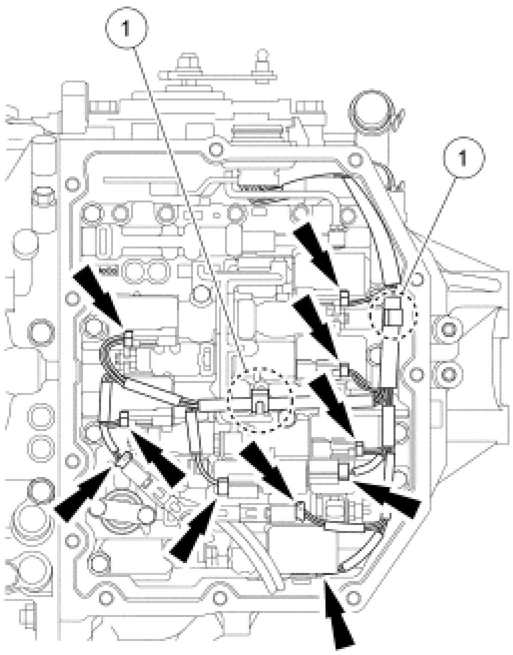
Courtesy of FORD MOTOR CO.

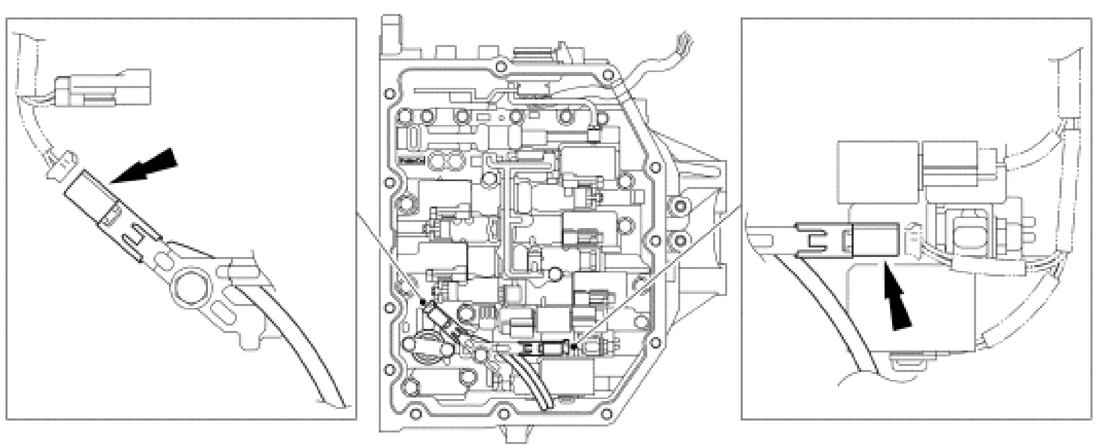
6. Disconnect the wire harness from the solenoids.
    1. Remove the wire harness from the clamps.
    2. Disconnect the 8 solenoid connectors and the 2 speed sensor connectors.



N0015461

Fig. 53: Locating Solenoid Connectors & Speed Sensor Connectors
Courtesy of FORD MOTOR CO.

7. Remove the 2 speed sensor wires from the solenoid clamp.



N0015462

Fig. 54: Locating Speed Sensor Wires

Courtesy of FORD MOTOR CO.

8. Remove the bolt and the lock plate and pull out the Transmission Fluid Temperature (TFT) sensor.

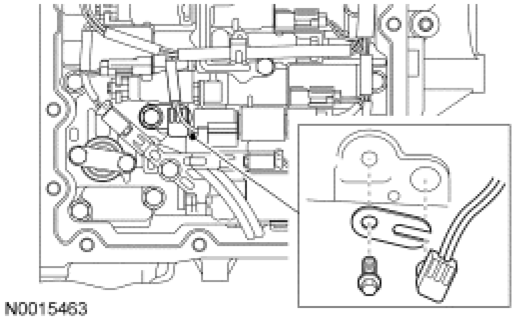


Fig. 55: Identifying Transmission Fluid Temperature Sensor, Bolt & Lock Plate
Courtesy of FORD MOTOR CO.

9. Remove the 2 bolts, suction cover and gasket.

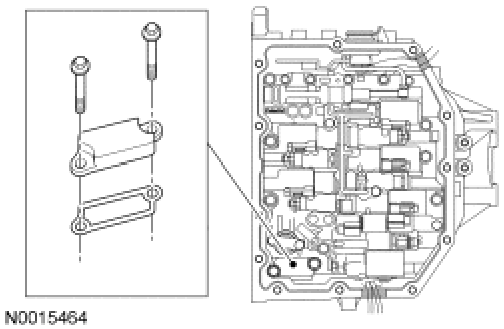

Fig. 56: Identifying Suction Cover, Gasket & Bolts
Courtesy of FORD MOTOR CO.

10. Remove the 6 main control valve body bolts in the sequence shown.

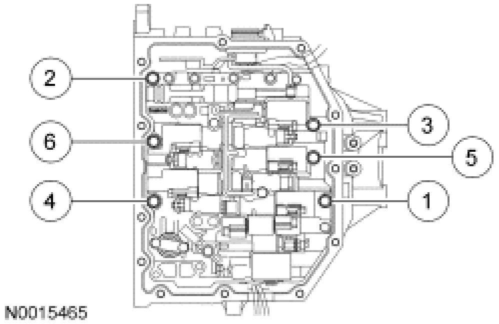

Fig. 57: Identifying Main Control Valve Body Bolts Sequence
Courtesy of FORD MOTOR CO.

NOTE: **Be careful when removing the main control valve body, the manual control lever will fall out of its bore. Also, once all the bolts are removed, the main control valve body will fall out of the transaxle.**

11. Remove the main control valve body.

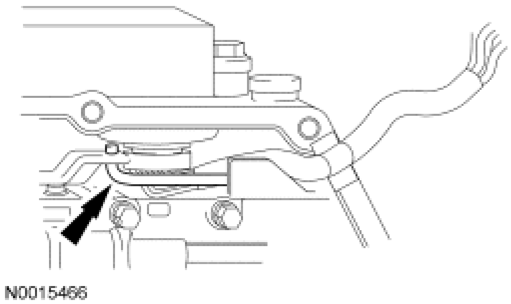

Fig. 58: Locating Manual Control Lever
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: **When installing the main control valve body, place the wire harness in the open space of the separate plate, being careful not to pinch the harness. Damage to the harness will occur.**

1. Connect the manual valve link and position the main control valve body in place.

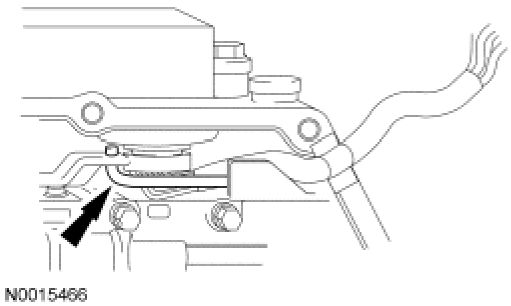

Fig. 59: Locating Manual Control Lever
Courtesy of FORD MOTOR CO.

2. Loosely install the 6 main control valve body bolts in the sequence shown.

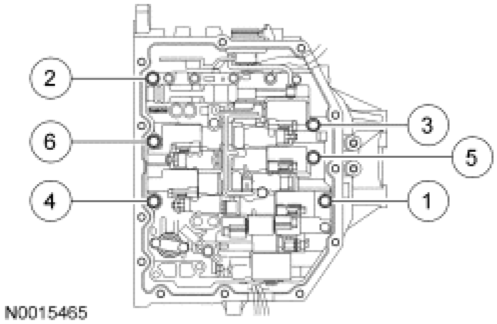

Fig. 60: Identifying Main Control Valve Body Bolts Sequence
Courtesy of FORD MOTOR CO.

3. Install the suction cover gasket, cover and loosely install the 2 bolts.

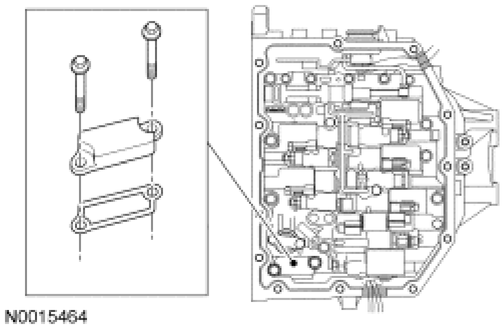

Fig. 61: Identifying Suction Cover, Gasket & Bolts
Courtesy of FORD MOTOR CO.

4. Tighten the 8 bolts to 10 Nm (89 lb-in) in the sequence shown.

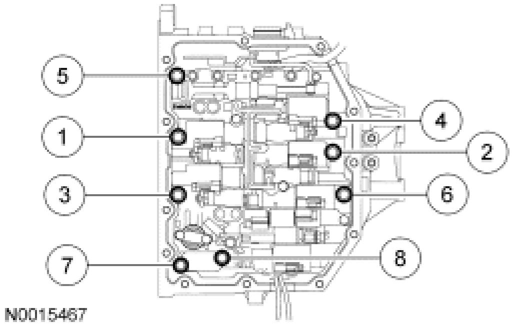

Fig. 62: Identifying Bolts Tightening Sequence
Courtesy of FORD MOTOR CO.

5. Lubricate the O-ring and install the TFT sensor.
   - Tighten to 10 Nm (89 lb-in).

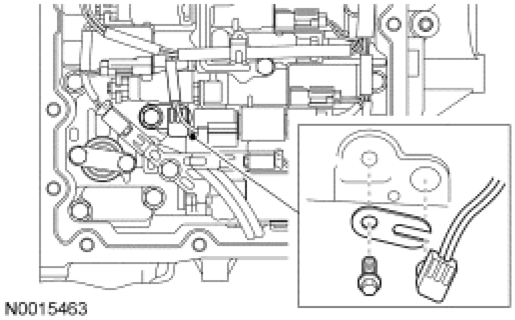

Fig. 63: Identifying Transmission Fluid Temperature Sensor, Bolt & Lock Plate
Courtesy of FORD MOTOR CO.

6. Connect the 2 speed sensor wires.

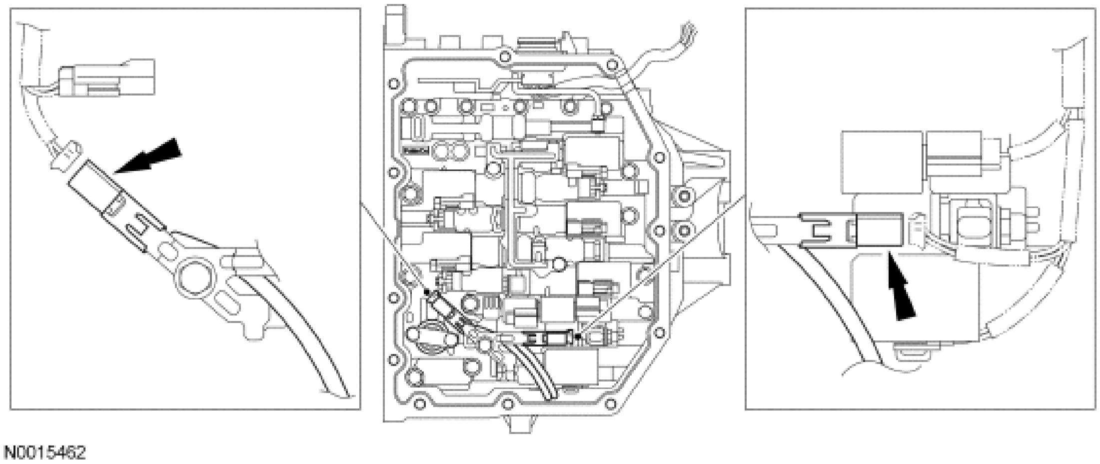

Fig. 64: Locating Speed Sensor Wires
Courtesy of FORD MOTOR CO.

7. Connect the wire harness to the solenoids.
    1. Install the wire harness into the clamps.
    2. Connect the 8 solenoid connectors and the 2 speed sensor connectors.

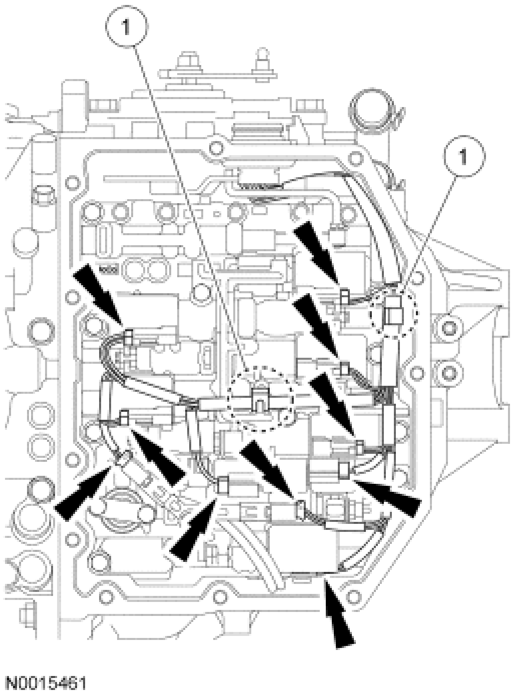

Fig. 65: Locating Solenoid Connectors & Speed Sensor Connectors
Courtesy of FORD MOTOR CO.

8. Install a bead of sealer to the fluid pan.

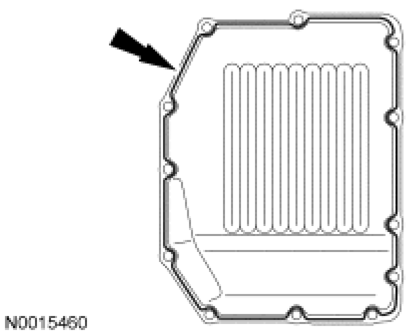

Fig. 66: Locating Fluid Pan Sealer
Courtesy of FORD MOTOR CO.

9. Using new pan bolts, install the fluid pan.
    - Tighten to 13 Nm (115 lb-in).

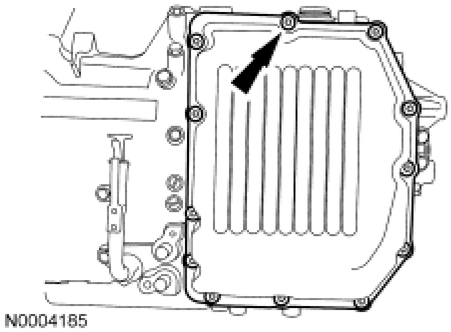

Fig. 67: Locating Transmission Fluid Pan Bolts
Courtesy of FORD MOTOR CO.

NOTE: Lubricate the new O-rings with clean automatic transmission fluid and install them onto the transmission fluid cooler tubes.

10. Connect the transmission fluid cooler tubes to the transaxle.
    - Tighten to 10 Nm (89 lb-in).

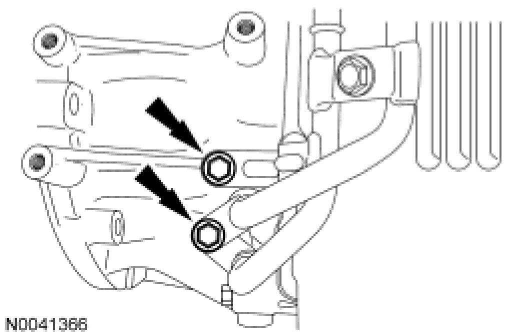

Fig. 68: Locating Transmission Fluid Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

11. Install the transmission fluid drain plug.
    - Tighten to 47 Nm (35 lb-ft).

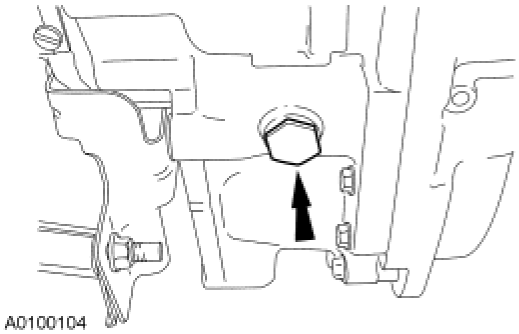

Fig. 69: Locating Transmission Fluid Drain Plug
Courtesy of FORD MOTOR CO.

12. Remove the transmission fluid fill plug.

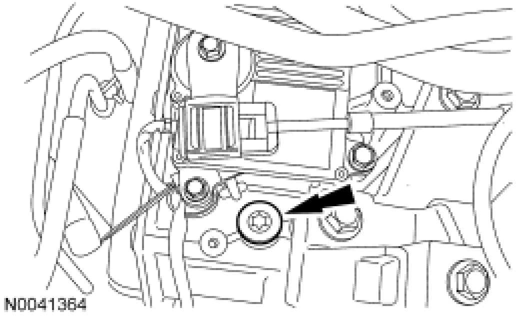

Fig. 70: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

13. Fill the transaxle with approximately 4.7L (5 qt) of clean transmission fluid.
14. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

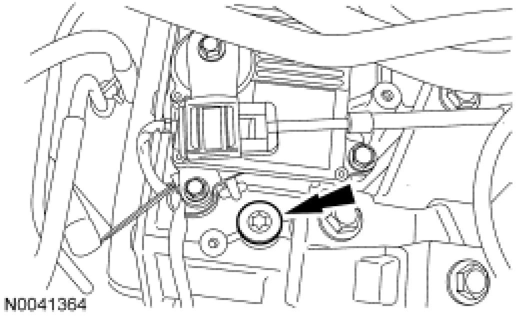

Fig. 71: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

15. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.
16. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
17. Wipe the transmission fluid level indicator with a clean cloth.

NOTE: **In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.**

18. If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator.

Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid level indicator. The transmission fluid level should be at the upper most mark on the transmission fluid level indicator. Only fill to the upper most mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.

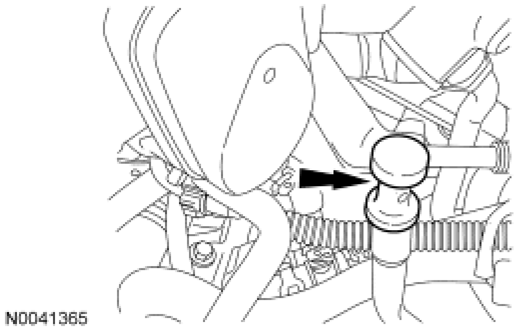

Fig. 72: Locating Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: **The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.**

19. Fill the transaxle to the correct transmission fluid level.

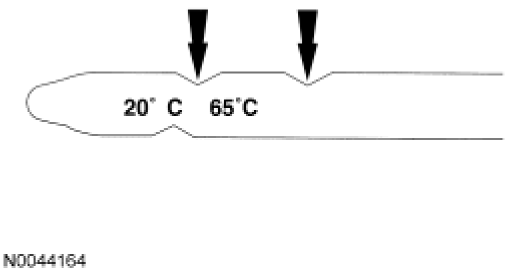

Fig. 73: Locating Temperature Marks On Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: **The correct transmission fluid level at cool operating temperature of 15°C-25°C (59°F-77°F), is at the bottom mark on the transmission fluid level indicator.**

20. If the TFT is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

NOTE: **The correct transmission fluid level at cold operating temperature of 15°C-25°C (59°F-77°F) is at the bottom mark on the transmission fluid level indicator.**

11. If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

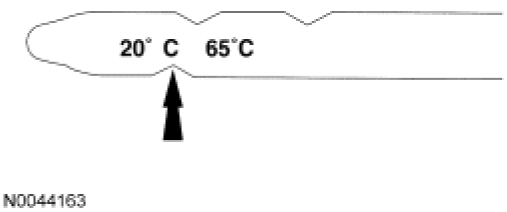

Fig. 99: Locating Bottom Mark On Fluid Level Indicator
Courtesy of FORD MOTOR CO.

12. Remove the transmission fluid fill plug.

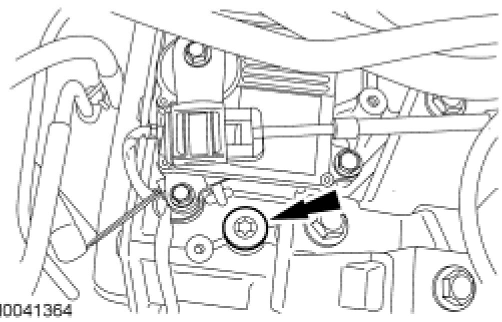

Fig. 100: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

13. Fill the transaxle with clean transmission fluid.
14. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

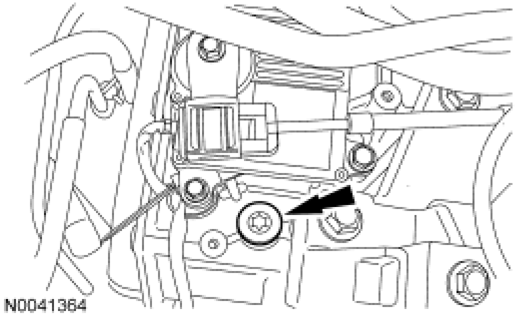

Fig. 101: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

TRANSMISSION CONTROL MODULE (TCM)

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Remove the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
4. Disconnect the selector lever cable end.

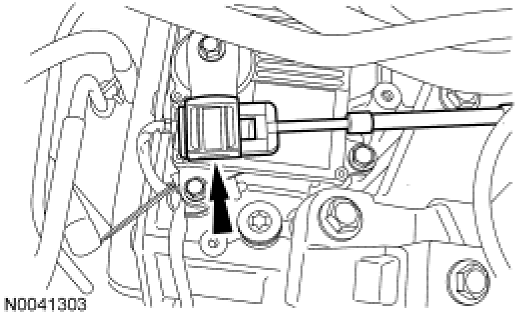

Fig. 102: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

5. Disconnect the Transmission Control Module (TCM) electrical connector.

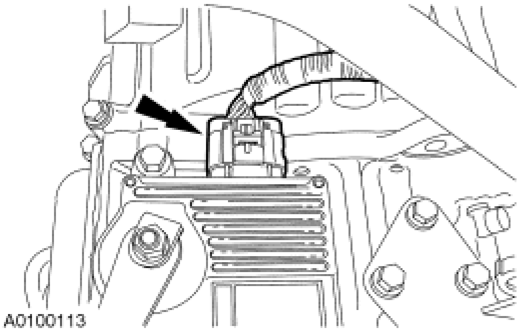

Fig. 103: Locating TCM Electrical Connector
Courtesy of FORD MOTOR CO.

6. Remove the manual control lever nut.

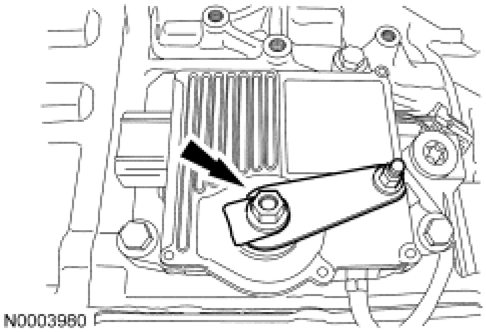

Fig. 104: Locating Manual Control Lever Nut
Courtesy of FORD MOTOR CO.

7. Remove the manual control lever.

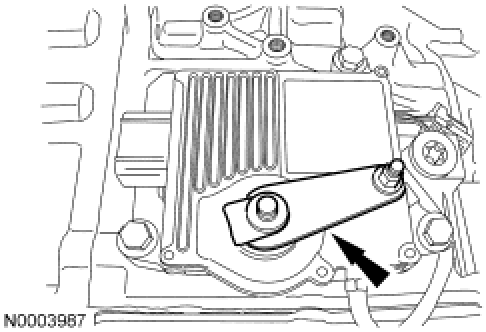

Fig. 105: Locating Manual Control Lever
Courtesy of FORD MOTOR CO.

8. Remove the bolts and remove the TCM.

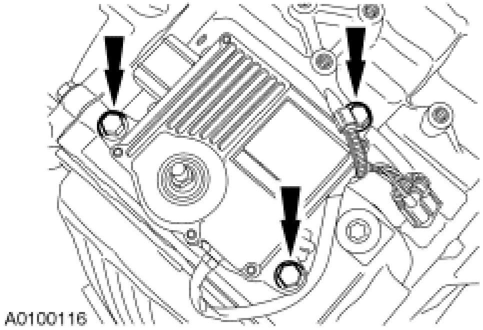

Fig. 106: Locating TCM Bolts
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Verify that the manual lever position markings are aligned. Markings should indicate that the manual lever is in the OVERDRIVE position.

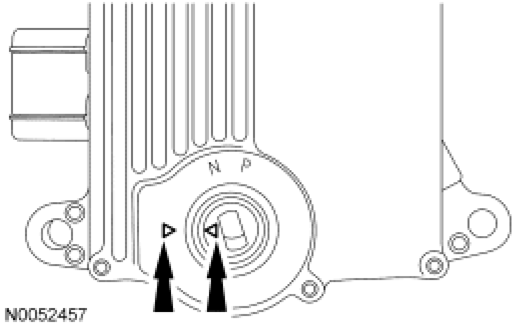

Fig. 107: Locating Manual Lever Position Markings
Courtesy of FORD MOTOR CO.

2. Install the TCM.
   - Tighten to 24 Nm (18 lb-ft).

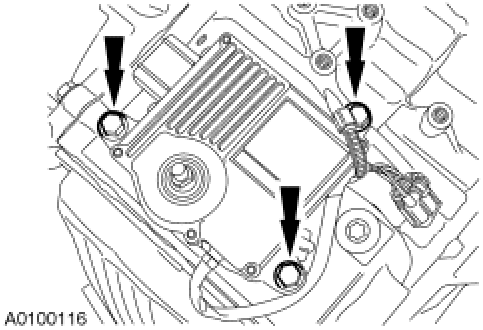

Fig. 108: Locating TCM Bolts
Courtesy of FORD MOTOR CO.

3. Install the manual control lever.

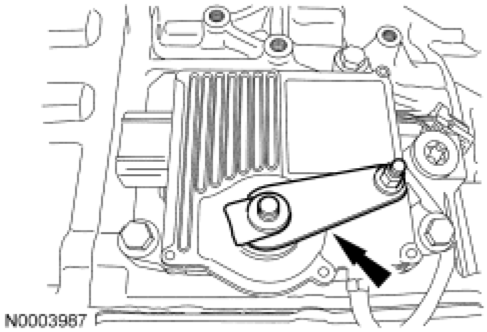

Fig. 109: Locating Manual Control Lever
Courtesy of FORD MOTOR CO.

4. Install the manual control lever nut.
   - Tighten to 12 Nm (106 lb-in).

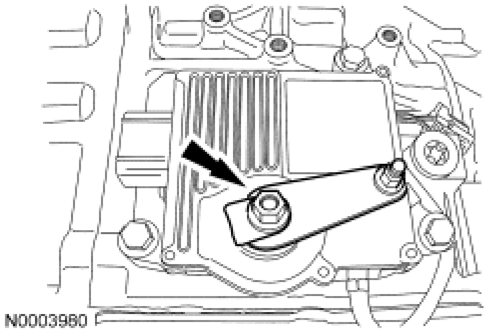

Fig. 110: Locating Manual Control Lever Nut
Courtesy of FORD MOTOR CO.

5. Connect the TCM electrical connector.

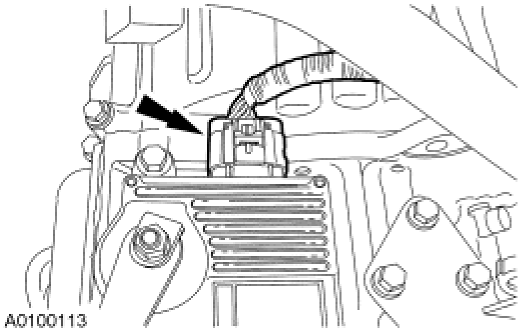

Fig. 111: Locating TCM Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: **Support the underside of the manual control lever when installing the selector lever cable or damage to the manual control lever or shaft may occur.**

6. Connect the selector lever cable end.

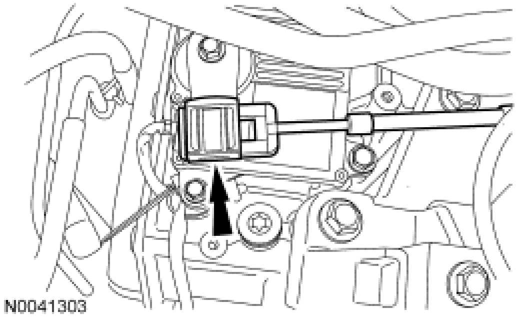

Fig. 112: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

7. Install the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
8. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
9. Carry out the TCM initial learning procedure. For additional information, refer to **Transmission Control Module (TCM) Initial Learning**.
10. Check for correct vehicle operation.

TRANSAXLE SUPPORT INSULATOR

Special Tools

Illustration	Tool Name	Tool Number
	Lifting Bracket, Engine	303-050 (T70P-6000)
	Oil Pan Holding Fixture	303-1295
	Support Bar, Engine	303-F072

	Universal Adapter Brackets	014-0001

Material

Item	Specification
Threadlock and Sealer TA-25	WSK-M2G351-A5

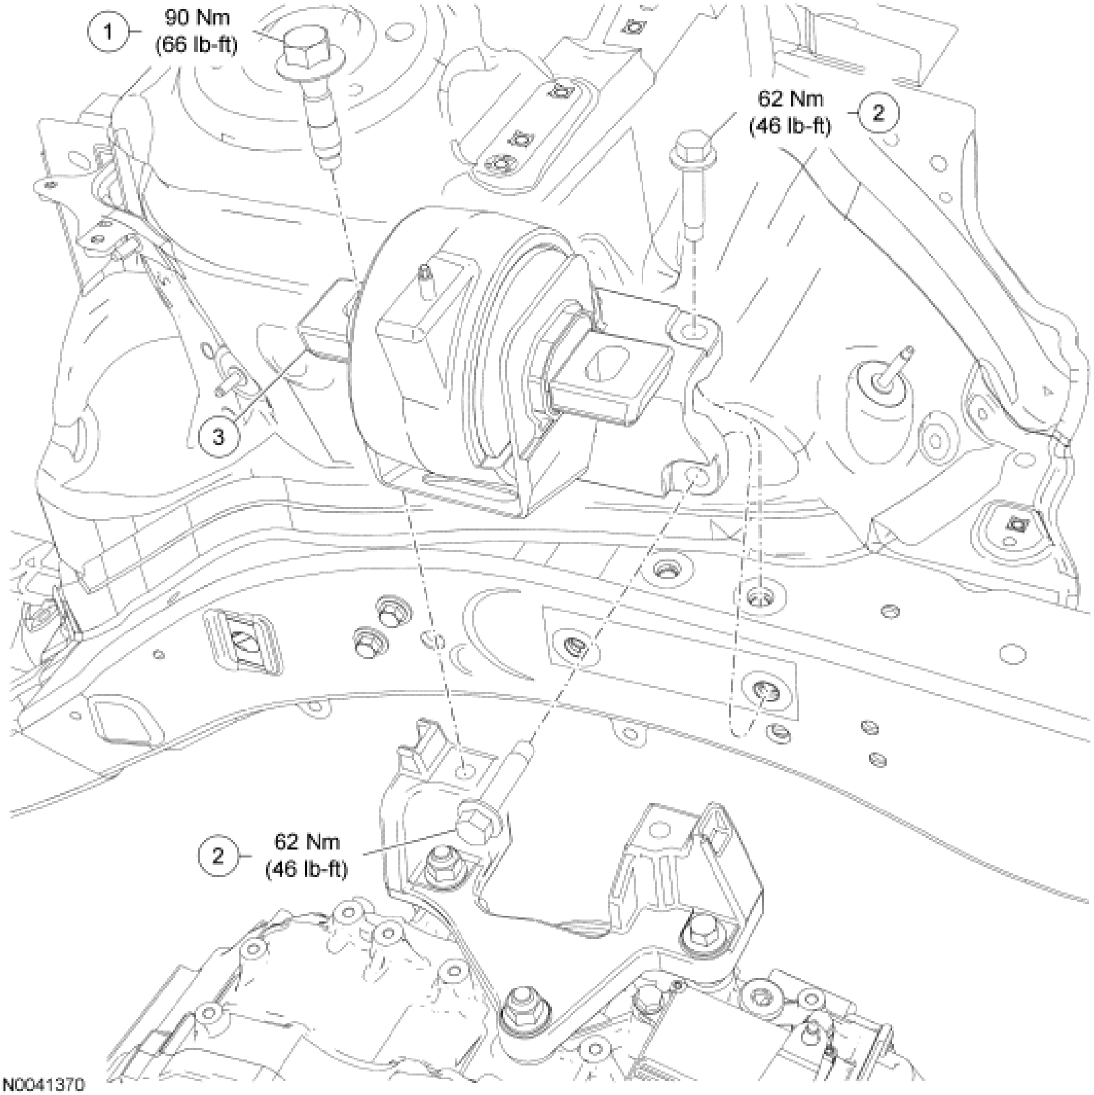

Fig. 113: Exploded View Of Transaxle Support Insulator With Torque Specifications - 3.0L Engine
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W711724	Transaxle support insulator-to-bracket bolt (2 required)
2	W709234	Transaxle insulator-to-frame bolts (4 required)
3	6F020	Transaxle insulator

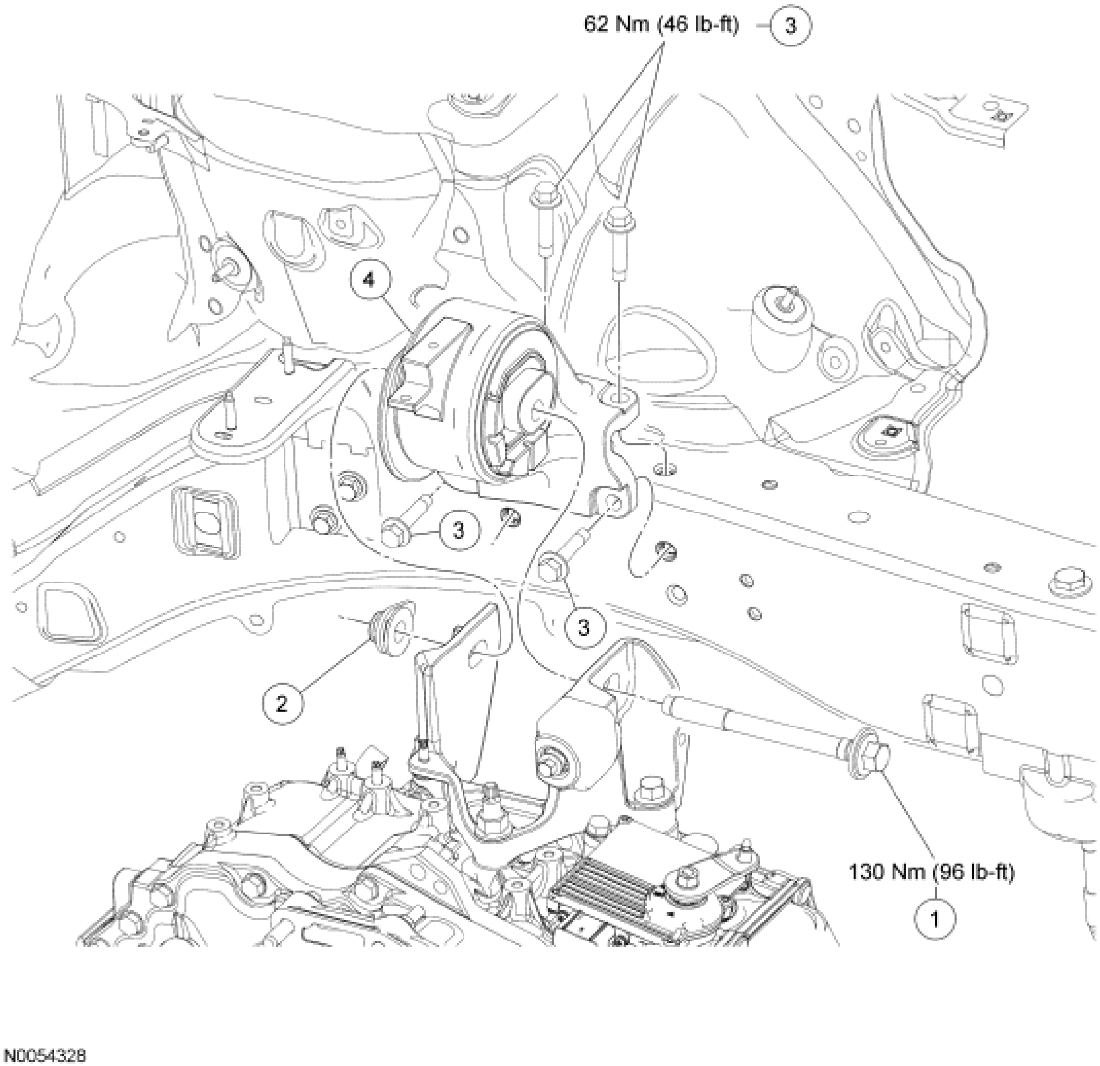

Fig. 114: Exploded View Of Transaxle Support Insulator With Torque Specifications - 3.5L Engine
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W711873	Transaxle insulator through bolt
2	W711872	Transaxle insulator through bolt flagnut
3	W709234	Transaxle insulator-to-frame bolts
4	6F020	Transaxle insulator

REMOVAL

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Remove the 4 screws and position the LH fender splash shield aside.

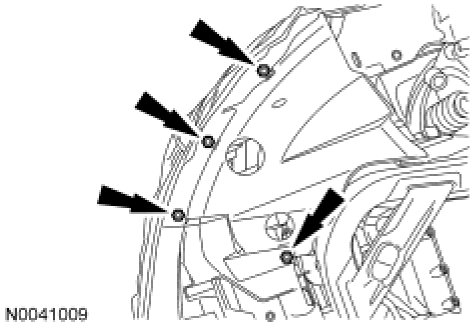

Fig. 115: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

4. Remove the 6 pin-type retainers and the LH front structure-to-subframe splash shield.

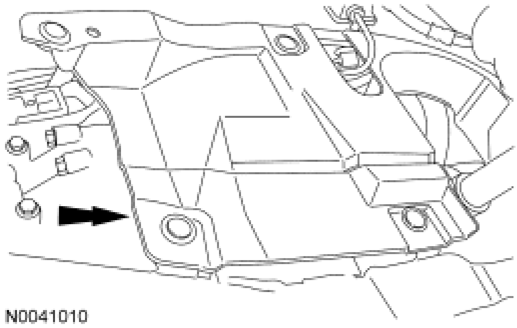

Fig. 116: Locating LH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

5. Remove the lower 2 transaxle insulator-to-frame bolts.

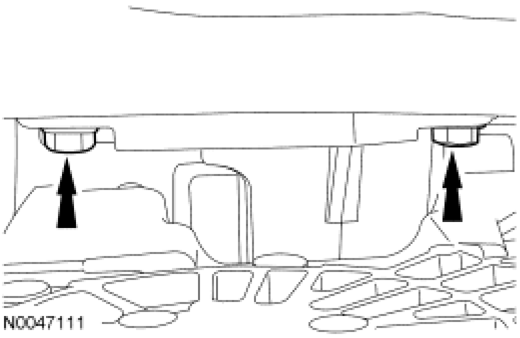

Fig. 117: Locating Bolts On Rear Transaxle Insulator
Courtesy of FORD MOTOR CO.

3.0L engine

6. Install the Engine Lifting Bracket and Universal Adapter Bracket "L" hook on the LH side of the engine.

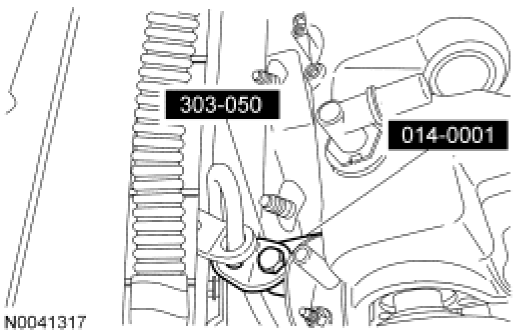

Fig. 118: Identifying Universal Lifting Brackets
Courtesy of FORD MOTOR CO.

7. Install the Engine Support Bar to support the engine.

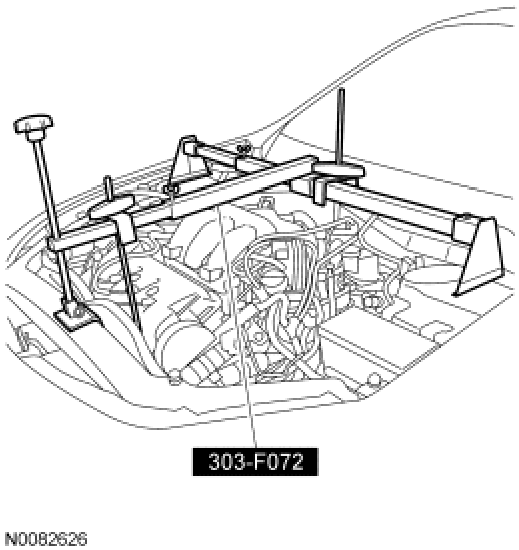

Fig. 119: Installing Engine Support Bar To Support Engine
Courtesy of FORD MOTOR CO.

8. Remove the 2 transaxle support insulator-to-bracket bolts.

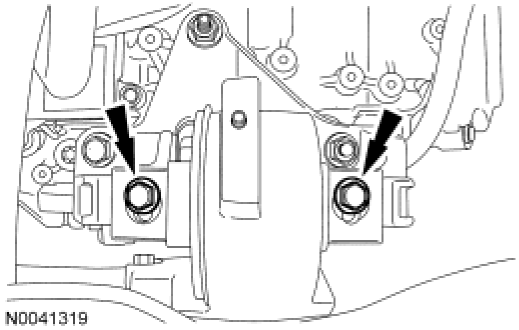

Fig. 120: Locating Transaxle Insulator Bolts
Courtesy of FORD MOTOR CO.

3.5L engine

9. Remove the exhaust Y-pipe. For additional information, refer to **EXHAUST SYSTEM** article.

NOTE: **The Oil Pan Holding Fixture must be carefully aligned to the mounting bosses on the oil pan. Failure to follow these instructions may result in damage to the oil pan.**

10. Position a floor jack and the Oil Pan Holding Fixture under the oil pan.

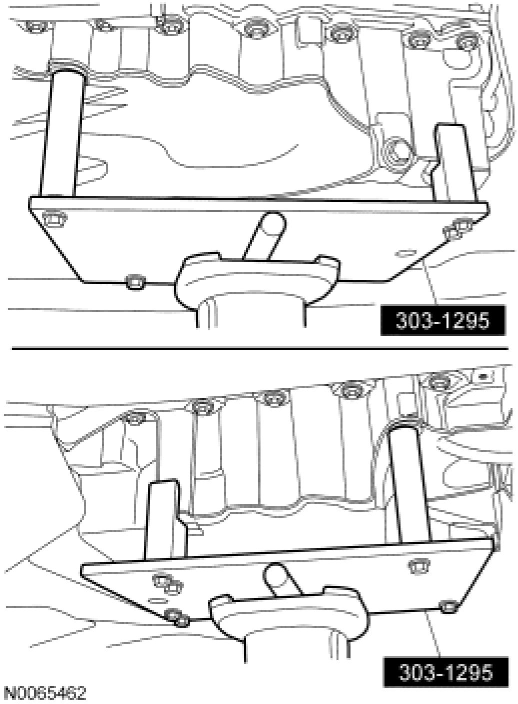

Fig. 121: Positioning Floor Jack & Special Tool (303-1295) Under Oil Pan
Courtesy of FORD MOTOR CO.

11. Remove the air cleaner. For additional information, refer to **ENGINE - 3.5L** article.
12. Remove the transaxle support insulator through bolt.

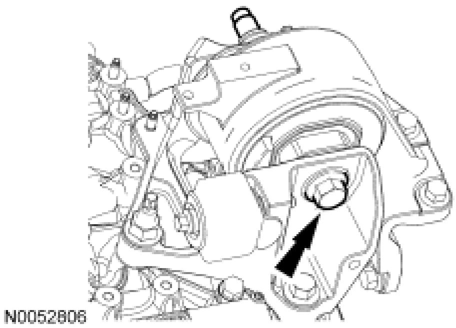

Fig. 122: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: 3.0L engine shown, 3.5L engine similar.

13. Remove the upper 2 transaxle insulator-to-frame bolts and remove the transaxle insulator.

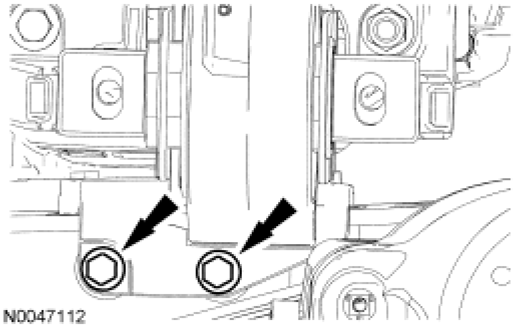

Fig. 123: Locating Upper Bolts On Rear Transaxle Insulator
Courtesy of FORD MOTOR CO.

INSTALLATION

All vehicles

1. Clean the rear transaxle support insulator bolts using a wire brush and apply new threadlock to the threads.

NOTE: **3.0L engine shown, 3.5L engine similar.**

2. Position the transaxle support insulator in place and install the upper 2 transaxle insulator-to-frame bolts.
   - Tighten to 62 Nm (46 lb-ft).

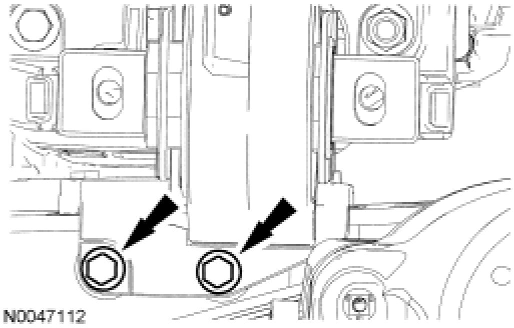

Fig. 124: Locating Upper Bolts On Rear Transaxle Insulator
Courtesy of FORD MOTOR CO.

3.5L engine

3. Install the transaxle insulator through bolt and flagnut.
   - Tighten to 130 Nm (96 lb-ft).

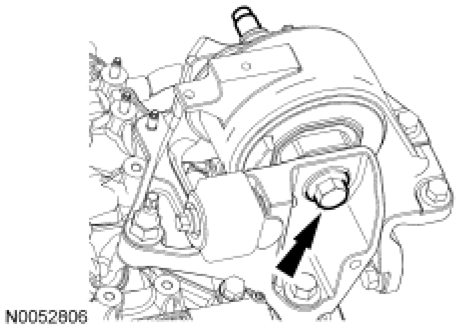

Fig. 125: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

4. Remove the floor jack and the Oil Pan Holding Fixture.

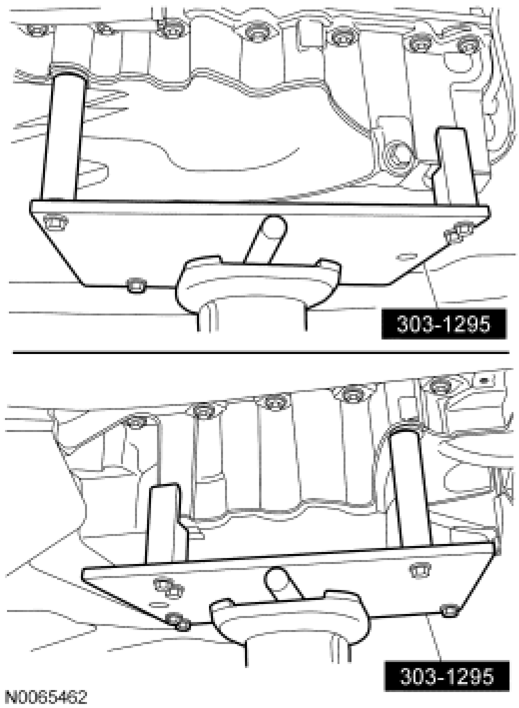

Fig. 126: Positioning Floor Jack & Special Tool (303-1295) Under Oil Pan
Courtesy of FORD MOTOR CO.

5. Install the air cleaner. For additional information, refer to **ENGINE - 3.5L** article.
6. Install the exhaust Y-pipe. For additional information, refer to **EXHAUST SYSTEM** article.

All vehicles

7. Position the transaxle support insulator in place and install the lower 2 transaxle insulator-to-frame bolts.
    - Tighten to 62 Nm (46 lb-ft).

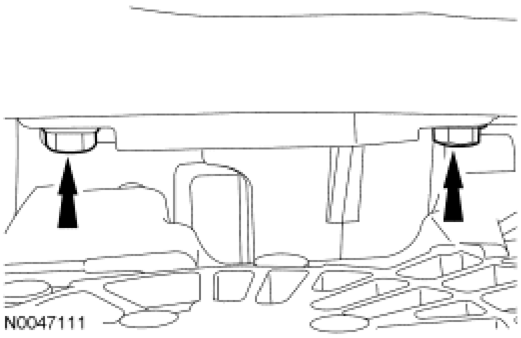

Fig. 127: Locating Bolts On Rear Transaxle Insulator
Courtesy of FORD MOTOR CO.

8. Position the LH front structure-to-subframe splash shield in place and install the 6 pin-type retainers.

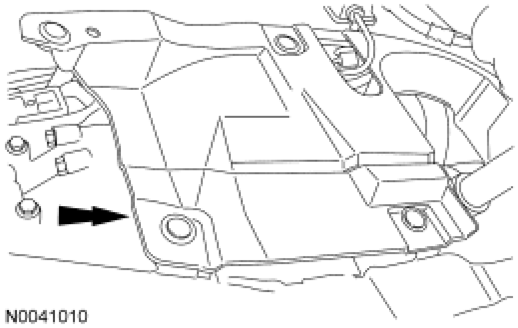

Fig. 128: Locating LH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

9. Position the LH splash shield in place and install the 4 screws.

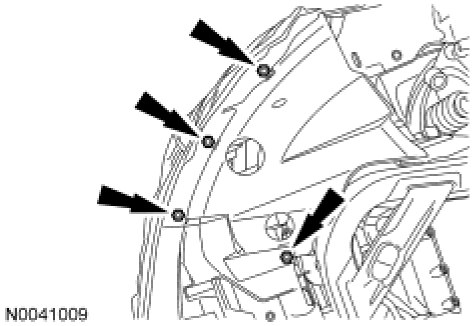

Fig. 129: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

3.0L engine

10. Install the 2 transaxle support insulator-to-bracket bolts.
    - Tighten to 90 Nm (66 lb-ft).

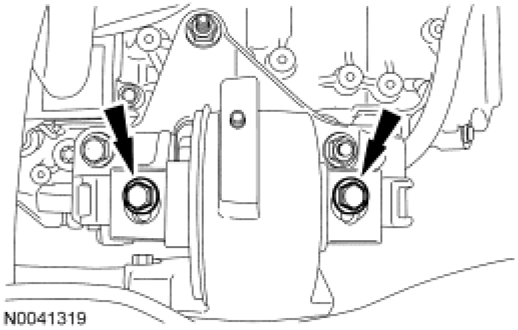

Fig. 130: Locating Transaxle Insulator Bolts
Courtesy of FORD MOTOR CO.

11. Remove the Engine Support Bar.

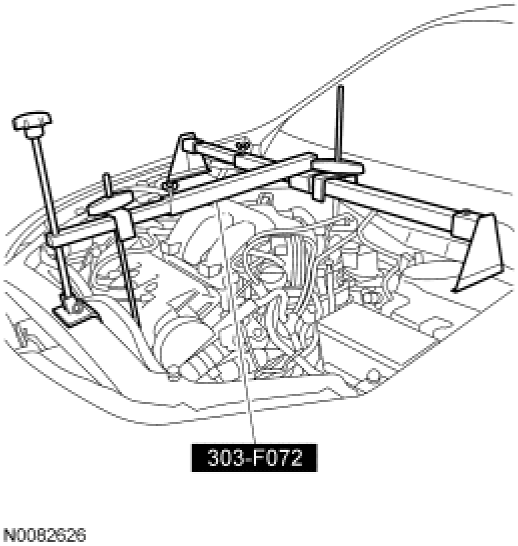

Fig. 131: Installing Engine Support Bar To Support Engine
Courtesy of FORD MOTOR CO.

12. Remove the Engine Lifting Bracket and Universal Adapter Bracket "L" hook from the LH side of the engine.

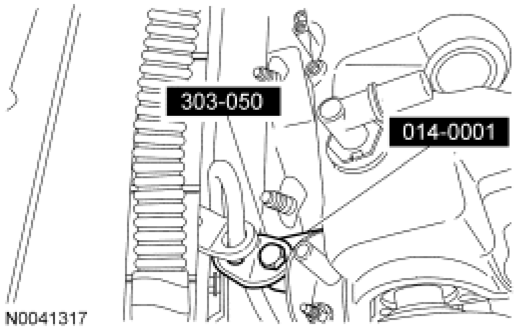

Fig. 132: Identifying Universal Lifting Brackets
Courtesy of FORD MOTOR CO.

All vehicles

13. Install the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

MANUAL CONTROL LEVER SHAFT AND SEAL

Special Tools

Illustration	Tool Name	Tool Number
	Installer, Shift Shaft Fluid Seal	307-549

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Remove the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
4. Disconnect the selector lever cable end.

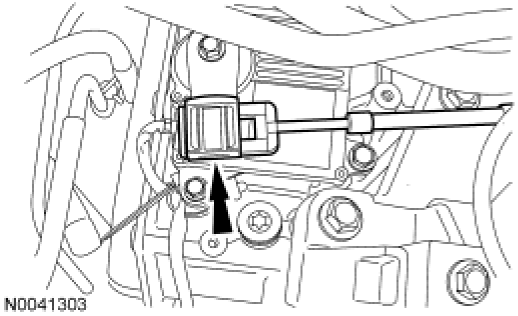

Fig. 133: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

5. Disconnect the Transmission Control Module (TCM) electrical connector.

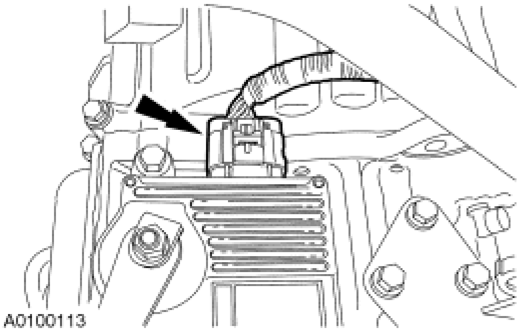

Fig. 134: Locating TCM Electrical Connector
Courtesy of FORD MOTOR CO.

6. Remove the manual control lever nut.

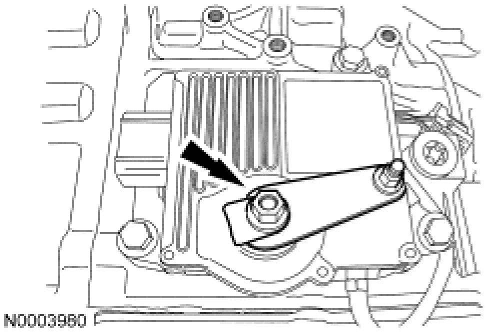

Fig. 135: Locating Manual Control Lever Nut
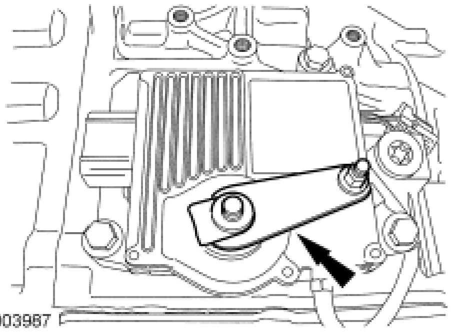
Courtesy of FORD MOTOR CO.

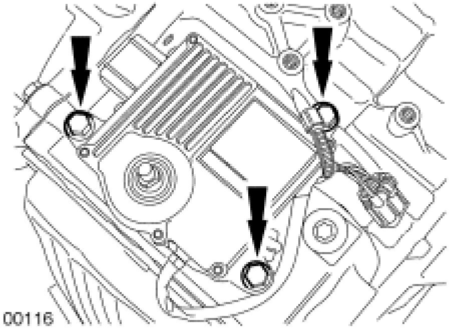
7. Remove the manual control lever.



N0003987

Fig. 136: Locating Manual Control Lever
Courtesy of FORD MOTOR CO.

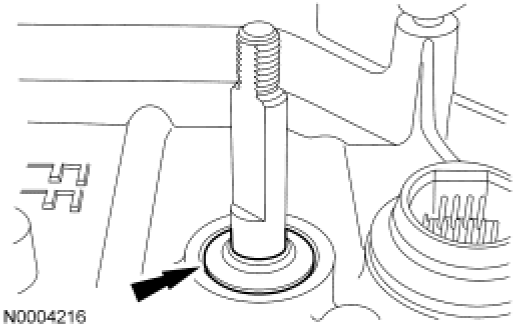
8. Remove the bolts and remove the TCM.



A0100116

Fig. 137: Locating TCM Bolts
Courtesy of FORD MOTOR CO.

9. Using a suitable pick, remove the manual control lever seal.



N0004216

Fig. 138: Locating Manual Control Lever Seal
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Using the Shift Shaft Fluid Seal Installer, install the manual control lever seal.

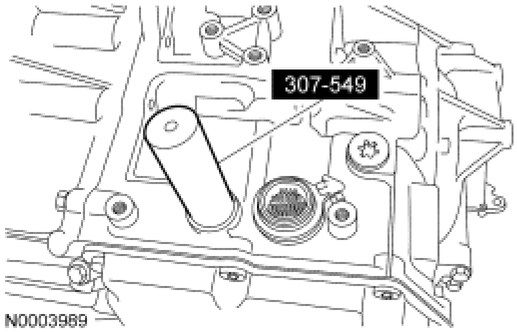


Fig. 139: Installing Manual Control Lever Seal
Courtesy of FORD MOTOR CO.

2. Verify that the manual lever position markings are aligned. Markings should indicate that the manual lever is in the OVERDRIVE position.

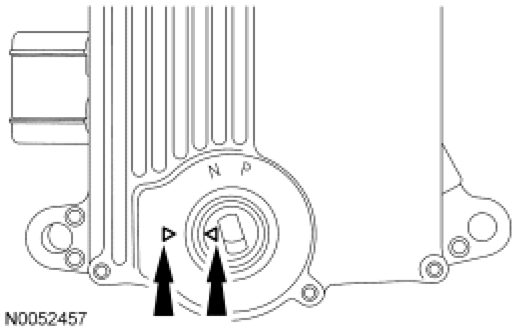

Fig. 140: Locating Manual Lever Position Markings
Courtesy of FORD MOTOR CO.

3. Install the TCM.
   - Tighten to 24 Nm (18 lb-ft).

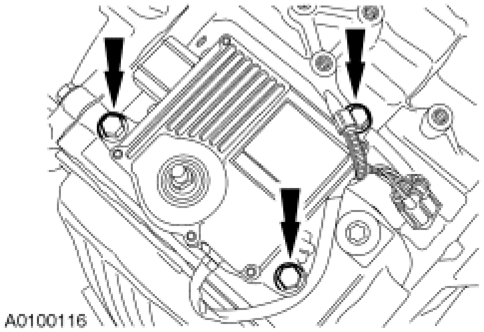

Fig. 141: Locating TCM Bolts
Courtesy of FORD MOTOR CO.

4. Install the manual control lever.

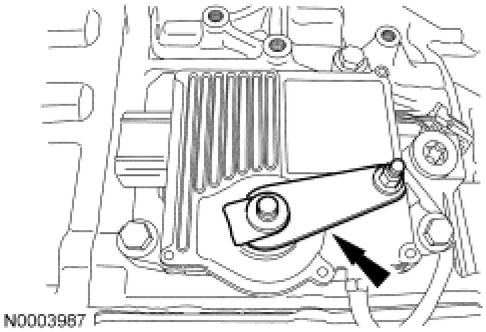

Fig. 142: Locating Manual Control Lever
Courtesy of FORD MOTOR CO.

5. Install the manual control lever nut.
    - Tighten to 12 Nm (106 lb-in).

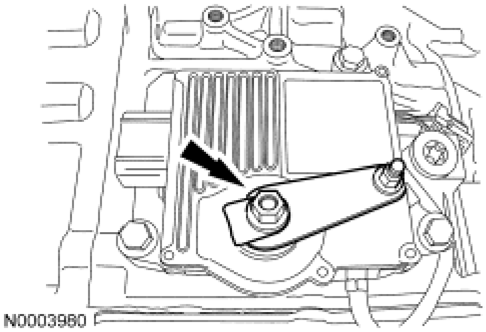

Fig. 143: Locating Manual Control Lever Nut
Courtesy of FORD MOTOR CO.

6. Connect the TCM electrical connector.

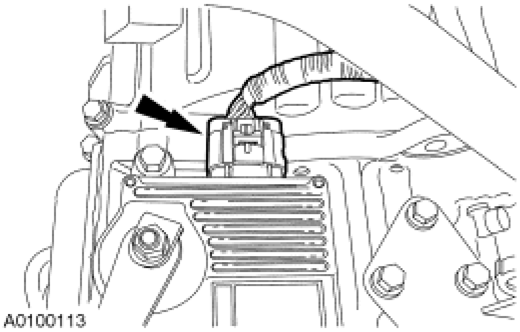

Fig. 144: Locating TCM Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: **Support the underside of the manual control lever when installing the selector lever cable or damage to the manual control lever or shaft may occur.**

7. Connect the selector lever cable end.

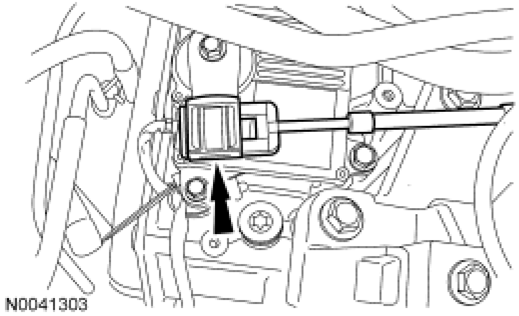

Fig. 145: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

8. Install the air cleaner assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
9. Connect the battery ground cable. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
10. Check for correct vehicle operation.

REMOVAL

TRANSAXLE - 3.0L

Special Tools

Illustration	Tool Name	Tool Number
	Adapter for 204-592	204-592/1
	Bearing Cup Puller	308-047 (T77F-1102-A)
	Engine Lifting Bracket Set	303-1140

 ST2981-A	Lifting Bracket, Engine	303-050 (T70P-6000)
 ST2272-A	Remover, Front Wheel Hub	205-D070 (D93P-1175-B) or equivalent
 ST2945-A	Separator, Ball Joint	204-592
 ST1298-A	Slide Hammer	100-001 (T50T-100-A)
 ST1382-A	Socket, Exhaust Gas Oxygen Sensor	303-476 (T94P-9472-A)
 ST1602-A	Support Bar, Engine	303-F072
 ST2743A	Universal Adapter Brackets	014-0001

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.

3. Remove the air cleaner and the outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
4. Disconnect the selector lever cable end.

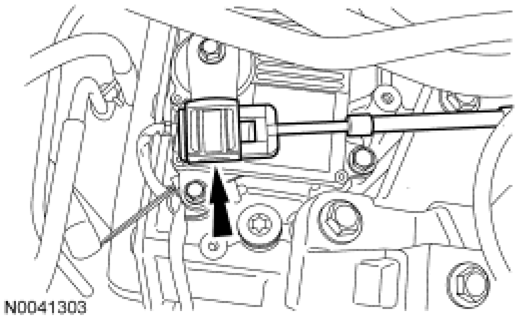

Fig. 146: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

5. Remove the 3 bolts for the selector lever cable bracket and position the cable and bracket aside.

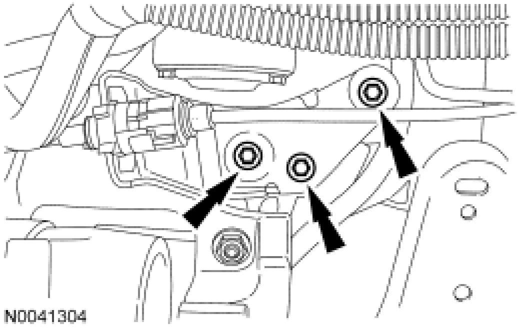

Fig. 147: Locating Transaxle Control Cable Bracket Bolts
Courtesy of FORD MOTOR CO.

6. Disconnect the wire harness from the Transmission Control Module (TCM).

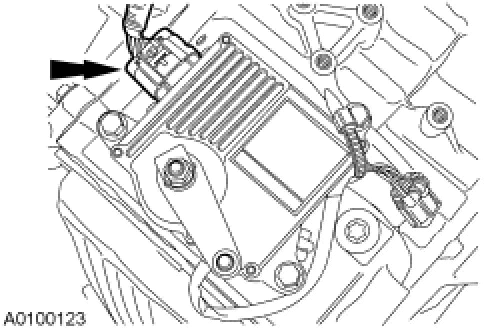

Fig. 148: Identifying Transmission Control Module Electrical Connector
Courtesy of FORD MOTOR CO.

7. Remove the 2 ground strap bolts and position aside the ground straps.

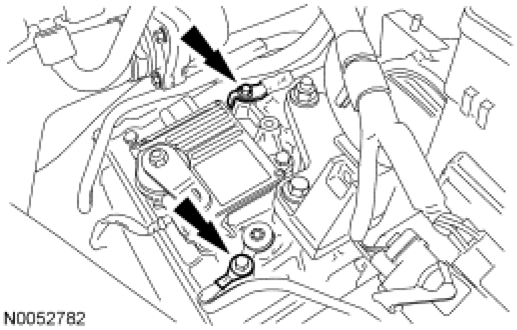

Fig. 149: Identifying Ground Straps & Ground Strap Bolts
Courtesy of FORD MOTOR CO.

8. Remove the electrical terminal cover for the starter motor electrical connectors.

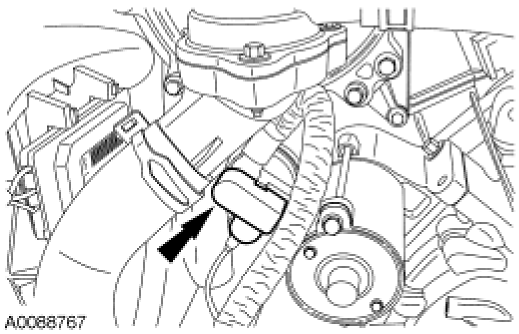

Fig. 150: Identifying Electrical Cover For Starter Motor Electrical Connectors
Courtesy of FORD MOTOR CO.

9. Remove the starter terminals.

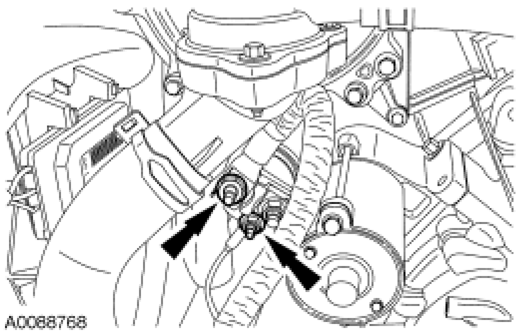

Fig. 151: Identifying Starter Motor Electrical Connectors
Courtesy of FORD MOTOR CO.

10. Remove the 2 bolts and the starter.

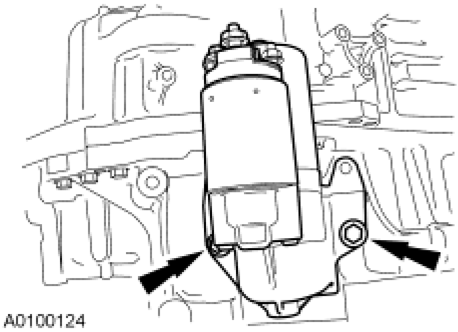

Fig. 152: Locating Starter Bolts
Courtesy of FORD MOTOR CO.

11. Remove the 3 upper torque converter housing bolts.

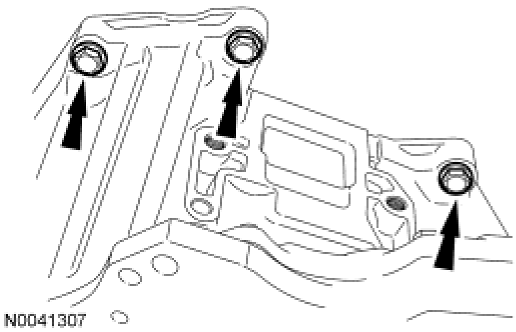

Fig. 153: Locating Upper Torque Converter Housing Bolts
Courtesy of FORD MOTOR CO.

12. Disconnect the EGR valve electrical connector.

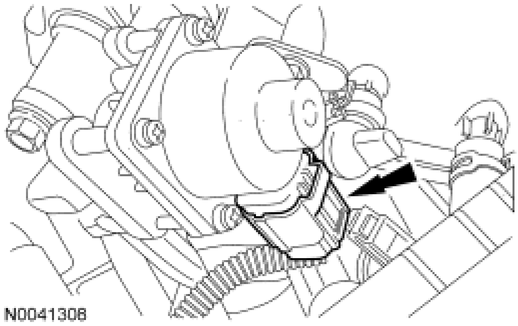

Fig. 154: Locating EGR Valve Electrical Connector
Courtesy of FORD MOTOR CO.

13. Disconnect the EGR tube nut from the valve.

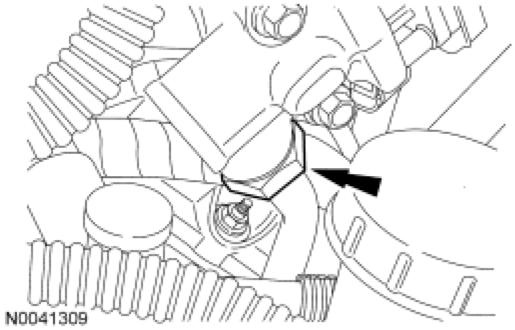

Fig. 155: Locating EGR Tube Nut
Courtesy of FORD MOTOR CO.

14. Remove the 2 bolts and the EGR valve. Discard the gasket.

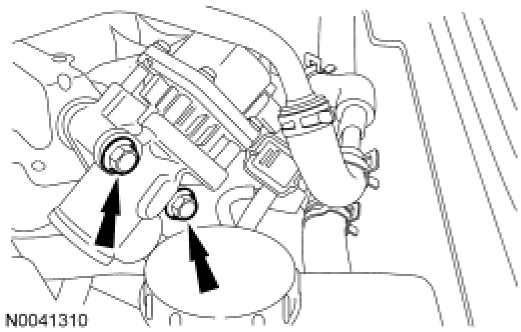

Fig. 156: Locating EGR Valve And Bolts
Courtesy of FORD MOTOR CO.

15. Remove the bolt from the power steering line bracket and position it aside.

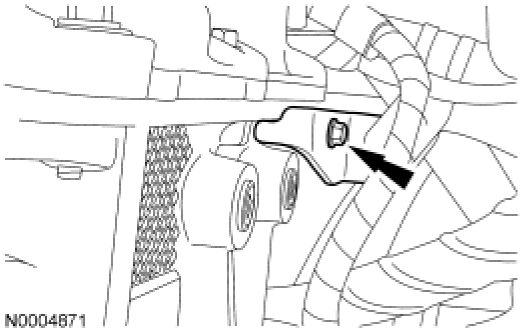

Fig. 157: Locating Bracket For Power Steering Hose
Courtesy of FORD MOTOR CO.

16. Remove the 4 screws and position the RH fender splash shield aside.

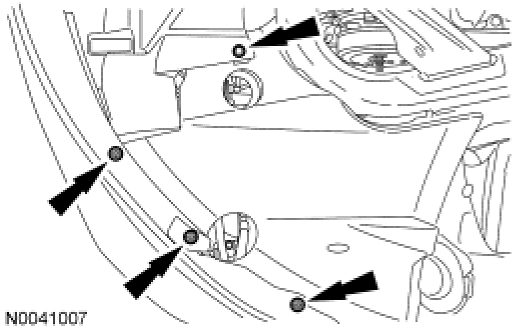

Fig. 158: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

17. Remove the 6 pin-type retainers and remove the RH front structure to subframe splash shield.

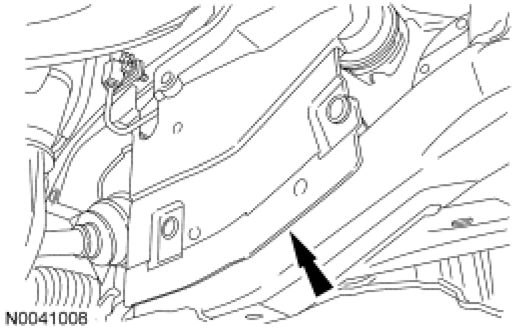

Fig. 159: Locating RH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

18. Remove the 4 screws and position the LH fender splash shield aside.

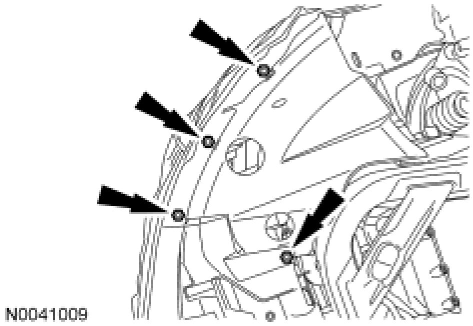

Fig. 160: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

19. Remove the pin-type retainers and remove the LH front structure to subframe splash shield.

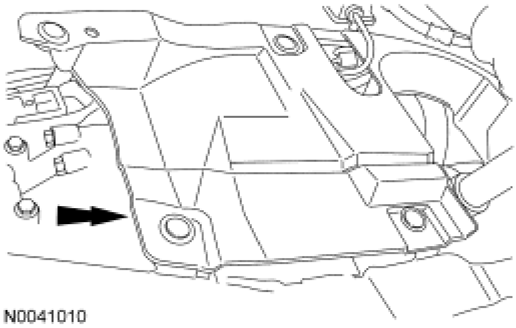

Fig. 161: Locating LH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

20. Remove the 2 nuts and separate the sway bar links from the struts.

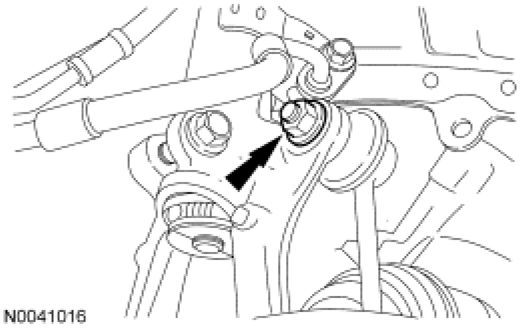

Fig. 162: Locating Sway Bar Links Nut
Courtesy of FORD MOTOR CO.

21. If a transaxle exchange or overhaul is required, the transmission fluid must be drained.
    - Remove the transmission fluid drain plug and allow the transmission fluid to drain.

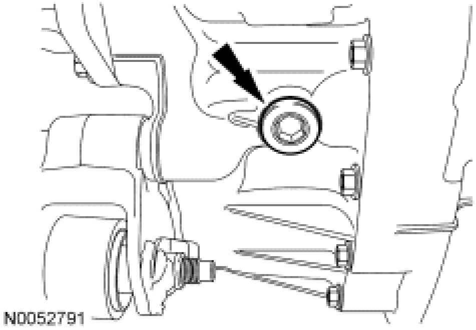

Fig. 163: Identifying Transmission Drain Plug
Courtesy of FORD MOTOR CO.

22. If removed, install the transmission fluid drain plug.

- Tighten to 47 Nm (35 lb-ft).

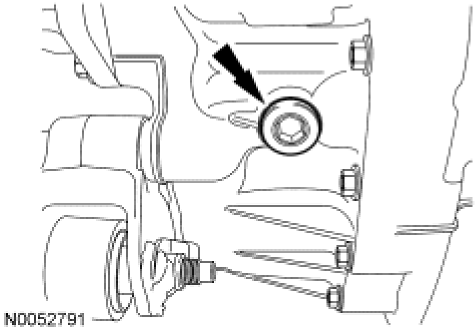

Fig. 164: Identifying Transmission Drain Plug
Courtesy of FORD MOTOR CO.

23. Remove the LH halfshaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

All-Wheel Drive (AWD) vehicles

24. Remove and discard the front wheel hub nut.

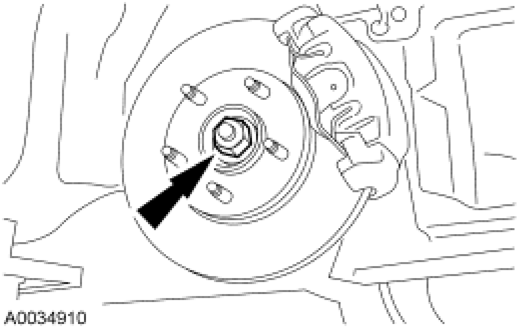

Fig. 165: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

All vehicles

25. Remove the RH lower control arm nuts.

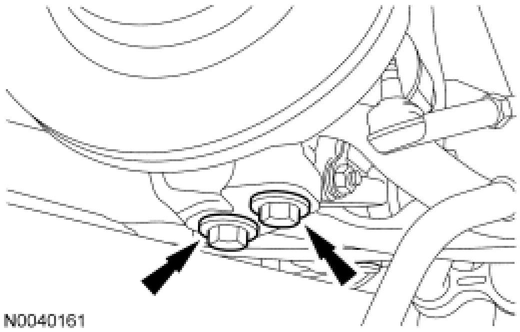

Fig. 166: Locating Front And Rear Lower Control Arm Nuts
Courtesy of FORD MOTOR CO.

NOTE:	**When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.**

NOTE:	**Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.**

26. Using the Ball Joint Separator and Adapter, separate the 2 lower ball joints from the wheel knuckle and remove the wheel knuckle.

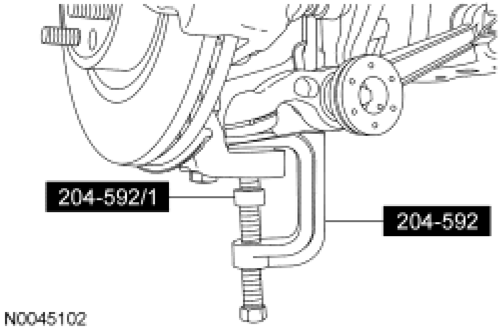

Fig. 167: Identifying Special Tool 204-592/1 And 204-592
Courtesy of FORD MOTOR CO.

27. Remove the bolt connecting the RH damper fork to the lower control arm.

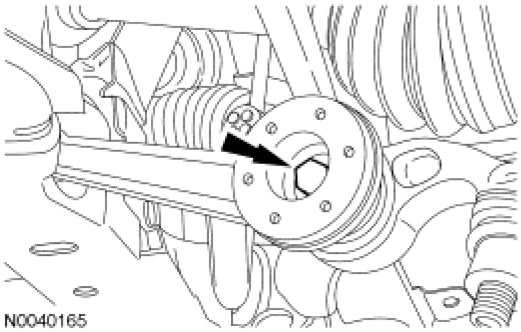

Fig. 168: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**Front Wheel Drive (FWD) shown, All-Wheel Drive (AWD) similar.**

28. Remove the 2 Y-pipe bolts and nuts.

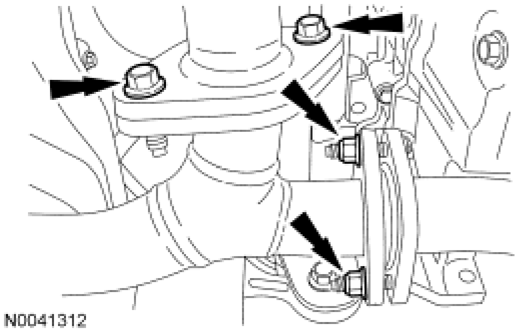

Fig. 169: Locating Y-Pipe Bolts And Nuts
Courtesy of FORD MOTOR CO.

NOTE: FWD shown, AWD similar.

29. Remove the flexpipe nuts and the Y-pipe assembly.

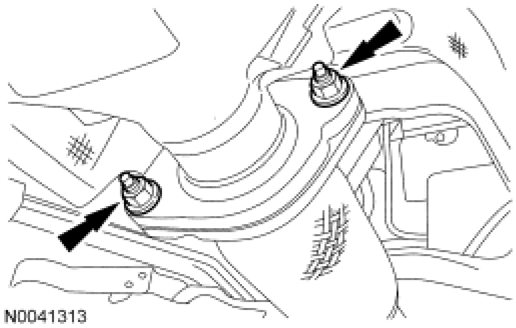

Fig. 170: Locating Flex Pipe Nuts
Courtesy of FORD MOTOR CO.

30. If equipped, remove the 2 bolts and the roll restrictor heat shield.

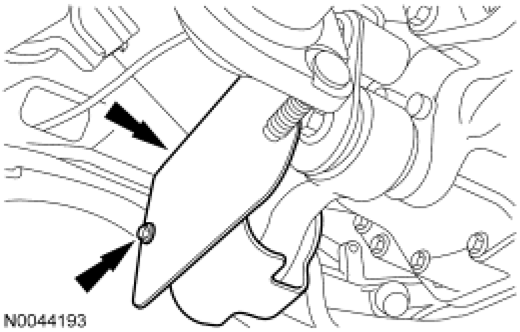

Fig. 171: Locating Heat Shield And Bolts
Courtesy of FORD MOTOR CO.

NOTE: FWD shown, AWD similar.

31. Remove the 2 bolts from the engine roll restrictor bracket.

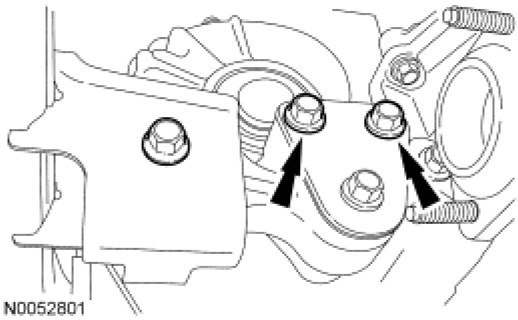

Fig. 172: Locating Engine Roll Restrictor Bracket Bolts
Courtesy of FORD MOTOR CO.

32. Remove the bolts and position the power steering cooler tube aside.

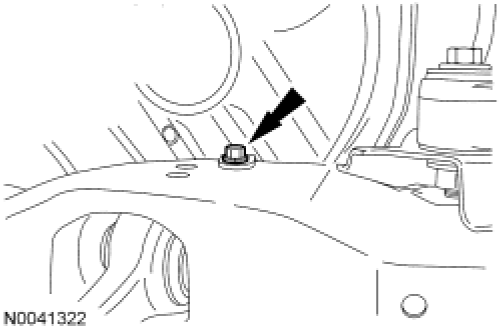

Fig. 173: Locating Power Steering Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

33. Remove the 3 steering gear bolts and position the steering gear aside with mechanic's wire.

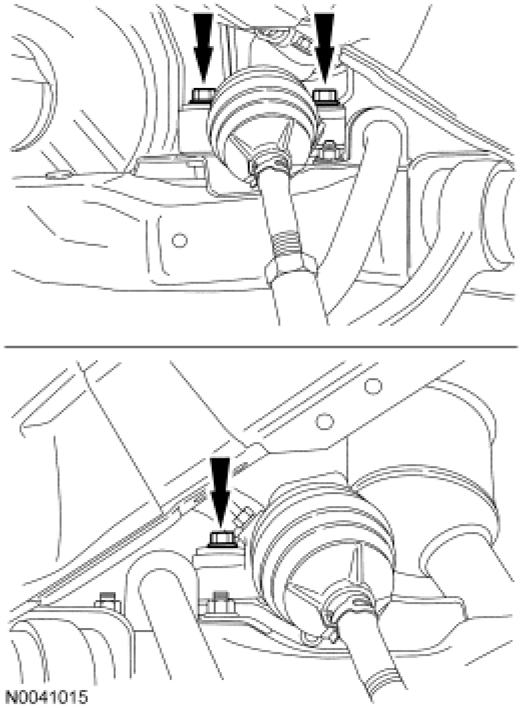

Fig. 174: Locating Steering Gear Bolts
Courtesy of FORD MOTOR CO.

34. Position a suitable drivetrain lift table under the subframe.
35. Remove the 2 rear subframe nuts.

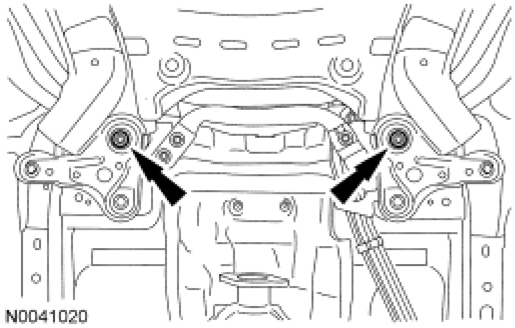

Fig. 175: Locating Rear Subframe Nuts
Courtesy of FORD MOTOR CO.

36. Remove the 4 bolts and the 2 subframe support brackets.

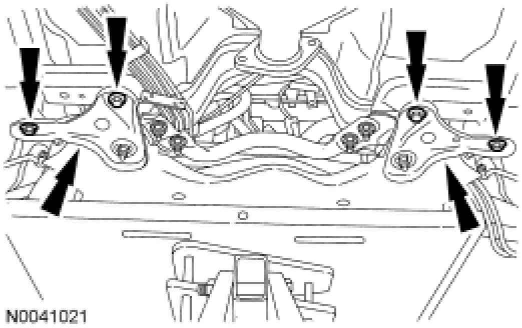

Fig. 176: Locating Subframe Support Brackets And Bolts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

37. Remove the 2 front subframe nuts and remove the subframe.

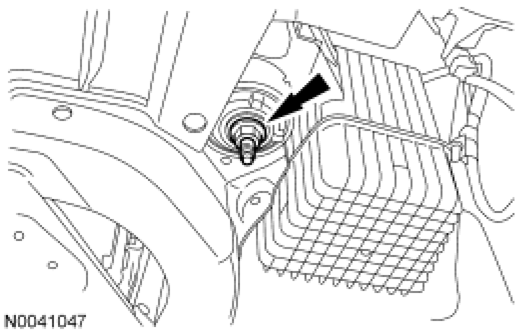

Fig. 177: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

NOTE: FWD shown, AWD similar.

38. Loosen the EGR tube nut at the RH exhaust manifold and remove the EGR tube.

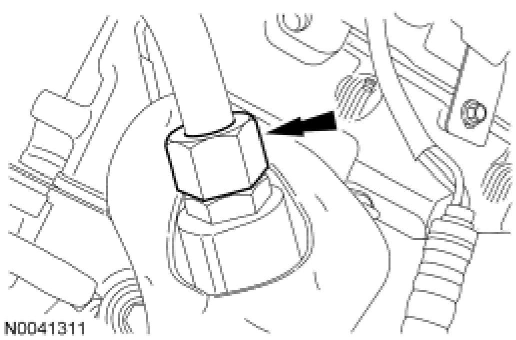

Fig. 178: Locating EGR Tube Nut At RH Exhaust Manifold
Courtesy of FORD MOTOR CO.

Front Wheel Drive (FWD) vehicles

39. Remove the 2 bolts and the RH exhaust manifold heat shield.

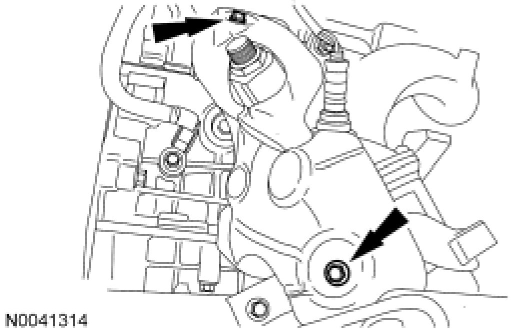

Fig. 179: Locating RH Exhaust Manifold Heat Shield And Bolts
Courtesy of FORD MOTOR CO.

40. Remove the 2 bolts and the catalytic converter band clamp.

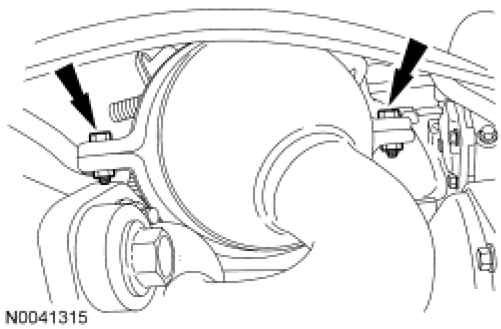

Fig. 180: Locating Catalytic Converter Band Clamp And Bolts
Courtesy of FORD MOTOR CO.

41. Remove the 2 bolts and the catalytic converter-to-engine block bracket.

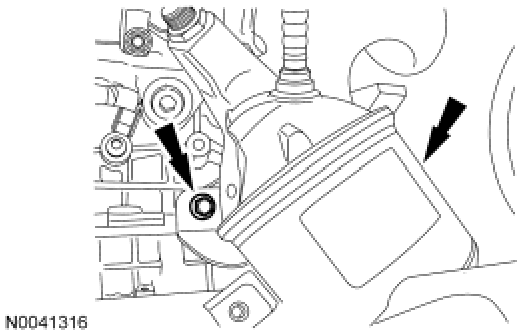

Fig. 181: Locating Catalytic Converter-To-Engine Block Bracket And Bolts
Courtesy of FORD MOTOR CO.

42. Disconnect the Heated Oxygen Sensor (HO2S) electrical connector from the RH halfshaft bearing

support bracket.

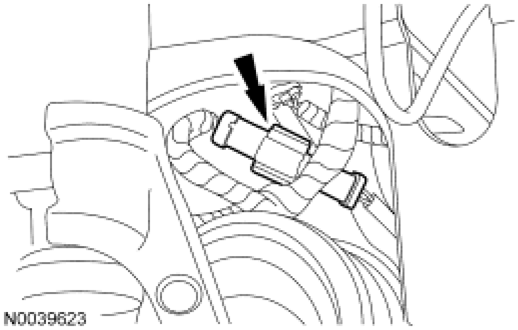

Fig. 182: Locating Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

43. Remove the bolt retaining the brake caliper hose.

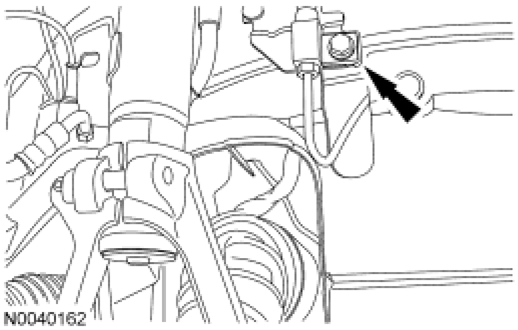

Fig. 183: Locating Brake Caliper Hose Bolt
Courtesy of FORD MOTOR CO.

44. Remove the 2 bolts and remove the RH halfshaft from the transaxle and position it aside with mechanic's wire.

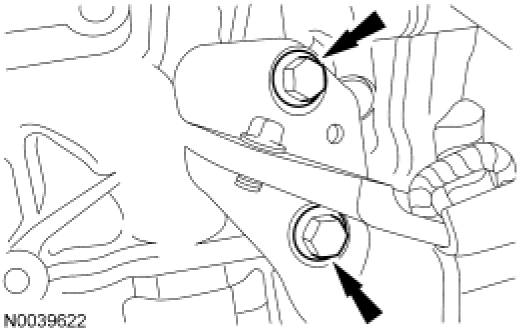

Fig. 184: Locating RH Halfshaft Carrier Bearing Bracket Bolts
Courtesy of FORD MOTOR CO.

AWD vehicles

45. Using the Front Wheel Hub Remover, separate the halfshaft from the wheel hub.

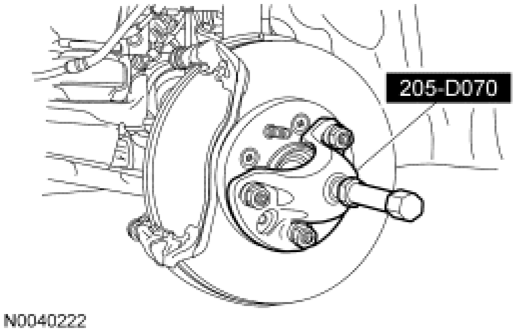

Fig. 185: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

46. Remove the 2 bolts and the RH halfshaft.

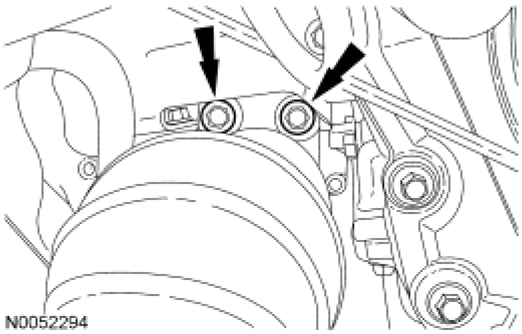

Fig. 186: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

47. Index the driveshaft, remove the 4 bolts from the driveshaft and position the driveshaft aside.

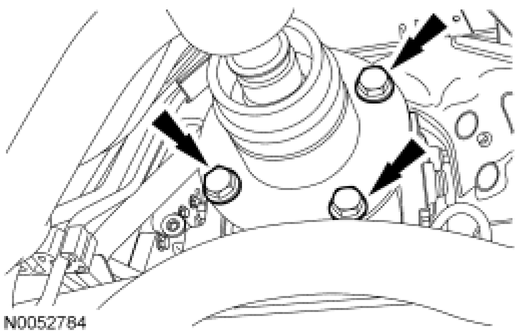

Fig. 187: Identifying Drive Shaft Bolts
Courtesy of FORD MOTOR CO.

48. Disconnect the RH catalyst monitor sensor electrical connector and detach the wiring retainer.

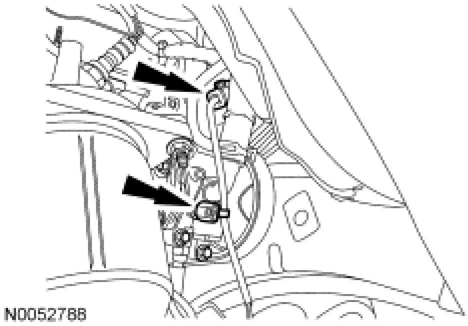

Fig. 188: Locating RH Catalyst Monitor Sensor Electrical Connector & Wiring Retainer
Courtesy of FORD MOTOR CO.

49. Using the Exhaust Gas Oxygen Sensor Socket, remove the RH catalyst monitor sensor.

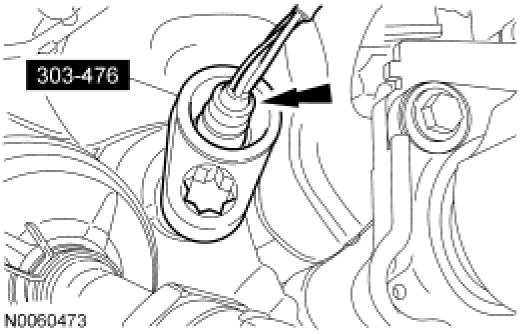

Fig. 189: Identifying RH Catalyst Monitor Sensor & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

50. Disconnect the RH HO2S electrical connector.

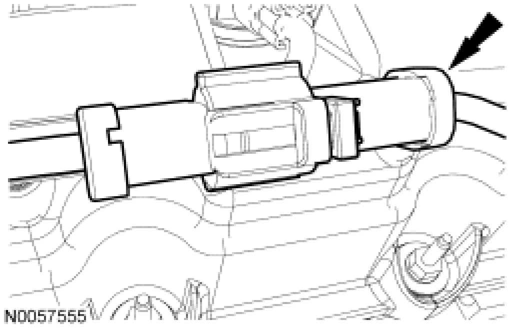

Fig. 190: Identifying RH HO2S Electrical Connector
Courtesy of FORD MOTOR CO.

51. Using the Exhaust Gas Oxygen Sensor Socket, remove the RH HO2S.

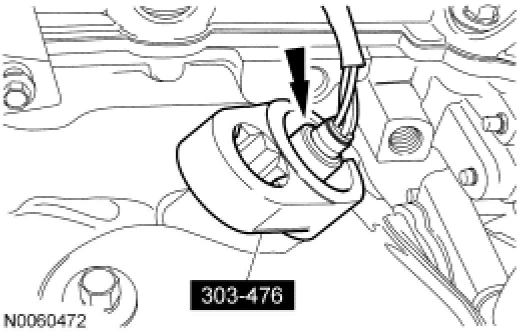

Fig. 191: Identifying RH HO2S & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

52. Remove the 6 bolts and the RH exhaust heat shield.

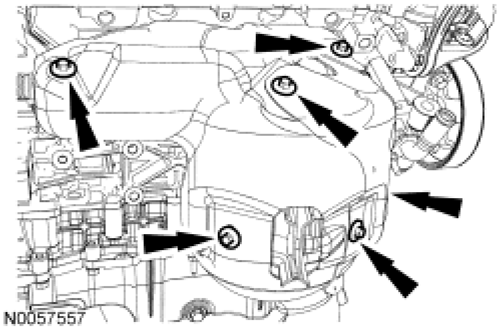

Fig. 192: Locating RH Exhaust Heat Shield Bolts
Courtesy of FORD MOTOR CO.

53. Remove the 3 nuts and the catalytic converter band clamp RH half.

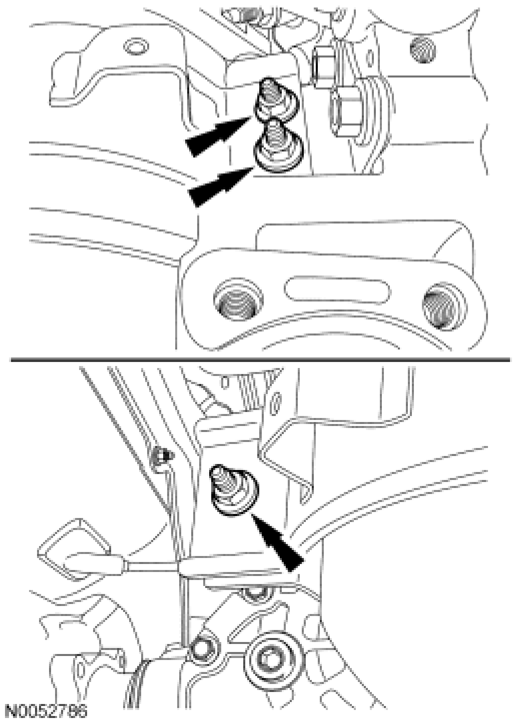

Fig. 193: Locating RH Exhaust Heat Shield Bracket Nuts - Inboard Half
Courtesy of FORD MOTOR CO.

54. Remove the 2 bolts and the catalytic converter band clamp LH half.

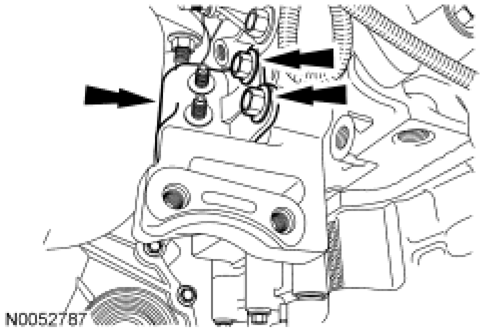

Fig. 194: Locating Catalytic Converter Band Clamp LH Half Nuts
Courtesy of FORD MOTOR CO.

55. Remove the nuts and the RH catalytic converter.

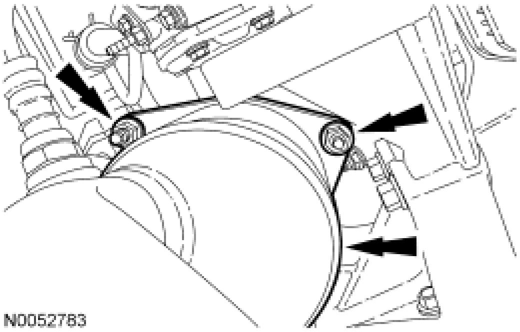

Fig. 195: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

56. Remove the 5 bolts and the Power Transfer Unit (PTU) support bracket.

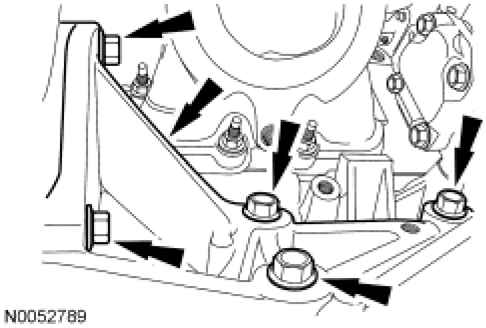

Fig. 196: Identifying PTU Support Bracket Bolts
Courtesy of FORD MOTOR CO.

NOTE: **A new halfshaft seal must be installed anytime the RH halfshaft is removed.**

NOTE: **The seal deflector will be damaged during removal. Be careful not to damage the cover seal directly behind the seal deflector.**

57. Remove the seal deflector.

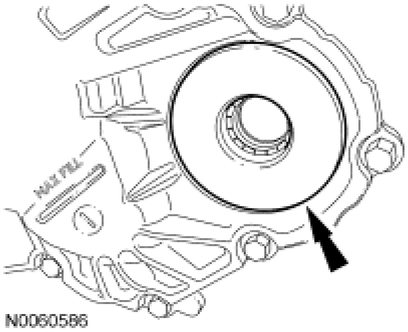

Fig. 197: Identifying Seal Deflector

Courtesy of FORD MOTOR CO.

58. Using the Bearing Cup Puller and Slide Hammer, remove the halfshaft seal from the PTU.

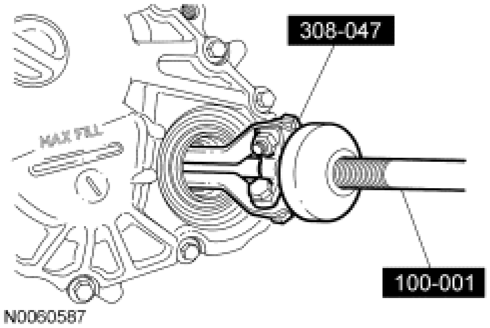

Fig. 198: Removing Intermediate Shaft Seal Using Special Tools (100-001) & (308-047)
Courtesy of FORD MOTOR CO.

59. Remove the 5 bolts and the PTU.

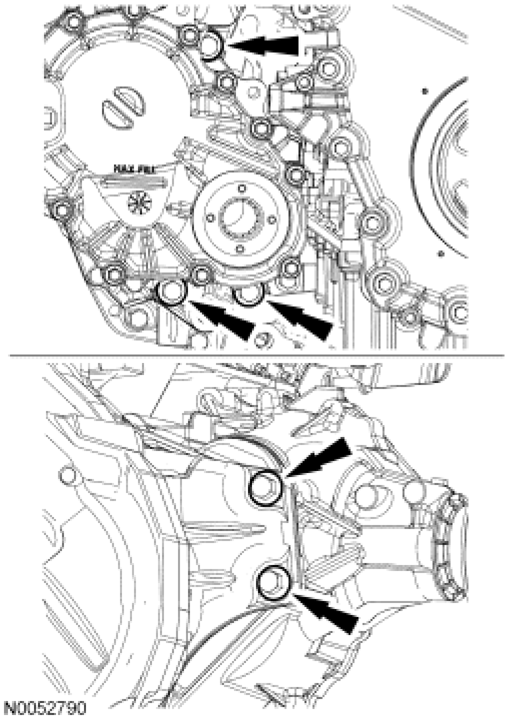

Fig. 199: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE:	**When installing the Engine Lifting Bracket Set, it will be easier to loosely install the upper bolt first, then install the lower bolt.**

60. Install the lower half of the Engine Lifting Bracket Set.

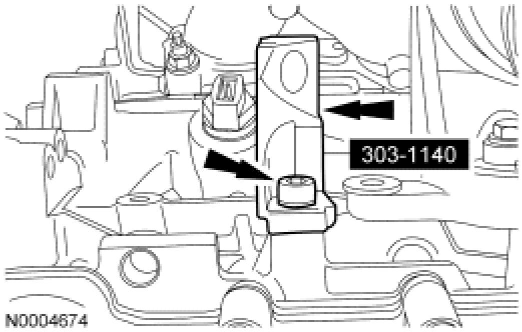

Fig. 200: Identifying Lower Half Of Lifting Hook
Courtesy of FORD MOTOR CO.

61. Install the upper half of the Engine Lifting Bracket Set.

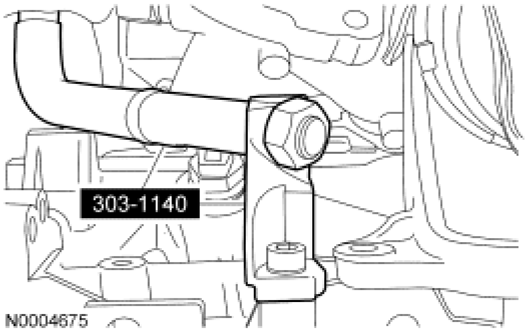

Fig. 201: Identifying Upper Half Of Lifting Hook
Courtesy of FORD MOTOR CO.

62. Install the Engine Lifting Bracket and Universal Adapter Bracket "L" hook on the LH side of the engine.

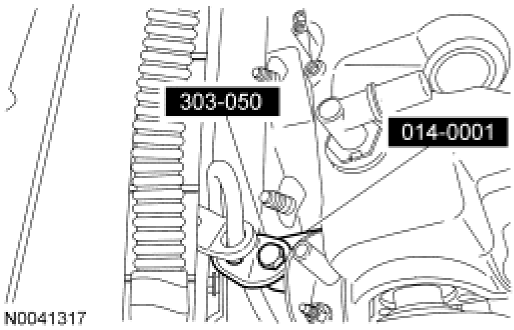

Fig. 202: Identifying Universal Lifting Brackets
Courtesy of FORD MOTOR CO.

63. Install the Engine Support Bar to support the engine.

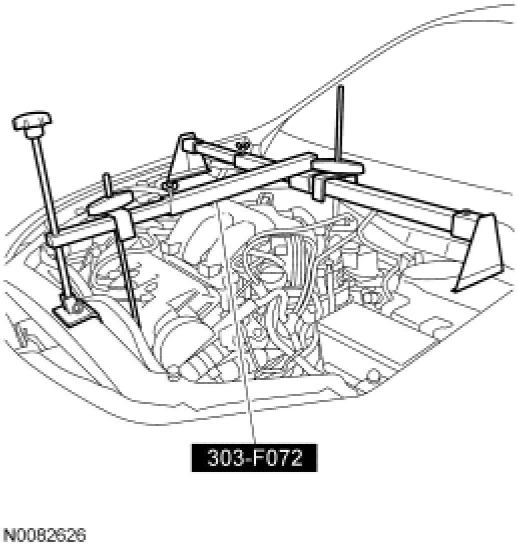

Fig. 203: Installing Engine Support Bar To Support Engine
Courtesy of FORD MOTOR CO.

64. Remove the 2 bolts from the transmission insulator.

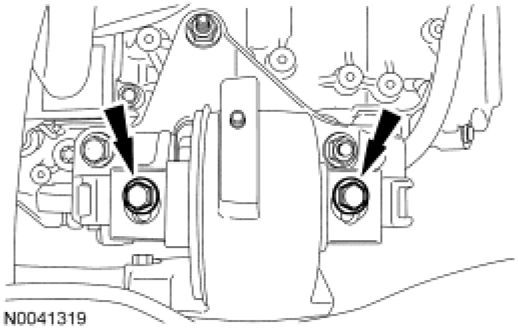

Fig. 204: Locating Transaxle Insulator Bolts
Courtesy of FORD MOTOR CO.

65. Lower the transaxle and remove the 2 nuts and the bolt and remove the transaxle support insulator bracket.

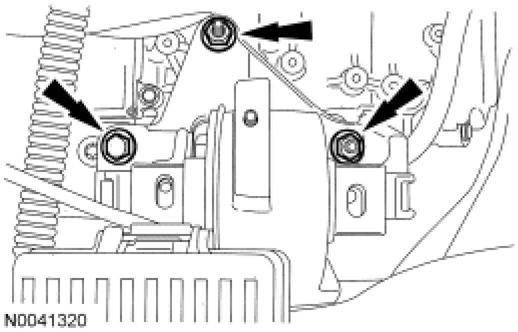

Fig. 205: Locating Transaxle Insulator Bracket Nuts And Bolt
Courtesy of FORD MOTOR CO.

66. Remove the HO2S bracket bolt and disconnect the wiring harness fastener.

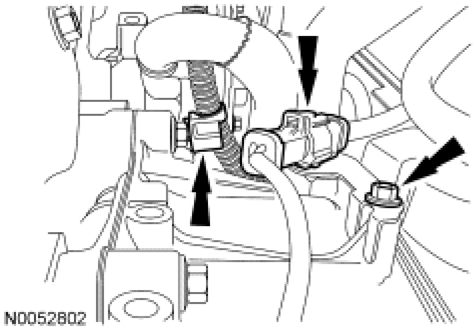

Fig. 206: Identifying Heated Oxygen Sensor (HO2S) Bracket & Stud Bolt
Courtesy of FORD MOTOR CO.

67. Remove the inspection cover.

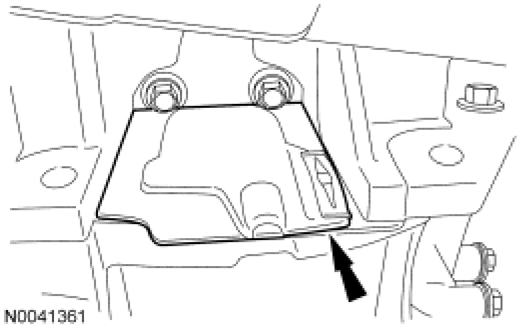

Fig. 207: Identifying Inspection Cover
Courtesy of FORD MOTOR CO.

68. Remove and discard the 3 torque converter nuts.

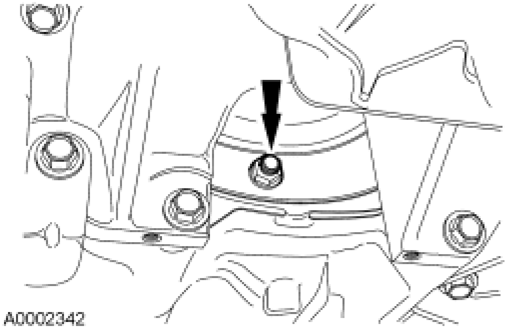

Fig. 208: Locating Torque Converter Nuts
Courtesy of FORD MOTOR CO.

69. Disconnect the transmission fluid cooler hoses.

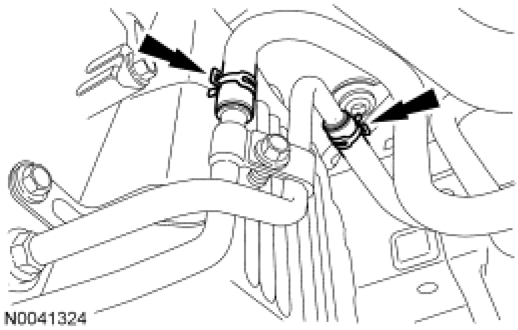

Fig. 209: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

70. Position a suitable high-lift transmission jack under the transaxle.
71. Remove the 5 torque converter housing bolts and remove the transmission.

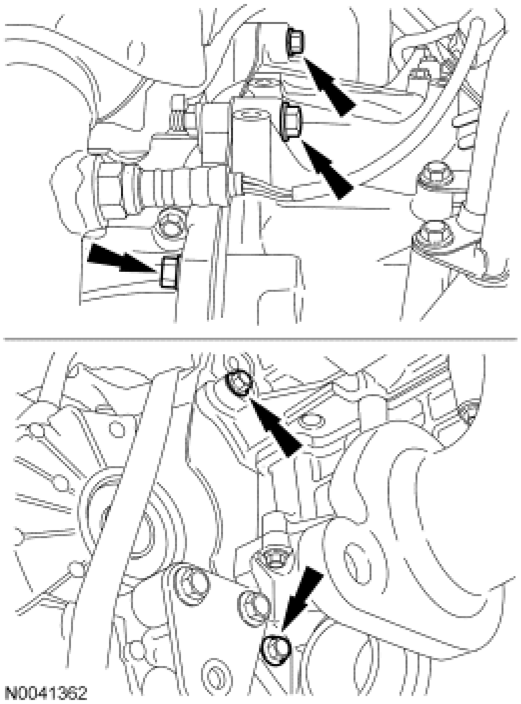

Fig. 210: Locating Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

72. If installing a new transaxle, the transmission fluid cooler will need to be backflushed and cleaned. Carry out transmission fluid cooler backflushing and cleaning. For additional information, refer to **Transmission Fluid Cooler - Backflushing and Cleaning**.

TRANSAXLE - 3.5L

Special Tools

Illustration	Tool Name	Tool Number
	Adapter for 204-592	204-592/1
	Bearing Cup Puller	308-047 (T77F-1102-A)
	Engine Lifting Bracket	303-1245

 ST3034-A		
 ST2272-A	Remover, Front Wheel Hub	205-D070 (D93P-1175-B) or equivalent

 ST1298-A	Slide Hammer	100-001 (T50T-100-A)
 ST2977-A	Spreader Bar	303-1246
 ST1602-A	Support Bar, Engine	303-F072

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the battery and battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Remove the air cleaner and the outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
4. Remove the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
5. Disconnect the selector lever cable end.

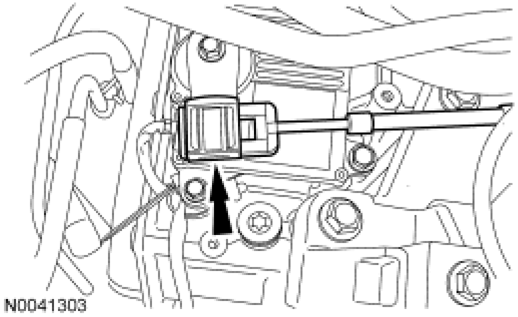

Fig. 211: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

6. Remove the 2 bolts and the nut for the selector lever cable bracket and position the cable and bracket aside.

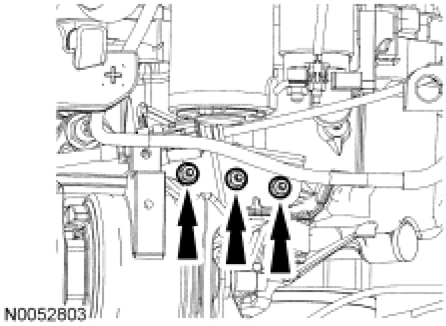

Fig. 212: Identifying Selector Lever Cable Bracket Bolts & Nuts
Courtesy of FORD MOTOR CO.

7. Disconnect the wire harness from the Transmission Control Module (TCM).

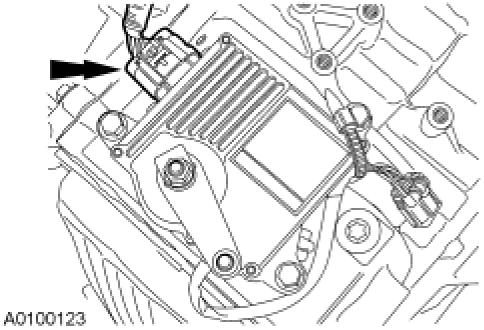

Fig. 213: Identifying Transmission Control Module Electrical Connector
Courtesy of FORD MOTOR CO.

8. Disconnect the wiring harness fasteners from the torque converter housing stud bolt and the starter motor.

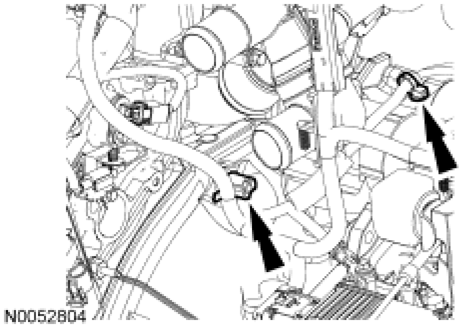

Fig. 214: Identifying Wiring Harness Fasteners & Torque Converter Housing Stud Bolt
Courtesy of FORD MOTOR CO.

9. Remove the 2 ground strap bolts and position aside the ground straps.

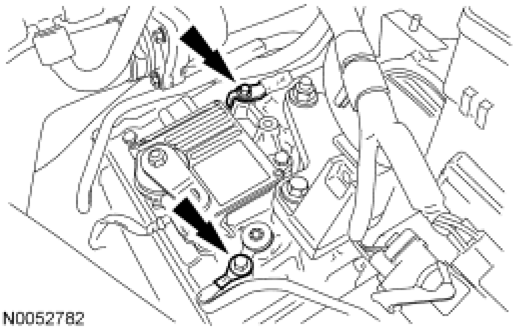

Fig. 215: Identifying Ground Straps & Ground Strap Bolts
Courtesy of FORD MOTOR CO.

10. Position the boot back and remove the starter terminals from the starter.

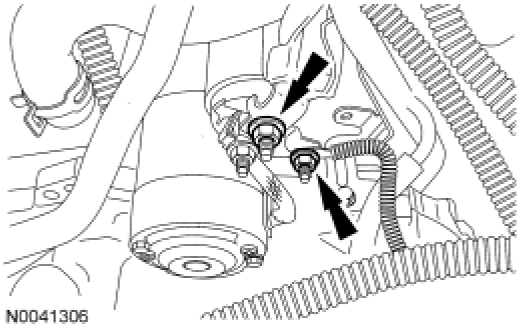

Fig. 216: Locating Bolts On Starter Terminals
Courtesy of FORD MOTOR CO.

11. Remove the 2 bolts and the starter.

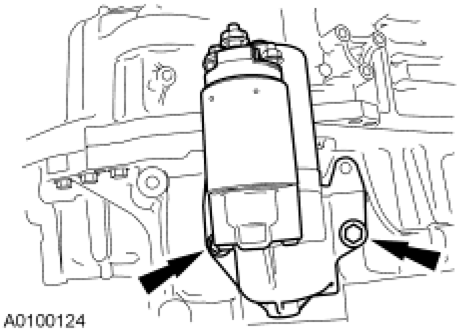

Fig. 217: Locating Starter Bolts
Courtesy of FORD MOTOR CO.

12. Remove the 4 upper torque converter housing bolts.

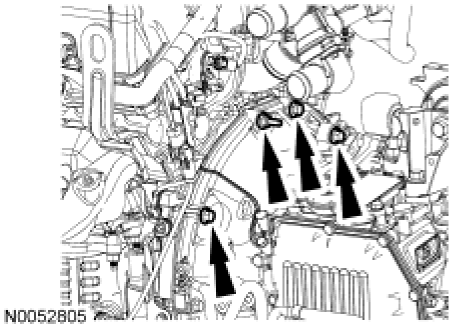

Fig. 218: Identifying Upper Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

13. Install the Engine Lifting Bracket on the LH cylinder head.

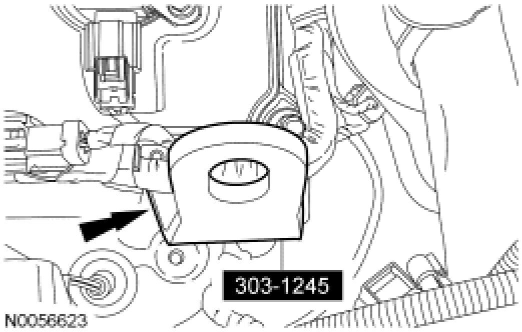

Fig. 219: Special Tool (303-1245) On LH Cylinder Head
Courtesy of FORD MOTOR CO.

14. Install the Engine Support Bar and Spreader Bar to support the engine.

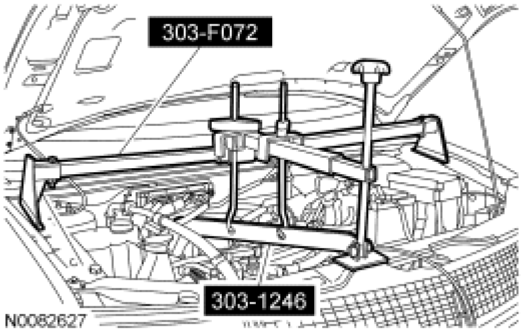

Fig. 220: Installing Engine Support Bar & Spreader Bar To Support Engine
Courtesy of FORD MOTOR CO.

15. Remove the transaxle support insulator through bolt.

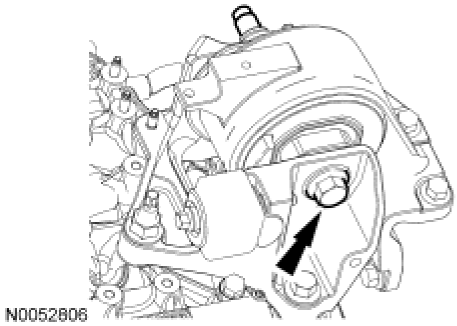

Fig. 221: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

16. Using the Engine Support Bar, lower the transaxle and remove the 2 transaxle support insulator bracket nuts, the bolt and the bracket.

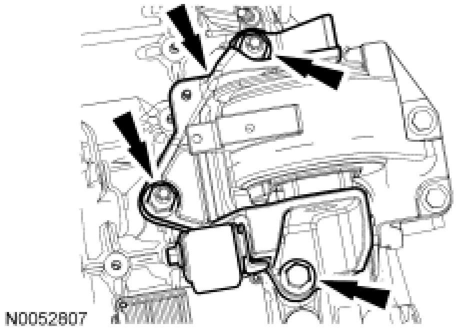

Fig. 222: Locating Transaxle Support Insulator Bracket Nuts & Bolt
Courtesy of FORD MOTOR CO.

17. Remove the 4 screws and position the RH fender splash shield aside.

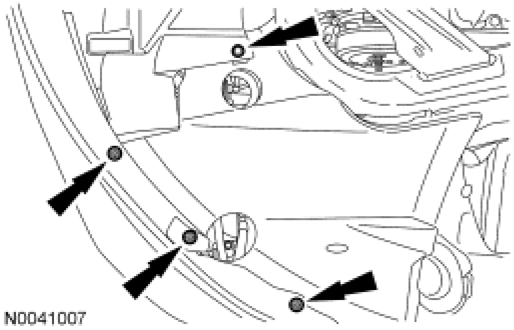

Fig. 223: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

18. Remove the 6 pin-type retainers and remove the RH front structure to subframe splash shield.

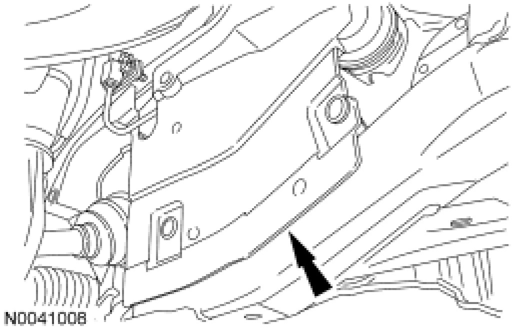

Fig. 224: Locating RH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

19. Remove the 4 screws and position the LH fender splash shield aside.

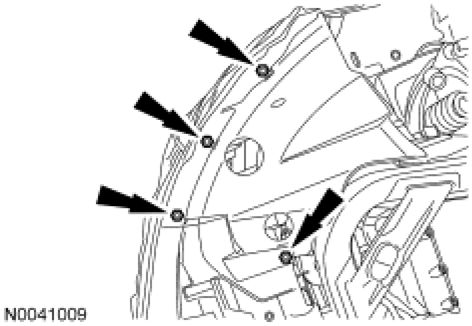

Fig. 225: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

20. Remove the pin-type retainers and remove the LH front structure-to-subframe splash shield.

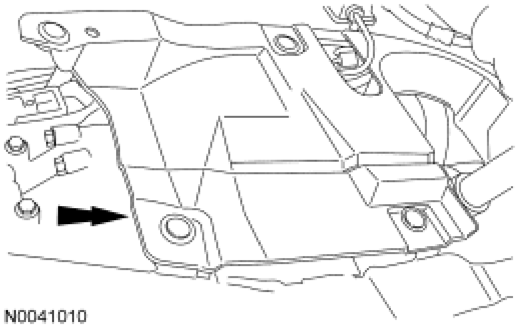

Fig. 226: Locating LH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

21. Remove the 6 Y-pipe nuts and the Y-pipe assembly.

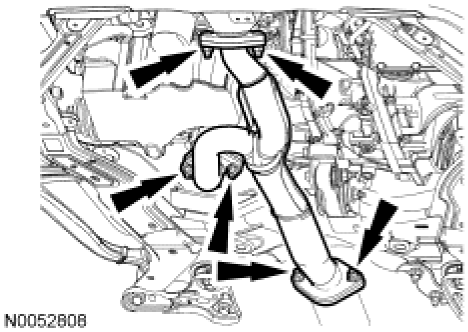

Fig. 227: Locating Y-Pipe Nuts & Y-Pipe Assembly
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

22. Remove the nuts and separate the sway bar links from the struts.

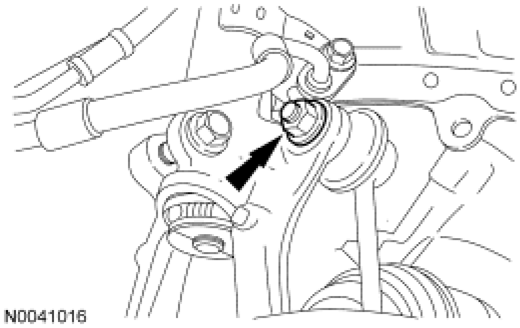

Fig. 228: Locating Sway Bar Links Nut
Courtesy of FORD MOTOR CO.

23. If a transaxle exchange or overhaul is required, the transmission fluid must be drained.
    - Remove the transmission drain plug and allow the transmission fluid to drain.

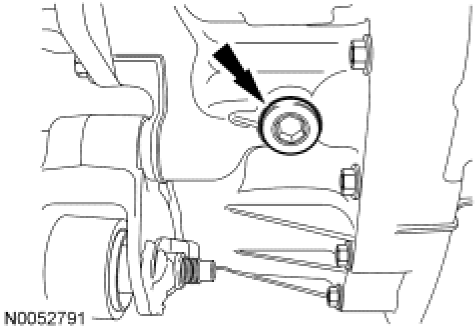

Fig. 229: Identifying Transmission Drain Plug
Courtesy of FORD MOTOR CO.

24. If removed, install the transmission fluid drain plug.
    - Tighten to 47 Nm (35 lb-ft).

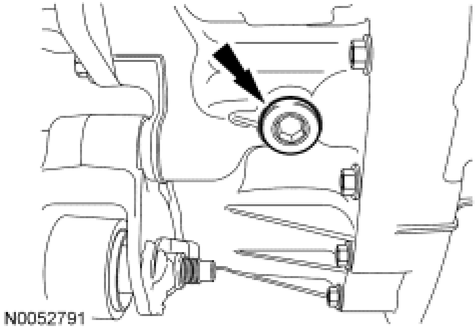

Fig. 230: Identifying Transmission Drain Plug
Courtesy of FORD MOTOR CO.

25. Remove the LH halfshaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

    All-Wheel Drive (AWD) vehicles

26. Remove and discard the front wheel hub nut.

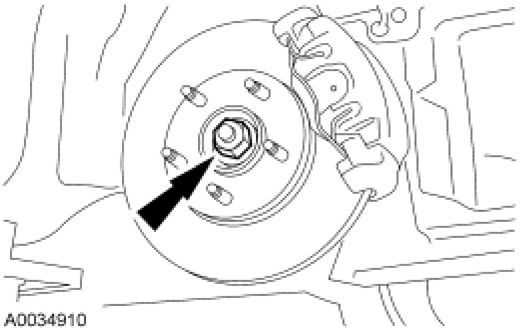

Fig. 231: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

All vehicles

27. Remove the RH lower control arm nuts.

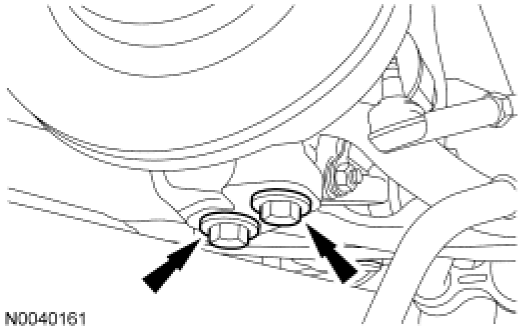

Fig. 232: Locating Front And Rear Lower Control Arm Nuts
Courtesy of FORD MOTOR CO.

NOTE: **When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.**

NOTE: **Once pressure is applied to the ball joint with the Ball Joint Separator and Adapter, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.**

28. Using the Ball Joint Separator and Adapter, separate the 2 lower ball joints from the wheel knuckle and remove the wheel knuckle.

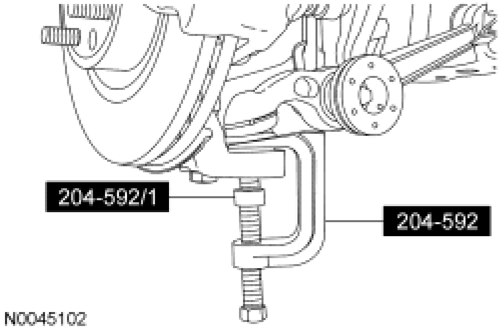

Fig. 233: Identifying Special Tool 204-592/1 And 204-592
Courtesy of FORD MOTOR CO.

29. Remove the bolt connecting the RH damper fork to the lower control arm.

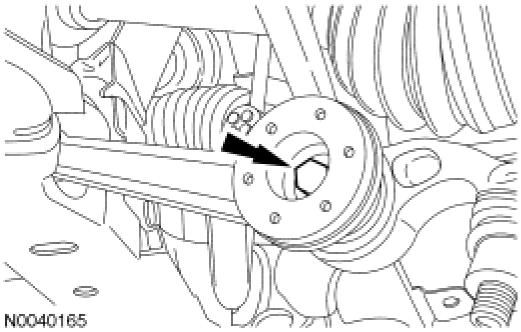

Fig. 234: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

30. Remove the 2 engine roll restrictor bracket bolts.

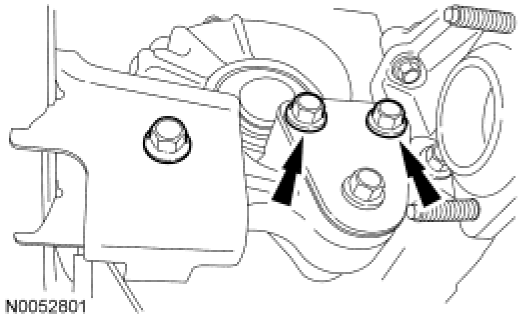

Fig. 235: Locating Engine Roll Restrictor Bracket Bolts
Courtesy of FORD MOTOR CO.

31. Remove the bolts and position the power steering cooler tube aside.

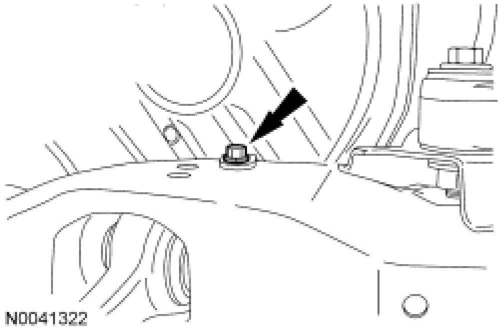

Fig. 236: Locating Power Steering Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

32. Remove the 3 steering gear bolts and position the steering gear aside with mechanic's wire.

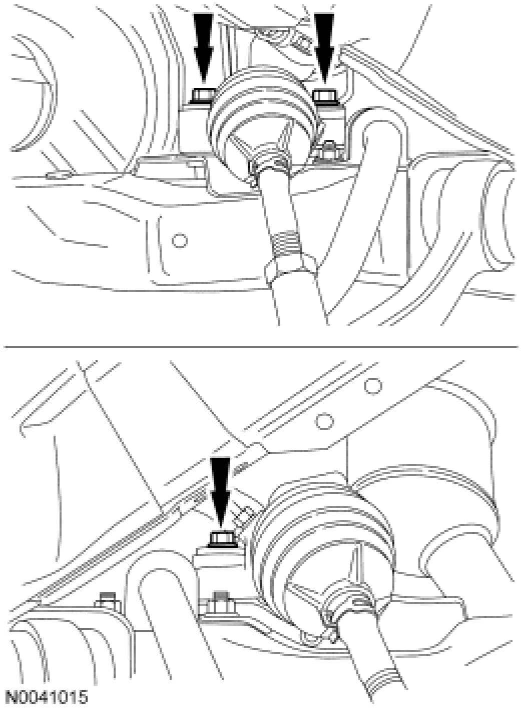

Fig. 237: Locating Steering Gear Bolts
Courtesy of FORD MOTOR CO.

33. Position a suitable powertrain lift table under the subframe.
34. Remove the 2 rear subframe nuts.

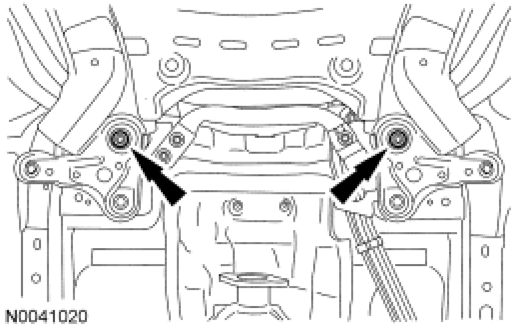

Fig. 238: Locating Rear Subframe Nuts
Courtesy of FORD MOTOR CO.

35. Remove the 4 bolts and the 2 subframe support brackets.

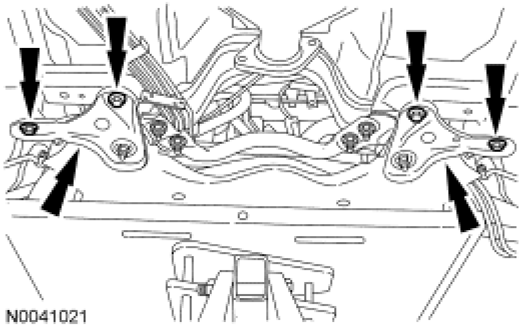

Fig. 239: Locating Subframe Support Brackets And Bolts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

36. Remove the 2 front subframe nuts and remove the subframe.

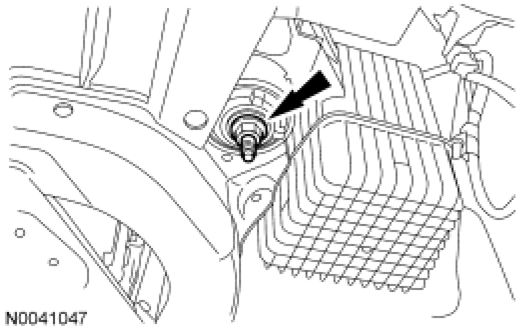

Fig. 240: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

Front Wheel Drive (FWD) vehicles

37. Remove the 2 catalytic converter bracket bolts.

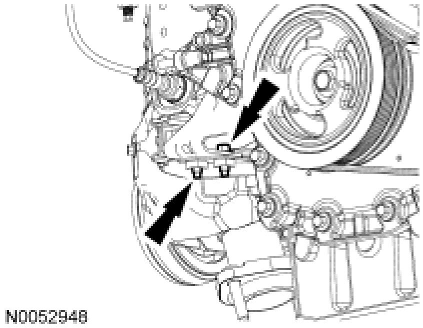

Fig. 241: Identifying Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

38. Remove the 2 nuts and remove the catalytic converter support bracket.

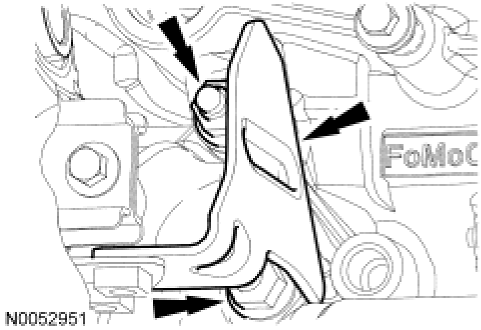

Fig. 242: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

39. Remove the 3 bolts and position the RH halfshaft aside.

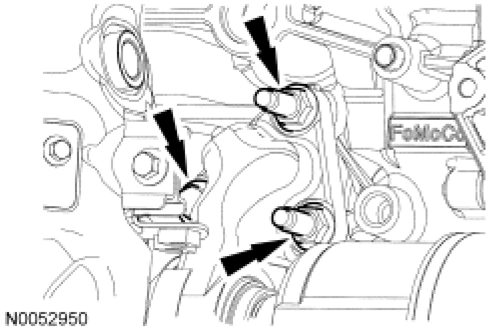

Fig. 243: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

AWD vehicles

40. Using the Front Wheel Hub Remover, press the halfshaft out of the wheel hub.

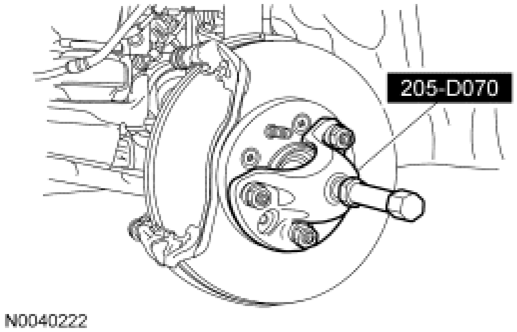

Fig. 244: Separating Halfshaft From Wheel Hub Using Special Tool (205-D070)
Courtesy of FORD MOTOR CO.

41. Remove the 2 bolts and the RH halfshaft.

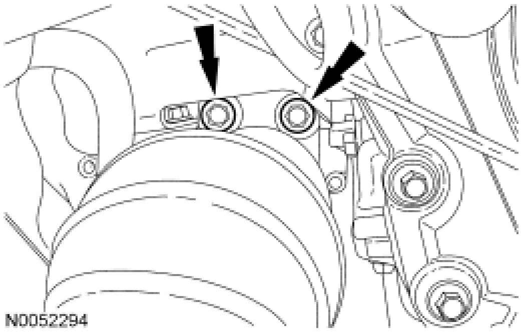

Fig. 245: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

42. Index the driveshaft, remove the 4 bolts and position the driveshaft aside.

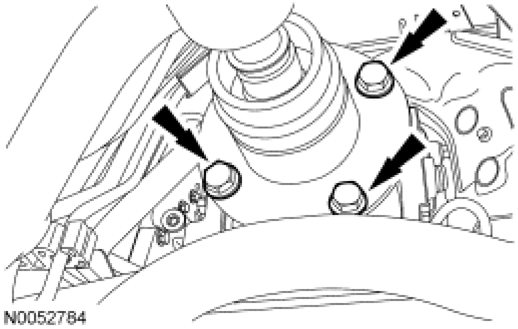

Fig. 246: Identifying Drive Shaft Bolts
Courtesy of FORD MOTOR CO.

43. Disconnect the RH catalyst monitor electrical connector.

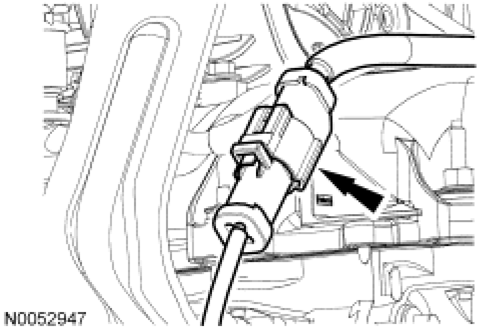

Fig. 247: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

44. Remove the 2 catalytic converter bracket bolts.

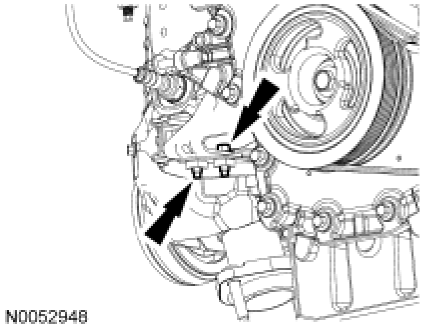

Fig. 248: Identifying Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

45. Remove the 4 nuts and the RH catalytic converter.

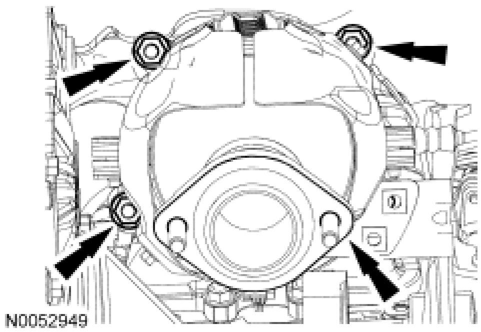

Fig. 249: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

46. Remove the 5 bolts and the power transfer unit PTU support bracket.

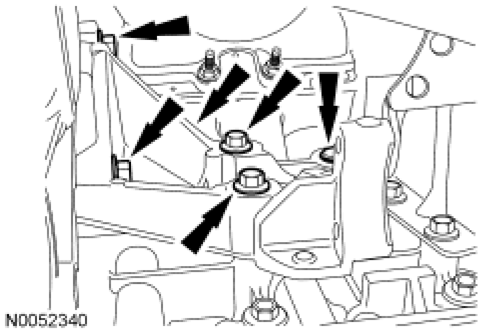

Fig. 250: Locating Power Transfer Unit (PTU) Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

NOTE:	**A new halfshaft seal must be installed anytime the RH halfshaft is removed.**

NOTE:	**The seal deflector will be damaged during removal. Be careful not to**

damage the cover seal directly behind the seal deflector.

47. Remove the seal deflector.

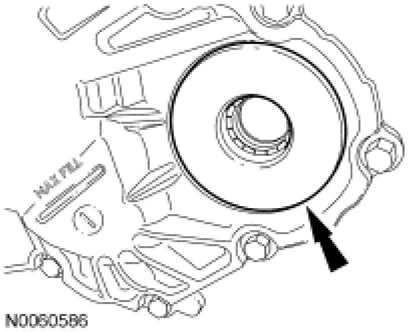

Fig. 251: Identifying Seal Deflector
Courtesy of FORD MOTOR CO.

48. Using the Bearing Cup Puller and Slide Hammer, remove the halfshaft seal from the PTU.

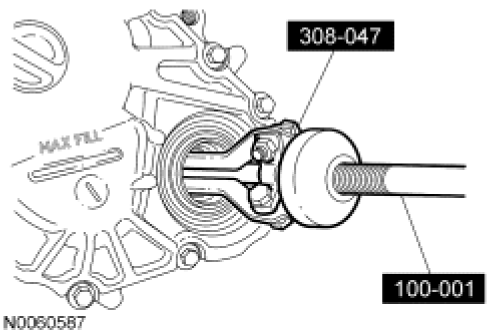

Fig. 252: Removing Intermediate Shaft Seal Using Special Tools (100-001) & (308-047)
Courtesy of FORD MOTOR CO.

49. Remove the 5 bolts and the PTU.

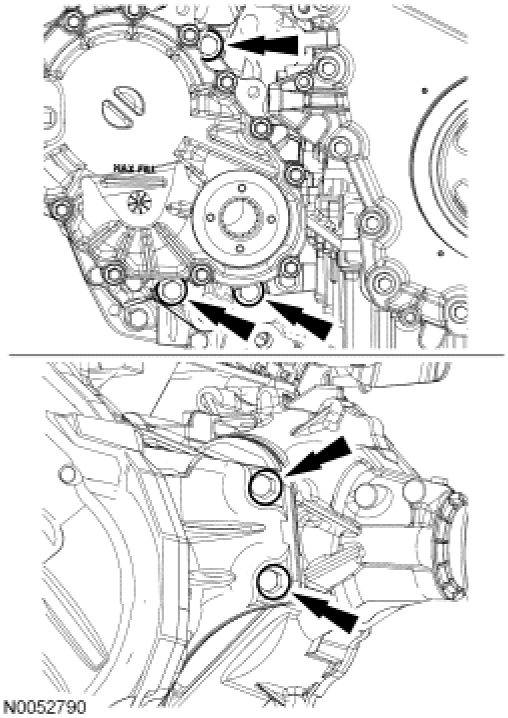

Fig. 253: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

All vehicles

50. Remove the 2 fasteners and the inspection cover.

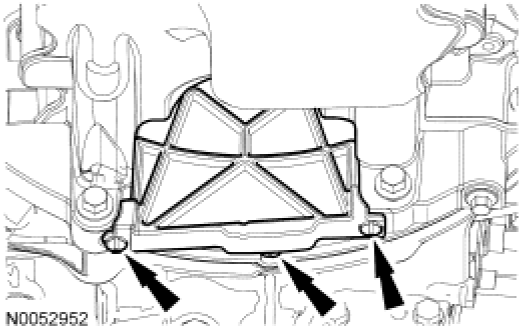

Fig. 254: Identifying Inspection Cover & Fasteners
Courtesy of FORD MOTOR CO.

51. Remove and discard the 4 torque converter nuts.

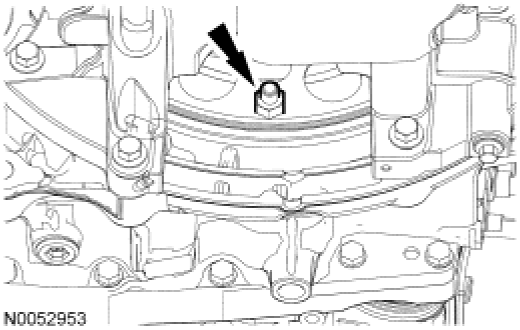

Fig. 255: Identifying Torque Converter Nuts
Courtesy of FORD MOTOR CO.

52. Disconnect the transmission fluid cooler hoses from the transmission fluid cooler tubes.

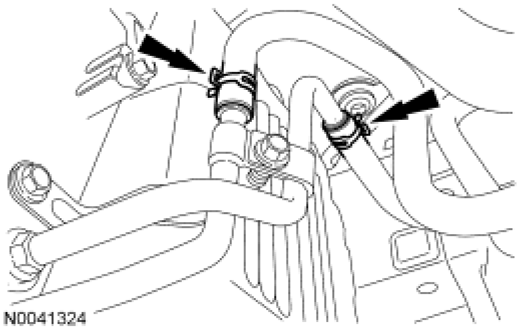

Fig. 256: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

53. Position a suitable high-lift transmission jack under the transaxle.
54. Remove the 7 torque converter housing bolts and remove the transaxle.

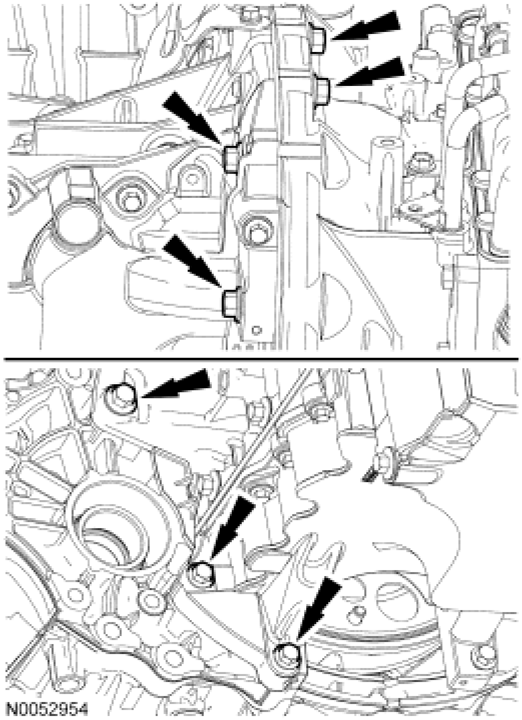

Fig. 257: Locating Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

55. If installing a new transaxle, the transmission fluid cooler will need to be backflushed and cleaned. Carry out transmission fluid cooler tube backflushing and cleaning. For additional information, refer to **Transmission Fluid Cooler - Backflushing and Cleaning**.

DISASSEMBLY AND ASSEMBLY OF SUBASSEMBLIES

TORQUE CONVERTER HUB SEAL

Special Tools

Illustration	Tool Name	Tool Number
	Converter Seal Installer	307-548
	Remover, Input Shaft Oil Seal	308-375

	Slide Hammer	307-005 (T59L100-B)

Material

Item	Specification
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

DISASSEMBLY

1. Remove the transaxle. For additional information, refer to **Transaxle - 3.0L** or **Transaxle - 3.5L**.
2. Remove the torque converter.
3. Using the Input Shaft Oil Seal Remover and Slide Hammer, remove the torque converter hub seal.

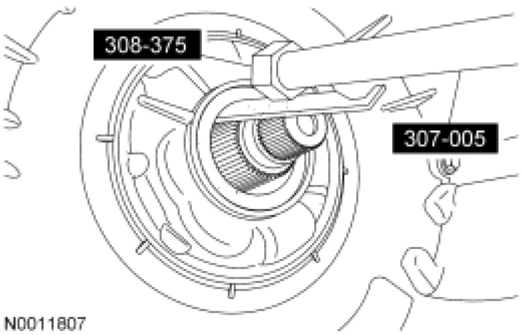

Fig. 258: Removing Torque Converter Hub Seal
Courtesy of FORD MOTOR CO.

ASSEMBLY

1. Position the torque converter hub seal in place.

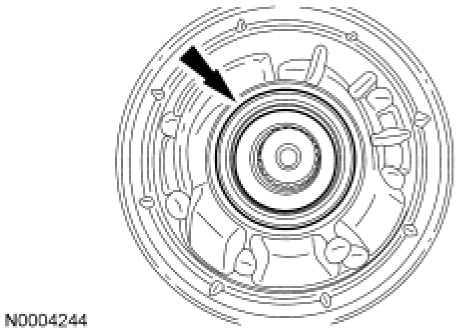

Fig. 259: Positioning Torque Converter Hub Seal In Place
Courtesy of FORD MOTOR CO.

2. Using the Converter Seal Installer, install the torque converter hub seal.

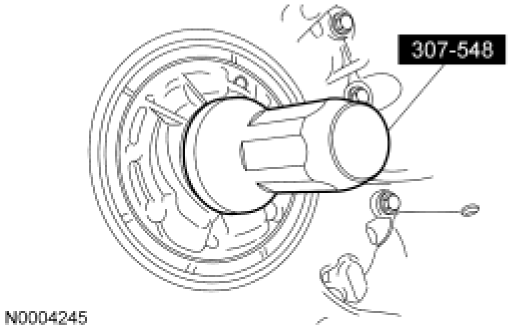

Fig. 260: Installing Torque Converter Hub Seal
Courtesy of FORD MOTOR CO.

3. Install the torque converter.
4. Install the transaxle. For additional information, refer to **Transaxle - 3.0L** or **Transaxle - 3.5L**.

TORQUE CONVERTER

Material

Item	Specification
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A

DISASSEMBLY

1. Remove the transaxle. For additional information, refer to **Transaxle - 3.0L** or **Transaxle - 3.5L**.
2. Remove the torque converter.

ASSEMBLY

1. Install the torque converter.
2. Install the transaxle. For additional information, refer to **Transaxle - 3.0L** or **Transaxle - 3.5L**.

INSTALLATION

TRANSAXLE - 3.0L

Item	Specification
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Threadlock and Sealer TA-25	WSK-M2G351-A5

NOTE: **MERCON®, MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid and Motorcraft Continuously Variable Chain Type Transmission Fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.**

NOTE: **If the transaxle was overhauled, or if installing a new transaxle and the transmission fluid cooler has not been flushed, flush the transmission fluid cooler at this time. For additional information, refer to Transmission Fluid Cooler - Backflushing and Cleaning.**

All vehicles

1. Prior to installing the transaxle, apply multi-purpose grease to the torque converter pilot hub.

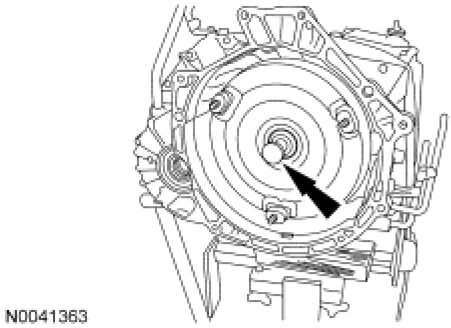

Fig. 261: Identifying Torque Converter Pilot Hub
Courtesy of FORD MOTOR CO.

2. Position the transaxle to the back of the engine.
3. Install the 5 transaxle-to-engine bolts.
   - Tighten to 40 Nm (30 lb-ft).

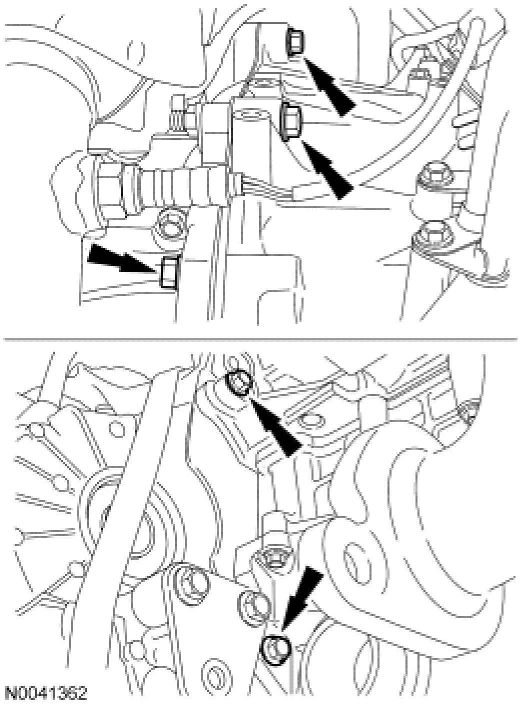

Fig. 262: Locating Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

4. Connect the transmission fluid cooler hoses to the transmission fluid cooler tubes.

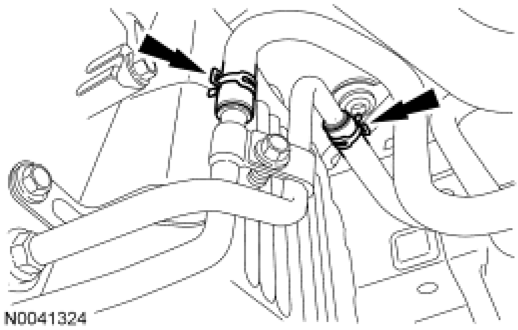

Fig. 263: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

5. Install 3 new torque converter nuts.
   - Tighten to 36 Nm (27 lb-ft).

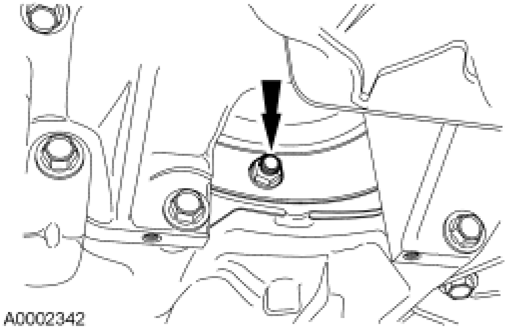

Fig. 264: Locating Torque Converter Nuts
Courtesy of FORD MOTOR CO.

6. Install the inspection cover.

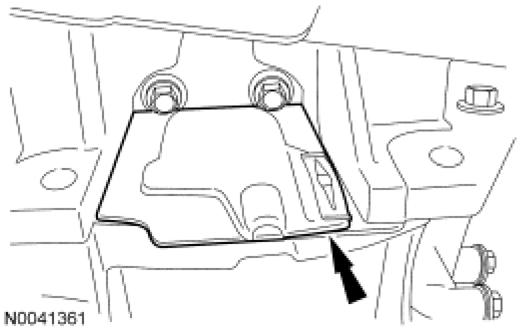

Fig. 265: Identifying Inspection Cover
Courtesy of FORD MOTOR CO.

7. Connect the wiring harness fastener to the stud bolt and position the Heated Oxygen Sensor (HO2S) bracket in place and install the bolt.
   - Tighten to 12 Nm (106 lb-in).

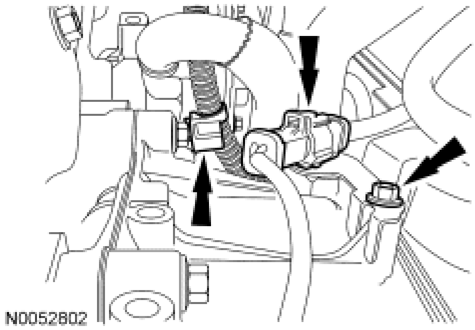

Fig. 266: Identifying Heated Oxygen Sensor (HO2S) Bracket & Stud Bolt
Courtesy of FORD MOTOR CO.

8. Position the transaxle insulator bracket in place. Apply threadlock and sealer to the threads and install the 2 nuts and the bolt.
   - Tighten to 80 Nm (59 lb-ft).

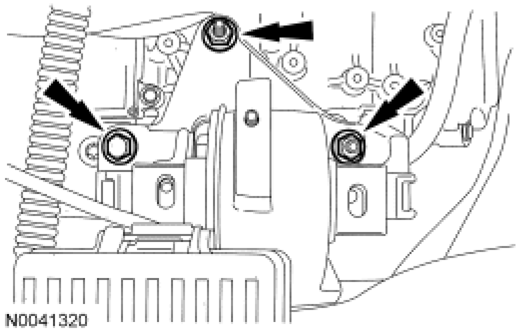

Fig. 267: Locating Transaxle Insulator Bracket Nuts And Bolt
Courtesy of FORD MOTOR CO.

9. Raise the transaxle. Apply threadlock and sealer to the threads and install the 2 transaxle insulator-to-frame bolts.
   - Tighten to 62 Nm (46 lb-ft).

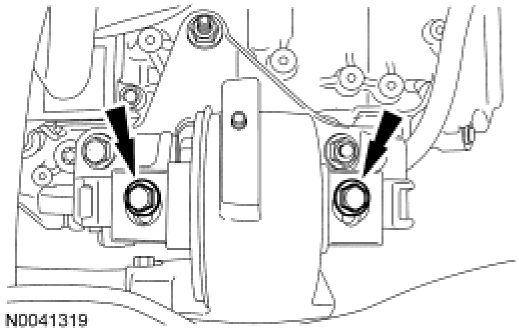

Fig. 268: Locating Transaxle Insulator Bolts
Courtesy of FORD MOTOR CO.

10. Remove the Engine Support Bar.

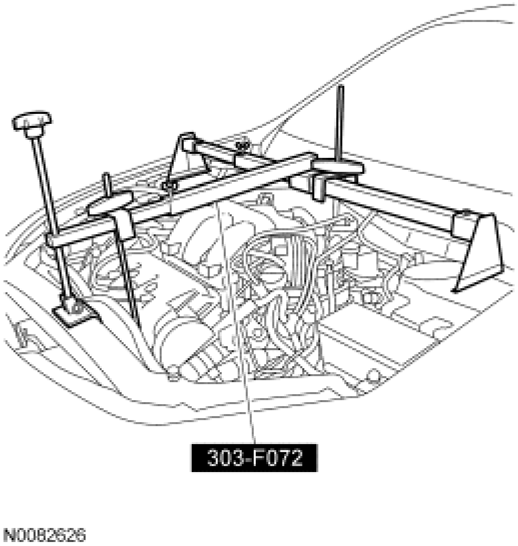

Fig. 269: Installing Engine Support Bar To Support Engine
Courtesy of FORD MOTOR CO.

11. Remove the Engine Lifting Bracket and the Universal Adapter Bracket "L" hook from the from the LH side of the engine.

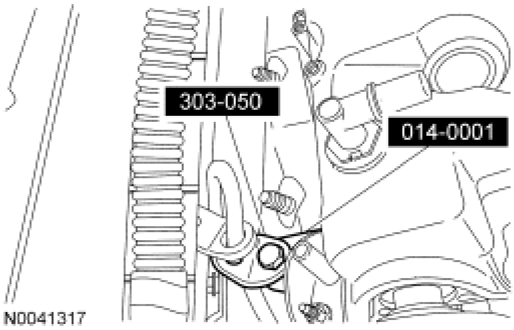

Fig. 270: Identifying Universal Lifting Brackets
Courtesy of FORD MOTOR CO.

12. Remove the upper half of the Engine Lifting Bracket Set.

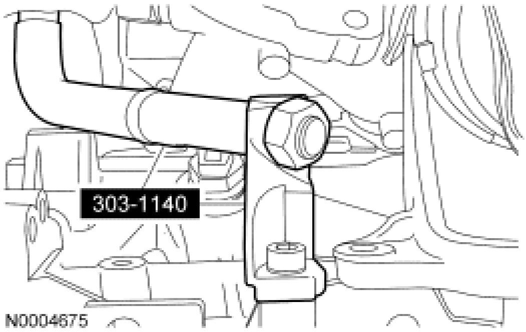

Fig. 271: Identifying Upper Half Of Lifting Hook
Courtesy of FORD MOTOR CO.

13. Remove the lower half of the Engine Lifting Bracket Set.

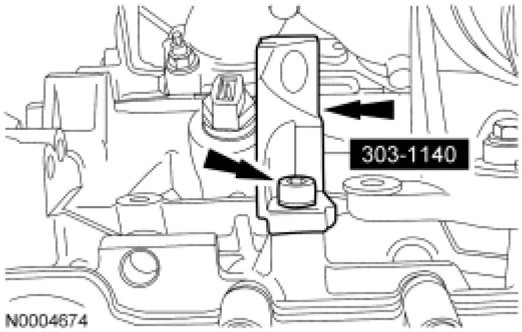

Fig. 272: Identifying Lower Half Of Lifting Hook
Courtesy of FORD MOTOR CO.

All-Wheel Drive (AWD) vehicles

14. Position the Power Transfer Unit (PTU) in place and install the 5 bolts.
    - Tighten to 90 Nm (66 lb-ft).

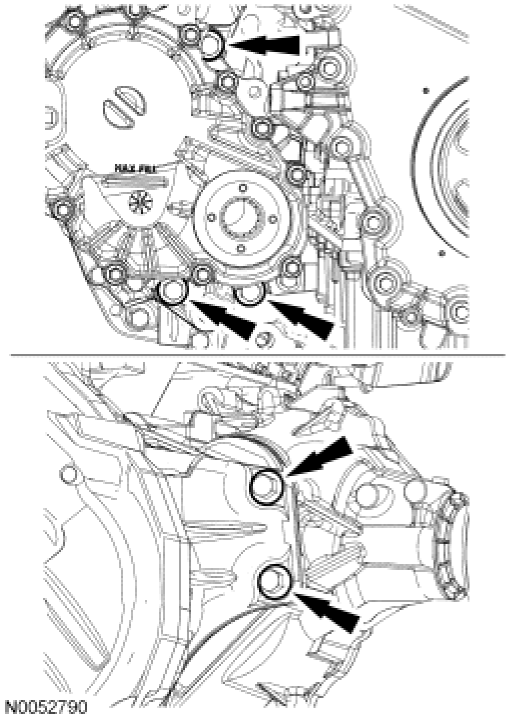

Fig. 273: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

15. Using the Bearing Cup Remover/Installer and Handle, install a new intermediate shaft seal.

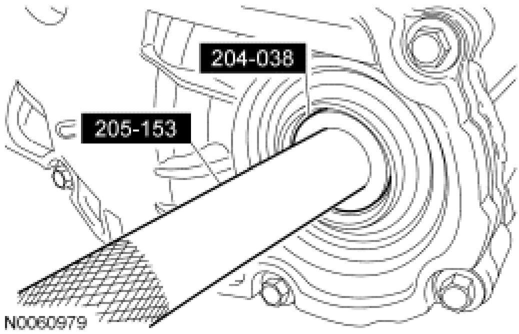

Fig. 274: Identifying Intermediate Shaft Seal & Special Tools (204-038, 205-153)
Courtesy of FORD MOTOR CO.

NOTE:	**Do not overheat (melt) the seal deflector. If the deflector is damaged, a new one must be used.**

16. Using the Heat Gun, heat the new seal deflector. Concentrate the heat across the back of the deflector near the white colored tabs. Install the seal deflector immediately after heating.
    - If necessary, use the PTU Drive Gear Outer Oil Seal Installer and Halfshaft Oil Seal Installer to seat the seal deflector. Make sure the deflector is fully seated and there are no cracks on the face or inner diameter white colored tab.

- For an alternate method to heat the seal deflector, place the deflector in boiling water for 3 to 5 minutes. Dry off deflector and install.
- Make sure the deflector is completely seated all the way around.

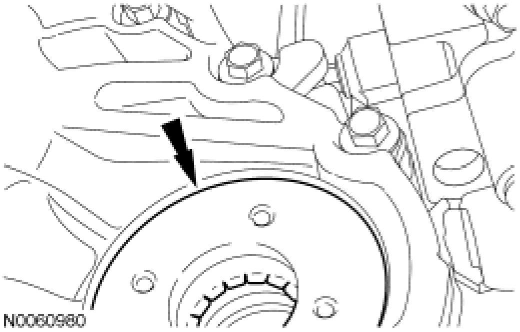

Fig. 275: Identifying Seal Deflector
Courtesy of FORD MOTOR CO.

17. Position the PTU support bracket in place and install the 5 bolts.
    - Tighten to 70 Nm (52 lb-ft).

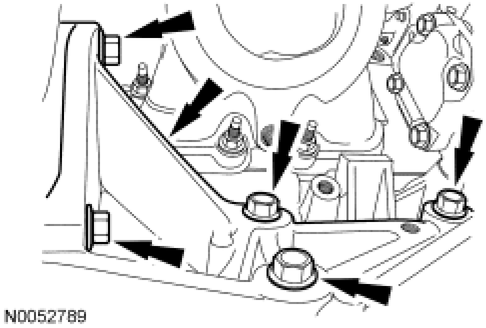

Fig. 276: Identifying PTU Support Bracket Bolts
Courtesy of FORD MOTOR CO.

18. Position the RH catalytic converter in place and install the catalytic converter-to-exhaust manifold nuts.
    - Tighten to 40 Nm (30 lb-ft).

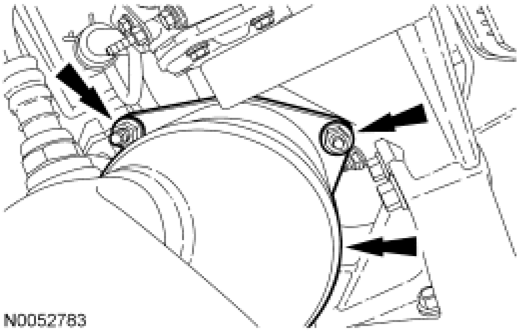

Fig. 277: Locating RH Catalytic Converter Nuts

Courtesy of FORD MOTOR CO.

19. Install the catalytic converter band clamp LH half and the 2 bolts.
    - Tighten to 40 Nm (30 lb-ft).

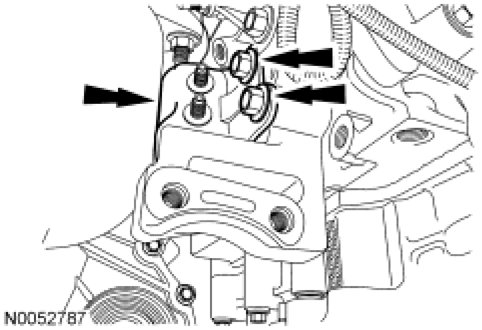

Fig. 278: Locating Catalytic Converter Band Clamp LH Half Nuts
Courtesy of FORD MOTOR CO.

20. Install the catalytic converter band clamp RH half and install the 3 nuts.
    - Tighten to 20 Nm (177 lb-in).

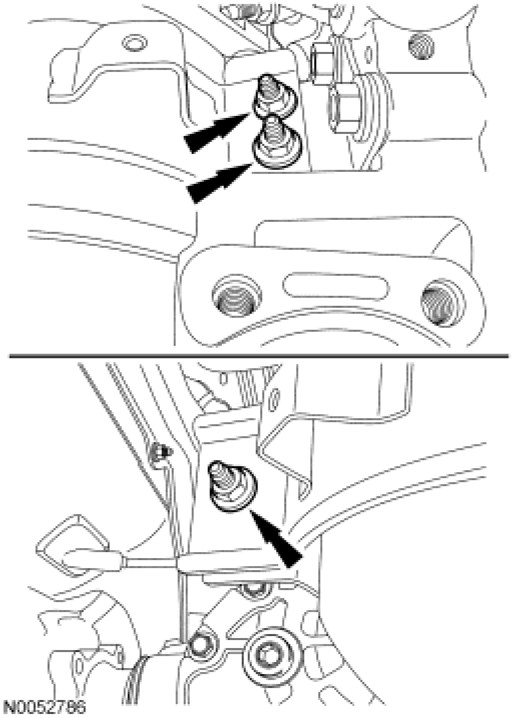

Fig. 279: Locating RH Exhaust Heat Shield Bracket Nuts - Inboard Half
Courtesy of FORD MOTOR CO.

21. Install the RH exhaust manifold heat shield and the 6 bolts.
    - Tighten to 11 Nm (97 lb-in).

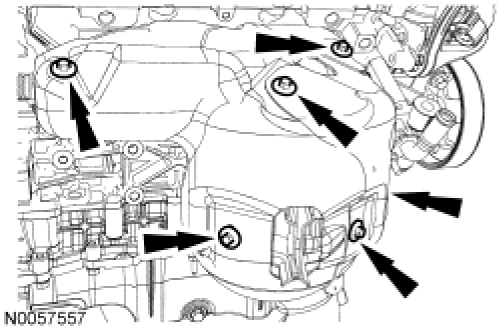

Fig. 280: Locating RH Exhaust Heat Shield Bolts
Courtesy of FORD MOTOR CO.

22. Using the Exhaust Gas Oxygen Sensor Socket, install the RH HO2S.
    - Tighten to 48 Nm (35 lb-ft).

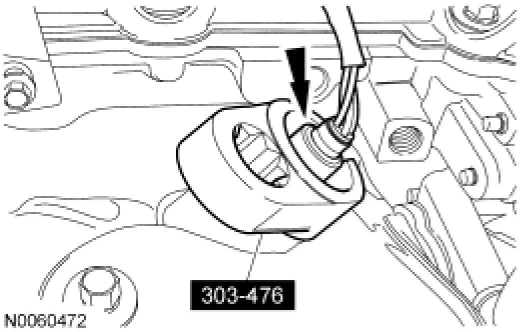

Fig. 281: Identifying RH HO2S & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

23. Connect the RH HO2S electrical connector.

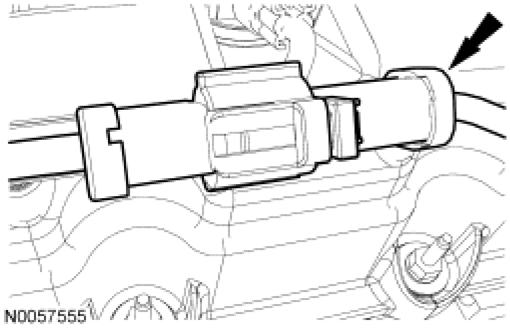

Fig. 282: Identifying RH HO2S Electrical Connector
Courtesy of FORD MOTOR CO.

24. Using the Exhaust Gas Oxygen Sensor Socket, install the RH catalyst monitor sensor.
    - Tighten to 48 Nm (35 lb-ft).

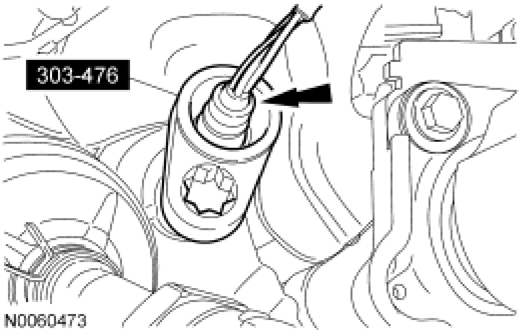

Fig. 283: Identifying RH Catalyst Monitor Sensor & Special Tool (303-476)
Courtesy of FORD MOTOR CO.

25. Connect the RH catalyst monitor sensor electrical connector and attach the wiring harness retainer.

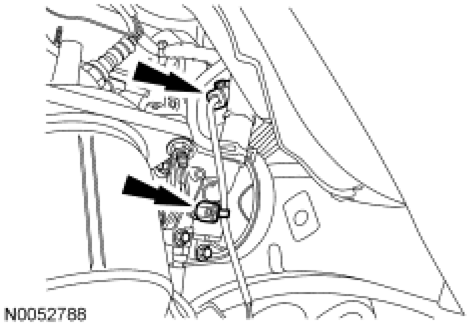

Fig. 284: Locating RH Catalyst Monitor Sensor Electrical Connector & Wiring Retainer
Courtesy of FORD MOTOR CO.

26. Position the driveshaft in place, align the index marks made during removal and install the 4 driveshaft bolts.
    - Tighten to 70 Nm (52 lb-ft).

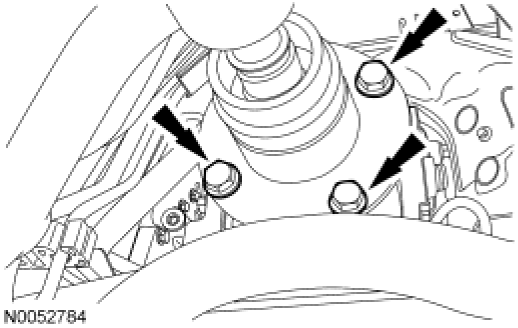

Fig. 285: Identifying Drive Shaft Bolts
Courtesy of FORD MOTOR CO.

27. Position the RH halfshaft in place and install the 2 RH halfshaft bearing support bracket bolts.
    - Tighten to 23 Nm (17 lb-ft).

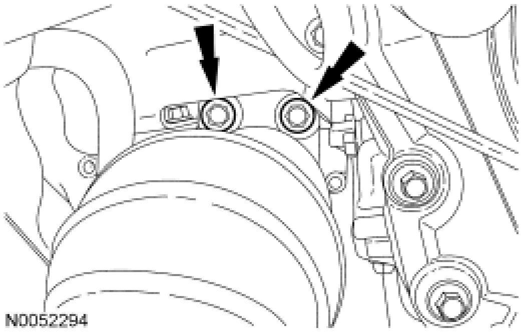

Fig. 286: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

Front Wheel Drive (FWD) vehicles

28. Position the RH halfshaft in the transaxle and install the 2 RH halfshaft bearing support bracket bolts.
    - Tighten to 55 Nm (41 lb-ft).

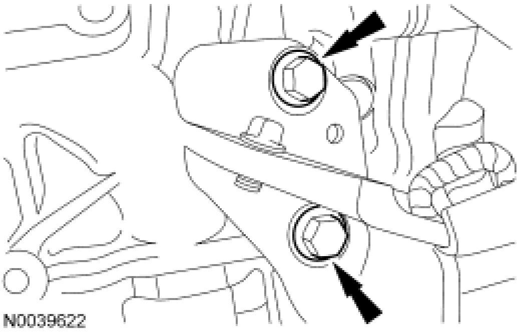

Fig. 287: Locating RH Halfshaft Carrier Bearing Bracket Bolts
Courtesy of FORD MOTOR CO.

29. Install the bolt retaining the brake caliper hose.
    - Tighten to 22 Nm (16 lb-ft).

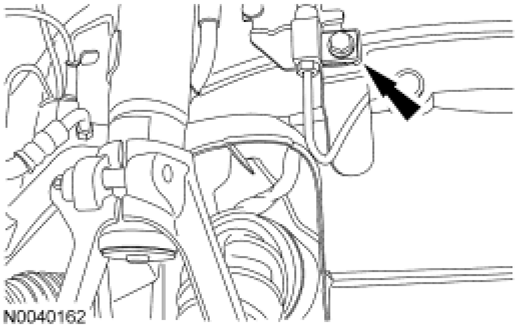

Fig. 288: Locating Brake Caliper Hose Bolt
Courtesy of FORD MOTOR CO.

30. Connect the HO2S to the RH halfshaft bearing support bracket.

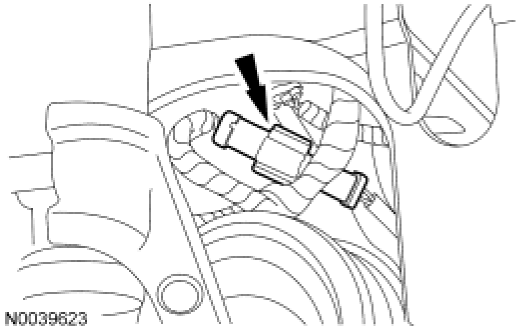

Fig. 289: Locating Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

31. Install the catalytic converter-to-engine block bracket and install the 2 bolts.
    - Tighten to 35 Nm (26 lb-ft).

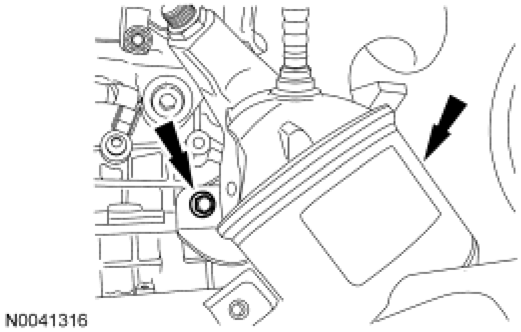

Fig. 290: Locating Catalytic Converter-To-Engine Block Bracket And Bolts
Courtesy of FORD MOTOR CO.

32. Install the catalytic converter band clamp and the 2 bolts.
    - Tighten to 20 Nm (177 lb-in).

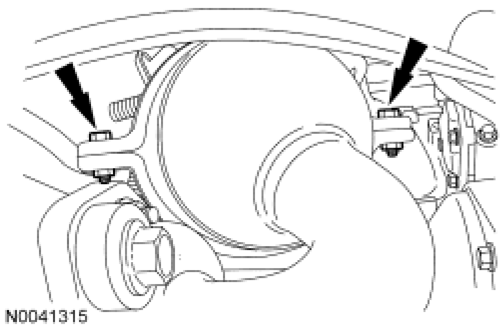

Fig. 291: Locating Catalytic Converter Band Clamp And Bolts
Courtesy of FORD MOTOR CO.

33. Install the RH exhaust manifold heat shield and the 2 bolts.
    - Tighten to 11 Nm (97 lb-in).

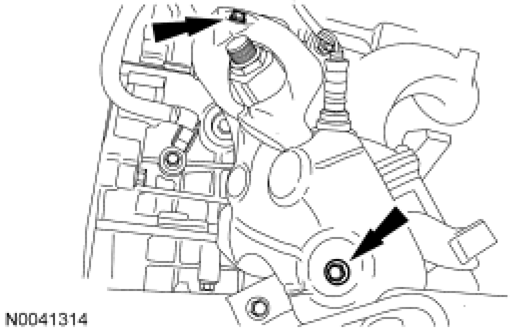

Fig. 292: Locating RH Exhaust Manifold Heat Shield And Bolts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: FWD shown, AWD similar.

34. Loosely install the EGR tube nut on the RH exhaust manifold.

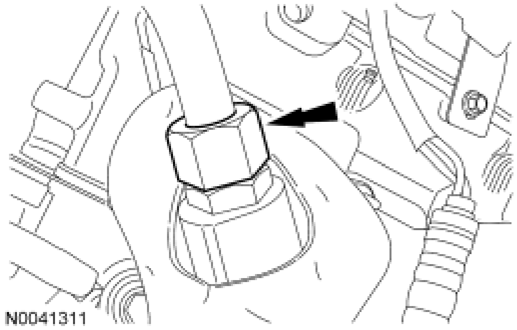

Fig. 293: Locating EGR Tube Nut At RH Exhaust Manifold
Courtesy of FORD MOTOR CO.

35. Position the subframe in place using a suitable powertrain lift.

NOTE: LH shown, RH similar.

36. Install the front subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

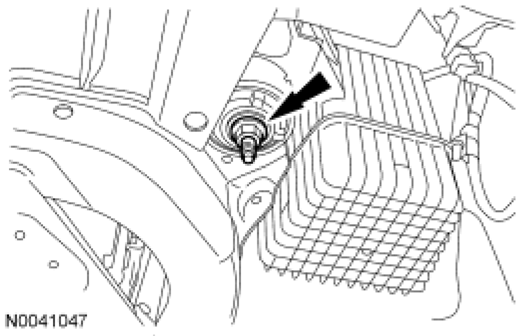

Fig. 294: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

37. Position the subframe support brackets in place and loosely install the bolts.

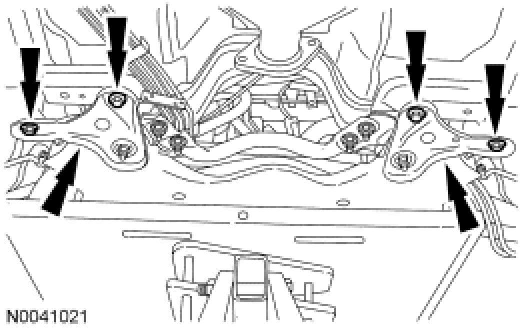

Fig. 295: Locating Subframe Support Brackets And Bolts
Courtesy of FORD MOTOR CO.

38. Install the rear subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

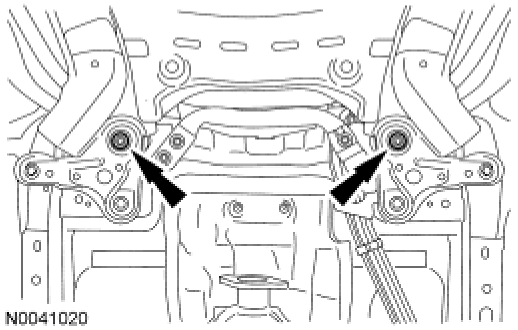

Fig. 296: Locating Rear Subframe Nuts
Courtesy of FORD MOTOR CO.

39. Tighten the subframe support bracket bolts.
    - Tighten to 103 Nm (76 lb-ft).

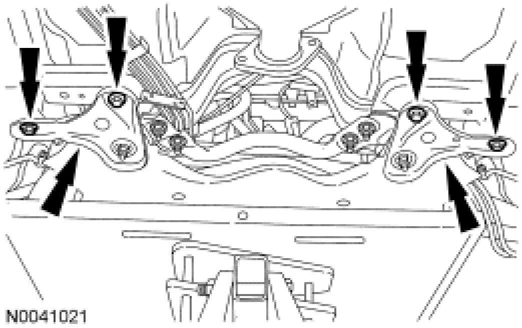

Fig. 297: Locating Subframe Support Brackets And Bolts
Courtesy of FORD MOTOR CO.

40. Position the power steering gear in place and install the 3 bolts.
    - Tighten to 107 Nm (79 lb-ft).

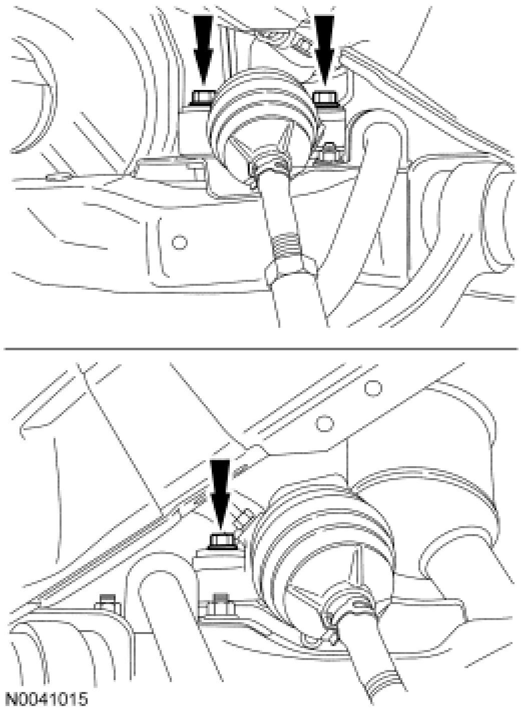

Fig. 298: Locating Steering Gear Bolts
Courtesy of FORD MOTOR CO.

41. Position the power steering line bracket in place and install the bolts.
    - Tighten to 9 Nm (80 lb-in).

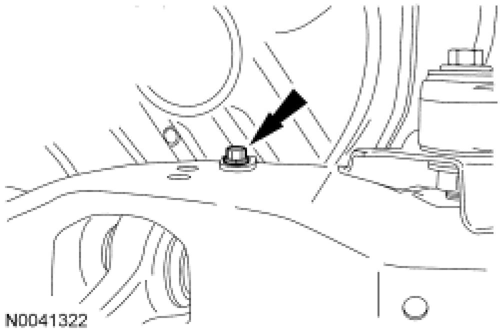

Fig. 299: Locating Power Steering Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

NOTE: FWD shown, AWD similar.

42. Install the 2 transaxle roll restrictor bolts.
    - Tighten to 90 Nm (66 lb-ft).

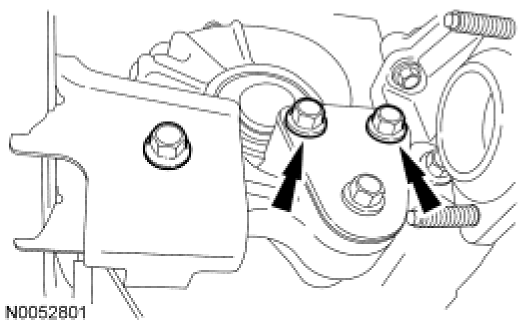

Fig. 300: Locating Engine Roll Restrictor Bracket Bolts
Courtesy of FORD MOTOR CO.

43. If equipped, install the roll restrictor heat shield and the bolts.

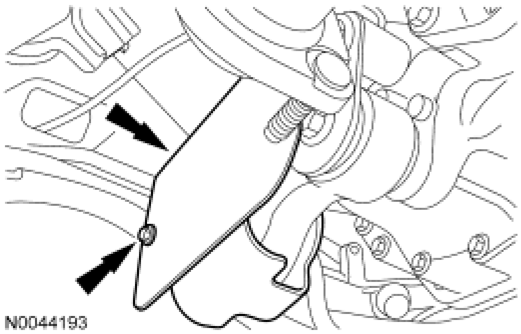

Fig. 301: Locating Heat Shield And Bolts
Courtesy of FORD MOTOR CO.

44. Position the Y-pipe assembly in place and install the 2 exhaust flexible pipe-to-catalytic converter nuts.

- Tighten to 40 Nm (30 lb-ft).

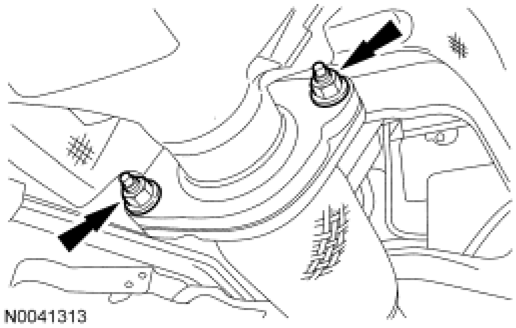

Fig. 302: Locating Flex Pipe Nuts
Courtesy of FORD MOTOR CO.

45. Install the Y-pipe bolts and the Y-pipe nuts.
    - Tighten to 40 Nm (30 lb-ft).

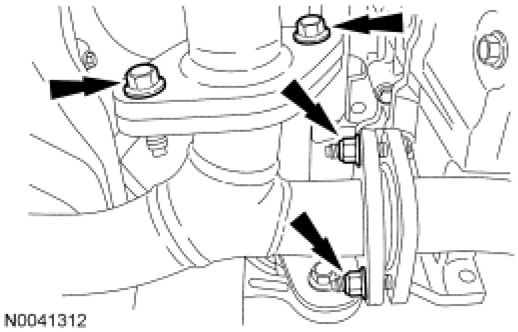

Fig. 303: Locating Y-Pipe Bolts And Nuts
Courtesy of FORD MOTOR CO.

46. Install the RH damper fork through bolt connecting the fork to the lower control arm.
    - Tighten to 103 Nm (76 lb-ft).

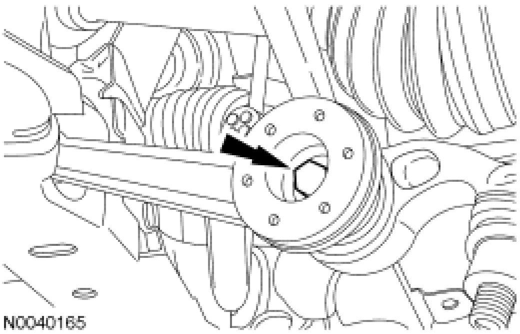

Fig. 304: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

47. Position the lower control arms in the knuckle and install the nuts.
    - Tighten to 200 Nm (148 lb-ft).

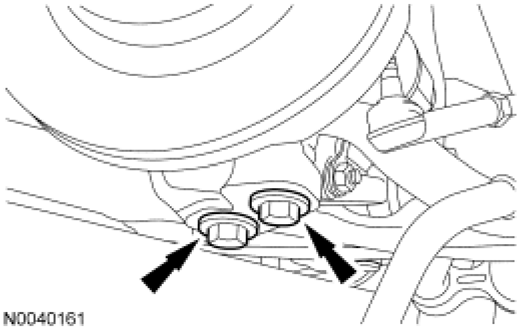

Fig. 305: Locating Front And Rear Lower Control Arm Nuts
Courtesy of FORD MOTOR CO.

AWD vehicles

48. Using the Halfshaft Installer, install the LH halfshaft in the wheel hub. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

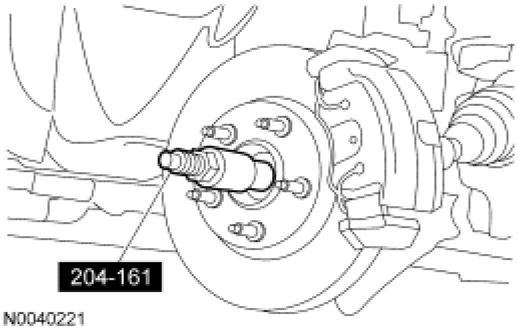

Fig. 306: Identifying Special Tool 204-161
Courtesy of FORD MOTOR CO.

49. Install the RH front wheel hub nut.
    - Tighten 225 Nm (185 lb-ft).

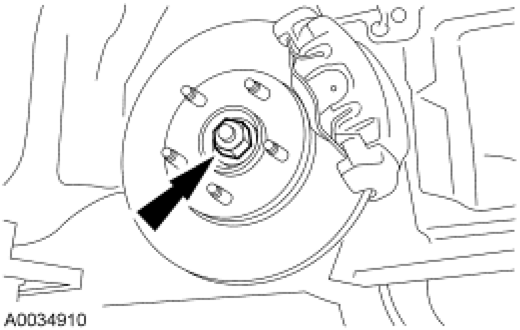

Fig. 307: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: LH shown, RH similar.

50. Using the Halfshaft Installer, install the RH halfshaft in the wheel hub. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

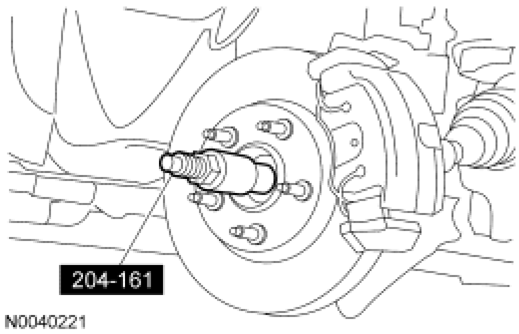

Fig. 308: Identifying Special Tool 204-161
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

51. Position the sway bar links in the struts and install the nuts.
    - Tighten to 40 Nm (30 lb-ft).

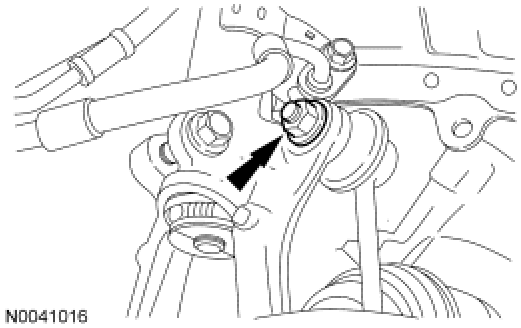

Fig. 309: Locating Sway Bar Links Nut
Courtesy of FORD MOTOR CO.

52. Install the LH front structure to subframe splash shield and install the pin-type retainers.

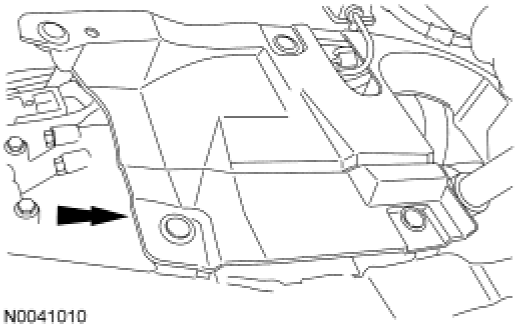

Fig. 310: Locating LH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

53. Position the LH fender splash shield in place and install the 4 screws.

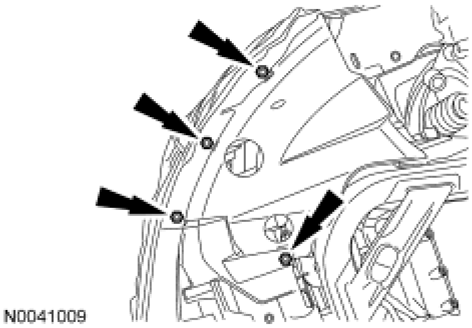

Fig. 311: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

54. Position the RH front structure-to-subframe splash shield in place and install the 6 pin-type retainers.

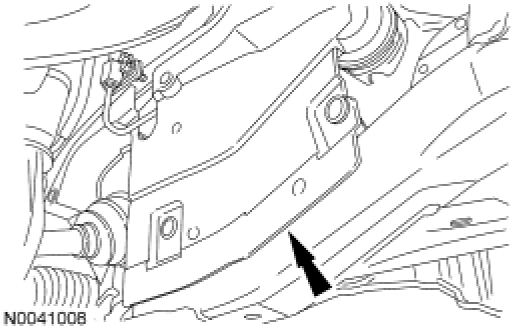

Fig. 312: Locating RH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

55. Position the RH fender splash shield in place and install the 4 screws.

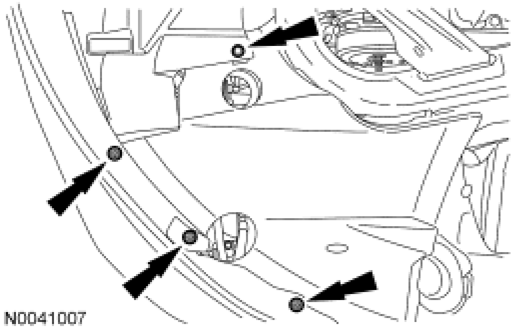

Fig. 313: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

56. Position the power steering line bracket on the right cylinder head and install the bolt.
    - Tighten to 7 Nm (62 lb-in).

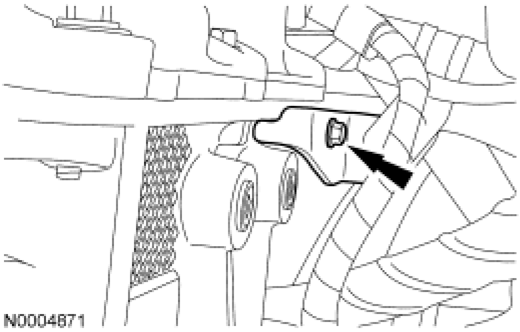

Fig. 314: Locating Bracket For Power Steering Hose
Courtesy of FORD MOTOR CO.

57. Install a new gasket and the EGR valve and install the 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).

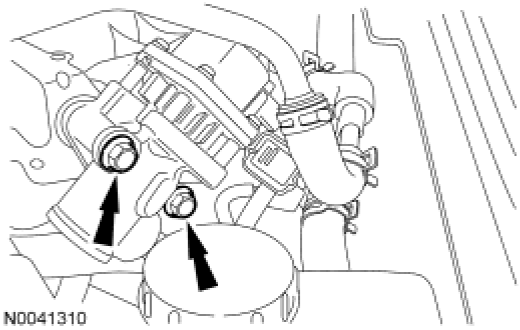

Fig. 315: Locating EGR Valve And Bolts
Courtesy of FORD MOTOR CO.

58. Install the EGR tube on the valve.
    - Tighten to 40 Nm (30 lb-ft).

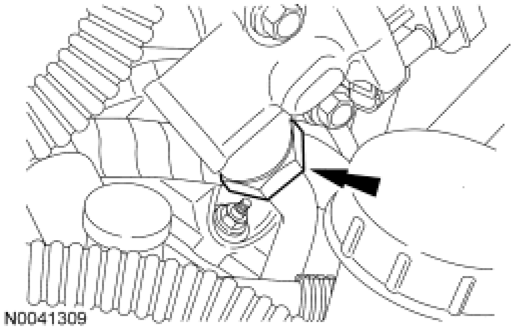

Fig. 316: Locating EGR Tube Nut
Courtesy of FORD MOTOR CO.

59. Connect the EGR valve electrical connector.

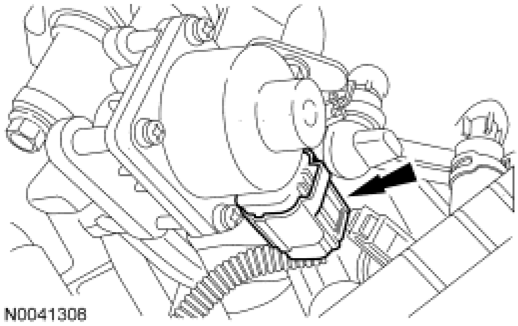

Fig. 317: Locating EGR Valve Electrical Connector
Courtesy of FORD MOTOR CO.

NOTE: FWD shown, AWD similar.

60. Tighten the EGR tube at the RH exhaust manifold.
    - Tighten to 40 Nm (30 lb-ft).

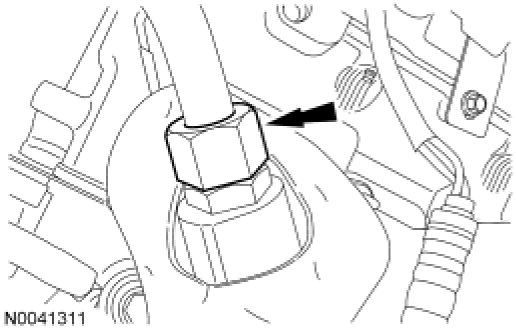

Fig. 318: Locating EGR Tube Nut At RH Exhaust Manifold
Courtesy of FORD MOTOR CO.

61. Install the 3 upper transaxle-to-engine retaining bolts.

- Tighten to 40 Nm (30 lb-ft).

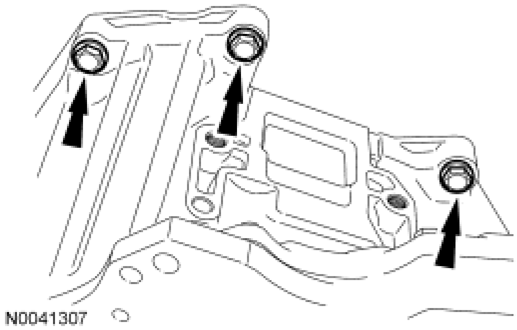

Fig. 319: Locating Upper Torque Converter Housing Bolts
Courtesy of FORD MOTOR CO.

62. Install the starter and the 2 bolts.
    - Tighten to 26 Nm (19 lb-ft).

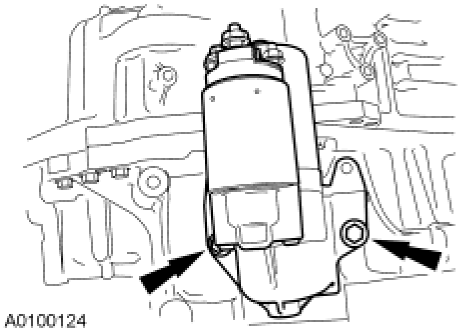

Fig. 320: Locating Starter Bolts
Courtesy of FORD MOTOR CO.

63. Connect the 2 starter motor electrical connectors.
    - Tighten the larger nut to 12 Nm (106 lb-in).
    - Tighten the smaller nut to 5 Nm (44 lb-in).

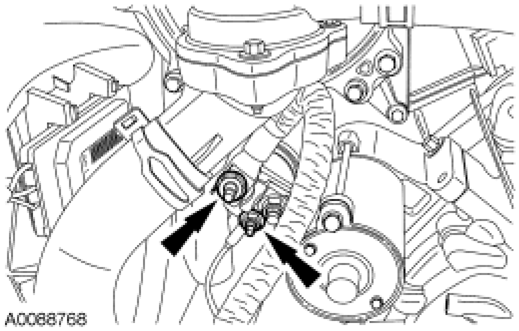

Fig. 321: Identifying Starter Motor Electrical Connectors
Courtesy of FORD MOTOR CO.

64. Install the electrical cover for the starter motor electrical connectors.

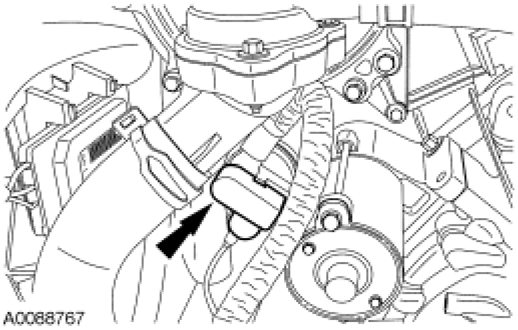

Fig. 322: Identifying Electrical Cover For Starter Motor Electrical Connectors
Courtesy of FORD MOTOR CO.

65. Install the 2 ground wires and ground wire bolts.
    - Tighten to 12 Nm (106 lb-in).

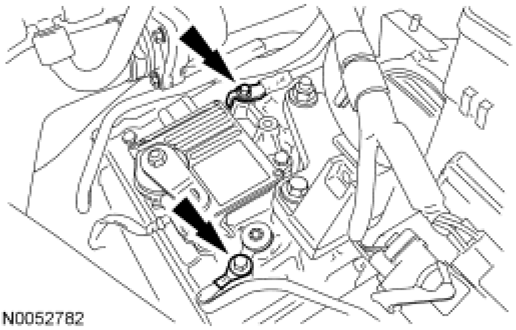

Fig. 323: Identifying Ground Straps & Ground Strap Bolts
Courtesy of FORD MOTOR CO.

66. Connect the Transmission Control Module (TCM) electrical connector.

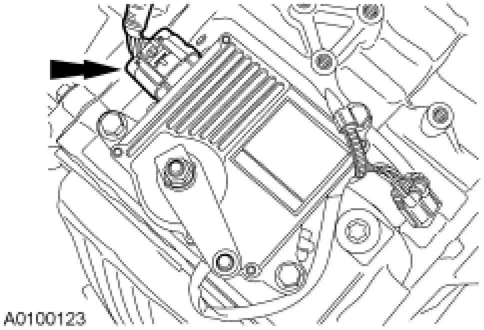

Fig. 324: Identifying Transmission Control Module Electrical Connector
Courtesy of FORD MOTOR CO.

67. Position the selector lever cable and bracket in place and install the selector lever cable nut and 2 selector

lever cable bolts.

- Tighten to 12 Nm (106 lb-in).

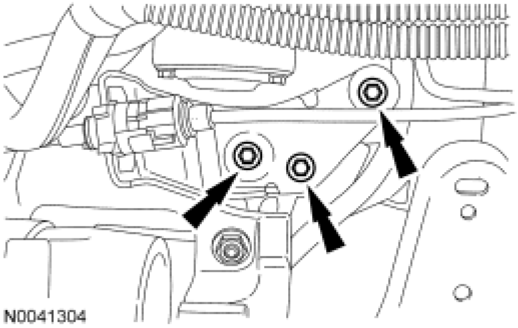

Fig. 325: Locating Transaxle Control Cable Bracket Bolts
Courtesy of FORD MOTOR CO.

68. Connect the selector lever cable end.

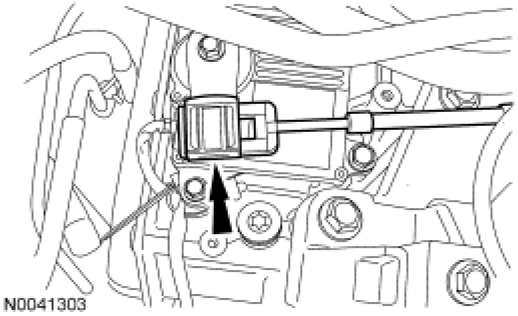

Fig. 326: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

69. Remove the transmission fluid fill plug.

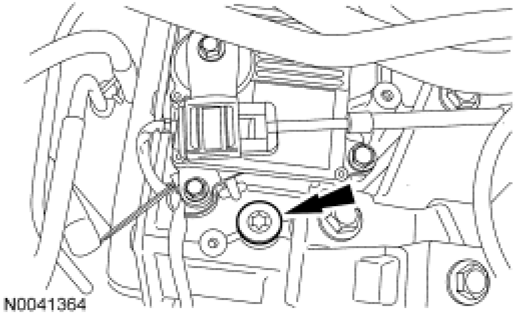

Fig. 327: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

70. Fill the transaxle with clean transmission fluid.

71. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

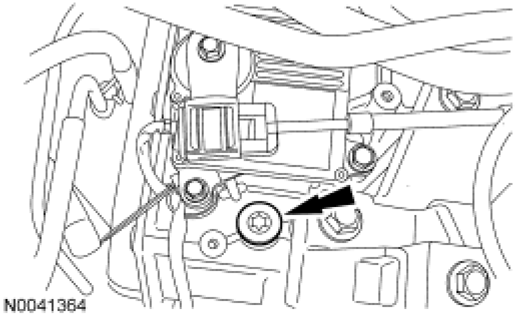

Fig. 328: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

72. Install the air cleaner and outlet tube. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
73. Install the battery tray and the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
74. Remove the transmission fluid level indicator and make sure that the transaxle has transmission fluid in it.
75. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.
76. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
77. Wipe the transmission fluid level indicator with a clean cloth.

NOTE: **In order to get an accurate transmission fluid level reading, the vehicle should be on a level surface. Idle the engine to reach the normal operating temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.**

78. If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the transmission fluid level indicator. The transmission fluid level should be at the upper most mark on the transmission fluid level indicator. Only fill to the upper most mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.

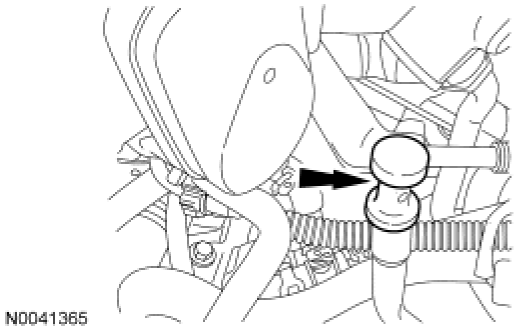

Fig. 329: Locating Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: **The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the fluid level indicator.**

79. Fill the transaxle to the correct fluid level.

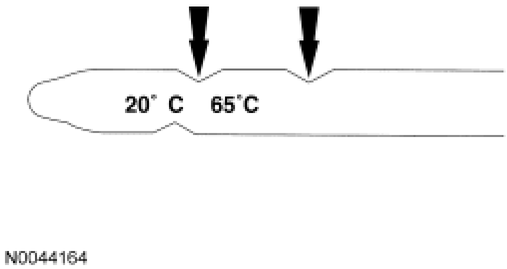

Fig. 330: Locating Temperature Marks On Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE: **The correct transmission fluid level at cold operating temperature of 15°C-25°C (59°F-77°F) is at the bottom mark on the transmission fluid level indicator.**

80. If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

Fig. 331: Locating Bottom Mark On Fluid Level Indicator
Courtesy of FORD MOTOR CO.

TRANSAXLE - 3.5L

Special Tools

Material

Item	Specification
Motorcraft Premium Automatic Transmission Fluid XT-8-QAW (US); CXT-8-LAW12 (Canada)	WSS-M2C924-A
Multi-Purpose Grease XG-4 and/or XL-5	ESB-M1C93-B
Threadlock and Sealer TA-25	WSK-M2G351-A5

NOTE: **MERCON®, MERCON® V, MERCON® SP, Motorcraft Premium Automatic Transmission Fluid and Motorcraft Continuously Variable Chain Type**

Transmission Fluid are not interchangeable transmission fluids. The use of any transmission fluid other than what is recommended for this transaxle will cause transaxle damage.

NOTE: **If the transaxle was overhauled, or if installing a new transaxle and the transmission fluid cooler has not been flushed, flush the transmission fluid cooler at this time. For additional information, refer to Transmission Fluid Cooler - Backflushing and Cleaning.**

All vehicles

1. Prior to installing the transaxle, apply multi-purpose grease to the torque converter pilot hub.

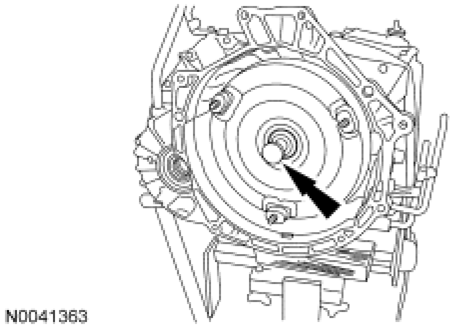

Fig. 332: Identifying Torque Converter Pilot Hub
Courtesy of FORD MOTOR CO.

2. Position the transaxle to the back of the engine.
3. Install the 7 transaxle-to-engine bolts.
   - Tighten to 48 Nm (35 lb-ft).

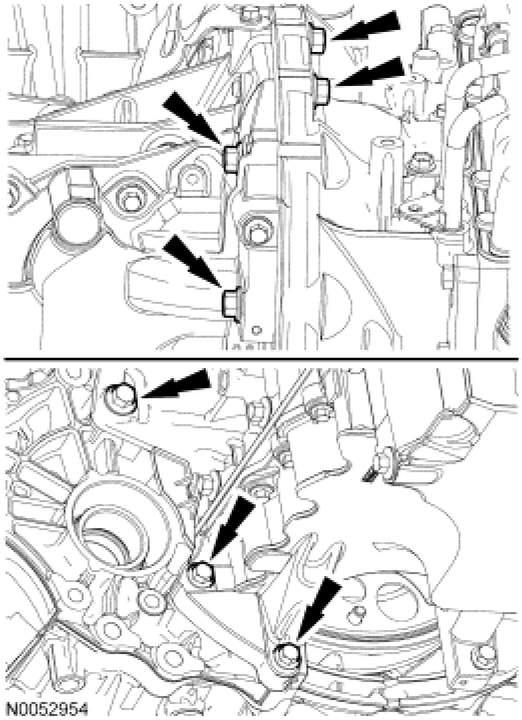

Fig. 333: Locating Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

4. Connect the transmission fluid cooler hoses to the transmission cooler tubes.

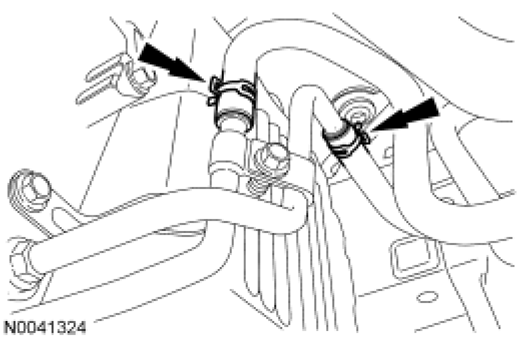

Fig. 334: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

5. Install 4 new torque converter nuts.
   - Tighten to 36 Nm (27 lb-ft).

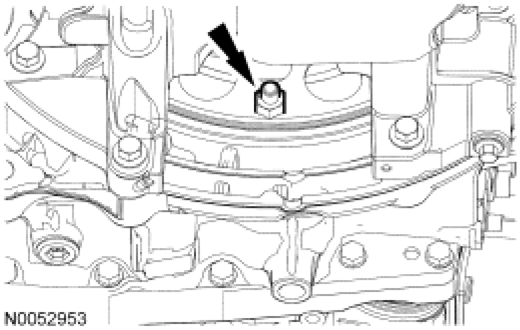

Fig. 335: Identifying Torque Converter Nuts
Courtesy of FORD MOTOR CO.

6. Position the inspection cover in place and install the 2 fasteners.

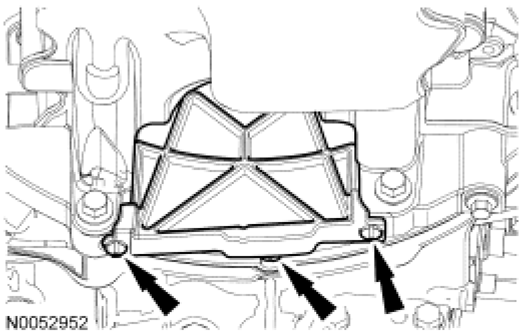

Fig. 336: Identifying Inspection Cover & Fasteners
Courtesy of FORD MOTOR CO.

All-Wheel Drive (AWD) vehicles

7. Position the power transfer unit Power Transfer Unit (PTU) in place and install the 5 bolts.
   - Tighten to 90 Nm (66 lb-ft).

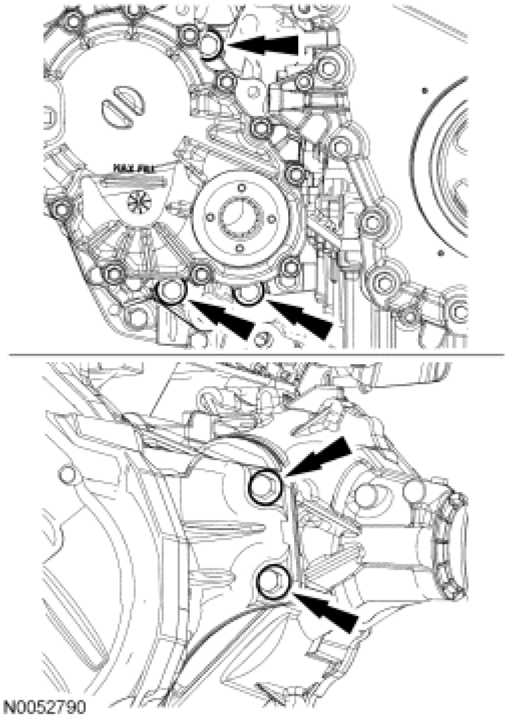

Fig. 337: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

8. Using the Bearing Cup Remover/Installer and Handle, install a new intermediate shaft seal.

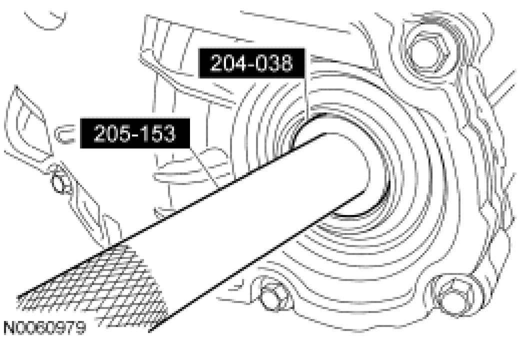

Fig. 338: Identifying Intermediate Shaft Seal & Special Tools (204-038, 205-153)
Courtesy of FORD MOTOR CO.

NOTE:	**Do not overheat (melt) the seal deflector. If the deflector is damaged, a new one must be used.**

9. Using the Heat Gun, heat the new seal deflector. Concentrate the heat across the back of the deflector near the white-colored tabs. Install the seal deflector immediately after heating.
   - If necessary, use the PTU Drive Gear Outer Oil Seal Installer and Halfshaft Oil Seal Installer to seat the seal deflector. Make sure the deflector is fully seated and there are no cracks on the face or inner diameter white-colored tab.

- For an alternate method to heat the seal deflector, place the deflector in boiling water for 3 to 5 minutes. Dry off deflector and install.
- Make sure the deflector is completely seated all the way around.

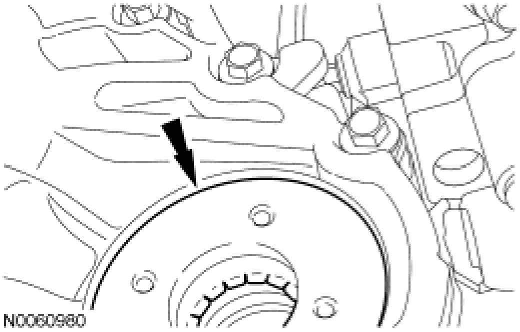

Fig. 339: Identifying Seal Deflector
Courtesy of FORD MOTOR CO.

10. Position the PTU support bracket in place and install the 5 bolts.
    - Tighten to 70 Nm (52 lb-ft).

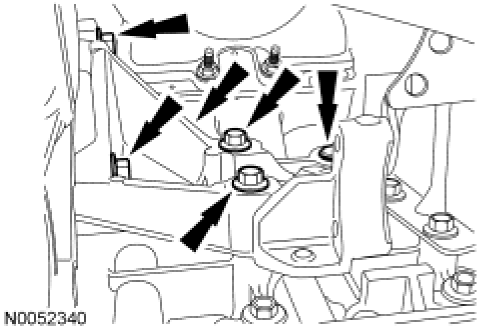

Fig. 340: Locating Power Transfer Unit (PTU) Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

11. Position the RH catalytic converter in place and install the 4 nuts.
    - Tighten to 40 Nm (30 lb-ft).

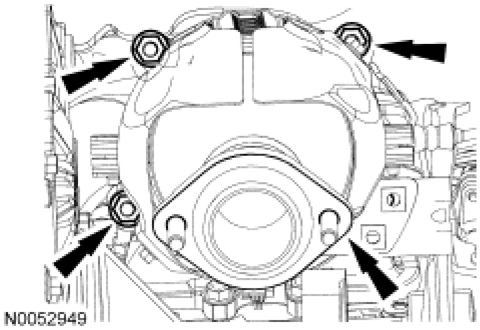

Fig. 341: Locating RH Catalytic Converter Nuts

Courtesy of FORD MOTOR CO.

12. Install the 2 catalytic converter bracket bolts.
    - Tighten to 20 Nm (177 lb-in).

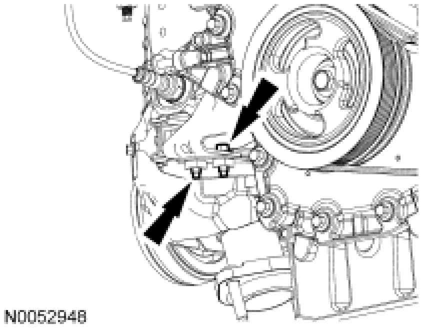

Fig. 342: Identifying Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

13. Connect the RH catalyst monitor sensor electrical connector.

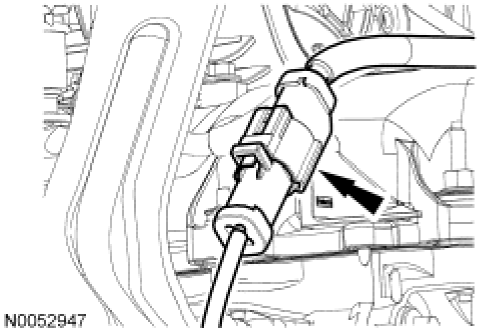

Fig. 343: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

14. Position the driveshaft in place, align the index marks made during removal and install the bolts.
    - Tighten to 70 Nm (52 lb-ft).

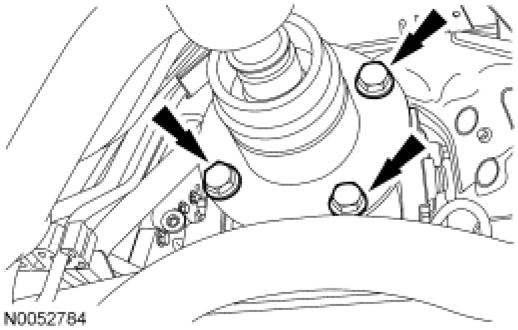

Fig. 344: Identifying Drive Shaft Bolts

Courtesy of FORD MOTOR CO.

15. Position the RH halfshaft in the transaxle and in the wheel hub and install the 2 bolts.
    - Tighten to 23 Nm (17 lb-ft).

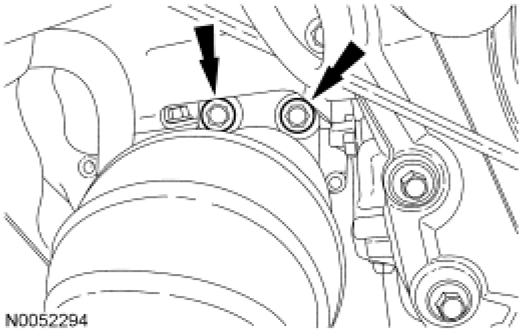

Fig. 345: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

Front Wheel Drive (FWD) vehicles

16. Install the RH halfshaft in the transaxle and install the 3 bolts.
    - Tighten to 55 Nm (41 lb-ft).

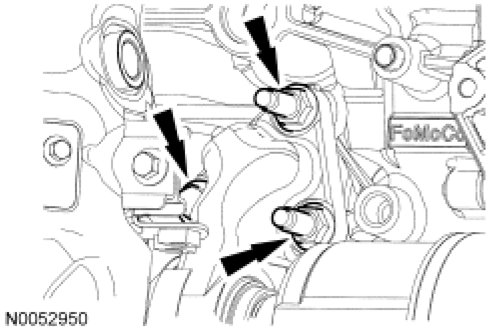

Fig. 346: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

17. Install the catalytic converter support bracket and install the 2 nuts.
    - Tighten to 23 Nm (17 lb-ft).

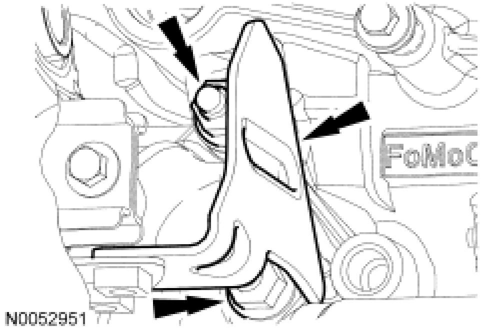

Fig. 347: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

18. Install the 2 catalytic converter bracket bolts.
    - Tighten to 20 Nm (177 lb-in).

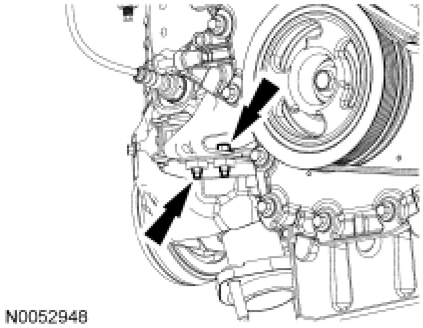

Fig. 348: Identifying Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: LH shown, RH similar.

19. Position the subframe in place and install the 2 front subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

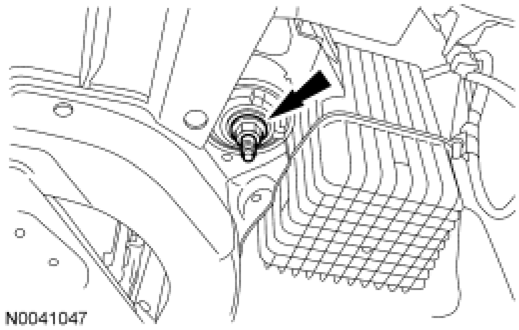

Fig. 349: Locating Front Subframe Nuts

Courtesy of FORD MOTOR CO.

20. Position the subframe support brackets in place and loosely install the bolts.

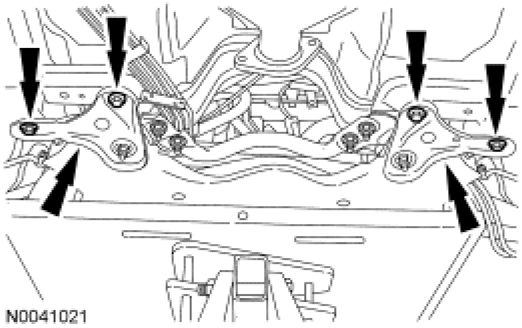

Fig. 350: Locating Subframe Support Brackets And Bolts
Courtesy of FORD MOTOR CO.

21. Install the rear subframe nuts.
    - Tighten to 150 Nm (111 lb-ft).

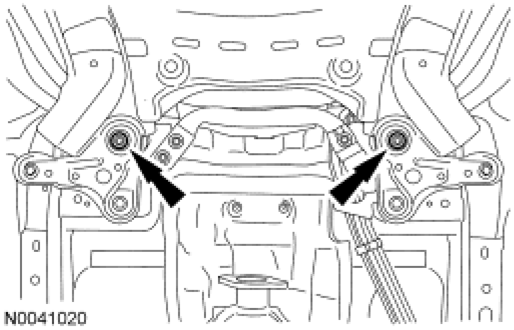

Fig. 351: Locating Rear Subframe Nuts
Courtesy of FORD MOTOR CO.

22. Tighten the subframe support bracket bolts.
    - Tighten to 103 Nm (76 lb-ft).

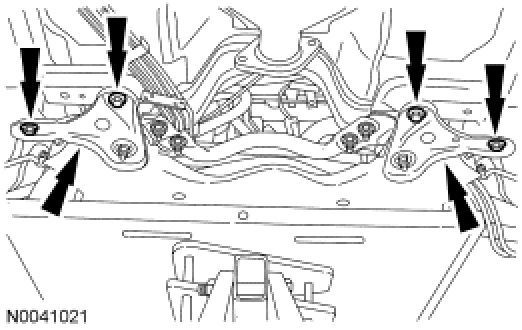

Fig. 352: Locating Subframe Support Brackets And Bolts

Courtesy of FORD MOTOR CO.

23. Position the steering gear in place and install the 3 bolts.
    - Tighten to 107 Nm (79 lb-ft).

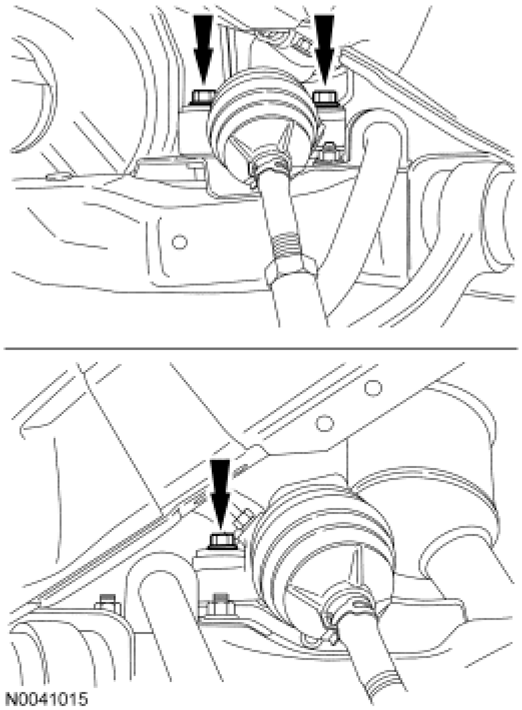

Fig. 353: Locating Steering Gear Bolts
Courtesy of FORD MOTOR CO.

24. Position the power steering cooler line bracket in place and install the bolts.
    - Tighten to 9 Nm (80 lb-in).

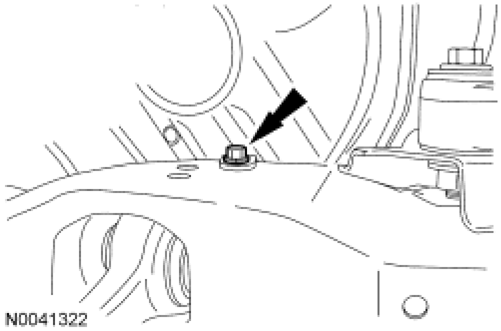

Fig. 354: Locating Power Steering Cooler Tube Bolts
Courtesy of FORD MOTOR CO.

25. Install the 2 roll restrictor bracket bolts.
    - Tighten to 90 Nm (66 lb-ft).

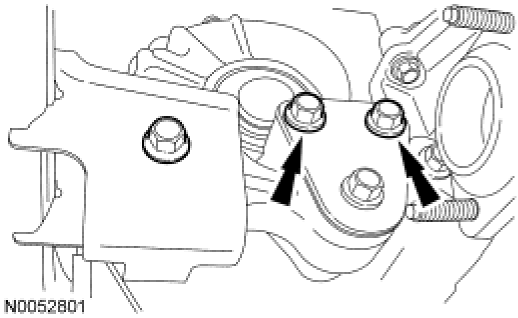

Fig. 355: Locating Engine Roll Restrictor Bracket Bolts
Courtesy of FORD MOTOR CO.

26. Install the RH damper fork through bolt connecting the fork to the lower control arm.
    - Tighten to 103 Nm (76 lb-ft).

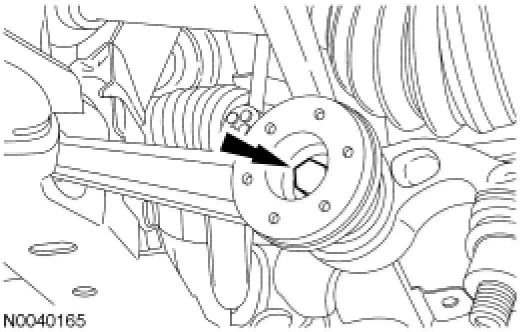

Fig. 356: Locating Damper Fork Bolt
Courtesy of FORD MOTOR CO.

27. Position the lower control arms in the knuckle and install the nuts.
    - Tighten to 200 Nm (148 lb-ft).

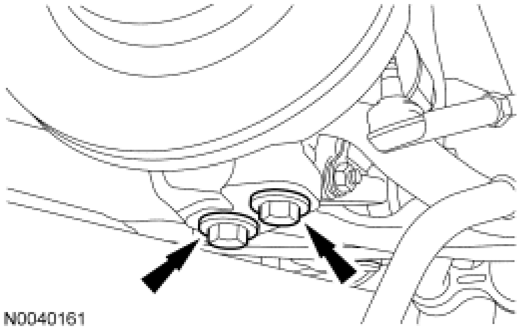

Fig. 357: Locating Front And Rear Lower Control Arm Nuts
Courtesy of FORD MOTOR CO.

AWD vehicles

28. Using the Halfshaft Installer, install the halfshaft in the wheel hub.

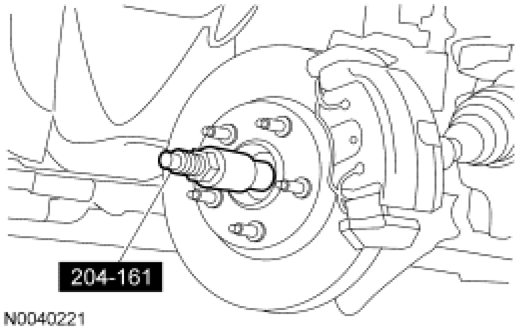

Fig. 358: Identifying Special Tool 204-161
Courtesy of FORD MOTOR CO.

29. Install a new front wheel hub nut.
    - Tighten to 255 Nm (185 lb-ft).

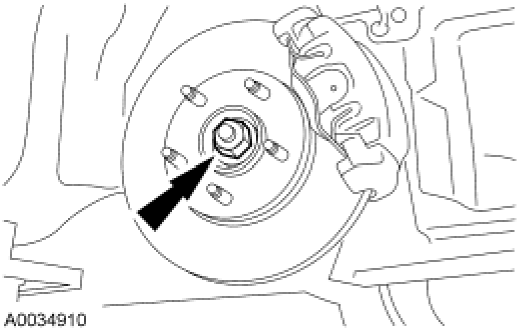

Fig. 359: Locating Front Wheel Hub Nut
Courtesy of FORD MOTOR CO.

All vehicles

30. Install the LH halfshaft. For additional information, refer to **FRONT DRIVE HALFSHAFTS** article.

NOTE: LH shown, RH similar.

31. Position the sway bar links in the struts and install the nuts.
    - Tighten to 40 Nm (30 lb-ft).

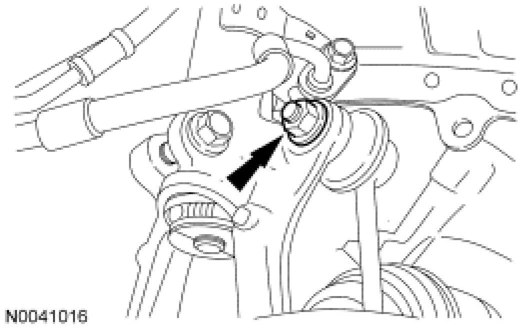

Fig. 360: Locating Sway Bar Links Nut
Courtesy of FORD MOTOR CO.

32. Position the Y-pipe in place and install the 6 Y-pipe nuts.
    - Tighten to 40 Nm (30 lb-ft).

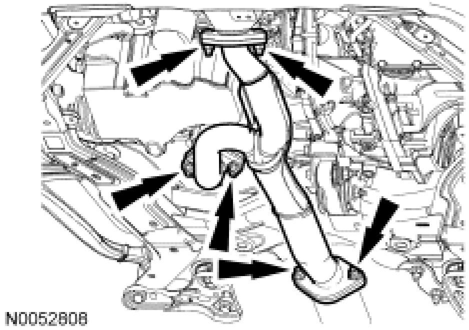

Fig. 361: Locating Y-Pipe Nuts & Y-Pipe Assembly
Courtesy of FORD MOTOR CO.

33. Install the LH front structure to subframe splash shield and install the pin-type retainers.

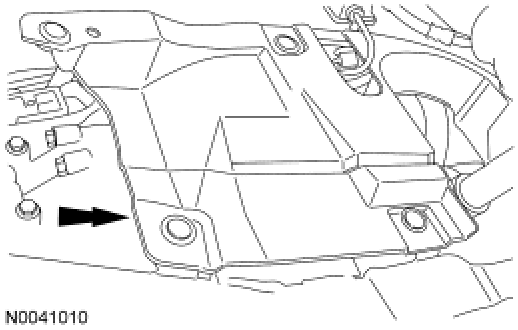

Fig. 362: Locating LH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

34. Position the LH fender splash shield in place and install the 4 screws.

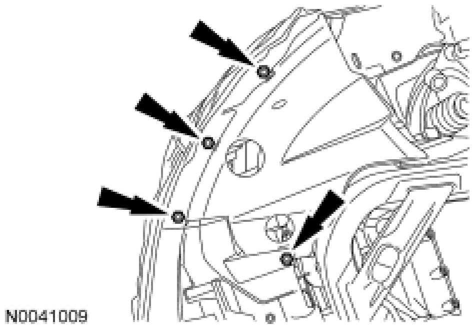

Fig. 363: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

35. Position the RH front structure-to-subframe splash shield in place and install the 6 pin-type retainers.

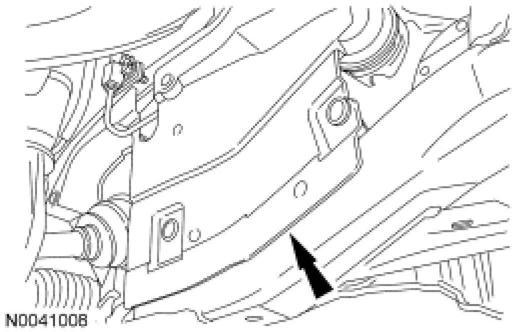

Fig. 364: Locating RH Front Structure-To-Subframe Splash Shield
Courtesy of FORD MOTOR CO.

36. Position the RH fender splash shield in place and install the 4 screws.

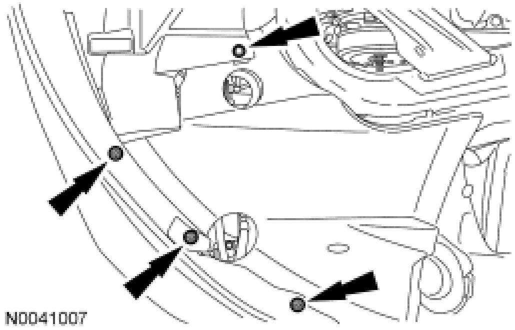

Fig. 365: Locating RH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

37. Apply threadlock and sealer to the threads and install the transaxle support insulator bracket, the 2 nuts and the bolt.
    - Tighten to 80 Nm (59 lb-ft).

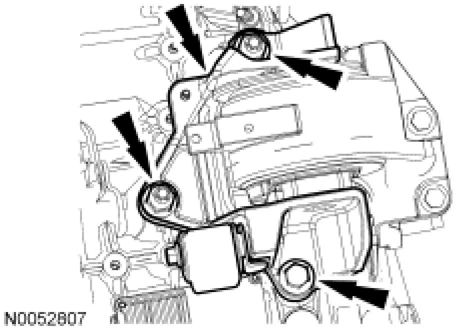

Fig. 366: Locating Transaxle Support Insulator Bracket Nuts & Bolt
Courtesy of FORD MOTOR CO.

38. Using the Engine Support Bar, raise the transaxle. Apply threadlock and sealant to the threads and install the transaxle support insulator through bolt.
    - Tighten to 130 Nm (96 lb-ft).

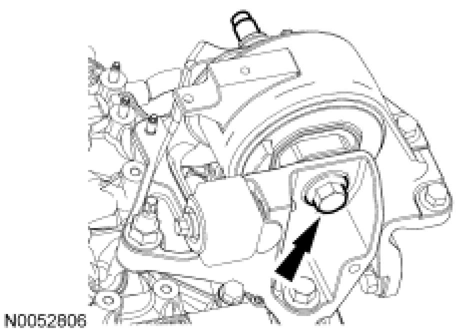

Fig. 367: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

39. Remove the Engine Support Bar and Spreader Bar.

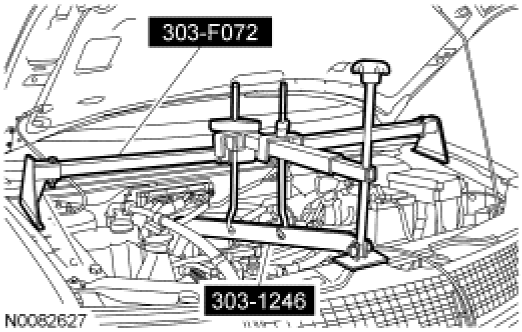

Fig. 368: Installing Engine Support Bar & Spreader Bar To Support Engine
Courtesy of FORD MOTOR CO.

40. Remove the Engine Lifting Bracket from the LH cylinder head.

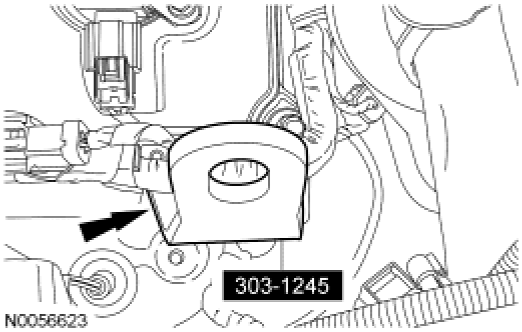

Fig. 369: Special Tool (303-1245) On LH Cylinder Head
Courtesy of FORD MOTOR CO.

41. Install the 4 upper transaxle-to-engine bolts.
    - Tighten to 48 Nm (35 lb-ft).

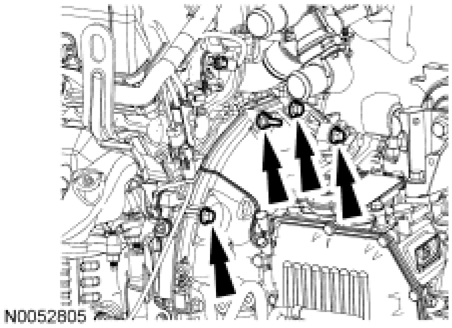

Fig. 370: Identifying Upper Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

42. Install the starter and the 2 bolts.
    - Tighten to 26 Nm (19 lb-ft).

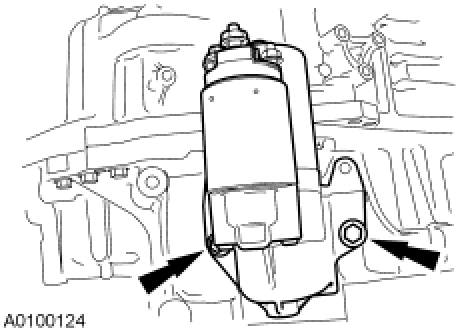

Fig. 371: Locating Starter Bolts
Courtesy of FORD MOTOR CO.

43. Connect the 2 starter motor electrical connectors and position back the electrical terminal cover.
    - Tighten the larger nut to 12 Nm (106 lb-in).

- Tighten the smaller nut to 5 Nm (44 lb-in).

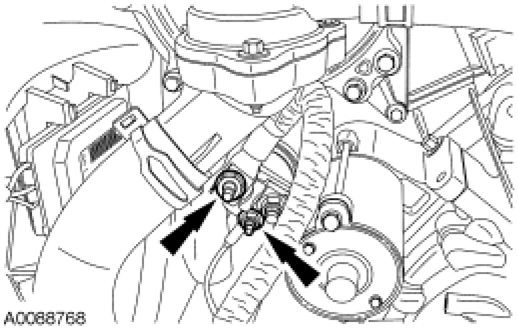

Fig. 372: Identifying Starter Motor Electrical Connectors
Courtesy of FORD MOTOR CO.

44. Position the 2 ground straps in place and install the 2 ground strap bolts.
    - Tighten to 12 Nm (106 lb-in).

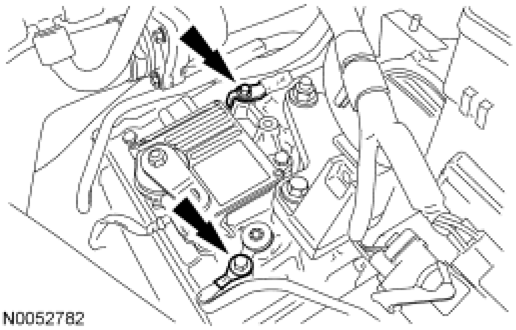

Fig. 373: Identifying Ground Straps & Ground Strap Bolts
Courtesy of FORD MOTOR CO.

45. Connect the wiring harness fasteners on the torque converter housing stud bolt and the starter motor.

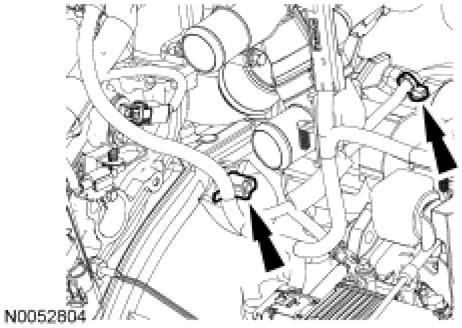

Fig. 374: Identifying Wiring Harness Fasteners & Torque Converter Housing Stud Bolt
Courtesy of FORD MOTOR CO.

46. Connect the Transmission Control Module (TCM) electrical connector.

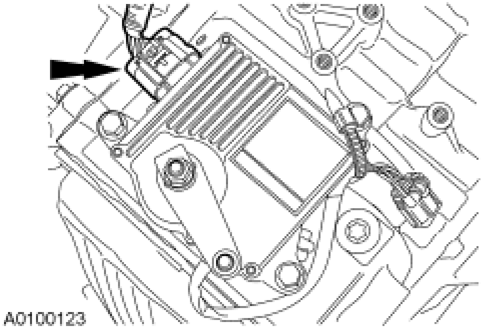

Fig. 375: Identifying Transmission Control Module Electrical Connector
Courtesy of FORD MOTOR CO.

47. Position the selector lever cable in place and install the 2 bolts and the nut.
    - Tighten to 12 Nm (106 lb-in).

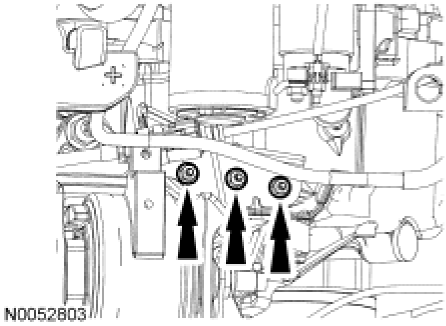

Fig. 376: Identifying Selector Lever Cable Bracket Bolts & Nuts
Courtesy of FORD MOTOR CO.

48. Connect the selector lever cable end.

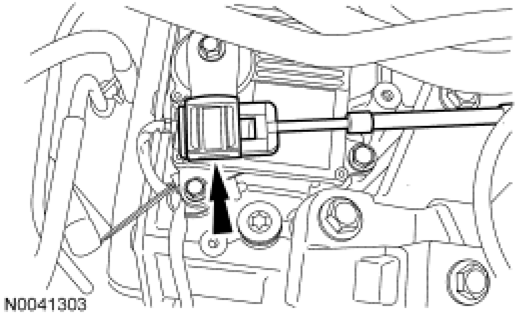

Fig. 377: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

49. Remove the transmission fluid fill plug.

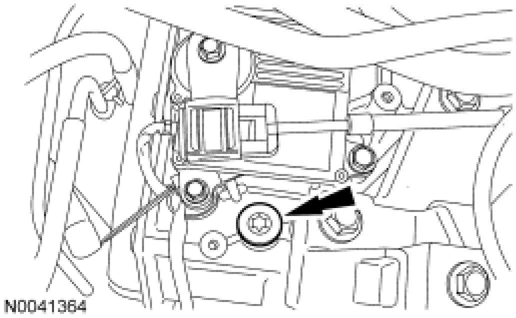

Fig. 378: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

50. Fill the transaxle with clean transmission fluid.
51. Install the transmission fluid fill plug.
    - Tighten to 39 Nm (29 lb-ft).

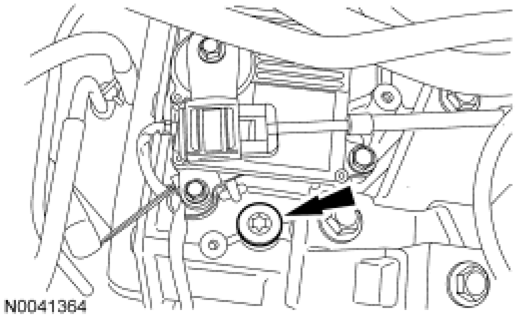

Fig. 379: Locating Fluid Fill Plug
Courtesy of FORD MOTOR CO.

52. Install the upper intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
53. Install the air cleaner and outlet tube. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 2.3L** article or **INTAKE AIR DISTRIBUTION AND FILTERING - 3.0L (4V)** article.
54. Install the battery tray and the battery. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
55. Remove the transmission fluid level indicator and make sure that the transaxle has transmission fluid in it.
56. With the transaxle in PARK, the vehicle on a level surface, the engine at idle (680-780 rpm) and foot pressed on the brake, move the selector lever through each gear and allow engagement of each gear. Place the selector lever back in the PARK position.
57. Wipe the transmission fluid level indicator cap and remove the transmission fluid level indicator.
58. Wipe the transmission fluid level indicator with a clean cloth.

NOTE: **In order to get an accurate transmission fluid level reading the vehicle should be on a level surface. Idle the engine to reach the normal operating**

temperature. Using the scan tool, verify that the transaxle is at normal operating temperature 60°C-70°C (140°F-158°F), prior to adjusting the transmission fluid level.

59. If transmission fluid needs to be added, add transmission fluid in 0.25L (1/2 pt) increments through the transmission fluid fill plug located on the top of the transaxle near the transmission fluid level indicator. Do not overfill the transmission fluid. Install the transmission fluid level indicator back in the transmission fluid filler tube until it is fully seated, then remove the indicator. The transmission fluid level should be at the upper most mark on the transmission fluid level indicator. Only fill to the upper most mark on the transmission fluid level indicator. Do not overfill. Damage to the transaxle will occur.

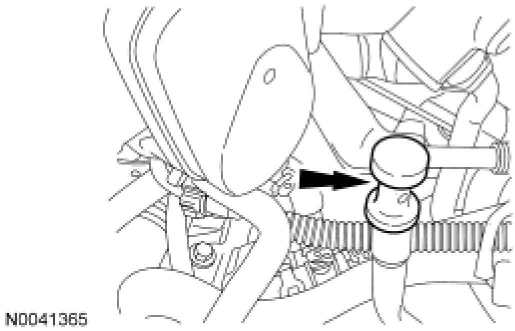

Fig. 380: Locating Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE:	**The correct transmission fluid level at normal operating temperature of 60°C-70°C (140°F-158°F) is between the top 2 marks on the transmission fluid level indicator.**

60. Fill the transaxle to the correct transmission fluid level.

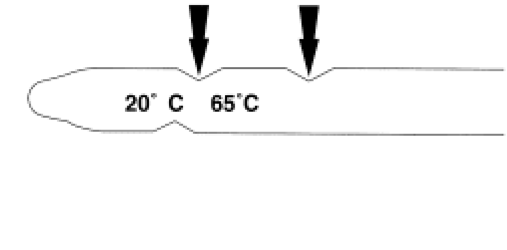

Fig. 381: Locating Temperature Marks On Fluid Level Indicator
Courtesy of FORD MOTOR CO.

NOTE:	**The correct transmission fluid level at cold operating temperature of 15°C-25°C (59°F-77°F) is at the bottom mark on the transmission fluid level indicator.**

61. If the Transmission Fluid Temperature (TFT) is low, fill the transaxle with transmission fluid to the cold range on the transmission fluid level indicator. Recheck the transmission fluid level when the transaxle has reached the normal operating temperature.

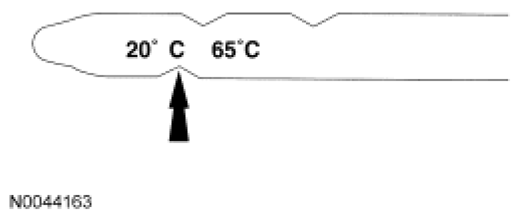

Fig. 382: Locating Bottom Mark On Fluid Level Indicator
Courtesy of FORD MOTOR CO.

2008 TRANSMISSIONS

Automatic Transaxle/Transmission External Controls - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-in
Selector lever cable grommet nuts	8	71
Selector lever knob bolts	2	18
Selector lever nuts	12	106

DESCRIPTION AND OPERATION

EXTERNAL CONTROLS

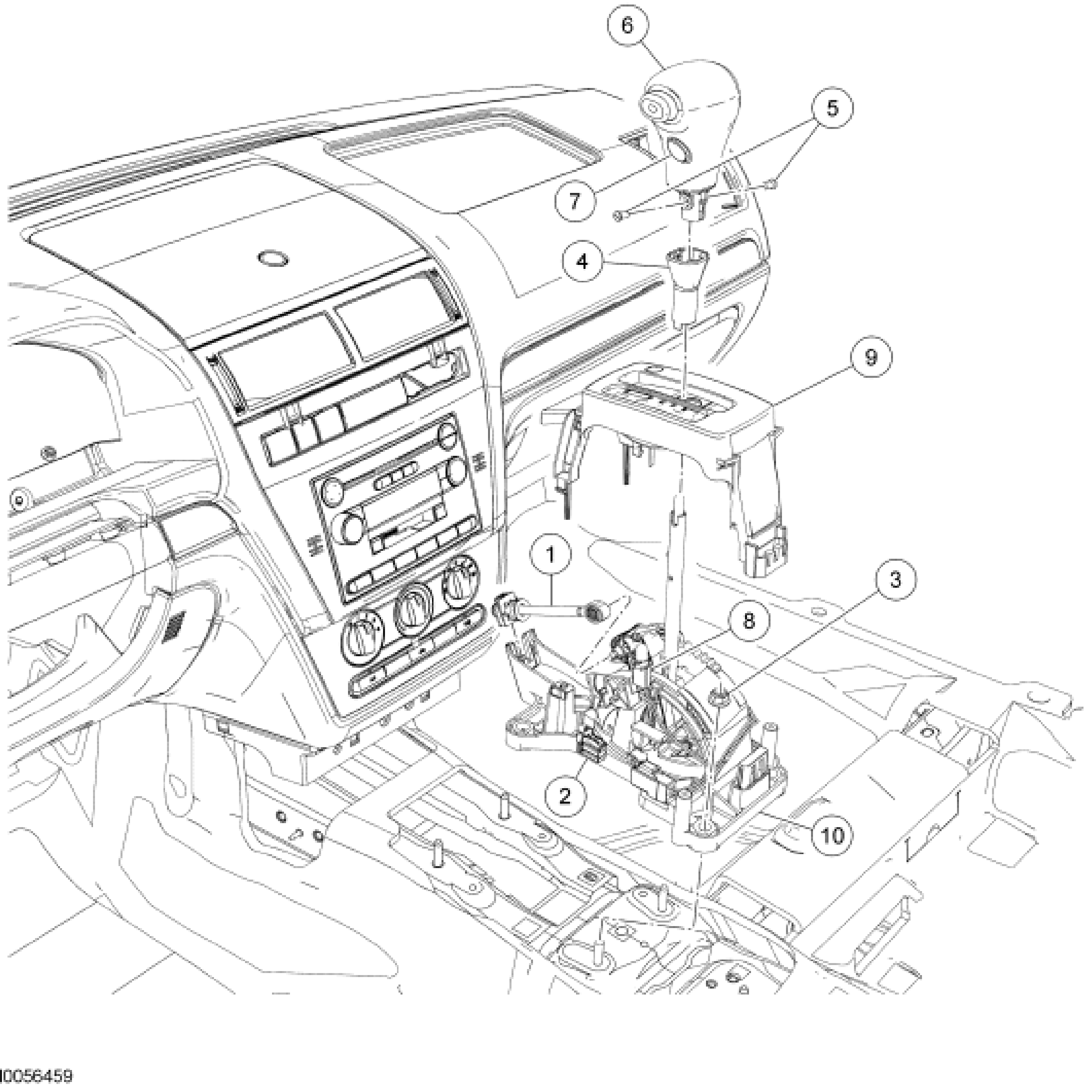

Fig. 1: Exploded View Of External Controls
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	7E395	Selector lever cable
2	14489	Selector lever electrical connector
3	W520102	Selector lever nut (4 required)
4	-	Lower selector lever knob bezel
5	-	Selector lever knob bolts
6	7L010	Selector lever knob
7	-	Transmission Control Switch (TCS) (3.5L engine) (part of 7L010) (MKZ only)
8	-	PRNDL light

9	7E034	PRNDL bezel
10	7K004	Selector lever assembly (items 4-10)

The transaxle selector lever control linkage consists of:

- a selector lever cable that connects the transaxle range selector lever to the floor selector lever assembly.
- a Brake Shift Interlock Actuator (BSIA) that is integral to the floor selector lever assembly.

The floor selector lever assembly:

- locks the transaxle range selector lever in the PARK position when the ignition switch is in the lock position.
- requires the transaxle range selector lever to be in the PARK position to turn the ignition switch to the lock position.

The MKZ Transmission Control Switch (TCS) is a momentary contact switch located on the selector lever knob that allows the driver to cancel the operation of OVERDRIVE.

DIAGNOSTIC TESTS

EXTERNAL CONTROLS

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	73 III Digital Multimeter	105-R0057 or equivalent
 ST1438-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.
3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the concern is not visually evident, verify the symptom. Go to **Symptom Chart - External Controls** or Go to **Symptom Chart - NVH**.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Selector lever cable • Manual control lever • Transmission Control Module (TCM) out of adjustment (6-speed transaxle) • Selector lever slider bunching or binding	• Battery Junction Box (BJB) fuse 14 (15A) • Connections • Wiring harness • Brake Pedal Position (BPP) switch • Brake Shift Interlock Actuator (BSIA) • Transmission Control Switch (TCS) (MKZ)

DTC Chart

DTC CHART

DTC	Component	Description	Condition	Symptom	Action
B2572	Brake Shift Interlock	Brake Shift Interlock Output Circuit Failure	The associated circuitry connected to the Smart Junction Box (SJB) or fuse, or the SJB itself may have an issue causing a brake shift interlock concern.	Brake shift interlock is inoperative or does not operate correctly.	Go to **Pinpoint Test A**.

Symptom Chart - External Controls

Symptom Chart - External Controls

Condition	Possible Sources	Action
• Brake shift interlock system does not release/lock correctly	• Circuitry open/shorted • Fuse 14 (15A) • Brake Pedal Position (BPP) switch	• Go to **Pinpoint Test A**.
• Brake shift interlock system does not release/lock correctly	• Brake Shift Interlock Actuator (BSIA) damaged or incorrectly installed after repair	• INSTALL a new selector lever assembly. REFER to **Selector Lever**.
• Transmission Control Switch (TCS) does not operate correctly (MKZ only)	• Instrument Cluster (IC) • Circuitry open/shorted • Transmission Control Module (TCM)	• Go to **Pinpoint Test B**.

	• TCS	
• Selector lever linkage is out of correct gear relationship	• Selector lever cable is out of adjustment • Loose selector lever cable bracket	• REFER to **Selector Lever Cable Adjustment**. • CHECK the selector cable bracket. TIGHTEN as necessary.
• Key stuck in the ignition cylinder or does not lock in the ignition cylinder when the selector lever is not in park	• Ignition cylinder damaged • Selector lever knob damaged • Selector lever park detent switch damaged • Selector lever pawl is not contacting park detent switch	• CHECK the ignition lock cylinder, REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article. • CHECK the selector lever knob button function by cycling the button. If the button is binding, INSTALL a new selector lever knob. REFER to **Selector Lever Knob - 2.3L, 3.0L** or **Selector Lever Knob - 3.5L**. • CHECK the park detent switch signal, go to **Pinpoint Test C**. • CHECK the selector lever for correct contact.
• Selector lever binding	• Selector lever bezel damaged • Selector lever damaged • Selector lever cable damaged • Internal transaxle components damaged	• CHECK the selector lever bezel for damage. If necessary, INSTALL a new selector lever bezel. REFER to **Selector Lever Bezel**. • CHECK the selector lever for damage. If necessary, INSTALL a new selector lever assembly. REFER to **Selector Lever**. • CHECK the selector lever cable for damage. If necessary, INSTALL a new selector lever cable. REFER to **Selector Lever Cable**. • CHECK the manual control lever and internal transaxle components for damage. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article or **AUTOMATIC TRANSAXLE/TRANSMISSION - FNR5** article.
• Brake shift interlock override does not release the selector lever	• Brake shift interlock override damaged	• INSPECT the selector lever for damage. If necessary, INSTALL a new selector lever. REFER to **Selector Lever**.

Symptom Chart - NVH

NOTE: **NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be**

necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - NVH

Condition	Possible Sources	Action
• Vibration - a high frequency (20-80 Hz) that is felt through the seat or selector lever. Changes with engine speed	• Selector lever cable incorrectly routed, grounded out or loose	• CHECK the selector lever cable. REPAIR as necessary.

Electrical Connectors

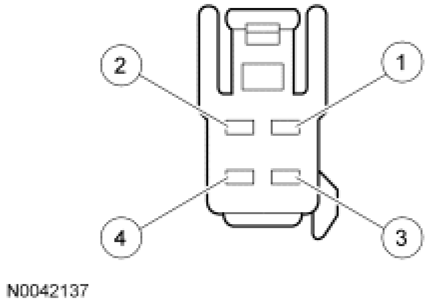

Fig. 2: Selector Lever Harness C3245 (3.0L Engine)
Courtesy of FORD MOTOR CO.

Pin Number	Circuit	Circuit Function
1	VET13 (GY/BU)	Brake Shift Interlock Actuator (BSIA) solenoid power circuit
2	CET22 (GY/BN)	Park position signal to ignition switch
3	CLN04 (BU/BN)	Power to PRNDL bulb
4	GD116 (BK/VT)	Ground

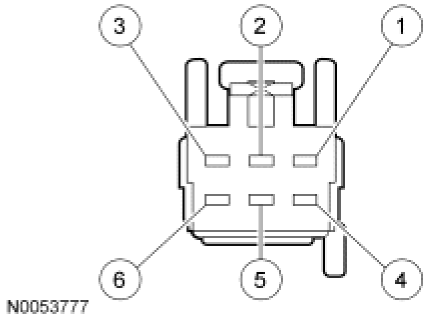

Fig. 3: Selector Lever Harness C3233 (3.5L Engine)

Courtesy of FORD MOTOR CO.

Pin Number	Circuit	Circuit Function
1	VET13 (GY/BU)	Brake Shift Interlock Actuator (BSIA) solenoid power circuit
2	CET22 (GY/BN)	Park position signal to ignition switch
3	-	Not used
4	VLN04 (VT/GY)	Power to PRNDL LED illumination
5	GD116 (BK/VT)	Ground
6	CET34 (BN/GN)	Transmission Control Switch (TCS)/ Overdrive (O/D) cancel (MKZ)

Pinpoint Tests

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Transmission Controls -6 Speed for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Transmission Controls-FNR5 for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Shift Interlock for schematic and connector information.

PINPOINT TEST A: THE BRAKE SHIFT INTERLOCK SYSTEM DOES NOT RELEASE/LOCK CORRECTLY

A1 TEST THE BRAKE LIGHTS

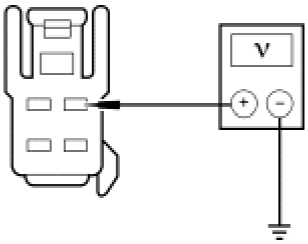
- Apply the brake pedal and view the brake lights.
- **Do the brake lights illuminate?**

  YES : Go to A2.

  NO : REFER to **EXTERIOR LIGHTING** article.

A2 TEST Brake Shift Interlock Actuator (BSIA) POWER CIRCUIT

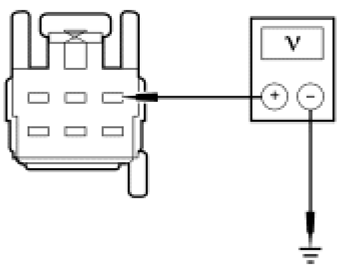
- Disconnect: Selector Lever Electrical C3245 (2.3L/3.0L engine) or C3233 (3.5L engine)
- Key in ON position.



N0042138

Fig. 4: Testing Shift Interlock Actuator Power Circuit - 3.0L or a 2.3L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the voltage between selector lever harness C3245-1, circuit VET13 (GY/BU), vehicle harness side and ground, while applying the brake pedal.



N0053796

Fig. 5: Measuring Voltage Between Selector Lever Harness C3245-1, Circuit VET13 (GY/BU)
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.5L engine, measure the voltage between selector lever harness C3233-1, circuit VET13 (GY/BU), vehicle harness side and ground, while applying the brake pedal.
- **Is the voltage greater than 10 volts?**

  YES : Go to A5.

  NO : Go to A3.

A3 TEST THE BSIA POWER CIRCUIT FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Smart Junction Box (SJB) C2280C

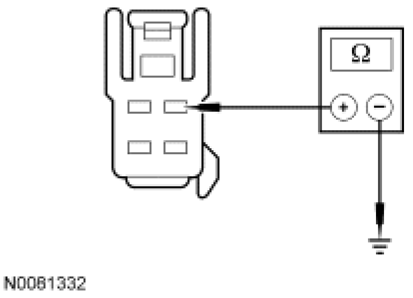


Fig. 6: Testing BSIA Power Circuit For A Short To Ground
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the resistance between the selector lever harness C3245-1, circuit VET13 (GY/BU), vehicle harness side and ground.

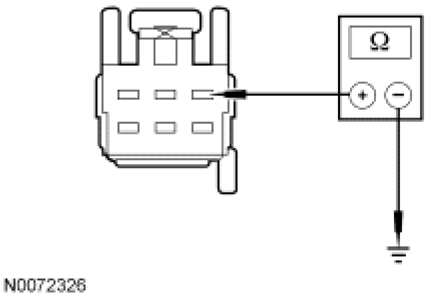

Fig. 7: Measuring Resistance Between Selector Lever Harness C3245-1, Circuit CET53 (BU/OG) & Ground
Courtesy of FORD MOTOR CO.

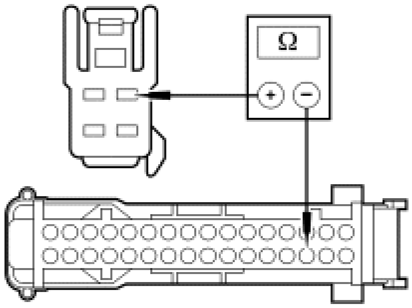
- Vehicles equipped with a 3.5L engine, measure the resistance between selector lever harness C3233-1, circuit VET13 (GY/BU), vehicle harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to A4.

  NO : REPAIR the circuit. TEST the system for normal operation.

A4 TEST THE BSIA POWER CIRCUIT FOR AN OPEN

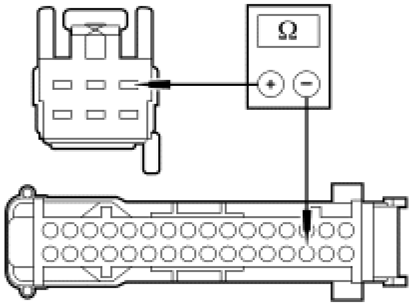
- Key in OFF position.



N0081330

Fig. 8: Testing BSIA Power Circuit For An Open
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the resistance between the selector lever harness C3245-1, circuit VET13 (GY/BU), vehicle harness side and SJB C2280C-14, circuit VET13 (GY/BU), vehicle harness side.



N0081331

Fig. 9: Measuring Resistance Between Selector Lever Harness C3245-1, Circuit VET13 (GY/BU)
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.5L engine, measure the resistance between the selector lever harness C3233-1, circuit VET13 (GY/BU), vehicle harness side and SJB C2280C-14, circuit VET13 (GY/BU), vehicle harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new SJB. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

A5 TEST THE BSIA GROUND CIRCUIT

- Key in OFF position.

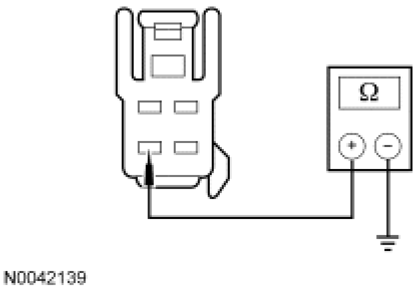


Fig. 10: Testing Shift Interlock Actuator Ground Circuit - 3.0L or a 2.3L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the resistance between the selector lever harness C3245-4, circuit GD116 (BK/VT), vehicle harness side and ground.

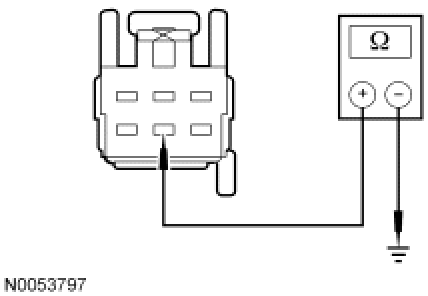

Fig. 11: Measuring Resistance Between Selector Lever Harness C3245-4, Circuit GD116 (BK/VT)
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.5L engine, measure the resistance between selector lever harness C3233-5, circuit GD116 (BK/VT), vehicle harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new selector lever. REFER to **Selector Lever**.

  NO : REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST B: Transmission Control Switch (TCS) DOES NOT OPERATE CORRECTLY (MKZ ONLY)

B1 TEST THE Instrument Cluster (IC)

- Connect the diagnostic tool.
- Using the scan tool, monitor the TCS PID while cycling the TCS.
- **Does the TCS PID cycle from depressed to not depressed?**

  YES : REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

  NO : Go to B2.

B2 TEST THE SELECTOR LEVER GROUND CIRCUIT FOR AN OPEN

- Disconnect: Selector Lever Harness C3233

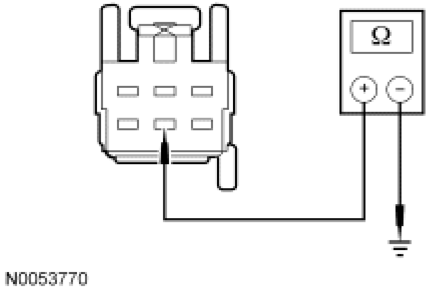

Fig. 12: Testing Selector Lever Ground Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3233-5, circuit GD116 (BK/VT), vehicle harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to B3.

  NO : REPAIR the selector lever ground circuit for an open. TEST the system for normal operation.

B3 TEST THE TCS CIRCUIT FOR AN OPEN

- Disconnect: Transmission Control Module (TCM) C1533

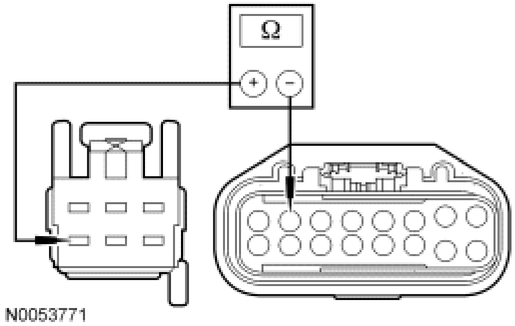

Fig. 13: Testing TC Switch Circuit For An Open
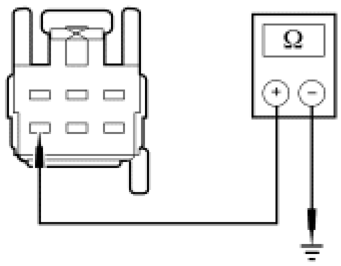
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3233-6, circuit CET34 (BN/GN), vehicle harness side and TCM C1533-7 circuit CET34 (BN/GN), vehicle harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B4.

  NO : REPAIR the circuit for an open. TEST the system for normal operation.

B4 TEST THE TCS CIRCUIT FOR A SHORT TO GROUND



N0053772

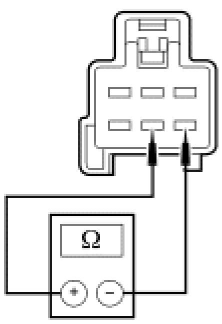
Fig. 14: Testing TCS Circuit For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3233-6, circuit CET34 (BN/GN), vehicle harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B5.

  NO : REPAIR the circuit for a short to ground. TEST the system for normal operation.

B5 TEST THE TCS



N0053773

Fig. 15: Testing TCS
Courtesy of FORD MOTOR CO.

- Measure the resistance between selector lever harness C3233-5 and C3233-6, component side, while cycling the TCS.
- **Is the resistance less than 5 ohms when pressed and greater than 10,000 ohms when released?**

  YES : INSTALL a new TCM. REFER to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article. TEST the system for normal operation.

  NO : INSTALL a new selector lever knob. REFER to **Selector Lever Knob - 3.5L**. TEST the system for normal operation.

PINPOINT TEST C: KEY STUCK IN THE IGNITION CYLINDER OR DOES NOT LOCK THE IGNITION CYLINDER WHEN THE SELECTOR LEVER IS NOT IN PARK

C1 TEST Battery Junction Box (BJB) FUSE 14 (15A)

- Check fuse: BJB Fuse 14 (15A)

- **Is the resistance less than 5 ohms?**

  YES : Go to C2.

  NO : REPAIR the circuit. INSTALL a new fuse. TEST the system for normal operation.

C2 TEST THE INHIBIT SOLENOID POWER CIRCUIT FOR AN OPEN

- Disconnect: Ignition Switch Electrical C250

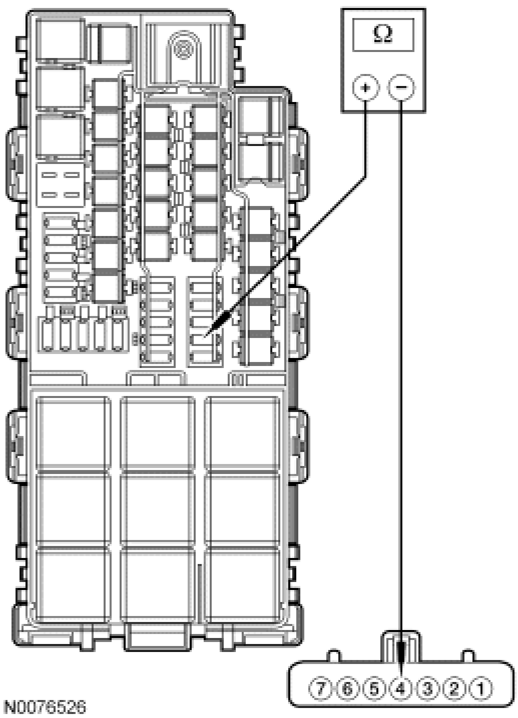


Fig. 16: Testing Inhibit Solenoid Power Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the output side of BJB fuse 14 (15A) and ignition switch electrical C250-4, circuit SBB14 (BN/RD), vehicle harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C3.

  NO : REPAIR the circuit. TEST the system for normal operation.

C3 TEST FOR VOLTAGE AT THE SELECTOR LEVER CONNECTOR

- Select PARK.
- Key in OFF position.
- Disconnect: Selector Lever Electrical C3245 (2.3L/3.0L engine) or C3233 (3.5L engine)
- Visually inspect the connector and wires for damage.
- Key in ON position.

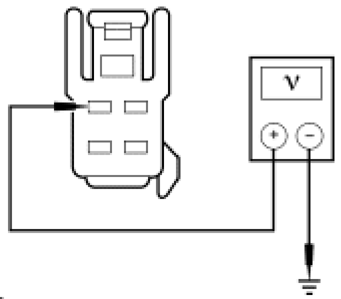

Fig. 17: Testing For Voltage At Selector Lever Connector - 3.0L Or 2.3L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the voltage between selector lever harness C3245-2, circuit CET22 (GY/BN), vehicle harness side and ground.

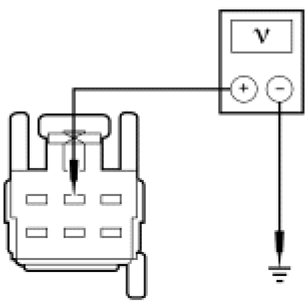

Fig. 18: Testing For Voltage At Selector Lever Connector - 3.5L
Courtesy of FORD MOTOR CO.

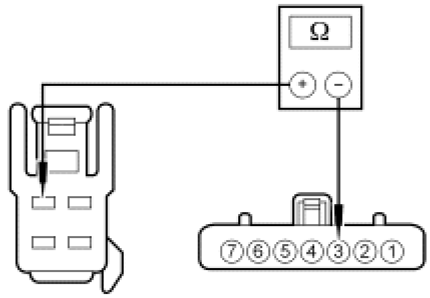
- Vehicles equipped with a 3.5L engine, measure the voltage between selector lever harness C3233-2, circuit CET22 (GY/BN), vehicle harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to C6.

  NO : Go to C4.

C4 TEST FOR AN OPEN CIRCUIT

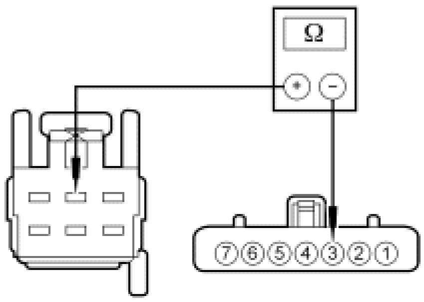
- Key in OFF position.
- Disconnect: Ignition Switch Electrical C250



N0071644

Fig. 19: Testing For An Open Circuit - 3.0L or 2.3L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the resistance between selector lever harness C3245-2, circuit CET22 (GY/BN), vehicle harness side and ignition switch electrical C250-3, circuit CET22 (GY/BN), vehicle harness side.



N0071645

Fig. 20: Testing For An Open Circuit - 3.5L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.5L engine, measure the resistance between selector lever harness C3233-2, circuit CET22 (GY/BN), vehicle harness side and ignition switch electrical C250-3, circuit CET22 (GY/BN), vehicle harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C5.

  NO : REPAIR the circuit. TEST the system for normal operation.

C5 TEST FOR A SHORT TO GROUND

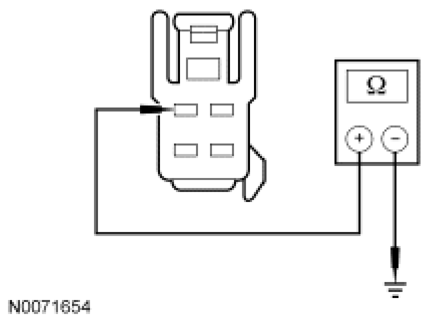


Fig. 21: Testing For A Short To Ground - 3.0L or 2.3L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the resistance between selector lever harness 3245-2, circuit CET22 (GY/BN), vehicle harness side and ground.

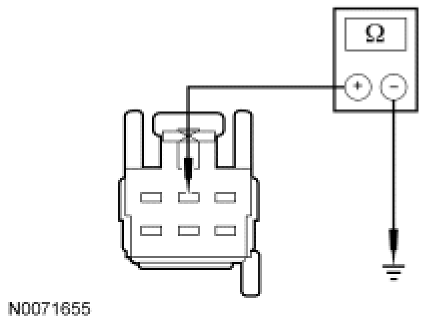

Fig. 22: Testing For A Short To Ground - 3.5L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.5L engine, measure the resistance between selector lever harness 3233-2, circuit CET22 (GY/BN), vehicle harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new steering column lock module. REFER to **STEERING COLUMN SWITCHES** article.

  NO : REPAIR the circuit. TEST the system for normal operation.

C6 TEST THE VEHICLE HARNESS GROUND CIRCUIT

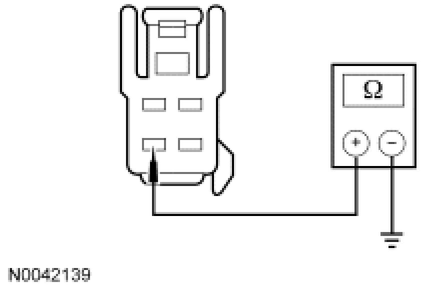

Fig. 23: Testing Shift Interlock Actuator Ground Circuit - 3.0L or a 2.3L
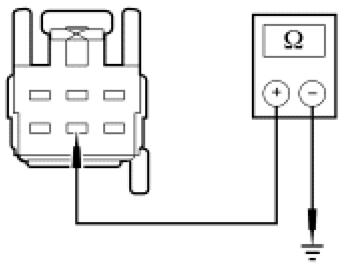
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the resistance between selector lever harness C3245-4, circuit GD116 (BK/VT), vehicle harness side and ground.



N0053797

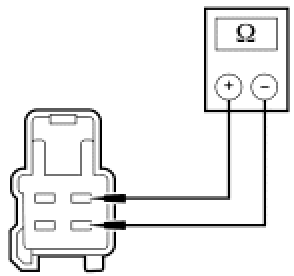
Fig. 24: Measuring Resistance Between Selector Lever Harness C3245-4, Circuit GD116 (BK/VT)
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.5L engine, measure the resistance between selector lever harness C3233-5, circuit GD116 (BK/VT), vehicle harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to C7.

  NO : REPAIR the circuit. TEST the system for normal operation.

C7 TEST THE PARK DETECT SWITCH



N0071657

Fig. 25: Testing Park Detect Switch - 3.0L or 2.3L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.0L or a 2.3L engine, measure the resistance between selector lever harness C3245-2 and C3245-4, component side, with the selector lever in PARK and DRIVE.

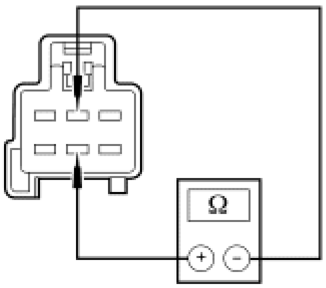


Fig. 26: Testing Park Detect Switch - 3.5L
Courtesy of FORD MOTOR CO.

- Vehicles equipped with a 3.5L engine, measure the resistance between selector lever harness C3233-2 and C3233-5, component side, with the selector lever in PARK and DRIVE.
- **Is the resistance greater than 10,000 ohms in PARK and less than 5 ohms in DRIVE?**

  YES : INSTALL a new steering column lock module. REFER to **STEERING COLUMN SWITCHES** article.

  NO : INSTALL a new selector lever assembly. REFER to **Selector Lever**.

GENERAL PROCEDURES

BRAKE SHIFT INTERLOCK OVERRIDE

NOTE: **If it is necessary to use the override procedure to move the selector lever out of the PARK position, it is possible that a fuse has blown and the brake lights are not operational. Before driving the vehicle, verify that the brake lights are working.**

This vehicle is equipped with a brake shift interlock feature that prevents the selector lever from being moved out of PARK when the ignition is in the ON position unless the brake pedal is depressed.

If the selector lever cannot be moved out of the PARK position when the ignition is in the ON position and the brake pedal is depressed carry out the following procedure:

1. Apply the parking brake.

   NOTE: **Relief located at the front of the access panel.**

2. Remove the access panel.

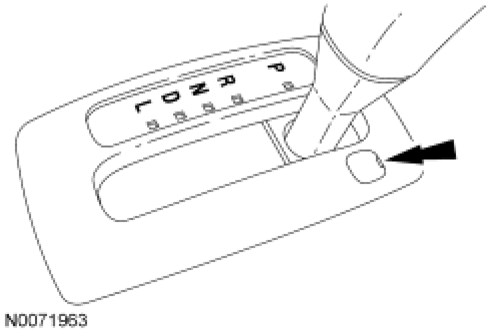

Fig. 27: Locating Access Panel
Courtesy of FORD MOTOR CO.

3. Using an suitable tool, depress the brake shift interlock override mechanism on the selector lever, apply the brake, depress the button on the selector lever and move the selector lever into NEUTRAL.

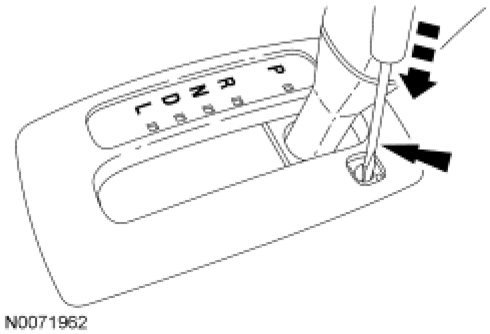

Fig. 28: Depressing Brake Shift Interlock Override Mechanism On Selector Lever Using An Suitable Tool
Courtesy of FORD MOTOR CO.

4. Start the vehicle.
5. Install the access panel.

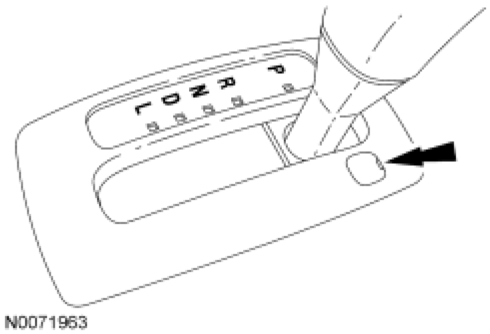

Fig. 29: Locating Access Panel
Courtesy of FORD MOTOR CO.

SELECTOR LEVER CABLE ADJUSTMENT

6-speed transaxle

1. Vehicles equipped with a 3.5L engine, remove the Air Cleaner (ACL) assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
2. Disconnect the selector lever cable end from the manual control lever.

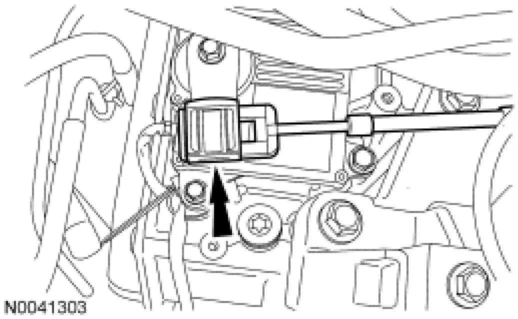

Fig. 30: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

3. Place the manual control lever in DRIVE.
    1. Place the manual control lever in PARK.
    2. Move the manual control lever counterclockwise 3 detents to the DRIVE position.

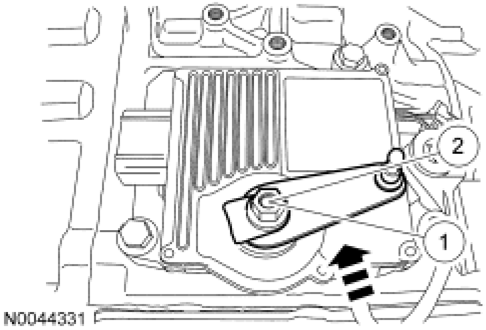

Fig. 31: Moving Manual Control Lever Counterclockwise
Courtesy of FORD MOTOR CO.

FNR5 transaxle

4. Disconnect the selector lever cable end from the manual control lever.

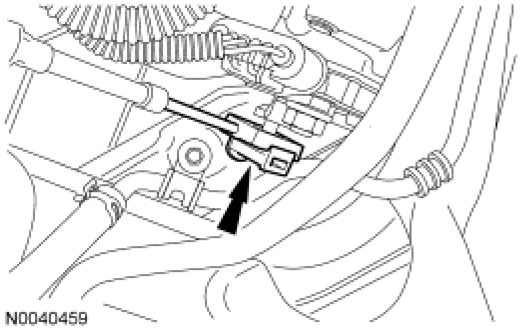

Fig. 32: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

NOTE: Transaxle removed from vehicle for clarity.

5. Place the manual control lever in NEUTRAL.
    1. Place the manual control lever in PARK.
    2. Move the manual control lever clockwise 3 detents to the DRIVE position.

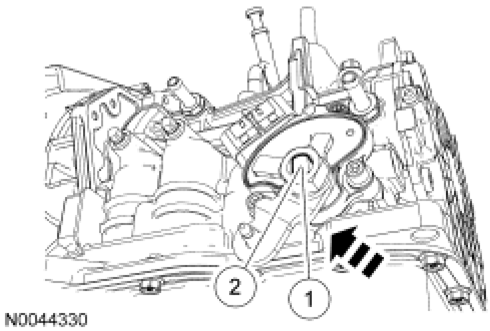

Fig. 33: Moving Manual Control Lever Clockwise
Courtesy of FORD MOTOR CO.

All vehicles

6. Place the selector lever in DRIVE.

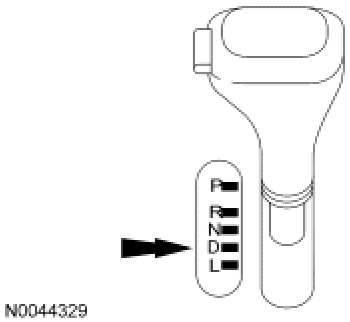

Fig. 34: Locating Gear Selector Lever

Courtesy of FORD MOTOR CO.

7. Unlock the adjuster by sliding the locking tab over.

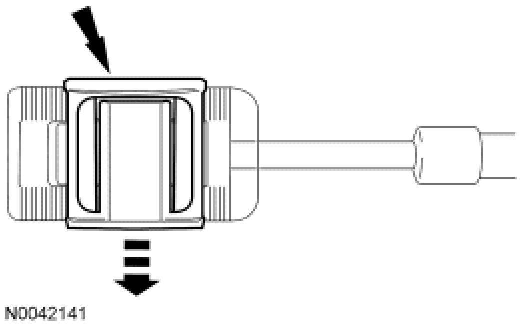

Fig. 35: Sliding Locking Tab Over
Courtesy of FORD MOTOR CO.

8. Slide the selector lever cable end forward or backward to align it with the manual control lever.

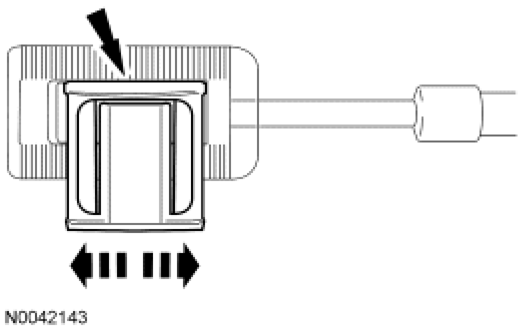

Fig. 36: Sliding Cable End
Courtesy of FORD MOTOR CO.

NOTE: FNR5 selector lever cable end shown, 6-speed transaxle similar.

9. With the adjuster locking tab released, connect the selector lever cable end to the manual control lever.

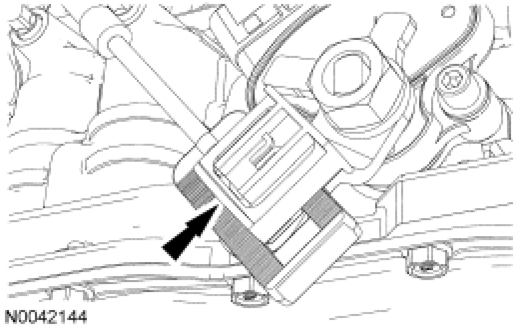

Fig. 37: Locating FNR5 Selector Lever Cable

Courtesy of FORD MOTOR CO.

NOTE: FNR5 selector lever cable end shown, 6-speed transaxle similar.

10. Slide the release tab back to lock the adjuster.

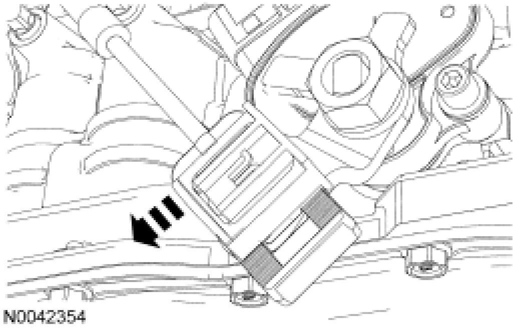

Fig. 38: Releasing Tab Back To Lock Adjuster
Courtesy of FORD MOTOR CO.

11. For vehicles equipped with a 3.5L engine, install the ACL assembly. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
12. Verify that the vehicle starts in PARK and NEUTRAL only and that the reverse lamps illuminate in REVERSE.

REMOVAL AND INSTALLATION

SELECTOR LEVER CABLE

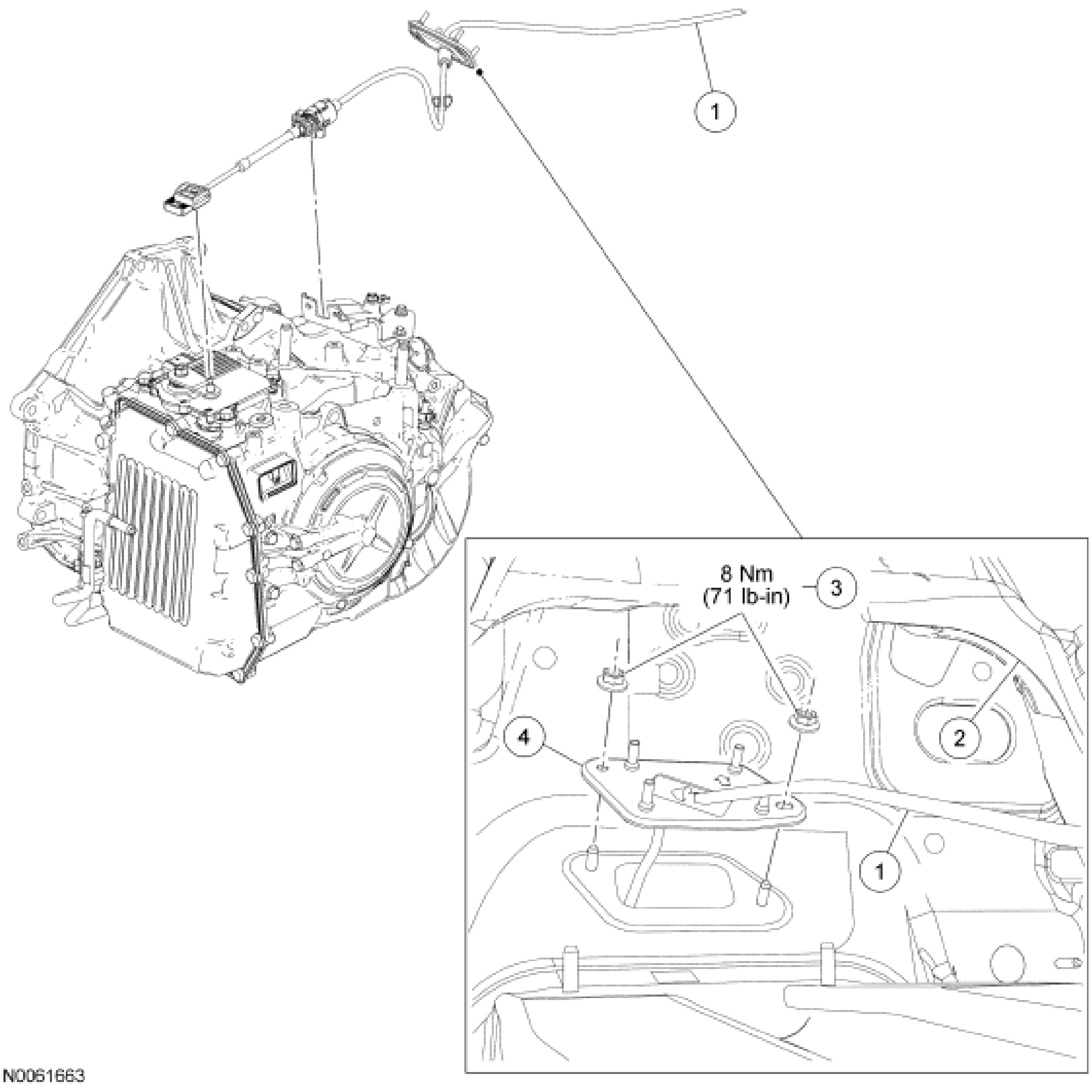

Fig. 39: Exploded View Of Selector Lever Cable With Torque Specification - 6-Speed Transaxle

7. Release the 2 tabs and remove the selector lever cable from the selector lever cable bracket.

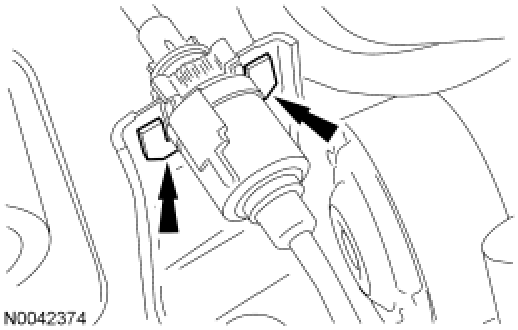

Fig. 44: Locating Selector Lever Cable Locking Tabs
Courtesy of FORD MOTOR CO.

All vehicles

8. Disconnect the 2 wiring harness fasteners and position the RCM wiring harness aside.

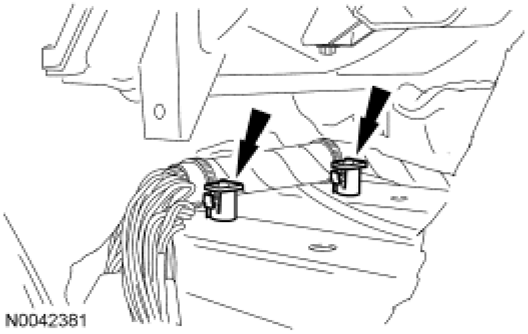

Fig. 45: Locating Wiring Harness Fasteners
Courtesy of FORD MOTOR CO.

9. Position the insulation blanket away from the bulkhead to gain access to the 2 selector lever cable bracket nuts.

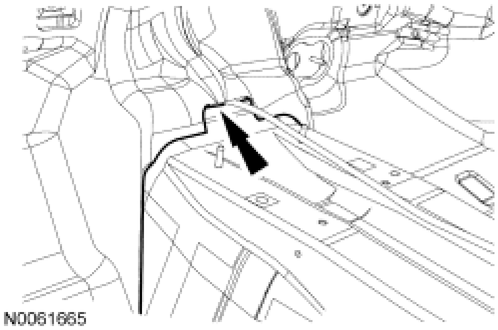

Fig. 46: Locating Insulation
Courtesy of FORD MOTOR CO.

10. Remove the 2 selector lever cable grommet nuts and remove the selector lever cable through the interior of the vehicle.

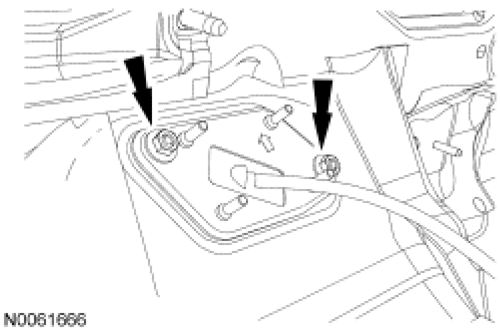

Fig. 47: Locating Selector Lever Cable Grommet Nuts
Courtesy of FORD MOTOR CO.

INSTALLATION

All vehicles

1. Position the selector lever cable in place and install the 2 nuts.
    - Tighten to 8 Nm (71 lb-in).

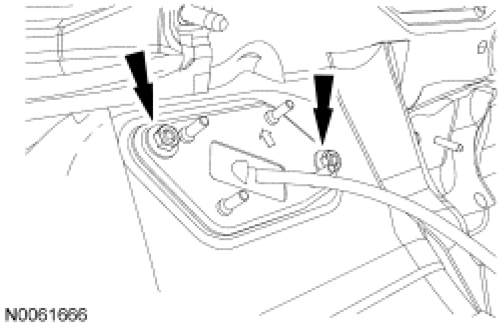

Fig. 48: Locating Selector Lever Cable Grommet Nuts
Courtesy of FORD MOTOR CO.

2. Position the insulation blanket in place over the selector lever cable grommet.

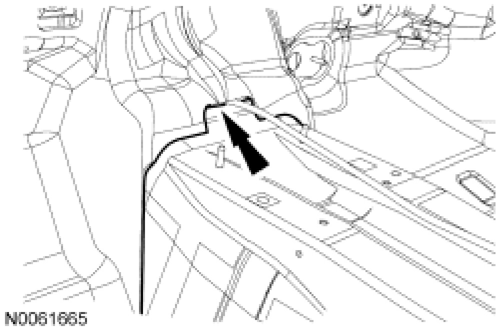

Fig. 49: Locating Insulation
Courtesy of FORD MOTOR CO.

3. Position back the RCM wiring harness and install the fasteners on the studs.

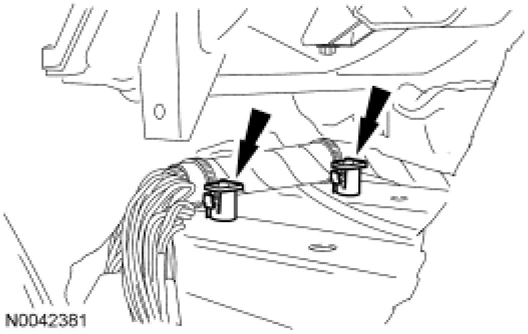

Fig. 50: Locating Wiring Harness Fasteners

DESCRIPTION AND OPERATION

BATTERY AND CABLES

Vehicles are equipped with a 12V, maintenance-free battery.

The battery and cable system consists of the following components:

- Battery
- Battery cable assembly
- Battery tray

Ford Motor Company strongly recommends that lead-acid batteries be returned to an authorized recycling facility for disposal.

Fig. 1: Recycling Symbol
Courtesy of FORD MOTOR CO.

DIAGNOSTIC TESTS

BATTERY

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Micro 490 Digital Battery Analyzer	162-00004 or equivalent

Principles of Operation

Battery Eye Operation

The purpose of the battery eye is to indicate the state of charge of the battery in the assembly plant and while on the dealership lot. The battery eye can also indicate the state-of-charge when the vehicle is delivered to the dealership and during the pre-delivery inspection process. The battery eye is made up of a viewing plate, 2 balls and a small passage. The balls indicate the specific gravity of the electrolyte by floating higher or lower in the passageway. It is important to note that the battery eye checks the specific gravity on only a single battery cell.

The color of the battery eye indicates the approximate state of charge.

- Red usually indicates the battery state-of-charge is at 40% or less.
- Yellow indicates the battery state-of-charge is between 40% and 57%.
- Green indicates the battery state-of-charge is above 57%.
- No color/black can occur after the battery has been in service for several years and some of the plate material has coated the balls.
- A clear battery eye can occur if the battery case becomes damaged and the electrolyte has fallen below the plates.

NOTE: The battery eye may remain red for a period of time (up to several days), even after the battery is fully charged, because the acid is not yet fully mixed.

Do not install a new battery based solely on the indication of the battery eye. The battery eye color simply indicates the battery state-of-charge, not its condition. For example, a red or yellow battery eye usually indicates the battery is discharged, not defective. If the battery eye indicates the battery may be discharged, it is necessary to recharge the battery before testing its condition.

Charging a Battery

Batteries discharge while the vehicle is on the dealer lot or parked by the customer for an extended period of time due to normal parasitic key-off loads. Also, vehicles still in dealer inventory or in long-term storage may be driven short distances with heavy electrical loads. Over a period of time (30 days or more), this could result in vehicles having shallow or deeply discharged batteries.

- Deeply discharged - A battery that is drained over a prolonged period of time, such as an unsold vehicle or a vehicle in storage, to the point the battery is dead.
- Shallow discharge - A battery that is drained by leaving an accessory on for several hours or a few days and has a very low charge.

The vehicle's charging system is designed to supply the electrical power needed to maintain the battery near full charge during normal vehicle use. The charging system is not capable of bringing a deeply discharged battery back near full charge in a short amount of time such as allowing the vehicle to idle for 15 minutes to "recharge the battery." Discharged batteries should be charged using an external charger.

NOTE: Battery chargers have improved greatly with the addition of the new generation pulse chargers. These chargers pulse current into the battery, breaking down the sulfation layer on the battery plates and generally reduce charging times to less than an hour.

NOTE: Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm to approximately 5°C (41°F) before charging. This may require 4 to 8 hours at room temperature.

The following chart summarizes 2 recommended methods of charging.

Type of Battery Discharge	Pulse Charger	Standard Charger
Deeply discharged	Follow directions supplied with the pulse charger	2 to 8 hours and may take up to an hour to accept initial charge
Shallow discharge	45 minutes to an hour charge	2 hours (40A) on manual setting or medium automatic setting

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, go to **Pinpoint Test A**.

Pinpoint Tests

Pinpoint Test A: Battery Condition Test

Normal Operation

Battery condition is determined by measuring battery terminal voltage after a specific discharge current is applied for a specified time period.

This pinpoint test is intended to diagnose the following:

- Battery charge
- Battery

PINPOINT TEST A: BATTERY CONDITION TEST

A1 TEST THE BATTERY CONDITION

NOTE: A red test-eye indicates the battery is discharged, not necessarily defective.

NOTE: Failure to fully charge the battery before retesting may cause false readings.

- Verify the battery condition using the battery analyzer.
- **Is the battery OK?**

  YES : If the meter reads GOOD BATTERY, RETURN the battery to service.

  If the meter reads GOOD-RECHARGE, CHARGE the battery and RETURN it to service.

  If the meter reads CHARGE & RETEST, fully CHARGE and RETEST the battery.

  NO : If the meter reads REPLACE BATTERY, INSTALL a new battery.

  If the meter reads BAD CELL-REPLACE, INSTALL a new battery.

GENERAL PROCEDURES

BATTERY DISCONNECT

WARNING: **Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

Refer to the Description and Operation portion of SUPPLEMENTAL RESTRAINT SYSTEM article for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

WARNING: **Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.**

WARNING: **Battery posts, terminals and related accessories contain lead and lead components. Wash hands after handling. Failure to follow these instructions may result in serious personal injury.**

NOTE: **When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.**

NOTE: When disconnecting the battery ground cable to interrupt power to the vehicle electrical system, disconnect the battery ground cable only. It is not necessary to disconnect the positive battery cable.

1. Disconnect the battery ground terminal.
   - To connect, tighten to 5 Nm (44 lb-in).
2. Disconnect the positive battery terminal.
   - To connect, tighten to 5 Nm (44 lb-in).
3. To connect, reverse the disconnect procedure.

REMOVAL AND INSTALLATION

BATTERY AND BATTERY TRAY - EXPLODED VIEW

BATTERY

REMOVAL AND INSTALLATION

WARNING: **Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always deplete the backup power supply before repairing or installing any new front or side air bag supplemental restraint system (SRS) component and before servicing, removing, installing, adjusting or striking components near the front or side impact sensors or the restraints control module (RCM). Nearby components include doors, instrument panel, console, door latches, strikers, seats and hood latches.**

Refer to the Description and Operation portion of SUPPLEMENTAL RESTRAINT SYSTEM article for location of the RCM and impact sensor(s).

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least 1 minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Failure to follow these instructions may result in serious personal injury or death in the event of an accidental deployment.

WARNING: **Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.**

NOTE: When the battery (or PCM) is disconnected and connected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The charging system set point may also vary. The vehicle may need to be driven to relearn its strategy.

All vehicles

1. Disconnect the battery. For additional information, refer to **Battery Disconnect**.

   2.3L and 3.0L vehicles

2. Remove the battery hold-down bracket bolt and nut.
   - To install, tighten to 10 Nm (89 lb-in).
3. Remove the battery hold-down bracket and J-bolt.

   3.5L vehicles

4. Remove the bolt and the battery hold-down bracket.

   All vehicles

5. Remove the battery heat shield.
6. Remove the battery.
7. To install, reverse the removal procedure.

BATTERY TRAY

REMOVAL AND INSTALLATION

1. Remove the battery. For additional information, refer to **Battery**.
2. Remove the 3 battery cable harness locators from the battery tray.
3. Remove the battery tray bolt and nut.
   - To install, tighten to 9 Nm (80 lb-in).
4. Remove the battery tray.
5. To install, reverse the removal procedure.

BATTERY CABLES - 2.3L

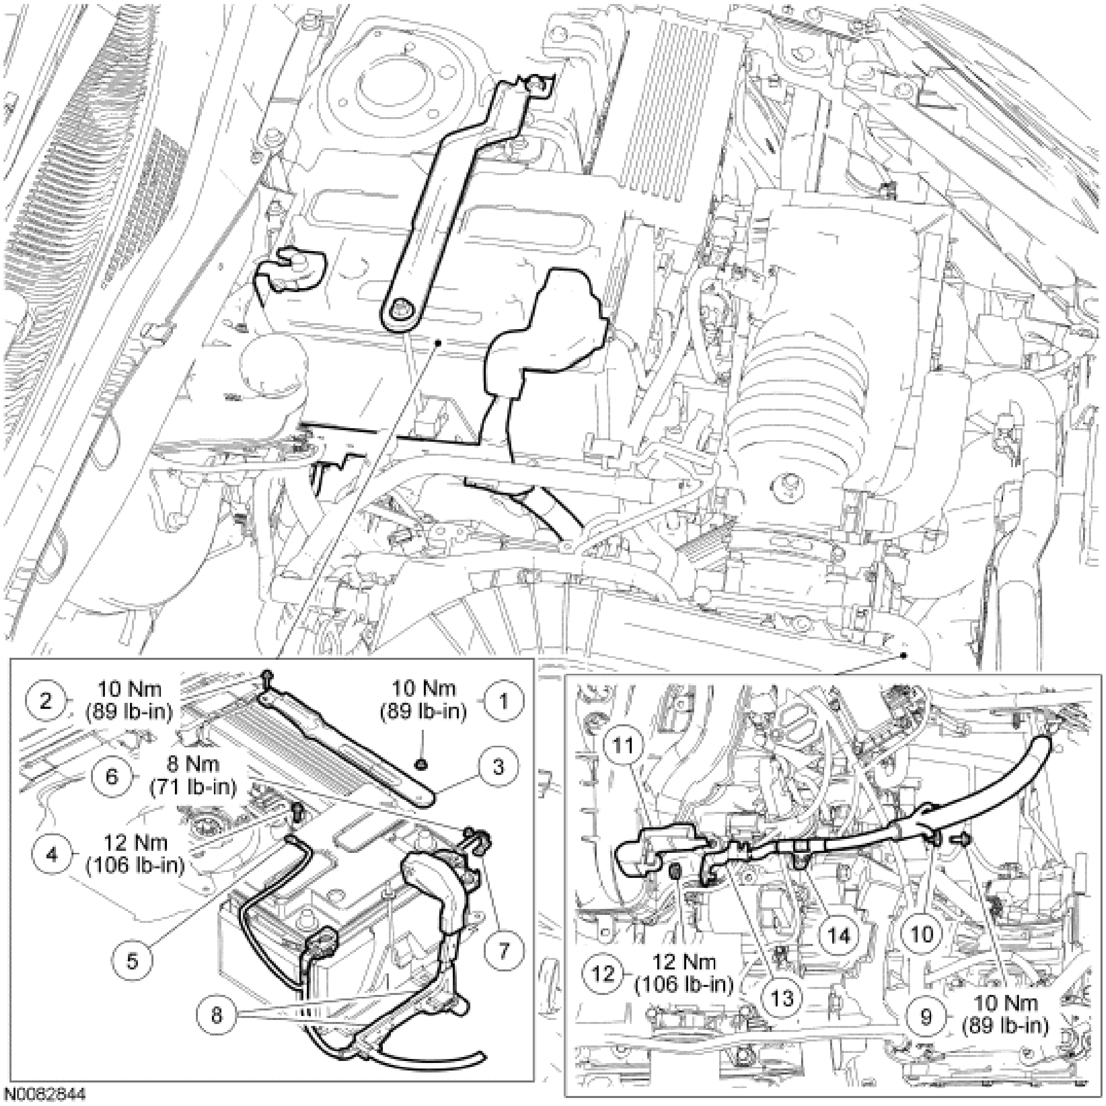

Fig. 4: Exploded View Of Battery Cables With Torque Specifications - 2.3L (1 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W707142	Battery hold-down bracket nut
2	99726	Battery hold-down bracket bolt
3	10716	Battery hold-down bracket
4	W705936	Battery cable body ground terminal bolt
5	-	Battery cable body ground terminal (part of 14B060)
6	W705790	Battery Junction Box (BJB) cable terminal nut
7	-	BJB cable terminal (part of 14290)
8	-	Battery cable locators (2 required) (part of 14B060)
9	W503271	Battery cable transaxle ground terminal bolt
10	-	Battery cable transaxle ground terminal (part of 14B060)

11	11N087	Starter solenoid terminal cover
12	W706414	Battery cable starter solenoid terminal nut
13	-	Battery cable starter solenoid terminal (part of 14B060)
14	-	Battery cable locator (part of 14B060)

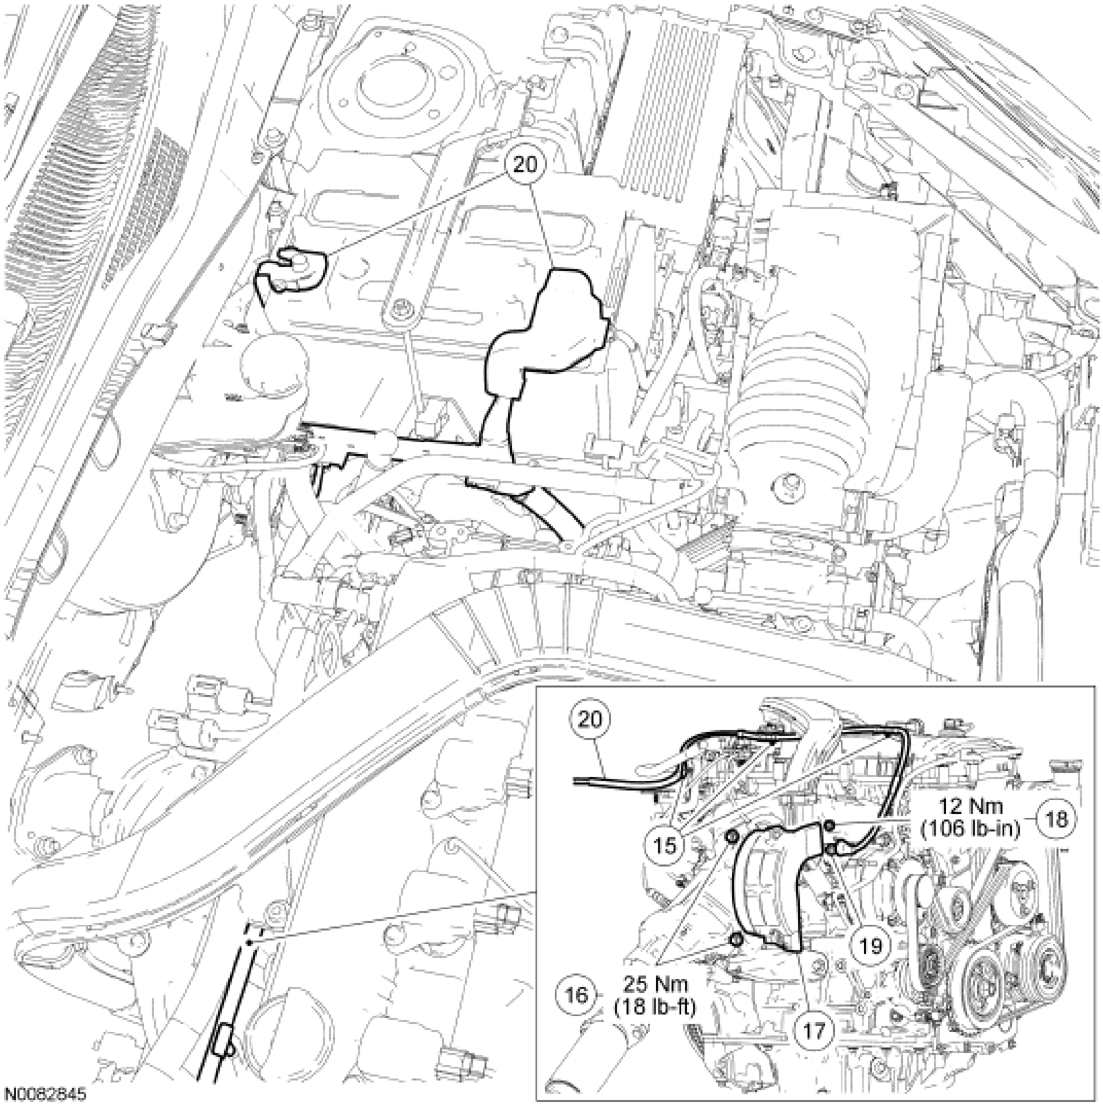

Fig. 5: Exploded View Of Battery Cables With Torque Specifications - 2.3L (2 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
15	-	Battery cable locators (3 required) (part of 14B060)
16	W520414	Generator shield nuts (2 required)
17	10A346	Generator shield
18	W706414	Generator B+ terminal nut

19	-	Generator B+ terminal (part of 14B060)
20	14B060	Battery cables

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the battery. For additional information, refer to **Battery Disconnect**.
3. Remove the bolt, nut and the battery hold-down bracket.
   - To install, tighten to 10 Nm (89 lb-in).
4. Remove the bolt and position the battery cable body ground terminal aside.
   - To install, tighten to 12 Nm (106 lb-in).
5. Remove the nut and position the Battery Junction Box (BJB) cable terminal aside.
   - To install, tighten to 8 Nm (71 lb-in).
6. Release the 2 battery cable locators from the battery tray.
7. Remove the bolt and position the battery cable transaxle ground terminal aside.
   - To install, tighten to 10 Nm (89 lb-in).
8. Remove the starter solenoid terminal cover.
9. Remove the nut and position the battery cable starter solenoid terminal aside.
   - To install, tighten to 12 Nm (106 lb-in).
10. Release the battery cable locator from the starter stud bolt.
11. Remove the 3 battery cable locators from the rear of the engine.
12. Remove the 2 nuts and the generator shield.
    - To install, tighten to 25 Nm (18 lb-ft).
13. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).
14. Remove the battery cables.
15. To install, reverse the removal procedure.

BATTERY CABLES - 3.0L

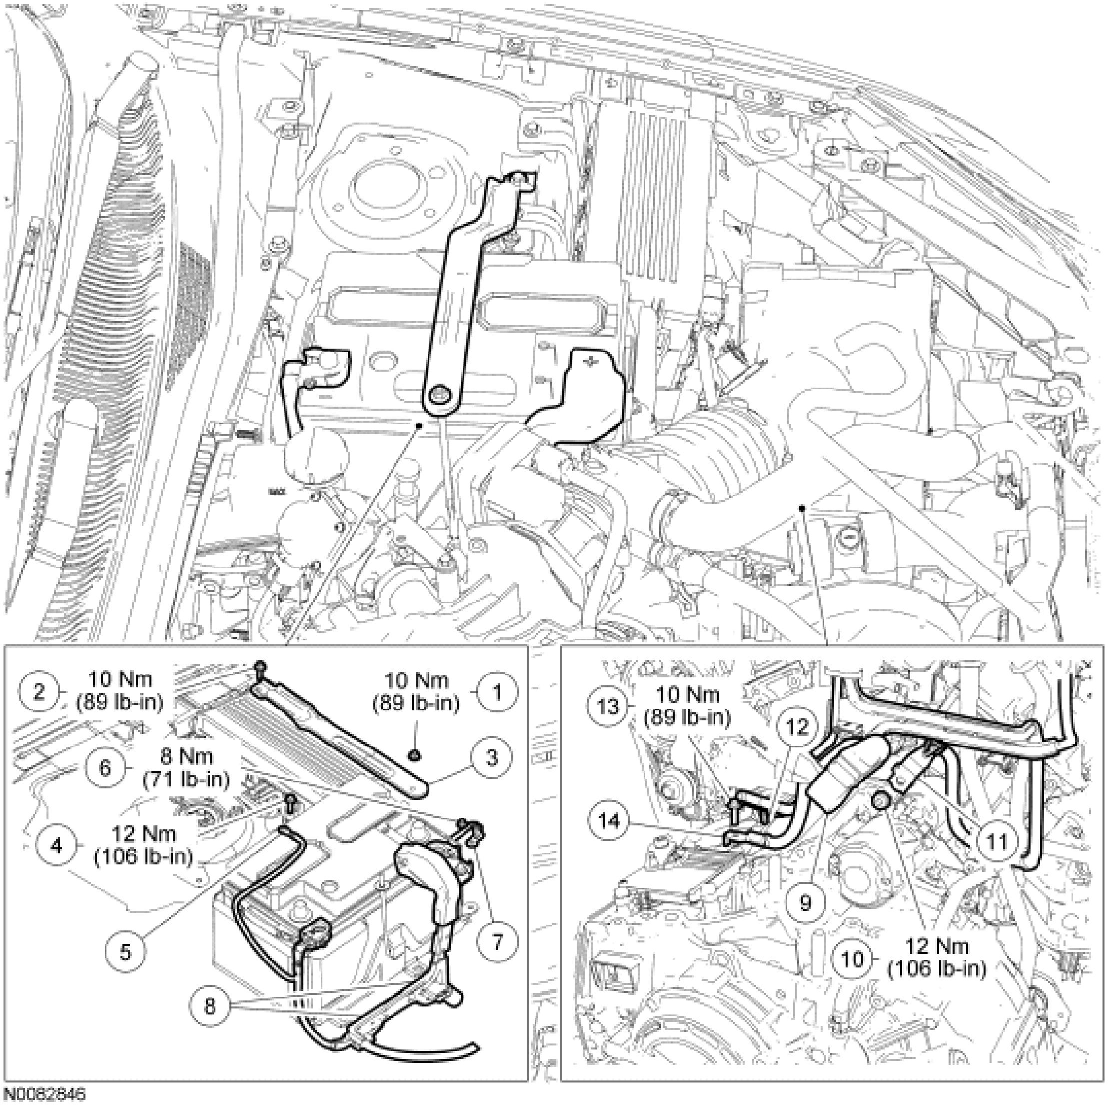

Fig. 6: Exploded View Of Battery Cables With Torque Specifications - 3.0L (1 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W707142	Battery hold-down bracket nut

3	10716	Battery hold-down bracket
4	W705936	Battery cable body ground terminal bolt
5	-	Battery cable body ground terminal (part of 14B060)
6	W705790	Battery Junction Box (BJB) cable terminal nut
7	-	BJB cable terminal (part of 14290)
8	-	Battery cable locators (2 required) (part of 14B060)
9	11N087	Starter solenoid terminal cover
10	W706414	Battery cable starter solenoid terminal nut

11	-	Battery cable starter solenoid terminal (part of 14B060)
12	-	Battery cable harness locator (part of 14B060)
13	W503271	Battery cable transaxle ground terminal bolt
14	-	Battery cable transaxle ground terminal (part of 14B060)

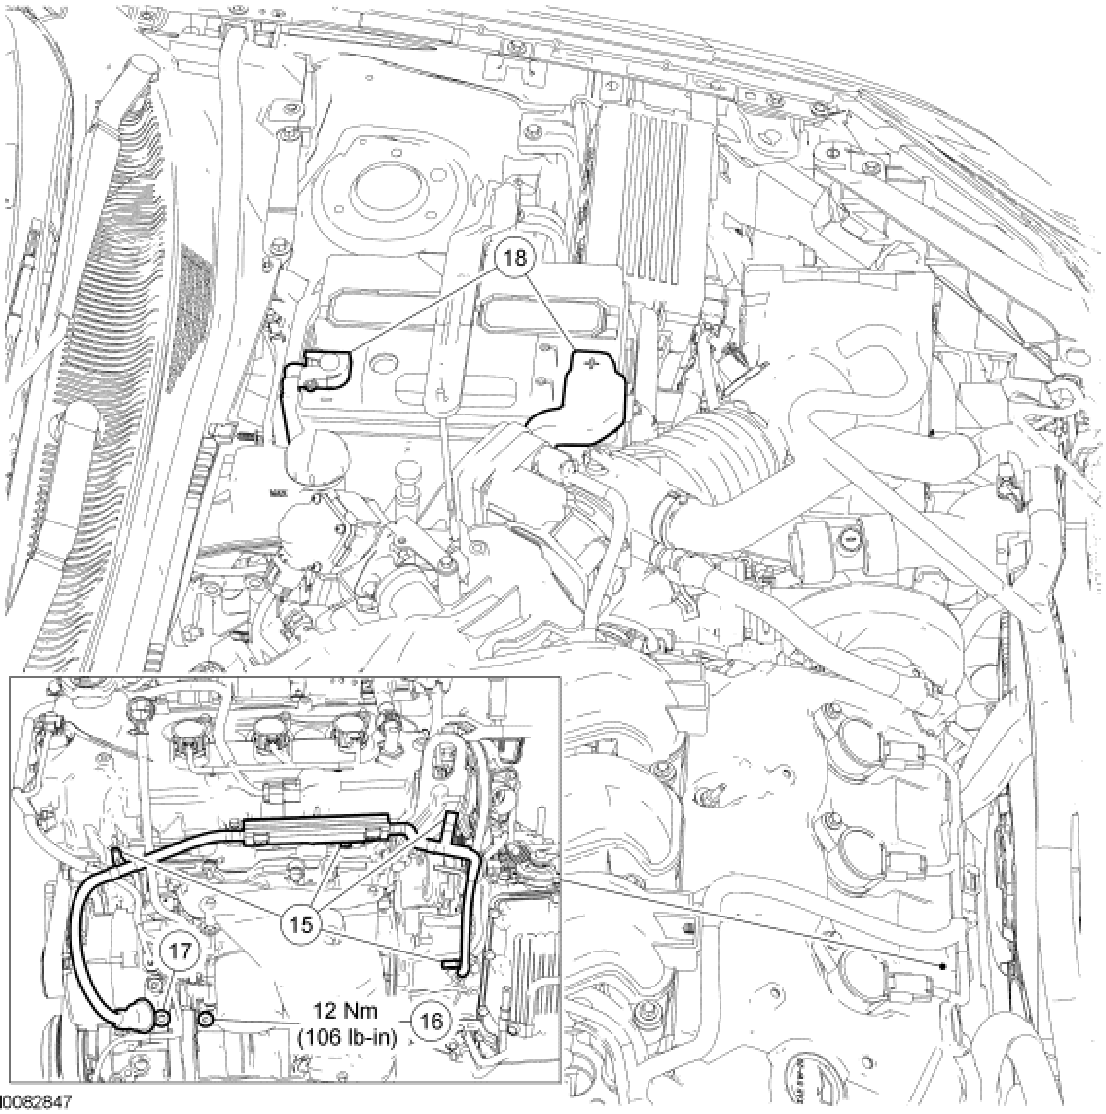

Fig. 7: Exploded View Of Battery Cables With Torque Specification - 3.0L (2 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
15	-	Battery cable locators (4 required) (part of 14B060)
16	W706414	Generator B+ terminal nut

17	-	Generator B+ cable terminal (part of 14B060)
18	14B060	Battery cables

REMOVAL AND INSTALLATION

1. Remove the battery tray. For additional information, refer to **Battery Tray**.
2. Remove the bolt, nut and the battery hold-down bracket.
   - To install, tighten to 10 Nm (89 lb-in).
3. Remove the bolt and position the battery cable body ground terminal aside.
   - To install, tighten to 12 Nm (106 lb-in).
4. Remove the nut and position the Battery Junction Box (BJB) cable terminal aside.
   - To install, tighten to 8 Nm (71 lb-in).
5. Remove the starter solenoid terminal cover.
6. Remove the nut and position the battery cable starter solenoid terminal aside.
   - To install, tighten to 12 Nm (106 lb-in).
7. Release the battery cable locator from the engine.
8. Remove the bolt and position the battery cable transaxle ground terminal aside.
   - To install, tighten to 10 Nm (89 lb-in).
9. Release the battery cable locator from the transaxle stud bolt.
10. Release the 3 battery cable locators from the LH valve cover.
11. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).
12. Remove the battery cables.
13. To install, reverse the removal procedure.

BATTERY CABLES - 3.5L

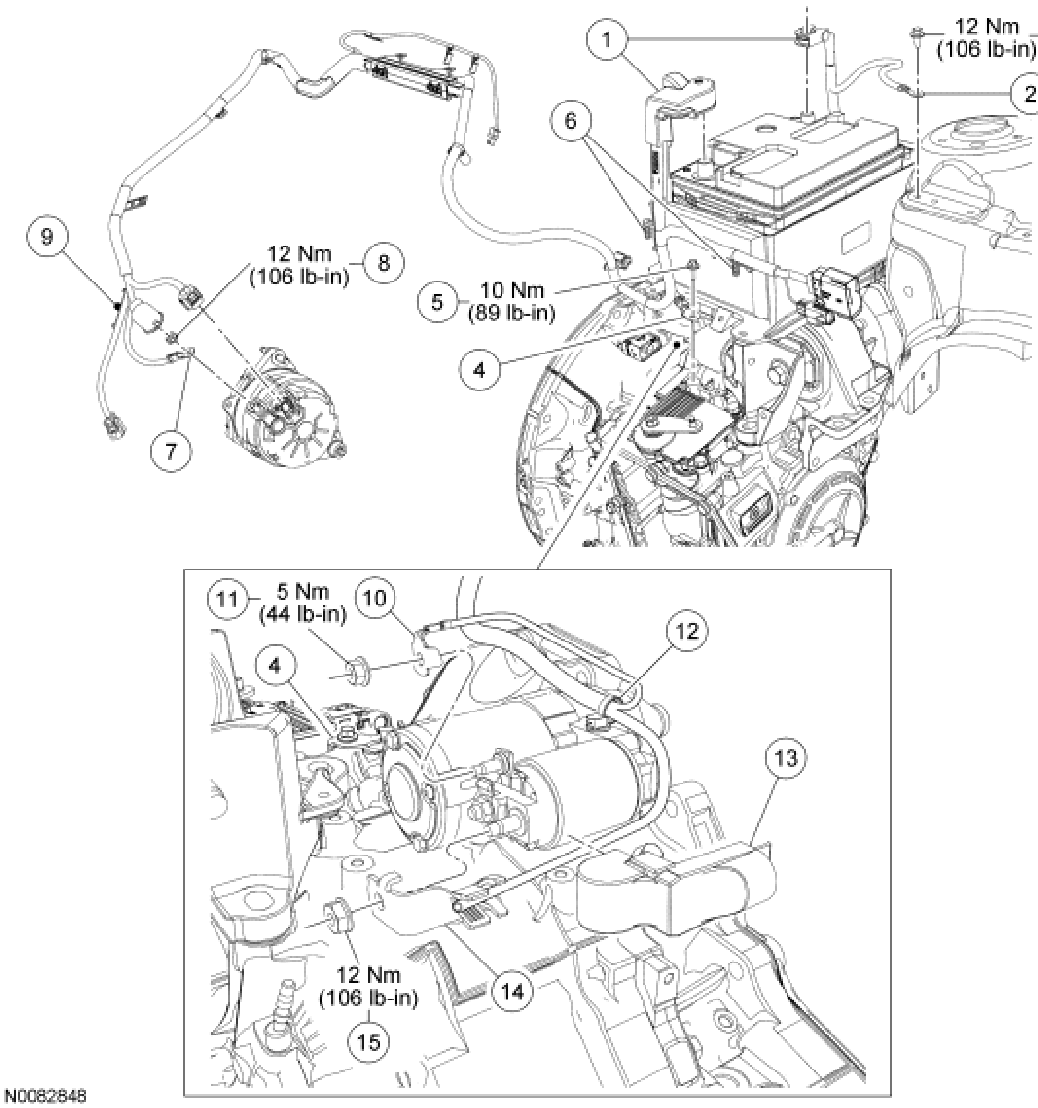

Fig. 8: Exploded View Of Battery Cables With Torque Specifications - 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Battery cables (part of 14B060)
2	-	Battery cable body ground terminal (part of 14B060)
3	W705936	Battery cable body ground terminal bolt
4	-	Battery cable transaxle ground terminal (part of 14B060)
5	W503271	Battery cable transaxle ground terminal bolt
6	-	Battery cable locators (2 required) (part of 14B060)
7	-	Generator B+ terminal (part of 14B060)
8	W706414	Generator B+ terminal nut
9	-	Pin-type retainer, wiring harness
10	-	Starter motor solenoid wire terminal (part of 14B060)

11	W705790	Starter motor solenoid wire terminal nut
12	-	Battery cable locator, starter
13	11N087	Starter solenoid terminal cover
14	-	Battery cable starter solenoid terminal (part of 14B060)
15	W706414	Battery cable starter solenoid terminal nut

REMOVAL AND INSTALLATION

1. Remove the battery tray. For additional information, refer to **Battery Tray**.
2. Remove the bolt and position the battery cable body ground terminal aside.
   - To install, tighten to 12 Nm (106 lb-in).
3. Remove the starter solenoid terminal cover.
4. Remove the nut and position the battery cable starter solenoid terminal aside.
   - To install, tighten to 12 Nm (106 lb-in).
5. Remove the nut and position the starter motor solenoid wire terminal aside.
   - To install, tighten to 5 Nm (44 lb-in).
6. Release the battery cable locator from the engine.
7. Remove the bolt and position the battery cable transaxle ground terminal aside.
   - To install, tighten to 10 Nm (89 lb-in).
8. Release the battery cable locator from the transaxle stud bolt.
9. Release the 3 battery cable locators from the LH valve cover.
10. Position the generator protective cover aside, remove the nut and position the generator B+ terminal aside.
    - To install, tighten to 12 Nm (106 lb-in).
11. Remove the battery cables.
12. To install, reverse the removal procedure.

2008 ACCESSORIES & BODY, CAB

Body Closures - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Door check arm-to-body bolt	25	18
Door check arm-to-door nuts	15	11
Door hinge-to-body bolts	25	18
Door hinge-to-door bolts	30	22
Door striker plate bolts	22	16
Luggage compartment lid hinge-to-body bolts	25	18
Luggage compartment lid hinge-to-luggage compartment lid nuts	25	18
Luggage compartment lid striker plate bolts	22	16

GENERAL PROCEDURES

DOOR ALIGNMENT - FRONT

All alignments

1. Remove the door latch striker plate.

   Front door in and out, up and down alignment

2. Loosen, but do not remove, the front door hinge-to-front door fasteners enough to allow door alignment.

   Front door fore, aft and tilt alignment

3. Remove the front fender. For additional information, refer to **FRONT END BODY PANELS** article.
4. Loosen, but do not remove, the upper front door hinge-to-body fasteners enough to allow door alignment.
5. Loosen, but do not remove, the lower front door hinge-to-body fasteners enough to allow door alignment.

   All alignments

6. Adjust the door. For additional information, refer to **BODY REPAIRS** article.
7. Tighten the door fasteners.
   - Tighten the front door hinge-to-front door fasteners to 30 Nm (22 lb-ft).
   - Tighten the front door hinge-to-body fasteners to 25 Nm (18 lb-ft).

Front door fore, aft and tilt alignment

8. Install the front fender. For additional information, refer to **FRONT END BODY PANELS** article.

All alignments

9. Install and adjust the door striker as necessary. For additional information, refer to **BODY REPAIRS** article.
    - Tighten the door latch striker plate bolts to 22 Nm (16 lb-ft).

DOOR ALIGNMENT - REAR

All alignments

1. Remove the door latch striker plate.

Rear door in and out, up and down alignment

2. Loosen, but do not remove, the rear door hinge-to-rear door fasteners enough to allow door alignment.

Rear door fore, aft and tilt alignment

3. Position aside the B-pillar panel.
4. Loosen, but do not remove, the upper rear door hinge-to-body fasteners enough to allow door alignment.
5. Loosen, but do not remove, the lower rear door hinge-to-body fasteners enough to allow door alignment.

All alignments

6. Adjust the door. For additional information, refer to **BODY REPAIRS** article.
7. Tighten the door fasteners.
    - Tighten the rear door hinge-to-rear door fasteners to 30 Nm (22 lb-ft).
    - Tighten the rear door hinge-to-body fasteners to 25 Nm (18 lb-ft).

Rear door fore, aft and tilt alignment

8. Install the B-pillar trim panel.

All alignments

9. Install and adjust the door striker as necessary. For additional information, refer to **BODY REPAIRS** article.
    - Tighten the door latch striker plate bolts to 22 Nm (16 lb-ft).

LUGGAGE COMPARTMENT LID ALIGNMENT

1. Remove the luggage compartment lid struts.
2. Loosen the 4 luggage compartment lid bolts.
3. Adjust the luggage compartment lid as necessary.
   - For additional information, refer to **BODY REPAIRS** article.
4. Tighten the 4 luggage compartment lid hinge bolts.
   - Tighten to 25 Nm (18 lb-ft).
5. Install the luggage compartment lid struts.

STRIKER ADJUSTMENT

NOTE: Before adjusting the door latch striker plate, verify that the door can be closed easily and fits tightly.

1. Loosen the door latch striker bolts.

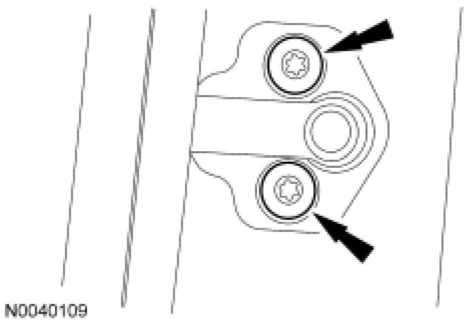

Fig. 1: Locating Door Latch Striker Plate Bolts
Courtesy of FORD MOTOR CO.

2. Reposition the door latch striker plate from side-to-side or up and down as necessary.
3. Tighten the door latch striker plate bolts.
   - Tighten to 22 N.m (16 lb-ft).

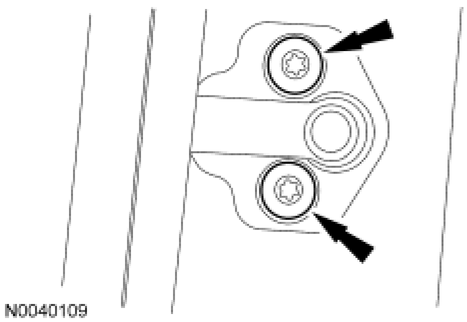

Fig. 2: Locating Door Latch Striker Plate Bolts
Courtesy of FORD MOTOR CO.

4. Check the adjustment of the door. For additional information, refer to **BODY REPAIRS** article.
   - Repeat the procedure as necessary.

REMOVAL AND INSTALLATION

DOOR

NOTE: Front door shown, rear door similar.

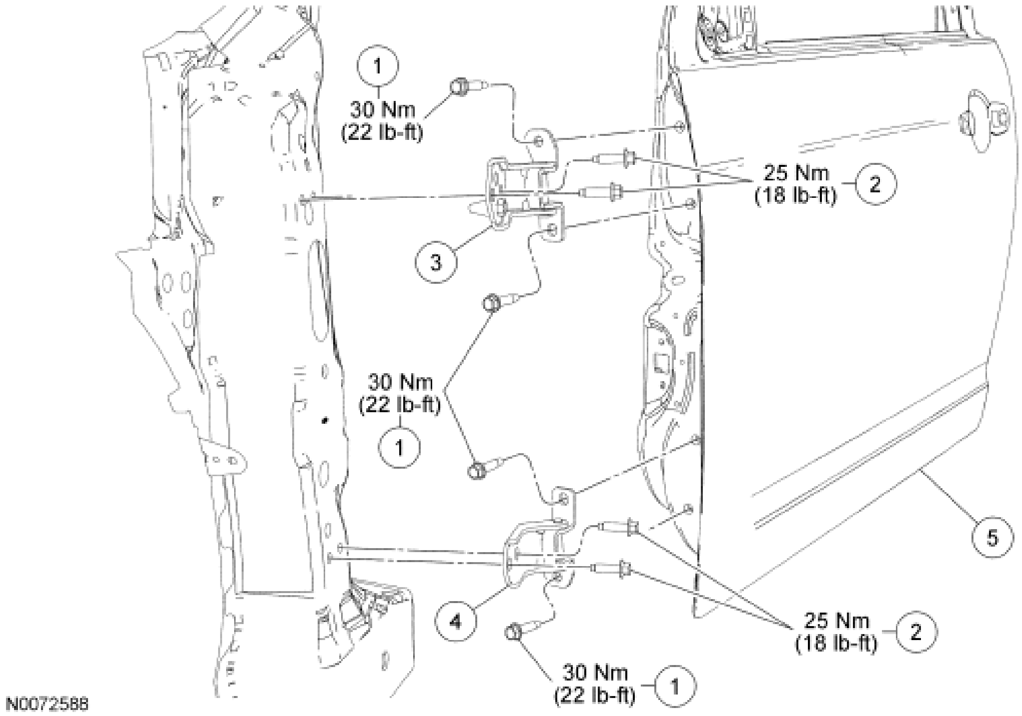

Fig. 3: Exploded View Of Door Components With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W711119	Hinge-to-door bolts
2	W506023	Hinge-to-body bolts
3	5422800	Upper hinge
4	5422810	Lower hinge
5	5420124	Front door

REMOVAL AND INSTALLATION

1. Remove the door check arm-to-body bolt.
   - To install, tighten to 25 Nm (18 lb-ft).

CAUTION: To minimize the possibility of cross threading, hand start all fasteners during the installation.

CAUTION: To avoid damaging the door, this step requires an assistant.

2. Mark the position of each hinge and remove the hinge-to-door bolts.
   - To install, tighten to 30 Nm (22 lb-ft).
3. Remove the front door.
4. To install, reverse the removal procedure.
   - If necessary, align the door. For additional information, refer to **Door Alignment - Front** or **Door Alignment - Rear**.

DOOR CHECK ARM

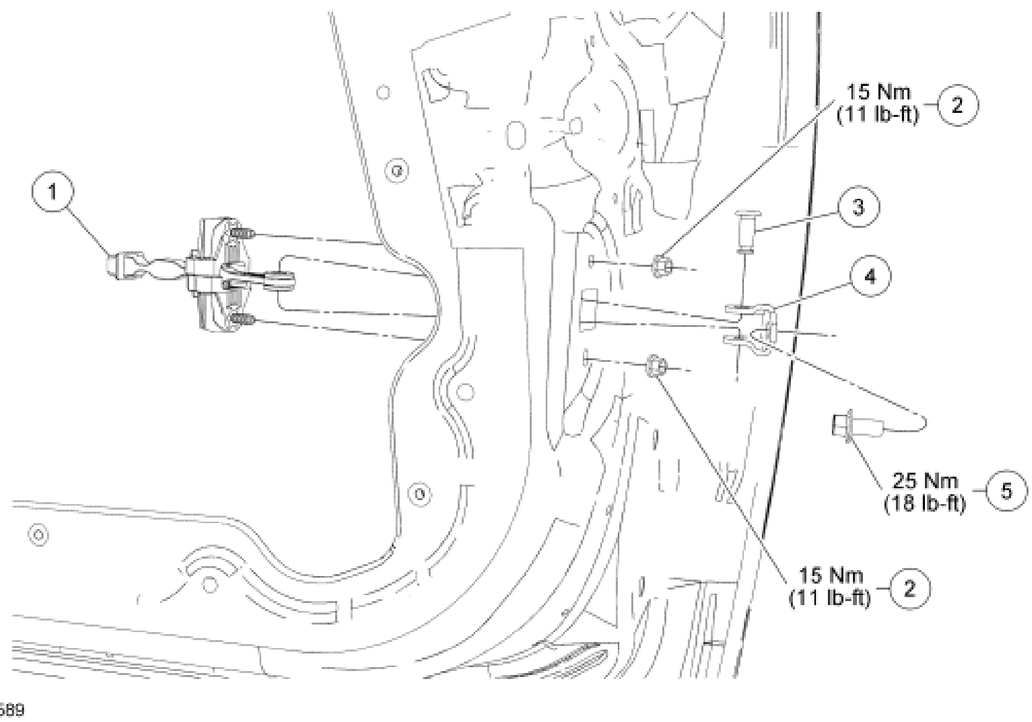

Fig. 4: Exploded View Of Door Check Arm With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5423552	Door check arm
2	W520111	Door check arm-to-door nuts
3	-	Door check arm-to-check arm bracket (part of 5423552)
4	-	Door check arm bracket (PIA-to-check arm)

5	W707375	Door check arm-to-door bolt

1. Remove the door trim panel. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the door check arm-to-body bolt.
   - To install, tighten to 25 Nm (18 lb-ft).
3. Remove the door check arm-to-door nuts.
   - To install, tighten to 15 Nm (11 lb-ft).
4. To install, reverse the removal procedure.

LUGGAGE COMPARTMENT LID

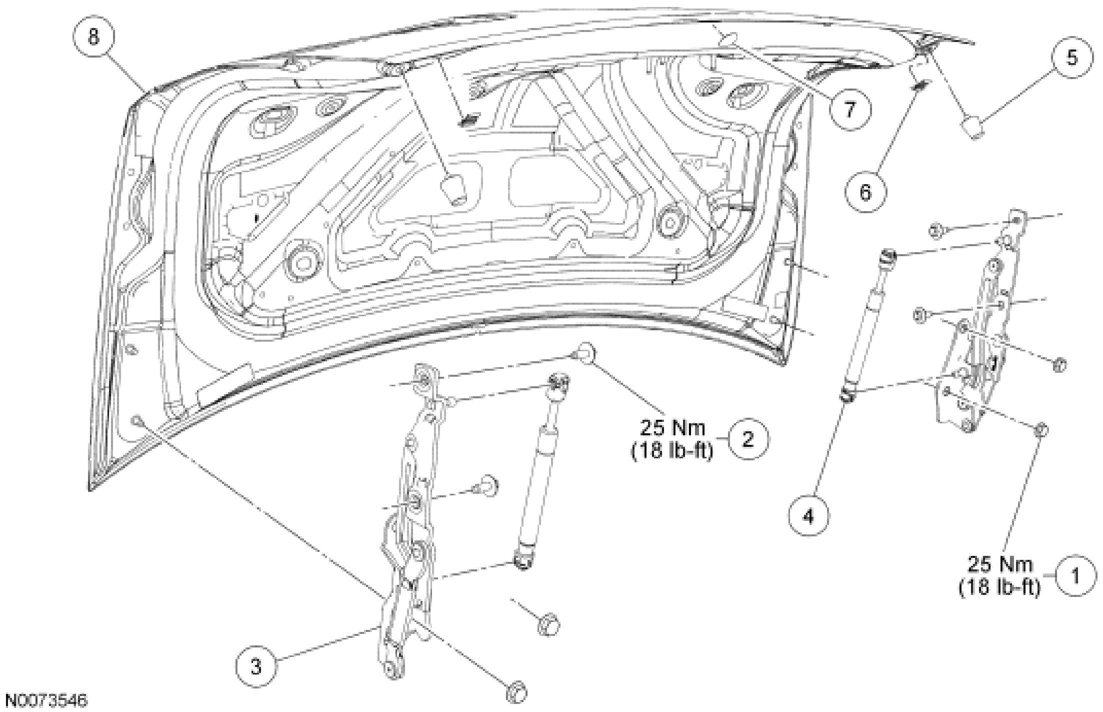

Fig. 5: Exploded View Of Luggage Compartment Lid With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	N811478-S	Hinge-to-luggage compartment lid nut (4 required)
2	W503931	Hinge-to-rear quarter panel bolt (4 required)
3	5442700 RH/ 5442701 LH	Luggage compartment lid hinge
4	54406A10	Luggage compartment lid assist strut (RH/LH)
5	W712985	Luggage compartment bumper (2

		required)
6	58404D12	Flapper valve (2 required)
7	54401A22	Decklid patch
8	5440110	Luggage compartment lid

1. Open the luggage compartment lid.
2. Remove the luggage compartment lid trim panel and pushpins.
3. Disconnect the electrical connectors.
4. Remove the luggage compartment lid lift struts.
5. With the help of an assistant, remove the luggage compartment lid nuts.
    - To install, tighten to 25 N.m (18 lb-ft).
6. With the help of an assistant, remove the luggage compartment lid.
7. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

BODY

The body consists of the following:

- Unibody construction
- Radiator support bolster constructed of hybrid glass fiber polypropylene material
- High-strength low alloy (HSLA), high-strength and mild steels
- Dual-phase steel in select body structure components
- Bolted, removable front fenders, hinged doors and hood
- Underhood and body side door opening dimensions common between Ford Fusion, Mercury Milan and Lincoln MKZ
- Steel fenders
- Steel doors incorporating dent-resistant steel outer panels
- Steel luggage compartment lid
- Steel roof panel
- Steel hood incorporating dent-resistant steel outer panel
- Rear body openings unique for each model
- High-strength roll-formed bolt-on front and rear bumper beams
- Front and rear subframe assemblies housing suspension and steering components
- Underbody common between Ford Fusion, Mercury Milan and Lincoln MKZ
- Tailor welded blanks used in underbody (front floor rails and rear frame rails)
- Structural adhesive used in rear body side outer to inner
- Pumpable mastic sound deadening material contained in interior and exterior underbody floor pan(s)
- Optional rear decklid spoiler

For dimensional information, refer to the following illustrations:

NOTE: The following dimensional illustrations apply to the Ford Fusion, Mercury Milan and Lincoln MKZ unless otherwise indicated.

NOTE: Dimensions apply to right and left side.

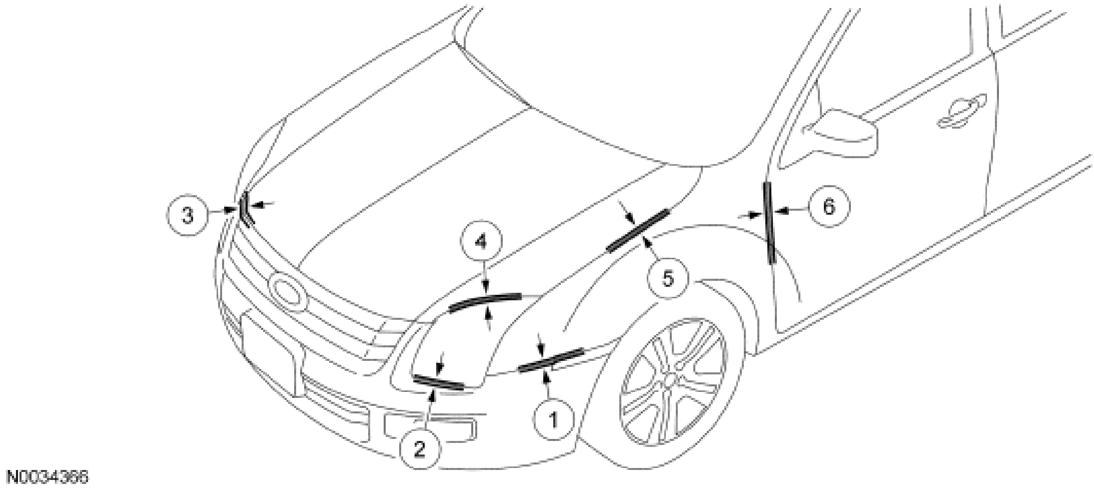

Fig. 1: Body Margins (1 Of 2)

Item	Description	Specification
7	Front door to rear door	4.0 mm (0.15 in) ± 2.0 mm (0.07 in)
8	Rear door to quarter panel	4.0 mm (0.15 in) ± 2.0 mm (0.07 in)
9	Fuel door to quarter panel	3.0 mm (0.11 in) ± 1.0 mm (0.03 in)
10	Quarter panel to luggage compartment lid	4.0 mm (0.15 in) ± 2.0 mm (0.07 in)
11	Lamp assembly to quarter panel	2.0 mm (0.07 in) ± 2.0 mm (0.07 in)
12	Lamp assembly to fascia	2.0 mm (0.07 in) ± 2.0 mm (0.07 in)
13	Luggage compartment lid to fascia	6.0 mm (0.23 in) ± 2.0 mm (0.07 in)

Underhood Dimensions

CAUTION: The radiator bolster is a hybrid component. If damage occurs to the radiator support component, it should not be repaired. A new component should be installed. Refer to ENGINE COOLING article. Failure to follow these instructions may result in incorrect operation of cooling system components.

NOTE: Measurements are obtained on center, unless otherwise indicated.

WELD NUGGET CHART

Test Thickness of Metal (mm)	Nugget Size

0.7 + 0.7	4.3 mm (0.16 in)
0.7 + 0.7 + 0.7	4.3 mm (0.16 in)
0.9 + 0.9	4.7 mm (0.18 in)
0.9 + 0.9 + 0.9	4.7 mm (0.18 in)
1.0 + 1.0	5.2 mm (0.2 in)
1.0 + 1.0 + 1.0	5.2 mm (0.2 in)
2.0 + 2.0	7.1 mm (0.27 in)
2.0 + 2.0 + 2.0	7.1 mm (0.27 in)
3.0 + 3.0	8.7 mm (0.34 in)
3.0 + 3.0 + 3.0	8.7 mm (0.34 in)
3.0 + 0.7	4.3 mm (0.16 in)
0.7 + 3.0 + 1.0	5.2 mm (0.2 in)
2.0 + 2.0 + 0.7	4.3 mm (0.16 in)
0.9 + 0.9 + 2.0	4.7 mm (0.18 in)
2.0 + 0.9 + 1.0	5.2 mm (0.2 in)
1.0 + 3.0 + 1.0	5.2 mm (0.2 in)
3.0 + 1.0 + 2.0	7.1 mm (0.27 in)
0.9 + 0.7 + 0.9	4.3 mm (0.16 in)

WARNING: **Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: Electronic modules and related wiring can be damaged when exposed to heat from welding procedures. Carefully disconnect and remove or position away from heat-affected areas. Failure to follow these instructions may result in incorrect operation of electronic module and related components.

NOTE: When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding.

The correct equipment and settings must be used when welding mild or high-strength steel. Metal Inert Gas (MIG) and Squeeze-Type Resistance Spot Welding (STRW) are the preferred methods. Surfaces must be clean and free of foreign materials.

- The correct protective clothing should always be worn.
- Adequate ventilation must be provided to avoid accumulation of poisonous gases.
- Place protective covers around components and wiring harnesses to protect from welding spatter.
- A test weld should always be carried out on a test sample.
- Follow equipment manufacturer's prescribed procedures and equipment settings for the type of weld being used.
- Use grinding discs and wire brushes dedicated to the type of material being welded.
- Follow equipment manufacturer's prescribed procedures and equipment settings for the type of weld being used. ER70S-2 or ER70S-6 wire are typically used for MIG welding steel.
- Disconnect the battery ground cable from the battery. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Components made of high-strength steel should not be heated to straighten or repair. Severely bent or kinked components should be replaced with new ones.
- Factory spot welds may be substituted with either STRW welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.
- Disconnect on-vehicle modules and protect them from possible heat damage and electrical currents when welding.
- Use of a weld-through primer is recommended where applicable.
- Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. Refer to **Restoring Corrosion Protection Following Repair**.

Welding Precautions - Dual-Phase Steel

The correct equipment and settings must be used when welding Dual-Phase steel. MIG and STRW are the recommended methods. Surfaces must be clean and free of foreign materials.

ER70-S-6 is the recommended wire specification to use when welding Dual-Phase steel components.

Recommended gas mixtures are as follows: C02, 92Ar8C02, 84Ar16C02 and 77Ar23C02.

Components made of Dual-Phase steel should not be heated to straighten or repair. Severely bent or kinked components should be replaced with new ones.

Do not use Oxyacetylene equipment to weld Dual-Phase steel.

- The correct protective clothing should always be worn.
- Adequate ventilation must be provided to avoid the accumulation of poisonous gases.
- Place protective covers around components and wiring harnesses to protect from welding spatter.
- Use grinding discs and wire brushes dedicated to the type of material being welded.
- A test weld should always be carried out on a test sample.
- Follow equipment manufacturer's prescribed procedures and equipment settings for the type of weld

being used.

- Disconnect the battery ground cable from the battery. Refer to **BATTERY, MOUNTING AND CABLES** article.
- Disconnect on-vehicle modules and protect them from possible heat damage and electrical currents when welding.
- Factory spot welds may be substituted with either STRW welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.
- Use of a weld-through primer is recommended where applicable.
- Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are carried out. Refer to **Restoring Corrosion Protection Following Repair**.

PLASTIC COMPONENTS

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

NOTE: **Ford Fusion shown, Mercury Milan and Lincoln MKZ similar.**

NOTE: **The following illustration(s) are not all-inclusive of trim levels available. The actual trim level of the vehicle will determine the viability of carrying out a plastic repair.**

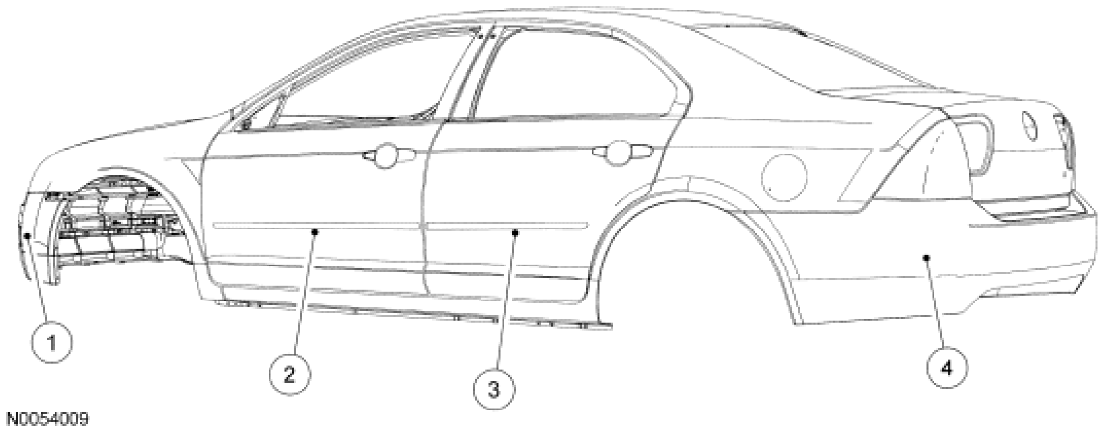

Fig. 12: Exterior Plastic Components - Painted
Courtesy of FORD MOTOR CO.

Item	Part Number	Description

1	17C831	Bumper cover (front) - Thermoplastic polyolefin (TPO)
2	25557 LH/ 25556 RH	Door molding (front) - TPO
3	20879 LH/ 20878 RH	Door molding (rear) - TPO
4	17K835	Bumper cover (rear) - TPO

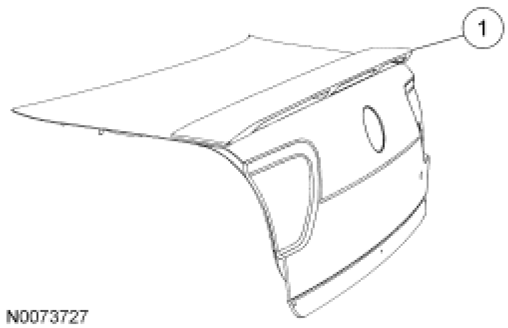

Fig. 13: Decklid Spoiler
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	44210	Spoiler - acrylonitrile butadiene styrene (ABS)

Several considerations will determine viability of plastic repair procedure(s):

- Is the damage cosmetic or structural?
- Can the repair be carried out on the vehicle?
- Is the part readily available?
- Is component repair the most cost effective method?
- Can the component be economically restored to original strength and appearance?
- Will the repair provide for the fastest, highest quality repair?

Several types of plastic are in use for automotive application. However, all plastics will fall into 2 primary categories of thermoplastic or thermosetting plastic.

Thermosetting Plastic - Generally, thermosetting plastics are made with 2-part thermosetting resins. When mixed together, heat is generated, producing a cure that is irreversible. Because of this thermosetting plastics will require the use of a 2-part adhesive for repair.

Sheet-Molded Compound - Sheet-molded compound (SMC) is a type of thermosetting plastic that uses glass fibers or nylon fibers in combination with thermosetting polyester resins. When fully cured SMC is strong and rigid.

SMC is similar to, but not identical to fiberglass. Ford Motor Company uses SMC in components such as fenders, hoods and liftgates.

Thermoplastic Compounds - Thermoplastic compounds are manufactured by a process that is reversible. Thermoplastics can be remolded repeatedly by reheating. This characteristic of thermoplastics makes plastic welding a possible repair alternative. A repair of thermoplastic compounds is still possible through the use of 2-part adhesive and filler repair materials and reinforcements as needed. Thermoplastics are widely used in interior trim components, wheel flares, body side cladding and bumper covers.

Polyolefin - Polyolefins fall into the family of thermoplastics with one unique characteristic: An oily or waxy feel to the material when sanded or ground. Polyolefin lends itself very well to remolding through the use of heat. Because of this, components made of this material lend themselves well to the possibility of plastic welding. Most adhesive repair materials and paint will not bond to surface of a polyolefin unless an adhesion promoter specially formulated for plastic is first applied to the exposed raw surface. Otherwise, polyolefins are repaired like most other thermoplastics. Some typical uses of polyolefins are:

- bumper covers.
- fan shrouds.
- wheel housings.

Proper identification of the various types of plastic is necessary to select the appropriate repair method(s) to carry out high quality plastic repairs. Refer to **Plastics Identification**.

SEALERS

MATERIAL

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Roof Ditch Sealer TA-15	-
Seam Sealer TA-2	-

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

The correct sealing of joints is essential to repairing the vehicle correctly. Sealers are used to prevent wind noise, water leaks, exhaust fumes and dust from entering the vehicle. They also provide anti-corrosion barriers. Sealers are applied to areas such as door and rear compartment hem flanges, wheelhouse, quarter outer, floor, cowl, roof and other panel-to-panel attaching points. The following joint sealers are recommended for use depending upon the application:

- Brushable Seam Sealer - A sealer intended to restore the original brushed seam appearance. It is used to seal lap joints in sheet metal that are spot welded (for example, floorpan and cowls).
- Roof Ditch Sealer - A self-leveling sealer used for drip rails, roof seams, quarter panels to rear deck and for water leaks.
- Seam Sealer - Heavy-bodied, non-sag adhesive/sealer for use on standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans.

- Clear Silicone Rubber - Used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

Sealers should remain flexible after curing and must be paintable. Follow the manufacturer's directions for correct application of these materials.

Any damage to originally sealed joints should be repaired by resealing. Along with attaching points of new panels, open joints that require bridging of sealer to close a gap should be sealed using a heavy-bodied sealer.

SOUND DEADENERS AND INSULATORS

NOTE: **Mastic is made of a combustible material and should be removed prior to carrying out welding procedures to the area. Heat zones from welding near the mastic may cause the mastic material to burn.**

NOTE: **Corrosion protection must be restored to the area AFTER the mastic material is applied. Corrosion protection products contain wax and loss of adhesion may occur.**

NOTE: **To restore the vehicle to design intent, missing or damaged sound deadeners and insulators should be installed with the correct service replacement component.**

NOTE: **The following illustrations serve as a reference to indicate mastic sound deadener locations. Sound deadener material is applied from the factory in a pumpable form. Additional insulators and sound deadeners are used beyond those indicated in the illustration.**

NOTE: **Arrow indicates rear of vehicle.**

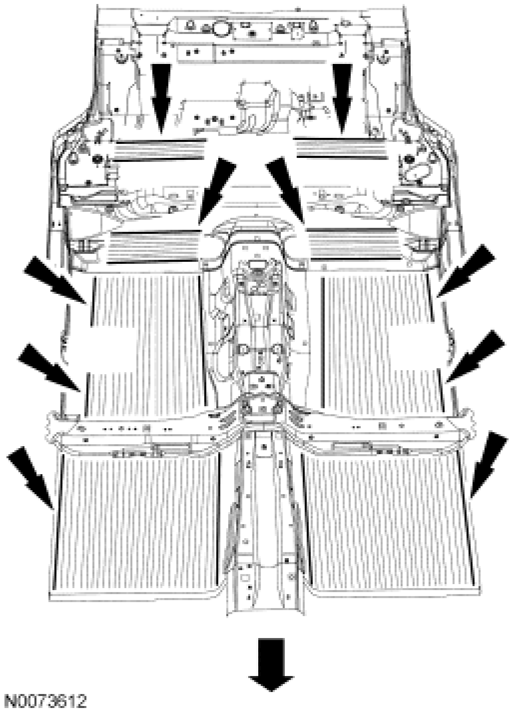

Fig. 14: Interior Floor Pan
Courtesy of FORD MOTOR CO.

NOTE: Arrow indicates rear of vehicle.

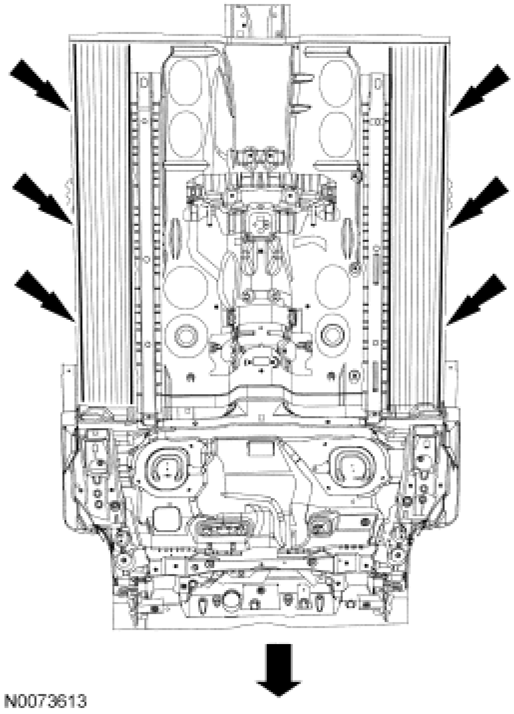

Fig. 15: Exterior Floor Pan

1. Whenever replacement of an existing mastic insulator is carried out, the surface must be thoroughly cleaned to make sure correct adhesion will occur. The surface should be 10°C (50°F) or greater before applying the mastic. The use of a heat gun to warm the metal surface will aid in adhesion.

ADHESIVES

MATERIAL

Item	Specification
Clear Silicone Rubber TA-32	ESB-M4G92-A
Metal Bonding Adhesive TA-1	-
Metal Patch Panel Adhesive TA-3	-
Motorcraft Metal Surface Prep ZC-31-A	-
Plastic Bonding Adhesive TA-9	-
Seam Sealer TA-2	-
Trim and Weatherstrip Adhesive TA-14	-

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

NOTE: **When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding.**

Adhesives are used in a variety of applications. Typical uses for adhesives include roof panels, door skins and quarter panels. Trim applications include body side moldings, emblems, stationary glass and weatherstripping. Combination sealer/adhesives are also used. Surface preparation is critical to a high quality repair. Following the label instructions for the product is essential.

Work in a well-ventilated area and protect adjacent surfaces when working with adhesives. The use of eye protection and protective clothing is also recommended when working with adhesives. Carry out a trial fit, mark and align the surfaces before bonding the materials together.

Seam sealers and corrosion protection may be necessary once the adhesive(s) has cured, depending on the application. The following is a list of adhesives recommended for certain types of applications:

- Metal Bonding Adhesive - For bonding cold-rolled steel, galvanized steel, aluminum and correctly prepared E-coat. It is used for door skin and roof panel replacement and OEM structural adhesive replacement.
- Plastic Bonding Adhesive - For bonding a variety of plastics to plastics and plastics to primed, painted or E-coated metals. Also for general purpose bonding of trim components.
- Seam Sealer - Heavy-bodied, non-sag adhesive/sealer for use on: standing cosmetic seams, truck bed seams, tooled door skin seams and floor pans.

- Trim and Weatherstrip Adhesive - For use on body side molding, emblems, trim, bumper impact strips and carpeting.
- Clear Silicone Rubber - Used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

NOTE: The following illustration identifies structural adhesive location(s).

WARNING: **Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

WARNING: **On vehicles equipped with safety canopy options, prior to carrying out any sectioning repairs near the roof line or sail panel areas of the vehicle, remove the safety canopy module and related components. Failure to comply may result in accidental deployment or damage to the safety canopy. Refer to SUPPLEMENTAL RESTRAINT SYSTEM article. Failure to follow these instructions may result in serious injury to technician or vehicle occupant(s).**

WARNING: **Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. Welding within 50 mm (1.96 in) of restraint anchoring points may result in incorrect operation of restraint devices. For additional restraints anchoring location information, refer to SAFETY BELT SYSTEM article and SUPPLEMENTAL RESTRAINT SYSTEM article. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

WARNING: **Do not carry out body side sectioning repairs in areas of door hinge or striker anchoring points. Welding within 50 mm (1.96 in) of door hinge or striker locations may compromise structural integrity during a collision. Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

NOTE: **Factory spot welds may be substituted with either squeeze-type resistance spot welds (STRSW) or metal inert gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original location. Plug weld hole should equal 8 mm (0.31 in) diameter.**

NOTE: **Observe prescribed welding procedures when carrying out any body side**

section repair. For additional information, refer to Welding Precautions - Steel.

NOTE: The new design of the front and rear doors incorporates a new precision weatherstrip seal retainer flange above the belt line. Dimensions of this flange are critical to maintain correct sealing from water leaks, wind noise, etc. If these upper channels are damaged in a collision, the entire door shell should be replaced. The door assembly also incorporates:

- **an open bottom hem flange for improved corrosion protection.**
- **flat modified front and rear door hem flanges, below the belt lines. After hemming the production doors, a secondary operation adds a taper to the inside surface of the hem that reduces the variability of the door dimensions. This allows for smaller factory margins between the doors, fenders and quarter panels.**

NOTE: Illustration applicable to Ford Fusion, Mercury Milan and Lincoln MKZ. Cut lines shown in illustration are approximate.

NOTE: When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding.

1. Drill out the spot welds of the damaged panel to be sectioned. Using a cut-off wheel, reciprocating saw or plasma cutter, cut through the damaged area of the outer panel only and remove the section to be replaced.

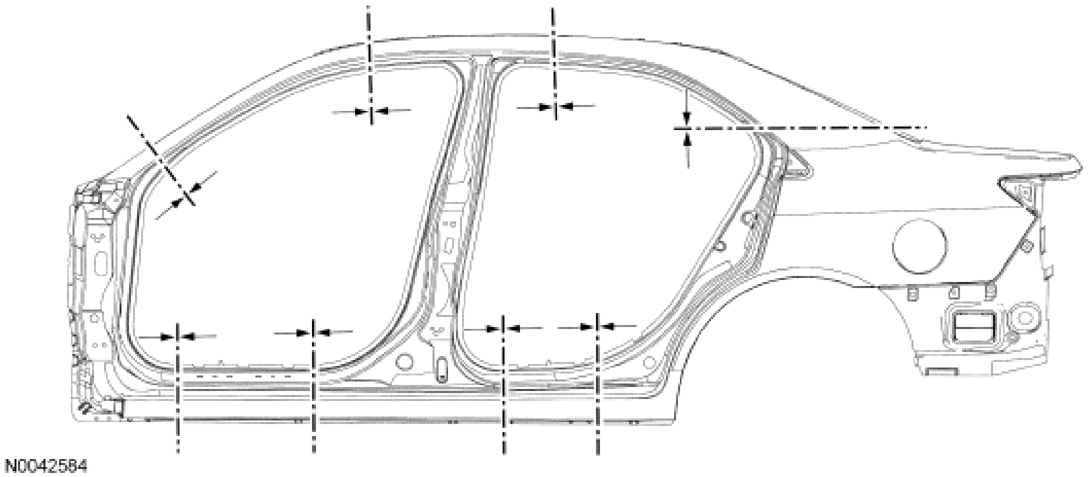

Fig. 18: Identifying Cut Lines
Courtesy of FORD MOTOR CO.

NOTE: Electronic modules and related wiring may be damaged when exposed to heat from welding procedures. Carefully disconnect and remove, or position away from heat affected areas. For additional information, refer to

Welding Precautions - Steel. Failure to follow these instructions may result in incorrect operation of modules and related components.

NOTE: **Ford Motor Company does not approve or recognize structural repair procedures using anything but genuine Ford parts.**

Structural repairs (frames, rails, aprons and body panels) carried out using other than Ford Motor Company parts have not been tested. In addition, structural equivalence and corrosion protection cannot be assured.

Returning a vehicle to pre-accident condition can only be assured if repair procedures are carried out by skilled technicians using genuine Ford Motor Company parts and approved methods.

Structural component repair procedures approved by Ford using genuine parts have been validated through testing by Ford Motor Company engineers. Should alternative structural component repair procedures and/or parts be used, repairers should be aware of the potential liability they incur.

NOTE: **When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding.**

2. Detrim the vehicle as necessary and drill out the spot welds from the damaged area. Using an air chisel or reciprocating saw, cut off the portion of the panel to be replaced.
3. Where possible, create a backer piece using a portion of the old panel. This will create a stronger joint.
4. When welding overlapping surfaces or substrates, apply corrosion protection material between the surfaces prior to welding. When the surfaces have been welded, apply corrosion protection material to the exterior surfaces or substrates. For additional information, refer to **Restoring Corrosion Protection Following Repair**.
    - Make sure horizontal joints and flanges are correctly sealed with seam sealer to prevent moisture intrusion. Water and moisture migrate to horizontal joints and corrosion tends to occur more rapidly in these areas. Metal surfaces must be clean and dry before applying seam sealer.
5. Proceed with refinish procedures following paint manufacturer's guidelines.

RESTORING CORROSION PROTECTION FOLLOWING REPAIR

Special Tools

Illustration	Tool Name	Tool Number
 ST3049-A	Rust Inhibitor Installation Kit	286-00002

	Undercoating Spray Gun	286-00001

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-
Motorcraft Premium Undercoating PM-25-A	-
Motorcraft Premium Undercoating Quart PM-25-B	-
Motorcraft Rust Inhibitor Aerosol PM-24-A	-
Motorcraft Rust Inhibitor Quart PM-24-B	-

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: Drilling access holes in body panels is not recommended. Drilling holes will break the original paint finish and promote corrosion.

NOTE: Corrosion protection needs to be restored whenever it is necessary to sand or grind through painted surfaces or E-coat, or when bare metal repairs are made.

NOTE: Rust inhibitor is a wax-based product and must be thoroughly stirred before applying to the vehicle. Store product at temperatures above 20°C (68°F) to avoid thickening of the material. If the product has been left in a cold environment, place the container in hot water for 5-10 minutes. Do not let water reach the cap of the container. Stir or shake vigorously before applying.

1. The surfaces must be free of oil, dirt and other foreign material. Carry out the process in the following sequence.
    1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.

2. For best results, the vehicle should be at room temperature.
3. Rust inhibitor should be applied after the welding and refinishing process. Product cannot be welded through.
4. Air pressure setting for applicator gun is 448-517 kPa (65-75 psi).
   - Use the long wand when spraying enclosed areas. The spray nozzle provides a 360-degree spray pattern. Insert the wand as far as possible into the access hole, pull the trigger and wait 2-3 seconds and slowly pull the wand out of the access hole.
   - The short, hook-shaped wand sprays in one direction and must be rotated to provide complete coverage.
   - Apply the material in light mist coats.
   - Material displaces moisture.
5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

NOTE: The following illustrations provide typical applications of body seams and spot welded flanges and are not vehicle specific.

NOTE: Door assembly lower view.

2. Apply rust inhibitor as shown to the inside of the door shell on all the interior metal surfaces using the most suitable applicator wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

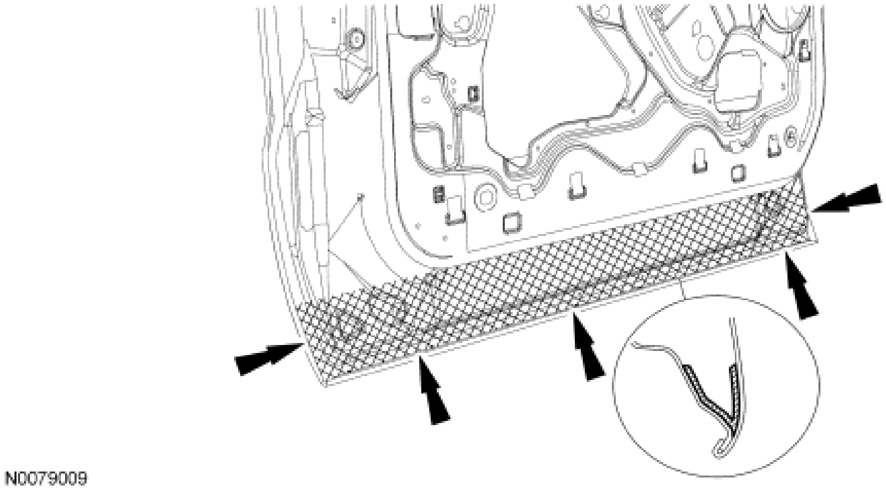

Fig. 19: Identifying Rust Inhibitor Application Locations
Courtesy of FORD MOTOR CO.

NOTE: Quarter panel inner view.

3. Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Apply material to the exposed edges after carrying out the welding process. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

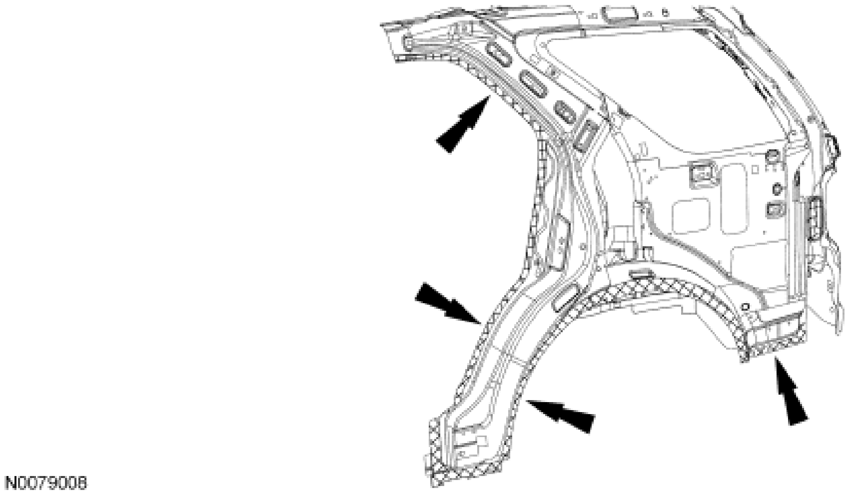

Fig. 20: Identifying Rust Inhibitor Application Locations
Courtesy of FORD MOTOR CO.

NOTE: Door frame opening view.

4. Apply rust inhibitor to the closed channel portion of the spot weld flange areas using the short, hook-shaped wand. Make sure horizontal surfaces are well protected as they are more susceptible to corrosion.

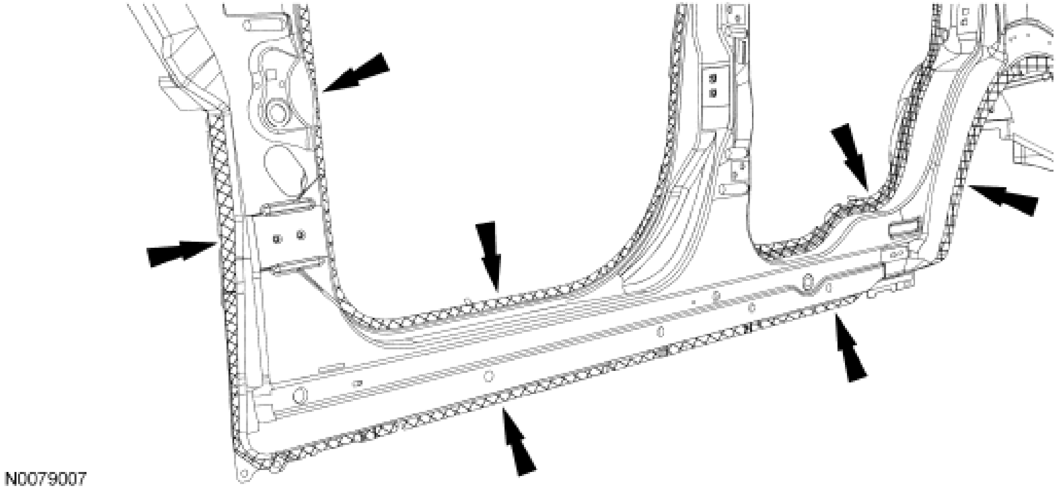

Fig. 21: Identifying Rust Inhibitor Application Locations

Body and Frame Undercoating

WARNING: Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: Do not allow undercoating on exhaust components, heat shields and driveshaft. Failure to follow these instructions may result in incorrect operation of these components.

NOTE: Undercoat is a wax-based product and must be thoroughly stirred before applying to the vehicle. Store product at temperatures above 20°C (68°F) to avoid thickening of the material. If the product has been left in a cold environment, place the container in hot water for 5-10 minutes. Do not let water reach the cap of the container. Stir or shake vigorously before applying.

NOTE: Avoid high-pressure water spray cleaning to treated underbody area for 24 hours.

1. Wire brush the area and make sure the surfaces are free of oil, dirt and other foreign material. Carry out the undercoating process in the following sequence.
    1. Thoroughly clean and degrease metal surfaces using metal surface prep to remove wax and grease.
    2. For best results, the vehicle should be at room temperature.
        - Bottle attaches directly to the dispensing gun.
    3. Undercoat should be applied after the welding and refinishing process. Product cannot be welded through.
    4. Air pressure setting for applicator gun is 552-621 kPa (80-90 psi).
        - Apply light mist coats, applicator sprays in fogging pattern.
        - Material displaces moisture.
    5. Clean up any overspray with a mild solvent such as mineral spirits or bug and tar remover.

NOTE: The following illustrations provide typical applications to frame rails and are not vehicle specific.

NOTE: Frame rail exterior spot-weld flange view.

2. Apply undercoat material to the exterior exposed edges after carrying out the welding and refinishing process.

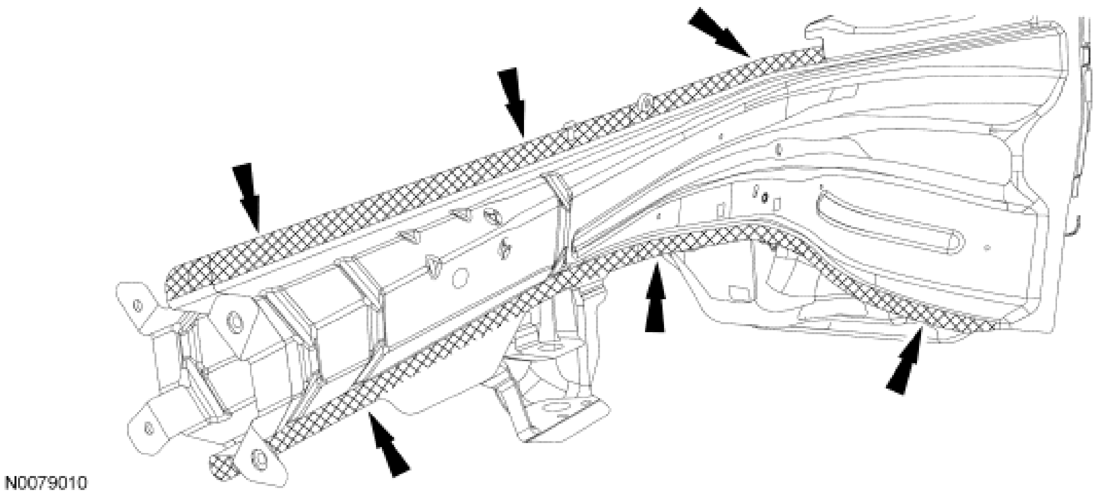

Fig. 22: Identifying Undercoat Material Application Locations
Courtesy of FORD MOTOR CO.

NOTE: Cross section view of typical unibody frame rail shown.

3. Apply rust inhibitor to the inner surfaces of the rail after carrying out welding process. Use the long wand and insert as far as possible, depress trigger and wait 2-3 seconds and slowly pull the wand to make sure the area is completely fogged.

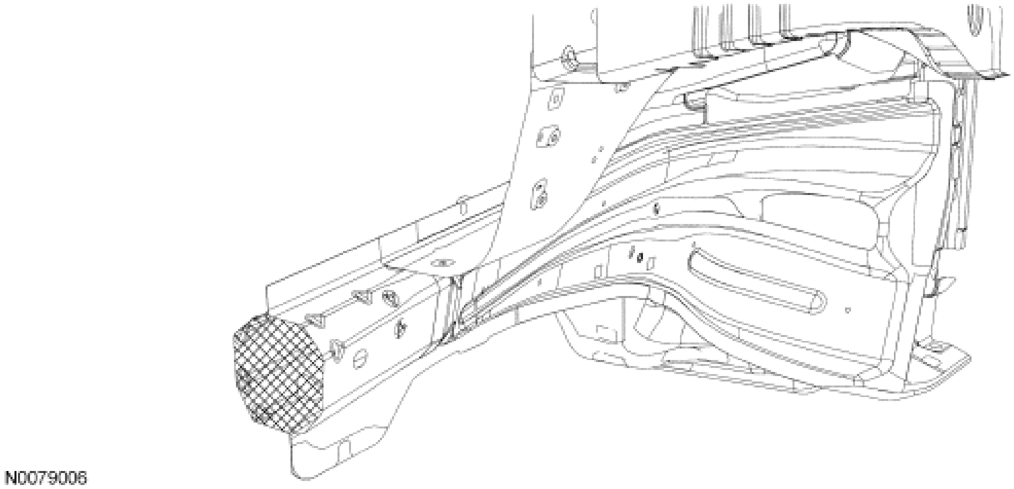

Fig. 23: Identifying Rust Inhibitor Application Locations
Courtesy of FORD MOTOR CO.

NOTE: Full frame vehicle, front rail-to-mid rail section repair shown.

4. Apply undercoat material to the exposed surfaces after carrying out the welding process. Make sure to completely cover any bare metal areas.

Iron Oxide (Rail Dust) or Acid Rain Decontamination

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: **In extreme cases of contamination, the vehicle may require refinishing. To avoid paint failure, follow the appropriate decontamination procedure prior to carrying out any panel refinishing procedure.**

NOTE: **Iron oxide contamination appears as tiny rust spots on horizontal surfaces and in severe cases can be felt. This damage is typically caused from rail shipment,**

storage near railroad tracks or fallout from industrial manufacturing facilities.

NOTE: Acid rain contamination can be identified as water spotting and, in severe cases, staining within the water spots.

NOTE: Never paint over iron particles as rust spots will reoccur. Use only the recommended decontamination procedure detailed below.

1. Rinse any dust, dirt and foreign material from the vehicle body with cold water. Flush liberally.
2. Prepare the acid neutralizer by mixing 8 parts of water to 1 part neutralizer in a bucket.

NOTE: To avoid paint failure, do not allow the product to dry on the vehicle.

NOTE: Use a separate wash mitt for each product applied to the vehicle.

3. Working quickly and beginning at the top of the vehicle and working to the sides, apply the acid neutralizer mix to the entire vehicle. Keep the vehicle wet with the solution and lightly agitate for 5 to 7 minutes. Continue around the vehicle 4 to 5 times. For severe conditions, work the product for up to 8 minutes.
4. Rinse the vehicle completely with cold water to remove the product.
5. Dry only the horizontal surfaces of the vehicle, do not dry the glass at this time.

NOTE: To avoid damage to the paint surface, do not apply the alkaline neutralizer directly to the vehicle plastic trim.

NOTE: Use a separate wash mitt for each product applied to the vehicle.

NOTE: Alkaline neutralizer is a ready-to-use product. Do not mix with water.

6. Pour the alkaline neutralizer into a squirt bottle and apply the solution to a clean wash mitt.

NOTE: To avoid paint failure, do not allow the alkaline neutralizer to dry on the vehicle.

7. Apply the product to the vehicle keeping the solution wet and lightly agitate for 5 to 7 minutes. For severe conditions, work the product for up to 8 minutes.
8. Rinse the vehicle completely with cold water to remove the product.
9. Prepare the detail wash by mixing 29.5 ml (1 oz.) with 3.78L (1 gal) of water.
10. Using a clean wash mitt, shampoo the entire vehicle and rinse with cold water. Dry the vehicle completely.
11. Visually inspect the paint surface for any remaining evidence of ferrous metal particles. Repeat procedure as necessary.

Surface Finishing Following Decontamination

NOTE: **When attempting to affect a repair by buffing, polishing or color sanding, do not remove an excess of 0.3 mil of paint film or refinishing will be required.**

NOTE: **Acid rain discoloring or etching may require color sanding in addition to buffing and polishing. In extreme cases, refinishing may be required if the following procedure does not restore the vehicle finish.**

NOTE: **Do not intermix buffing products. Use only one manufacturer's product.**

NOTE: **Always follow the manufacturer's product usage sequence. Use the appropriate buffing or polishing pad at the recommended buffing speed as specified by the product manufacturer.**

1. Apply rubbing compound to the vehicle surface as recommended by the product manufacturer.
2. Apply machine glaze to the vehicle surface as recommended by the product manufacturer.
3. Use an alcohol and water mixture (1 to 1) to clean the buffed and polished areas. Verify removal of scratches and swirls before the application of the final polish.
4. Apply a final polish material by hand, with a dual-action sander and foam pad, or with an orbital polisher and appropriate polishing bonnet.
5. Wash and dry the vehicle.

REFINISHING - MANUFACTURING DAMAGE

Material

Item	Specification
Motorcraft Detail Wash ZC-3-A	-

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: **To avoid overspray damage to adjacent panels, protect adjacent areas/substrates when preparing for and during refinishing.**

NOTE: Peeling/delamination concerns can be described as lack of adhesion, either between the substrate and topcoats or between individual coats of paint.

1. Wash the repair area with detail wash or pH-neutral soap and water.
2. Remove any trim, emblems and hardware from the area to be repaired.

   NOTE: All delamination must be removed.

3. Sand or media blast the damaged surface, keeping the repair area as minimal as possible.
4. Treat any bare metal surface to prevent flash corrosion, and prime and block sand as necessary prior to refinishing.
5. Mask the adjacent panels to protect from overspray.
6. Spot repair the base coat as necessary, following the paint manufacturer's prescribed procedures.
7. Following the paint manufacturer's prescribed procedure, apply clear coat to the entire panel.

Weld-Bonding - Squeeze-Type Resistance Spot Welding (STRW) Method

WARNING: **Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is**

strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: **Ford Motor Company does not approve or recognize structural repair procedures using anything but genuine Ford parts.**

Structural repairs (frames, rails, aprons and body panels) carried out using other than Ford Motor Company parts have not been tested. In addition, structural equivalence and corrosion protection cannot be assured.

Returning a vehicle to pre-accident condition can only be assured if repair procedures are carried out by skilled technicians using genuine Ford Motor Company parts and approved methods.

Structural component repair procedures approved by Ford using genuine parts have been validated through testing by Ford Motor Company engineers. Should alternative structural component repair procedures and/or parts be used, repairers should be aware of the potential liability they incur.

NOTE: **Corrosion protection needs to be restored whenever it is necessary to grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair.**

NOTE: **On door shells that are manufactured with structural adhesives only, weld bonding door skins is not recommended. Only metal bonding adhesive should be used.**

NOTE: **Weld-bonding is a method used to join metals using Squeeze-Type Resistance Spot Welding (STRW) or Metal Inert Gas (MIG) welding and structural adhesive. The steps listed in this procedure apply to both types of welding. STRW is the preferred method. MIG welding should only be used when areas to be welded cannot be accessed using STRW-type machinery.**

NOTE: **Factory spot welds should be substituted with either resistance spot welds or**

MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Verify the vehicle is dimensionally correct on a frame machine. Straighten if necessary.
2. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.
3. Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.
4. Prepare any damaged flanges on the vehicle using hammer and dolly.
5. Grind the mating surface of the original flanges no greater than 25 mm (0.98 in) where the metal bonding adhesive will be applied.
   - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.
   - Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed.
6. Dry-fit and clamp the replacement service parts to verify a correct fit.
   - Remove the service part after verifying correct fit and alignment.

NOTE: **The ends of welding clamps should be insulated on the ends using tape or similar material when welding is carried out.**

7. Follow manufacturer's prescribed welding procedures and settings. For additional information, refer to **Welding Precautions - Steel**.
8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of a correct mix ratio.

NOTE: **Welding can be carried out anytime during the adhesive curing process, or after the adhesive is fully cured. Welder settings will vary when welding through wet adhesive versus welding through fully cured adhesive. Refer to welder manufacturer's recommended settings for welding through fully cured adhesive. It is recommended to place a shunt weld in an area with no adhesive to make sure of conductivity, particularly when welding through fully cured adhesive.**

NOTE: **Working time of the adhesive is 40-50 minutes at 21°C (70°F). For every -7°C (20°F) above 21°C (70°F), decrease the working time by one half. For every -7°C (20°F) below 21°C (70°F), double the working and cure time.**

9. Create a test sample.
   1. Prepare the metal and adhesive as described. Apply a 6-9 mm (0.23-0.35 in) bead of adhesive and weld the sample.
   2. Place the welded sample in a vice and carry out destructive weld tests by peeling the scrap metal

apart using large lock-type pliers. Measure the weld nugget to determine that the nugget meets Ford weld nugget requirements. If the weld nugget does not meet required size, adjust welder settings until the correct weld nugget size is achieved.

3. When the correct weld nugget size is achieved, the service part can be weld-bonded.

WELD NUGGET CHART

Test Thickness of Metal (mm)	Nugget Size
0.7 + 0.7	4.3 mm (0.16 in)
0.7 + 0.7 + 0.7	4.3 mm (0.16 in)
0.9 + 0.9	4.7 mm (0.18 in)
0.9 + 0.9 + 0.9	4.7 mm (0.18 in)
1.0 + 1.0	5.2 mm (0.2 in)
1.0 + 1.0 + 1.0	5.2 mm (0.2 in)
2.0 + 2.0	7.1 mm (0.27 in)
2.0 + 2.0 + 2.0	7.1 mm (0.27 in)
3.0 + 3.0	8.7 mm (0.34 in)
3.0 + 3.0 + 3.0	8.7 mm (0.34 in)
3.0 + 0.7	4.3 mm (0.16 in)
0.7 + 3.0 + 1.0	5.2 mm (0.2 in)
2.0 + 2.0 + 0.7	4.3 mm (0.16

	in)
0.9 + 0.9 + 2.0	4.7 mm (0.18 in)
2.0 + 0.9 + 1.0	5.2 mm (0.2 in)
1.0 + 3.0 + 1.0	5.2 mm (0.2 in)
3.0 + 1.0 + 2.0	7.1 mm (0.27 in)
0.9 + 0.7 + 0.9	4.3 mm (0.16 in)

10. Apply a 6-9 mm (0.23-0.35 in) bead of metal bonding adhesive to the vehicle prepared flange surface.
11. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.
12. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

NOTE: If welding will not be carried out immediately, allow a minimum of 1.5 to 2 hours of adhesive cure time at 21°C (70°F) before removing clamps. Cure time at lower temperatures should be increased. Clamps may be removed immediately after the component is welded.

13. Wipe excess adhesive from the panel before it cures.
14. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.
15. Use seam sealer wherever a cosmetic seam sealer is required.
16. Mix and apply primer surfacer per Ford-approved paint recommendations.
17. Mix and apply basecoat per Ford-approved paint recommendations.
18. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.
19. Apply anti-corrosion treatment to the repair area as required. For additional information, refer to **Restoring Corrosion Protection Following Repair**.

Weld-Bonding - Metal Inert Gas (MIG) Welding Method

WARNING: Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric

welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: Metal Inert Gas (MIG) weld-bonding can be substituted as an alternative to Squeeze-Type Resistance Spot Welding (STRW). It may only be used to weld areas that are inaccessible to STRW machinery. However, when accessible, STRW is the preferred method.

NOTE: Corrosion protection needs to be restored whenever it is necessary to grind through painted surfaces or E-coat, or when bare metal repairs are made. For additional information, refer to Restoring Corrosion Protection Following Repair.

NOTE: On door shells that are manufactured with structural adhesives only, weld-bonding door skins is not recommended. Only metal bonding adhesive should be used.

NOTE: Factory spot welds should be substituted with either resistance spot welds or MIG plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

1. Remove damaged panels with an air saw or air chisel. Remove only large portions of the damaged panel. Avoid cutting into mating flanges or adjacent parts.
    - Drill out the spot welds using an appropriate spot-weld cutter and remove the remaining portions of the panel to be replaced.
2. After removing the damaged sheet metal panel(s), repair any damaged flanges on the vehicle using a hammer and dolly.
3. Using an appropriate grinder, carefully grind around the entire receiving flange area following the original welds. Be sure to remove all E-coat, paint or galvanized coating from the mating surfaces of the joint.
    - Be sure to remove galvanizing on metal. Metal should have a shiny appearance.

- Be careful not to damage the corners or thin the metal. The E-coat should also be removed on the opposite side of the flange only where the spot welds are to be placed.

4. Repeat the procedure from Step 3 on the mating surface of the replacement service part(s).
5. Prepare the new service panel for plug welds.
   - Using the original panel as a reference, drill or punch 8 mm (0.31 in) diameter holes in the exact number as the original spot welds. The holes should be positioned as close as possible to the original spot weld locations, without lining up exactly on top of an original spot weld site.
   - To make sure of correct weld performance, grind the immediate perimeter of the plug weld hole. Grind only in the area of the plug weld; this will keep corrosion to a minimum.
6. Dry-fit and clamp the replacement service parts to verify a correct fit and alignment.
   - Remove the service part after verifying correct fit and alignment.
7. The vehicle prepared flange areas where plug welds will be located must be kept free of adhesive. Apply 25 mm (0.98 in) tape to the plug weld areas to prevent contamination from the adhesive.
8. Prepare the adhesive. Dispense a small amount of metal bonding adhesive from the cartridge to make sure of an even flow of both components. Attach the mixing tip and dispense a mixing tip length of adhesive to make sure of correct mix ratio.

NOTE: **Work time of the adhesive is 40-50 minutes at 21°C (70°F). For every -7°C (20°F) above 21°C (70°F), decrease the working time by one half. For every -7°C (20°F) below 21°C (70°F), double the working and cure time.**

9. Apply a 6-9 mm (0.23-0.35 in) bead of adhesive to the vehicle prepared flange surface. Remove the tape from the plug weld areas.
10. Place the service part(s) in the correct position on the vehicle.
    - When positioned, do not pull the component away from the vehicle. If repositioning is necessary, slide the service part(s). This will make sure of correct contact between the components and adhesive.
11. Clamp evenly and tightly. The adhesive contains glass beads which will prevent over-clamping the component.

NOTE: **Welding can be carried out anytime during the adhesive curing process or after the adhesive is fully cured.**

NOTE: **If welding will not be carried out immediately, allow a minimum of 1.5 to 2 hours of adhesive cure time at 21°C (70°F) before removing clamps. Cure time at lower temperatures should be increased. Clamps may be removed immediately after the component is welded.**

12. Wipe excess adhesive from the panel before it cures.
13. Finish any cosmetic section seams with fiber-filled body filler. Rough sand the filler, apply conventional body filler after the adhesive cures and block-sand the area.
14. Use seam sealer wherever a cosmetic seam sealer is required.
15. Mix and apply primer surfacer per Ford-approved paint recommendations.

16. Mix and apply basecoat per Ford-approved paint recommendations.
17. Mix and apply clearcoat per Ford-approved paint recommendations. Refinishing materials may be force-dried following paint manufacturer's recommendations.
18. Apply anti-corrosion treatment to the repair area as required. For additional information, refer to **Restoring Corrosion Protection Following Repair**.

PLASTICS IDENTIFICATION

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: Identification of the various plastic types is necessary to select the appropriate repair methods to make high quality plastic repairs. Plastics can generally be broken down into 2 categories, thermoplastics and thermosetting plastics. Thermoplastics can be remolded by heating. This makes plastic welding a possible repair alternative.

NOTE: In some instances, a code or material designation is stamped indicating the plastic type.

1. Thermoplastics are solvent reactive. Types of thermoplastics include Thermoplastic Olefin (TPO), Polyvinyl Chloride (PVC) and Acrylonitrile Butadiene Styrene (ABS). Polyolefins have an oily or waxy appearance. Examples include some bumper covers, stone shields, fender aprons and fan shrouds. Polyolefins require an adhesion promoter prior to carrying out any refinish procedure.
    - To determine if the part is a polyolefin, grind the damaged area in an out-of-sight area. Grinding a polyolefin will melt and smear the plastic and leave a ragged edge. If the part is non-polyolefin, the area will grind or sand smoothly, producing a powdery dust.

RIGID PLASTIC PARTS

Code	Family Name	Common Trade Name	Typical Application
ABS	Acrylonitrile Butadiene Styrene	ABS, Cycolac, Lustran, Kralistic	A-Pillars, Consoles, Grilles
SMC	Sheet Molded Composite	SMC	Body Panels

FLEXIBLE PLASTIC PARTS

Code	Family Name	Common Trade Name	Typical Application
RRIM	Reinforced Reaction Injection-Mold Material PUR	RRIM	Fascias, Body Panels, Body Trims
TPO	Thermoplastic Polyolefin	Polytrope, Renflex, Santropren Telcar, Vistaflex, ETA, Apex, TPO	Bumpers, End Caps, Rubber Strips, Sight Shields, Claddings, Interior B-Post

2. Olefin plastic can also be identified by placing a small sliver in a container of water, if the sample floats, it is an olefin plastic. A non-olefin will sink when placed in a container of water.
3. Generally, thermosetting plastics are rigid or semi-rigid. Sheet-Molded Composite (SMC) is reinforced with glass and other fibers and are strong and rigid. SMC is used for large panels such as hoods, liftgates, fenders and quarter panels.
    - A burn test can be a reliable method to determine if a plastic is a thermosetting plastic. Extreme care must be exercised when using this method.
        - Apply an open flame to the corner of the damaged component. If the material crystallizes and becomes hard, it is a thermosetting plastic.

PLASTICS REFINISHING - EXTERIOR

Material

Item	Specification
Motorcraft Adhesion Promoter PM-19A316-AA	-

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

NOTE: Care must be used if applying heat to parts. Thermoplastics soften and tend to lose their shape when heated.

1. The first step to any repair or refinish procedure is to identify the type of plastic. Is it thermosetting or thermoplastic, grained or smooth? This will determine how it should be cleaned and prepared for

refinishing. For additional information, refer to **Plastics Identification**.

- It is essential that the correct cleaner is used, depending on which painting system is employed, solvent-based or water-based.
- Clean part with warm water/mild detergent and gray scuff pad, then with plastic cleaner to remove wax, silicone and other contaminants. As a general rule, if water beads on the part, it requires additional cleaning as all the manufacturing release agent has not been removed.

2. New parts may require baking in a spray booth or heating with heat lamps to release trapped solvents or mold release agents used during manufacture.
3. After cleaning, lightly sand with 600-grit or finer sandpaper. Clean sanding residue with plastic cleaner and wipe clean.
4. A sealer may be required to prevent wrinkling and lifting of the topcoat prior to carrying out the refinish procedure.
5. Flexible and non-flexible components should be refinished separately as a flex additive is generally added to the paint material when refinishing flexible plastics.
6. It is recommended to carry out the refinish process with component installed on-vehicle to control color and blending of the adjacent panels.
7. Apply adhesion promoter. For best results, use only when product and surface temperatures are between 15°C (60°F) and 33°C (92°F). In cases of high humidity, apply the adhesion promoter in a spray booth or controlled climate. Hair dryers or fans may be used to create air movement to speed the adhesion promoter curing process.
   - Shake can vigorously for one full minute before use and repeat for 10 seconds after each full minute of use.
   - Test spray on a hidden area before proceeding.
8. Hold can 150 mm (5.9 in) to 254 mm (10 in) from the surface and spray a full wet coat with a steady back and forth motion. Be sure all areas of the surface are covered. Observe for a uniform gloss/coverage across the surface while the adhesion promoter is still wet.
9. Allow the adhesion promoter to dry 2-3 minutes and reapply a second wet coat. Allow to dry 2-3 minutes.
10. Proceed with the refinish process and follow the Ford-approved paint system procedures. Steps may vary between paint manufacturers.

PLASTICS REFINISHING - INTERIOR

Material

Item	Specification
Interior Spray Paint PM-19M547-xxxxH	-
Motorcraft Adhesion Promoter PM-19A316-AA	-

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not repaint air bag modules with discolored or damaged trim covers or deployment doors; new air bag modules must be installed. Failure to follow this instruction may result in the air bag deploying incorrectly, which increases the risk of serious personal injury or death in a crash.**

NOTE: The use of adhesion promoter is only required for polyolefin plastics. To avoid paint failure, do not use adhesion promoter or equivalent prior to color coating soft plastic.

NOTE: Care must be used if applying heat to parts. Thermoplastics soften and tend to lose their shape when heated.

1. The first step to any repair or refinish procedure is to identify the type of plastic. Is it thermosetting or thermoplastic, grained or smooth? This will determine how it should be cleaned and prepared for refinishing. For additional information, refer to **Plastics Identification**.
   - Clean part with warm water/mild detergent and gray scuff pad, then with plastic cleaner to remove wax, silicone and other contaminants.

NOTE: As with most refinishing procedures, surface preparation is critical to a correct repair. Surfaces must be clean, dry and free of contaminants that could cause loss of adhesion. A test sample should be painted prior to refinishing the repair or replacement part for correct color match.

2. Use interior trim spray paint only when the product and surface temperatures are 15°C to 33°C (60°F to 92°F). Blushing may occur in high humidity conditions. To alleviate this, apply paint in a spray booth or controlled climate. Hair dryers or fans may be used to create air movement to speed the paint curing process.
   - Shake can vigorously for 2 full minutes prior to use.
   - Apply to a small inconspicuous area to verify color match.

NOTE: If applying refinish materials to components on the vehicle, mask off adjacent areas to protect from overspray.

3. Hold can vertically 305 mm (12 in) from surface to be painted. Apply in light mist coats using even strokes from side to side. Stop spraying at the end of strokes.
4. Apply 2 to 3 mist coats, allowing approximately 10 minutes between coats. Heavy coats will result in patchiness and runs and may trap solvents, resulting in incorrect curing.

Adhesion Promoter

NOTE: Correct surface preparation must be carried out before any adhesion promoter or paint product is applied. Thoroughly clean surface to be coated. Remove any grease, dirt, polish, moisture or foreign material with a plastics wax and grease remover by wiping in one direction. To make sure of correct adhesion, it is

essential that all silicone, conditioners and existing paint be removed prior to application. If applying refinish materials to components on the vehicle, mask off adjacent areas to protect from overspray.

1. For best results, use only when the product and surface temperatures are between 15°C and 33°C (60°F to 92°F). In cases of high humidity, apply the adhesion promoter in a spray booth or controlled climate. Hair dryers or fans may be used to create air movement to speed the adhesion promoter curing process.
2. Shake can vigorously for one full minute before use and repeat for 10 seconds after each full minute of use.
    - Test spray on a hidden area before proceeding.
3. Hold can 150 mm (5.9 in) to 254 mm (10 in) from the surface and spray a full wet coat with a steady back and forth motion. Be sure all areas of the surface are covered. Observe for a uniform gloss/coverage across the surface while the adhesion promoter is still wet.
4. Allow the adhesion promoter to dry 2-3 minutes and reapply a second wet coat. Allow to dry 2-3 minutes.
5. Apply the color coat as soon as possible after second coat of adhesion promoter dries, within 10 minutes if possible.

PLASTICS REPAIR

Material

Item	Specification
Motorcraft Adhesion Promoter PM-19A316-AA	-
Plastic Bonding Adhesive TA-9	-

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always refer to Material Safety Data Sheet (MSDS) when handling chemicals and wear protective equipment as directed. Examples may include but are not limited to respirators and chemically resistant gloves. Failure to follow these instructions may result in serious personal injury.**

1. In deciding whether to repair or install a new component, follow these guidelines.
    - Is a part readily available?
    - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
    - Will repair provide for the fastest, highest quality repair?

NOTE: **Never apply solvents such as lacquer thinner or reducer at any stage of plastic repair. Solvents, cleaners and water are absorbed by many types of**

plastics and by the glass fibers used for reinforcements. If this occurs, the plastic may swell in the area of repair and cause the repair to fail. Remove cleaners and water quickly and use air and heat to speed up drying.

NOTE: During the repair of polyolefin plastics, an adhesion promoter must be applied to the substrate to allow repair materials and paint to bond correctly. Reapplication is required when grinding or sanding through the sealer or primer layers.

NOTE: When possible, it is recommended to carry out as much of the plastic repair as possible on the vehicle. Parts mounted on the vehicle are held in correct alignment throughout the repair. Attempting to repair the part off the vehicle may cause misalignment. This could lead to failure of the repair.

2. Select the correct repair method by identifying the type of plastic being repaired. For additional information, refer to **Plastics Identification** to determine the type of plastic being repaired.

NOTE: Always refer to the manufacturer's label directions for the type of repair materials, fillers and bonding agents being used as they are material specific.

3. Determine whether a reinforcement piece is needed as a backer on large repairs.
   - Construct a reinforcement piece from a scrap piece of the type of plastic being repaired and follow manufacturer's label directions for the type of system being used.
   - When repairing Sheet-Molded Composite (SMC), a reinforcement piece can be constructed using several layers of glass cloth saturated with resin or structural adhesive. The weave of the cloth or screening should be loose enough to allow the resin to thoroughly penetrate. Reinforcement should cover the entire area of damage and extend outward beyond the damage or joint area.

Sheet-Molded Composite (SMC) Panel Repair

NOTE: The following procedure applies to repair of structural cracks and large gouges. If damage is cosmetic, use of reinforcing cloth may not be necessary.

1. Panels to be repaired should be dry and at room temperature 18°C (65°F) to 24°C (75°F) prior to carrying out any repairs. Both sides of the panel must be thoroughly cleaned before sanding or grinding.
2. Cover the break in the SMC (front and back) with masking tape. This protects the damaged area from absorbing the prep cleaner and eliminates wicking of the cleaner through the fibers into the SMC.
3. Remove all waxes, silicones, dirt and road oils from the area surrounding both sides of the damaged area with a plastics wax and grease remover.
   - Remove the tape and sand the back of the repair area with an angle grinder, Dual Action (D/A) sander or by hand using 80-grit sandpaper. Remove all dust with vacuum and tack cloth.
4. Create a reinforcing patch using a piece of scrap SMC that conforms well to the back of the damaged area

or form a patch from fiberglass cloth.

- Cut a section of cloth large enough to cover the repair, plus 25.4 mm (1 in) around the repair area.
- Cut a section of plastic film backing approximately 25.4 mm (1 in) larger than the cloth. Lay the plastic on a smooth, flat surface where it will be used to create a pyramid patch.

5. Follow manufacturer's directions and apply plastic repair adhesive to the plastic film backing and smooth with plastic spreader to recommended thickness. Place the pre-cut fiberglass cloth on the adhesive-coated plastic film. Cover the cloth with a coat of repair adhesive and spread to the recommended thickness.
6. Apply the prepared patch to the backside of the panel and compress. Follow manufacturer's instructions for adhesive cure. Remove plastic film after adhesive cures and sand as necessary to remove roughness.
7. Remove masking tape from the front side of damaged area and grind down to the backing patch. Use an angle grinder with a 30- to 40-grit wheel. Make a gradual taper in the area, this will prevent bull's-eyes or read-through in the finished repair. Sand prepared area with a D/A sander or hand-sand with 80-grit sandpaper.
8. Build a pyramid patch using fiberglass cloth or equivalent and plastic repair adhesive. Following manufacturer's directions, apply patch to damaged area.
9. Rough-grind area to remove excess adhesive. Sand repair area with 80-grit sandpaper, making sure to cut slightly below the SMC finished surface. This will allow for a finish coat of plastic body repair material.
10. Apply a finish coat of plastic repair filler material per manufacturer's directions.
11. Finish-sand, prime and topcoat using Ford-approved paint systems.

Thermoplastic Compounds

1. In deciding whether to repair or install a new component, follow these guidelines.
   - Is a part readily available?
   - Can the damaged part be economically returned to its original strength and appearance, or will the labor cost exceed the cost of a new component?
   - Will repair provide for the fastest, highest quality repair?

NOTE: The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.

2. Thoroughly clean the damaged area with wax and grease remover formulated for use with plastics.
3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.
4. Apply a plastics adhesion promoter per label directions to the repair area.
5. For small repairs, a plastic adhesive filler can be applied to damaged area. Follow manufacturer's directions and build layers to form a thickness above the damaged area. This will allow the area to be sanded smooth.
6. To repair large holes or cracks, measure and cut a piece of fiberglass cloth or equivalent 25.4 mm (1 in) larger than crack or hole.
   - Apply plastic repair adhesive to damaged area and immediately apply fiberglass cloth into plastic adhesive for reinforcement. Apply additional plastic repair adhesive for strength and shape as required.

7. Contour and shape the repair as necessary with D/A sander. Avoid sanding through the repair.
8. Finish-sand the area and carry out any required paint operations using Ford-approved paint systems.

Tab Repair - Bumper

NOTE:	**Inspect the bumper cover to determine if part can be repaired to an acceptable level of quality of appearance, fit and durability. Will labor and material cost of the repair meet or exceed the cost of a new replacement bumper cover? If the bumper cover is determined to be repairable, proceed to the following steps.**

NOTE:	**The following steps are to be used as a guideline. Depending on what brand of adhesives or patch materials are used, procedures may vary slightly.**

1. Remove the affected bumper. For additional information, refer to **BUMPERS** article.

NOTE:	**Illustration is not vehicle specific.**

2. Clean the broken tab(s) with a plastics wax and grease remover.

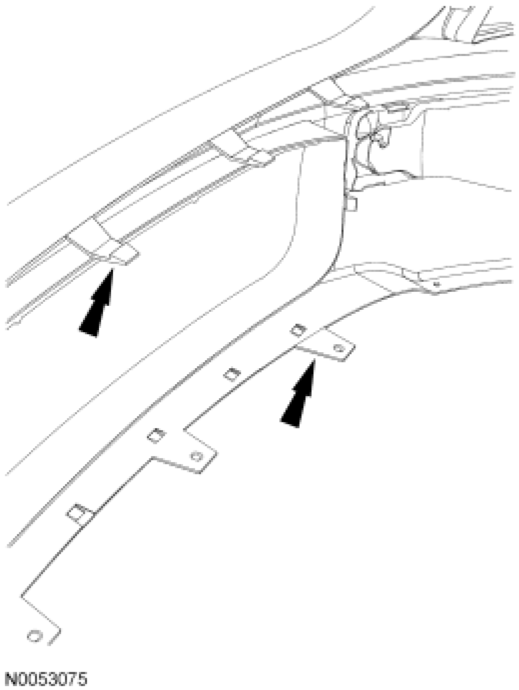

Fig. 25: Identifying Tab Repair - Bumper
Courtesy of FORD MOTOR CO.

3. Hand sand the repair area with 80-grit sandpaper and remove any foreign material with compressed air.

4. Apply a plastics adhesion promoter per label directions to the repair area.
5. Measure and cut a patch of fiberglass cloth or equivalent large enough to form the front of the tab, then slope back in a wedge shape approximately 51 mm (2 in) from original tab.
6. Prepare the repair adhesive cloth patch per manufacturer's instructions and apply to the affected area.
    - Immediately position the plastic repair material patch to form the tab shape.
7. Allow appropriate cure time and shape the repair tab using a small angle sander. Use extreme care to not sand through the exterior surface.
8. Carry out any required paint repair operations to the bumper cover using Ford-approved paint systems.
9. Reassemble and install the bumper cover. For additional information, refer to **BUMPERS** article.

REMOVAL AND INSTALLATION

INNER BODY REINFORCING PANELS

General Equipment

3 Phase Inverter Spot Welder 254-00002
Compuspot 700F Welder 190-50080

WARNING: **Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

WARNING: **On vehicles equipped with safety canopy options, prior to carrying out any sectioning repairs near the roof line or sail panel areas of the vehicle, remove the safety canopy module and related components. Failure to comply may result in accidental deployment or damage to the safety canopy. Refer to No Content . Failure to follow these instructions may result in serious injury to technician or vehicle occupant(s).**

WARNING: **Do not cut or grind body side components within 50 mm (1.96 in) of restraint anchoring points. Welding within 50 mm (1.96 in) of restraint anchoring points may result in incorrect operation of restraint devices. For additional restraints anchoring location information, refer to No Content and No Content . Failure to follow these instructions may result in serious injury to vehicle occupant(s).**

WARNING: **Do not carry out body side sectioning repairs in areas of laser welds. Factory laser welds cannot be duplicated with conventional welding equipment and structural integrity may be compromised. Failure to follow this instruction may result in serious injury to vehicle occupant(s).**

NOTE: **Left side shown, right side similar.**

21	10692B	Crossmember - mild steel
22	10716	Crossmember - mild steel
23	111B42	Floor panel - mild steel

NOTE: Factory spot welds may be substituted with either squeeze-type resistance spot welds (STRSW) or metal inert gas (MIG) plug welds. Spot/plug welds should equal factory welds in both location and quantity. Do not place a new spot weld directly over an original weld location. Plug weld hole should equal 8 mm (0.31 in) diameter.

NOTE: Ford Motor Company does not approve or recognize structural repair procedures using anything but genuine Ford parts.

Structural repairs (frames, rails, aprons and body panels) carried out using other than Ford Motor Company parts have not been tested. In addition, structural equivalence and corrosion protection cannot be assured.

Returning a vehicle to pre-accident condition can only be assured if repair procedures are carried out by skilled technicians using genuine Ford Motor Company parts and approved methods.

Structural component repair procedures approved by Ford using genuine parts have been validated through testing by Ford Motor Company engineers. Should alternative structural component repair procedures and/or parts be used, repairers should be aware of the potential liability they incur.

1. Remove the outer body sheet metal from the affected area prior to carrying out any reinforcing panel replacement. For additional information, refer to **Sectioning Guidelines**.

NOTE: Electronic modules and related wiring may be damaged when exposed to heat from welding procedures. Carefully disconnect and remove, or position away from heat affected areas. For additional information, refer to Welding Precautions - Steel.

NOTE: When it is necessary to carry out weld-bonding procedures, refer to Weld-Bonding.

2. Remove the outer body sheet metal from the affected area prior to carrying out any reinforcing panel replacement. For additional information, refer to **Sectioning Guidelines**.
3. When welding overlapping surfaces or substrates, apply corrosion protection material between the surfaces prior to welding. When the surfaces have been welded, apply corrosion protection material to the exterior surfaces or substrates. For additional information, refer to **Restoring Corrosion Protection Following Repair**.
   - Make sure horizontal joints and flanges are correctly sealed with seam sealer to prevent moisture intrusion. Water and moisture migrate to horizontal joints and corrosion tends to occur more rapidly in these areas. Metal surfaces must be clean and dry before applying seam sealer.
4. Proceed with refinish procedures following manufacturer's guidelines.

REMOVAL

WARNING: **Invisible ultraviolet and infrared rays emitted in welding can injure unprotected eyes and skin. Always use protection such as a welder's helmet with dark-colored filter lenses of the correct density. Electric welding will produce intense radiation, therefore, filter plate lenses of the deepest shade providing adequate visibility are recommended. It is strongly recommended that persons working in the weld area wear flash safety goggles. Also wear protective clothing. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always wear protective equipment including eye protection with side shields, and a dust mask when sanding or grinding. Failure to follow these instructions may result in serious personal injury.**

NOTE: **Be sure to adequately protect all glass, exterior finish and interior trim to avoid damage during the repair procedure.**

NOTE: **Ford Motor Company does not approve or recognize structural repair procedures using anything but genuine Ford parts.**

Structural repairs (frames, rails, aprons and body panels) carried out using other than Ford Motor Company parts have not been tested. In addition, structural equivalence and corrosion protection cannot be assured.

Returning a vehicle to pre-accident condition can only be assured if repair procedures are carried out by skilled technicians using genuine Ford Motor Company parts and approved methods.

Structural component repair procedures approved by Ford using genuine parts have been validated through testing by Ford Motor Company engineers. Should alternative structural component repair procedures and/or parts be used, repairers should be aware of the potential liability they incur.

NOTE: **The roof panel on the Ford Fusion, Lincoln MKZ and Mercury Milan is affixed using a process not previously employed on a Ford Motor Company vehicle. The driver and passenger sides of the roof panel are laser skip-welded. Installation of a new roof panel will employ a weld-bonding technique. The use of mechanical welding and chemical bonding are both part of the installation technique.**

1. Remove the windshield and rear window glass. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
2. Remove the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.

3. Remove the roof ditch moldings.

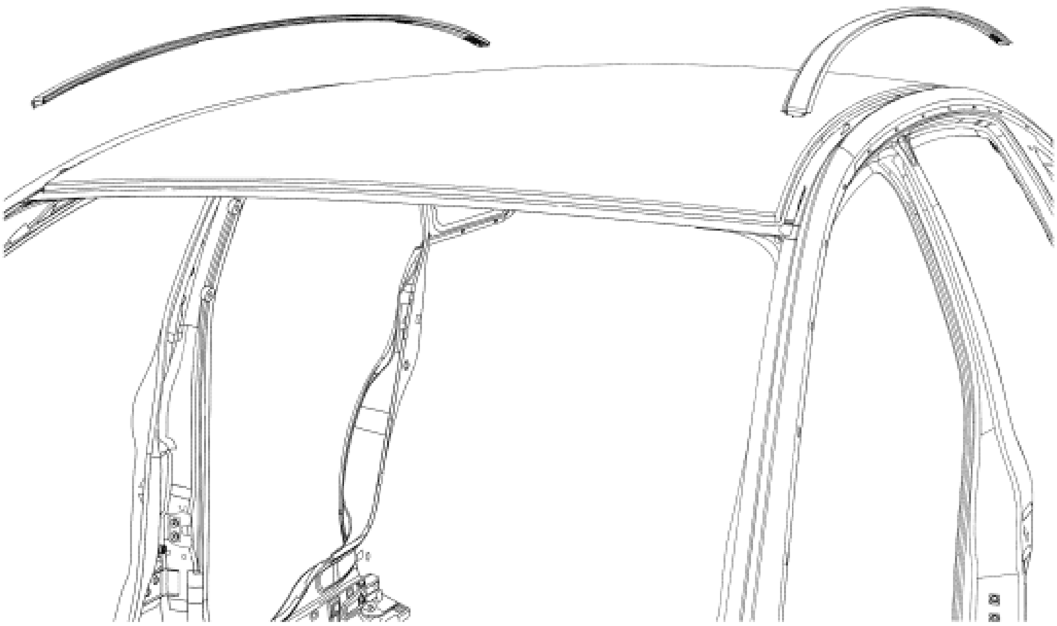

Fig. 29: Identifying Roof Ditch Moldings
Courtesy of FORD MOTOR CO.

NOTE: **For installation purpose, particular attention must be paid to the depth (thickness) of the sealer removed.**

4. Using a heat gun and a narrow scraper, remove the sealant along the entire length of the roof sides. Remove sealer as completely as possible.
5. From inside the vehicle, leaving as much of the foam as possible intact, separate the NVH foam along the roof bows from the roof panel using a flexible and sharp broad scraper or knife.

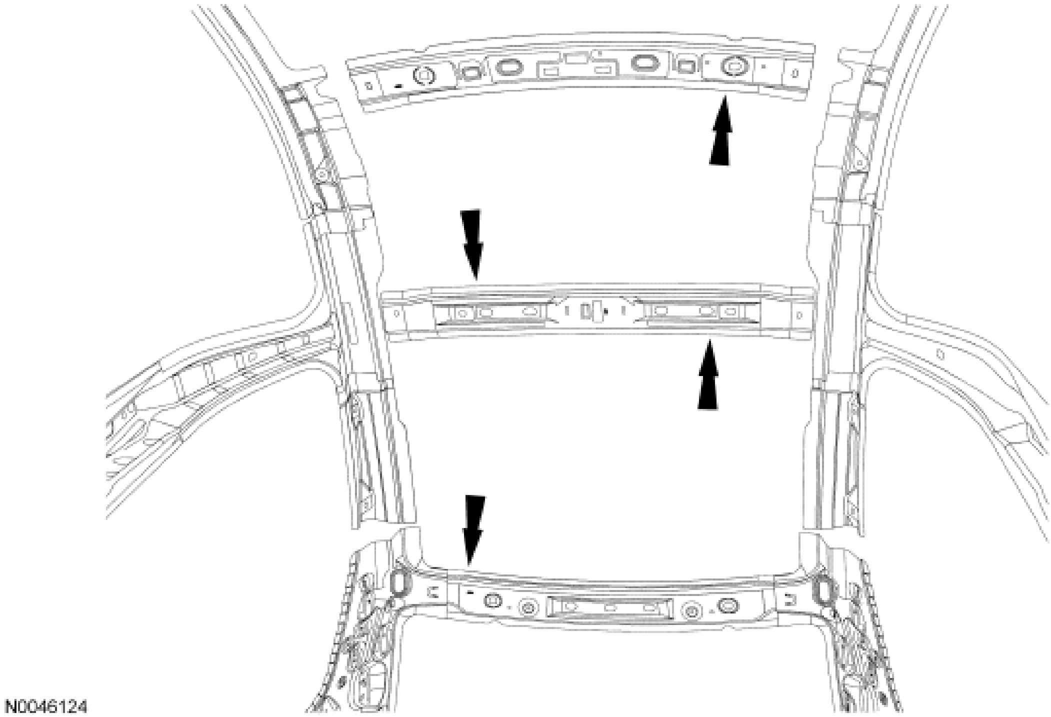

Fig. 30: Locating NVH Foam
Courtesy of FORD MOTOR CO.

6. Remove (drill out) all the roof panel spot welds from the windshield and rear window glass openings.
7. Using a cut-off wheel, plasma cutter or an air hammer equipped with a panel cutter bit, carefully separate the panel from the vehicle by cutting the entire length along the inner portion of the roof ditch seam on each side of the roof panel.

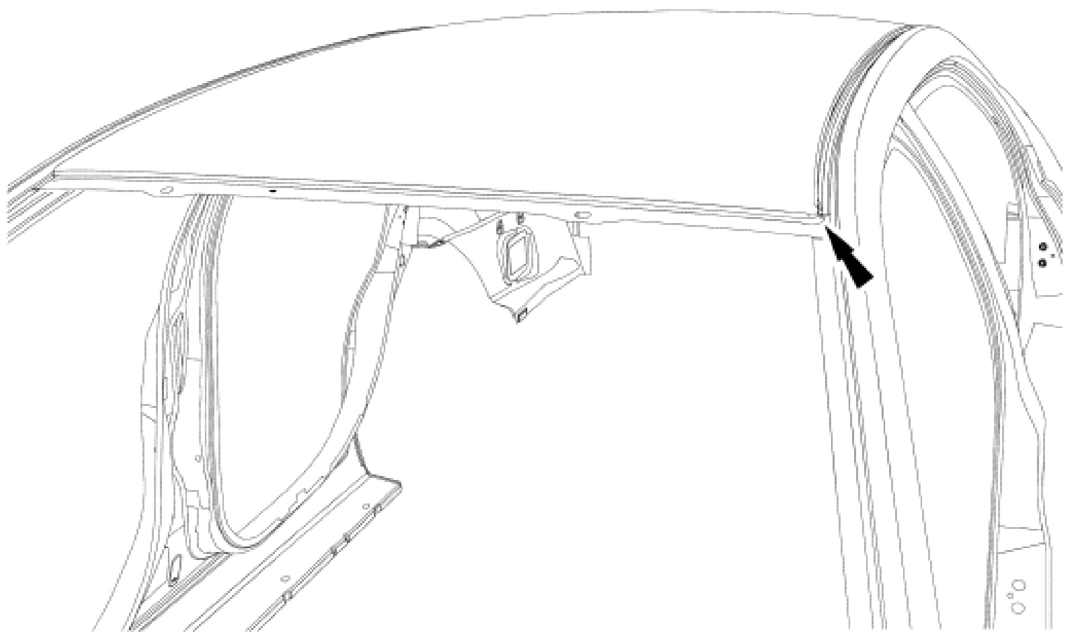

Fig. 31: Locating Roof Ditch Seam
Courtesy of FORD MOTOR CO.

8. With the help of an assistant, remove the roof panel from the vehicle.
9. Using an air hammer equipped with a flat chisel, remove the remaining portion of the roof panel from the roof ditch area.

INSTALLATION

NOTE: **Be sure to adequately protect all glass, exterior finish and interior trim to avoid damage during the repair procedure.**

1. Using a hammer and dolly, straighten any damage caused to flange areas during removal.
2. Using a grinder, carefully prepare the roof ditch area for the new roof panel.
3. With the help of an assistant, position the new roof panel on the vehicle.
4. Properly align and index-mark the positioning of the panel-to-vehicle and remove the panel.
5. Apply a 13 mm (0.51 in) tall bead of seam sealer TA-2 directly to the NVH foam remaining on the roof bows and immediately reinstall the roof panel aligning it to the index marks made during the test fitting.
   - If necessary, application of flexible foam repair may be used with the seam sealer.

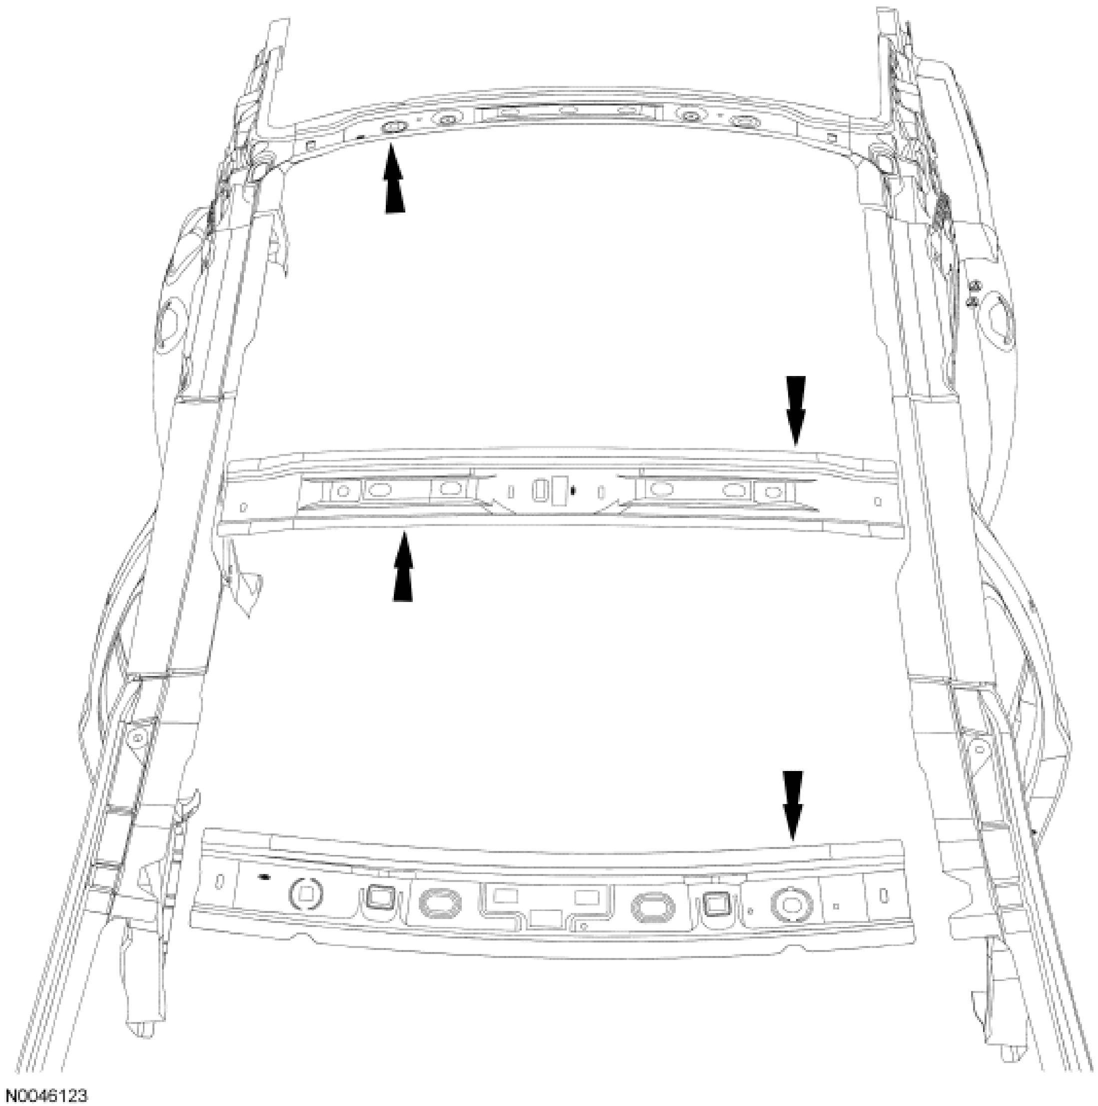

Fig. 32: Locating NVH Foam
Courtesy of FORD MOTOR CO.

6. Make sure good contact is made with the sealer and carefully clamp the roof panel on all sides.
7. Using the resistance spot welder, weld the roof panel to the vehicle in the windshield and rear window glass areas. Spot welds should match factory welds in both location and quantity.
8. Using the Metal Inert Gas (MIG) welder, seam-weld the roof panel sides with 10 mm (0.39 in) long weld beads spaced 40 mm (1.57 in) apart. Each corner must have a 10 mm (0.39 in) weld bead applied.
9. Prepare the repair area for refinish material application following the paint manufacturer's recommendations.
10. Apply a quality primer-sealer following the paint manufacturer's recommendation for both compatibility and application.

NOTE: **Always use refinishing materials from a single paint manufacturer. Combining products from more than one manufacturer may result in**

refinishing material incompatibility issues and potential void of warranty for each product applied.

11. If required, follow up with a quality primer-surfacer following the paint manufacturer's recommendations. Block sand to level using the recommended grit sandpaper.

NOTE: **Failure to purge air bubbles from the roof ditch sealer may result in air trapped in the roof ditch which may cause refinishing materials to pop.**

12. Stand the roof ditch sealer vertically (nose up) for a minimum of 30 minutes prior to application to permit trapped air to rise to the top so it may be purged.
13. Position the vehicle so it is level front-to-rear.
14. Using masking tape, form a dam at each end of the roof ditch (both sides) to prevent roof ditch sealer run-off.
15. Apply the roof ditch sealer following product directions to a depth equal to the sealer noted during removal.
16. Allow the material to cure 40-60 minutes at room temperature before refinishing. If roof ditch sealer has been allowed to cure in excess of 2 hours, scuff the surface using a red scuff pad.
17. Refinish the roof and repair area following Ford approved paint system recommendations.
18. Allow refinishing materials sufficient cure time to permit safe handling (refer to paint manufacturer's specification) and install the roof ditch molding.
19. Install the headliner. For additional information, refer to **INTERIOR TRIM AND ORNAMENTATION** article.
20. Install the windshield and rear window glass. For additional information, refer to **GLASS, FRAMES AND MECHANISMS** article.

2008 ACCESSORIES & BODY, CAB

Body System - General Information - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

INSULATION

Insulation is used as a sound-deadener to reduce exterior road and powertrain noises from the interior of the vehicle. Mastic insulators are also used as insulation. For information on the location of the mastic insulators, refer to **BODY REPAIRS** article. Insulation is installed:

- under the roof.
- above and below the instrument panel.
- at the cowl side panels.
- over the front and rear floor pans.
- inside the A-, B- and D-pillar sections.
- behind the rear quarter trim panel.

It has heat-bondable mastic deadeners for improved noise, vibration and harshness (NVH) characteristics.

BODY SEALER TYPES AND APPLICATIONS

Clear Silicone Rubber

Clear Silicone Rubber TA-32 or equivalent meeting Ford Specification ESB-M4G92-A:

- does not run.
- is fast drying.
- remains semi-elastic.
- can be used for sealing water leaks, noise concerns, remounting trim and repairing torn weatherstripping.

Caulking Cord

3M Strip Caulk-Black 051135-08578 or equivalent meeting Ford specification WSB-M4G32-C:

- is a heavy-bodied, plastic base with a filler.
- is commonly known as perma-gum.
- is used on spot-weld holes and between surfaces not sealed with a gasket.

Weatherstrip Adhesive

Trim and Weatherstrip Adhesive TA-14 or equivalent:

- is a quick drying, strong adhesive designed to hold weatherstripping onto all body panels and surrounding metal.

Silicone Lubricant

Silicone Spray Lubricant XL-6 or equivalent meeting Ford specification ESR-M13P4-A:

- is used to keep the door and the window weatherstrip pliable and soft.
- makes the door easier to close.
- retards weatherstrip squeaks.
- retards weatherstrip wear.
- helps retain door window alignment by reducing friction between the glass frame and the rubber weatherstrip.
- should not be used prior to painting.

Flexible Foam Repair

Flexible Foam Repair TA-4 or equivalent:

- deadens vibrations, fills voids and seals.
- stops wind noise and water leaks.
- expands to 10 times its size.
- typically used in replacement of mastic sealing and filling of door skins-to-impact bar, between hood inner and outer panels, between trunk inner and outer panels, pillar posts, roof rails and quarter panels.

DIAGNOSTIC TESTS

BODY SYSTEM

Material

Item	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4

Inspection and Verification

Dust and Water Leaks

Most dust and water leaks occur due to missing or mis-installed body sealer or components. The source of the leak is detected by:

- inspecting for a dust pattern or water path near and above the area in question.
- removing any trim or carpet in the general area of the leak.
- road testing or water-hose testing the vehicle.
- placing a bright light under the vehicle, removing any necessary trim or carpet and inspecting the interior of the body at joints and weld lines.

Wind Noise

Most wind noise leaks occur at the corners of the windows or in the doors. Wind noise is detected by driving the vehicle at highway speeds or at speeds as specified by the customer. The vehicle should be driven in 4 different directions, with all the windows CLOSED, the radio OFF and the A/C blower motor OFF.

Squeak and Rattle

Squeak and rattle noises are generally caused by loose parts, contact or relative movement between 2 surfaces, or loose wires and connectors. The source of the noise can be detected by stopping movement of the suspect part by hand or by using dampening or low friction materials.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible that any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Draft/wind noise and water leak around door perimeter	• Loose fit seal	• PINCH seal carrier to improve retention on seal flange.
	• Seal installed incorrectly	• REINSTALL the seal.
	• Door misaligned	• REALIGN the door. CHECK door gaps and fit in door opening and ADJUST as necessary. REFER to **BODY CLOSURES** article.
	• Scuff plate installed incorrectly	• REINSTALL the scuff plate.
	• Seal or seal pushpins damaged	• INSTALL a new seal/pushpins.
	• Sheet metal joints in door or door opening	• SEAL leaks with Silicone Gasket and Sealant.
• Draft/wind noise and water leak around glass run	• Door glass misaligned	• ADJUST door glass.
	• Glass run installed incorrectly	• REINSTALL glass run.
	• Leak path behind glass run	• INSTALL foam rope behind glass run.
	• Glass run channel spread wide	• PINCH glass run channel to reduce size of opening.
	• Glass run damaged	• INSTALL a new glass run.
• Draft/wind noise and water leak at inner belt line	• Belt line seal installed incorrectly on flange	• ADJUST seal. (Do not bend the flange.)
	• No contact with side glass	• ADJUST door glass.
	• No contact with glass runs at both ends of belt line seal	• ADJUST belt line seal or ADD foam at seal ends.
	• Belt line seal damaged	• INSTALL a new seal.
• Draft/wind noise and water leak at outer belt line	• Belt line seal installed incorrectly on flange (no glass contact)	• ADJUST seal.
	• Belt line seal does not contact the glass	• ADJUST door glass.
	• No contact with glass runs at both ends of belt line seal	• ADJUST belt line seal or ADD foam at seal ends.
	• Belt line seal damaged	• INSTALL a new seal.

• Draft/wind noise at inner door handle/speaker opening	• Hole in weathershield	• SEAL hole with suitable tape.
	• Weathershield misaligned	• REALIGN weathershield. INSTALL a new weathershield if pressure sensitive adhesive fails.
	• Exterior door handle seal misaligned/damaged	• REALIGN or INSTALL a new seal as necessary. REFER to **HANDLES, LOCKS, LATCHES AND ENTRY SYSTEMS** article.
	• Speaker or speaker seal missing or damaged	• INSTALL a new door speaker.
• Draft/wind noise and water leaks at floor pan and grommets	• Missing or damaged plugs/grommets	• CHECK plugs/grommets for correct installation or damage. INSTALL new plugs/grommets if necessary.
• Road noise	• Missing mastic insulators	• CHECK for missing mastic insulators. REFER to **BODY REPAIRS** article.
	• Missing body insulators	• CHECK for missing body insulators.
• Rattles in body/doors and instrument panel	• Loose wires/cables	• CHECK that all wires/cables are correctly routed and inserted in correct retainers.
	• Loose objects/components in door wells, pillars quarter trim panels	• CHECK doors by carefully striking underside of doors with a rubber mallet while listening for rattles in doors and pillars. REMOVE or TIGHTEN loose objects/components.
	• Buzz from instrument panel components	• IDENTIFY which components of the instrument panel are buzzing. SECURE/FASTEN components as necessary, ADD foam or felt as needed if rattle persists.
• Door drain holes collecting water	• Holes clogged with mud or road tar	• CLEAN drain holes of foreign material with a punch or screwdriver. CHECK drain holes regularly.

• Wind noise from exterior rear view mirror	• Exterior mirror housing misaligned	• REALIGN with edges shingled to airflow, with no gaps.
	• Mirror sail gasket folded/misaligned	• REINSTALL with gasket unfolded and aligned correctly.
	• Mirror housing trim cap installed incorrectly	• REINSTALL with edges shingled to airflow.
	• Air leak through mirror housing hinge	• Fully ENGAGE mirror into its operating position. USE foam to block air path through hinge.
	• Inner sail trim installed incorrectly	• REINSTALL sail trim. ADJUST door trim.
	• Inner sail gasket/barrier installed incorrectly	• REINSTALL trim cover with gasket/barrier aligned correctly.
	• Air path through wiring bundle/fastener access holes	• BLOCK air path(s) with foam/tape.
	• Exposed fastener access hole on mirror housing/sail	• INSTALL a new cap if missing.
• Rattle/vibration from exterior rear view mirror	• Mirror glass adjustment screws loose	• REMOVE mirror glass and TIGHTEN mirror glass adjustment motor screws. REFER to **REAR VIEW MIRRORS** article.
	• Mirror mounting nuts loose	• TIGHTEN mirror mounting nuts. REFER to **REAR VIEW MIRRORS** article.
	• Aftermarket air deflector/stone shields	• If possible, REMOVE aftermarket air deflector/stone shield, then ROAD TEST vehicle. If concern is no longer present, ADVISE customer that aftermarket component was causing concern.
• Draft/wind noise and water leak around perimeter of all fixed glass	• Gaps in the sealant bead	• APPLY approved sealant.
	• Air traveling up windshield molding along A-pillar	• INSTALL foam rope full length of the A-pillar.

	• Gaps in sealant bead of windshield/rear glass	• RESEAL windshield/rear glass. REFER to **GLASS, FRAMES AND MECHANISMS** article.
	• Windshield/rear glass misaligned or not installed correctly	• REINSTALL windshield/rear glass. REFER to **GLASS, FRAMES AND MECHANISMS** article.
	• Rear hood seal at base of windshield misaligned/damaged	• REALIGN or INSTALL a new seal as necessary.
• Draft noise at cowl	• Cowl seal misaligned/damaged	• REALIGN or INSTALL a new seal as necessary.
• Draft/water leak or noise from roof opening panel	• Roof opening panel/components	• REFER to **ROOF OPENING PANEL** article for diagnosis.
• Wind noise created by airflow over or behind body panels	• Fender splash shield misaligned	• REALIGN fender splash shield.
	• Body panel misaligned (exposed edge)	• REALIGN appropriate body panel.
	• Hood misaligned (front margin)	• CHECK hood gaps and fit. ADJUST hood as necessary.
	• Front grille edge noise	• APPLY foam in hollow areas behind louvers.
• Wind noise created by grille opening panel	• Grille relationship to leading edge on hood	• If possible, ADJUST grille opening panel forward to eliminate wind noise.
	• Sharp edges due to material imperfections	• REMOVE sharp edges (no damage to visible surface).
• Wind noise from air extractor (body vent)	• Air extractor housing seated incorrectly	• REINSTALL air extractor housing.
	• Air extractor housing or flaps damaged	• INSTALL a new air extractor.
• Wind noise from bug shield/exterior windshield sun visor	• Turbulence created by location and shape	• DETERMINE if an OEM part or aftermarket. If aftermarket ADVISE customer accordingly. If OEM, VERIFY correctly installed. If noise is abnormal, REPAIR or INSTALL new as required.

TORQUE SPECIFICATIONS

Description	Nm	lb-ft	lb-in
Bleeder screw	8	-	71
Brake caliper guide pin bolts	26	19	-
Master cylinder brake tubes	17	-	150

DESCRIPTION AND OPERATION

BRAKE SYSTEM

The brake system consists of the following components:

- Front and rear disc brakes
- Cable/caliper actuated parking brake
- Brake master cylinder and fluid reservoir
- Vacuum-assisted power brake booster
- Four-wheel ABS
- Red brake light indicator

The brake pedal is connected to the power brake booster, which is connected to the brake master cylinder. When the brake pedal is pressed, brake fluid is pushed through the double-walled steel tubes and flexible hoses to the front and rear disc brake calipers. The brake fluid enters the disc brake calipers, forcing the caliper pistons and brake pads outward against the brake disc friction surface, slowing or stopping rotation. When the brake pedal is released, brake fluid pressure is relieved, returning the front and rear disc brake caliper pistons and brake pads to the unapplied position.

For additional information on the following:

- Front disc brakes, refer to **FRONT DISC BRAKE** article.
- Rear disc brakes, refer to **REAR DISC BRAKE** article.
- Parking brake actuation, refer to **PARKING BRAKE AND ACTUATION** article.
- Hydraulic brake actuation, refer to **HYDRAULIC BRAKE ACTUATION** article.
- Vacuum-assisted power brake booster, refer to **POWER BRAKE ACTUATION** article.
- ABS, refer to **VEHICLE DYNAMIC SYSTEMS** article.

Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A

Principles of Operation

Brake System

Applying the brake pedal uses lever action to push a rod into the brake booster which, through the use of vacuum, boosts the force of the rod and then transmits this force into the master cylinder. This produces hydraulic pressure in the master cylinder. On vehicles not equipped with ABS, the hydraulic pressure is transmitted by brake fluid through the brake tubes to the individual brake calipers. On vehicles equipped with ABS, the hydraulic pressure is transmitted by brake fluid through the brake tubes to the ABS hydraulic control unit (HCU), which then distributes that pressure to the individual brake calipers. The brake calipers use hydraulic pressure to apply the pads. The application of the brake pads will cause the rotation of the wheels to slow or stop depending on how much brake pressure is applied. The parking brakes carry out the same function except that they are mechanically actuated by a cable that connects only to the rear brakes.

Red Brake Warning Indicator

The red brake warning indicator alerts the driver to certain conditions that exist in the brake system. The instrument cluster performs a bulb check when the ignition key is turned to the RUN position. The conditions that cause the indicator to illuminate are low brake fluid level, the parking brake is applied or there is a fault in the ABS (if the yellow ABS warning indicator is also illuminated). To diagnose a red brake warning indicator concern, refer to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article.

Inspection and Verification

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

CAUTION: Blistering or swelling of rubber brake components can indicate contamination of the brake fluid by a petroleum-based substance. Contaminated rubber components in the hydraulic brake system must be replaced and the entire hydraulic brake system must be flushed with clean, specified brake fluid to prevent recontamination.

CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled on a painted or plastic surface, immediately wash it with water.

NOTE: Always check the fluid level in the brake master cylinder reservoir before carrying out any test procedures. If the fluid level is not at the correct level, clean the reservoir cap before removing, then add clean, specified brake fluid.

NOTE: Prior to carrying out any diagnosis, make sure the red brake warning indicator is functional. Refer to INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES article.

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal. The brake warning indicator in the instrument cluster and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. This bleeding operation may release the brakes but will not correct the concern. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

Inspect all hoses and connections. All unused vacuum connectors should be capped. Make sure hoses and their connections are correctly secured and in good condition with no holes, soft or collapsed areas.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Brake master cylinder • Brake master cylinder reservoir • Brake booster • Brake booster check valve • Brake booster vacuum hose • Brake hoses and tubes • Brake caliper • Brake caliper piston seals • Brake caliper guide pins • Brake disc • Brake pads • Brake pedal linkage • Wheel bearings • Tires	• Parking brake switch • Brake fluid level switch • Wiring, terminals and connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, go to **Symptom Chart - Brake System** or Go to **Symptom Chart -**

Noise, Vibration and Harshness (NVH).

For low or spongy brake pedal concerns:

- check for fluid leaks. Repair as necessary.
- check and, if necessary, refill the brake master cylinder reservoir with clean, specified brake fluid.
- bleed the brake system and retest the brake pedal feel.
- if the brake pedal is still low or feels spongy, check the brake pedal mounting for looseness and correct installation. Check the power brake booster and the master cylinder for loose mounting. Correct as necessary and retest the system for normal operation.

For a slow or incomplete brake pedal return concern:

- inspect for binding, damage, correct installation or interference at the brake pedal.
- check the power brake booster for binding, damage and correct installation.

Road Test

The technician should have a thorough knowledge of the brake system operation and accepted general braking guidelines in order to detect any problems.

Select a road that is reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Avoid crowned roads.

A key factor in evaluating brake concerns is the deceleration rate. This varies from vehicle to vehicle and with changes in operating conditions. It is evident how well the brakes are working after just a few applications.

Brake Pads

NOTE: It is not required to install new brake pads if the friction material thickness is within specifications. It is also not required to install new brake pads when the brake discs are machined.

- Remove the brake pads. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
- Inspect and measure the thickness of the brake pad friction material. Refer to **SPECIFICATIONS**.
  - If there are missing chunks or cracks in the lining through to the backing plate, install new brake pads. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
  - If the thickness of the friction material is less than the specified thickness, install new brake pads. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
  - If the friction material shows taper wear that is not within specifications, verify the caliper guide pins are functioning correctly. Refer to **Brake Caliper Guide Pins**.

Brake Discs

CAUTION: Using an impact tool without a torque socket will lead to unevenly tightened wheel nuts. This causes brake disc on-vehicle lateral runout and brake roughness.

NOTE: It is generally not required to install new brake discs to address noise issues.

- Remove the brake disc. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
- Inspect the brake discs and measure the brake disc thickness in a minimum of 4 places around the circumference of the brake disc. Record the measurements, refer to **SPECIFICATIONS**.
  - If the brake disc is cracked or otherwise damaged, install a new brake disc. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
  - If any thickness measurement is less than the minimum specification, install a new brake disc. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
  - If the diagnosis has revealed vibration in the steering wheel, seat or pedal while braking that varies with vehicle speed, machine the brake disc. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, discs must be above the minimum thickness specification. Refer to Specifications and **Brake Disc Machining**.

Brake Calipers

Inspect the brake calipers for the following:

- Brake fluid leaks
- Boots and seals for tears or cracks
- Caliper pistons for binding and corrosion
- Guide pins for correct operation. Refer to **Brake Caliper Guide Pins**

Brake Caliper Guide Pins

CAUTION: Do not use power tools for caliper guide pin bore cleaning. Damage to the bore may result.

NOTE: The guide pins are part of the anchor plate.

The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, install a new brake caliper anchor plate. Refer to **FRONT DISC BRAKE** article for the front brake caliper anchor plate or **REAR DISC BRAKE** article for the rear brake caliper anchor plate.

If the lining is not within specifications, install new brake pads. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.

Brake Hoses and Tubes

CAUTION: Never use copper tubing. It is subject to fatigue, cracking and corrosion, which may result in brake tube failure.

- Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.
- If a section of the brake tube is damaged, the entire section must be installed with a new tube of the same type, size, shape and length.
- When installing the hydraulic brake tubing, hoses or connectors, tighten all connections to specifications. After installation, bleed the brake system. Refer to **Brake System Bleeding**.

Install a new brake flexible hose if the hose shows signs of softening, cracking or other damage.

When installing a new brake hose, position the hose to avoid contact with other vehicle components.

Non-Pressure Leaks

Two parts of the brake system that may have a brake fluid loss that does not appear when the system is under pressure are the brake master cylinder reservoir and the brake caliper under the following conditions:

Reservoir

- Missing or poorly-fitted brake master cylinder filler cap
- Missing or damaged brake master cylinder filler cap gasket
- Punctured or otherwise damaged brake master cylinder reservoir
- Missing, damaged or poorly-fitted sealing grommets between the brake master cylinder and the brake master cylinder reservoir

The brake master cylinder reservoir grommets are not serviceable and must be installed new as part of a new brake master cylinder and reservoir assembly. Refer to brake master cylinder in **HYDRAULIC BRAKE ACTUATION** article.

Caliper

- Foreign material in the caliper piston seal groove
- Punctured or otherwise damaged caliper piston seal

The brake caliper piston seals are not serviceable and must be installed new as part of a new brake caliper. Refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.

Brake Master Cylinder - Normal Conditions

The following conditions are considered normal and are not indications that the brake master cylinder is in need

of service.

Condition 1: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will fall during brake application and rise during release. The net fluid level (such as after brake application and release) will remain unchanged.

Condition 2: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

Condition 3: Fluid level will decrease with pad wear.

Brake Master Cylinder - Abnormal Conditions

Changes in brake pedal feel or travel are indicators that something may be wrong in the brake system. Go to **Symptom Chart - Brake System** for abnormal condition diagnosis.

Brake Booster

Inspect the brake booster:

- for excessive corrosion or damage.
- vacuum connections for leakage.
- vacuum hoses for kinks or leakage.
- check valve for correct operation.

Parking Brake

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Carry out the parking brake system diagnosis, refer to **PARKING BRAKE AND ACTUATION** article.

Symptom Chart - Brake System

Symptom Chart - Brake System

Condition	Possible Sources	Action
• The red brake warning indicator and the yellow ABS warning indicator are illuminated	• DTCs in the ABS module	• REFER to **VEHICLE DYNAMIC SYSTEMS** article to diagnose the ABS module.
• The red brake warning indicator is always/never on	• Brake fluid level switch • Parking brake switch • Wiring, terminals or connectors • Instrument cluster	• REFER to **INSTRUMENT CLUSTER (IC), MESSAGE CENTER, AND WARNING CHIMES** article to diagnose the red brake warning indicator.

	• Smart junction box (SJB)	
• The brakes pull or drift	• Tires	• INSPECT the tires for uneven or excessive wear, and correct inflation. REFER to **WHEELS AND TIRES** article.
	• Brake pads	• INSPECT the brake pads for contamination, uneven taper or excessive wear. REFER to **Brake Pads**.
	• Brake discs	• INSPECT the brake discs and the hubs for contamination or damage, INSTALL new as necessary.
	• Brake calipers and/or guide pins	• INSPECT the brake calipers and guide pins, REFER to **Brake Calipers** and **Brake Caliper Guide Pins**.
	• Suspension component and/or wheel alignment	• INSPECT the suspension and CHECK the wheel alignment. REFER to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
• Brake pedal goes down fast	• Brake fluid leaks and/or air in the system	• INSPECT the system for leaks. REPAIR as necessary. FILL the brake master cylinder reservoir. BLEED the system. REFER to **Brake System Bleeding**.
	• Brake master cylinder	• CARRY OUT the **Brake Master Cylinder - Bypass Condition**.
	• Hydraulic control unit (HCU)	• INSPECT the HCU. REFER to **VEHICLE DYNAMIC SYSTEMS** article.
• The brake pedal eases down slowly	• Air in the system	• BLEED the system. REFER to **Brake System Bleeding**.
	• Brake master cylinder	• CARRY OUT the **Brake Master Cylinder - Bypass Condition**.
	• HCU	• INSPECT the HCU. REFER to **VEHICLE DYNAMIC SYSTEMS** article.
		• INSPECT the brake pads for

• Brakes lock up under light brake pedal force	• Brake pads	uneven taper or excessive wear, REFER to **Brake Pads**.
	• Brake calipers and/or guide pins	• INSPECT the brake calipers and guide pins, REFER to **Brake Calipers** and **Brake Caliper Guide Pins**.
	• Anti-lock brake control system	• CHECK the anti-lock brake control system. REFER to **VEHICLE DYNAMIC SYSTEMS** article.
• Excessive/erratic brake pedal travel	• Brake fluid leaks and/or air in the system	• INSPECT the system for leaks. REPAIR as necessary. BLEED the system. REFER to **Brake System Bleeding**.
	• Brake calipers and/or guide pins	• INSPECT the brake calipers and guide pins, REFER to **Brake Calipers** and **Brake Caliper Guide Pins**.
	• Brake flexible hose	• INSPECT the brake flexible hoses for swelling and damage. INSTALL new as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
	• Brake master cylinder	• CARRY OUT the **Brake Master Cylinder - Bypass Condition**.
	• Brake pads	• INSPECT the brake pads for taper wear, REFER to **Brake Pads**.
	• Brake pedal	• INSPECT the brake pedal for binding, obstructions and correct installation. REPAIR as necessary. CHECK the brake pedal fasteners for correct torque. REFER to Specifications in **HYDRAULIC BRAKE ACTUATION** article.
	• Anti-lock brake control system	• CHECK the anti-lock brake control system. REFER to **VEHICLE DYNAMIC SYSTEMS** article.
		• REPAIR or INSTALL new

		components as necessary. REFER to **PARKING BRAKE AND ACTUATION** article.
• Brakes drag	• Parking brake component	
	• Brake caliper guide pins	• INSPECT the caliper guide pins for correct operation. INSTALL new components as necessary. REFER to **Brake Caliper Guide Pins**.
	• Disc brake caliper(s)	• REPAIR or INSTALL new brake calipers as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
	• Brake booster	• CARRY OUT the **Brake Master Cylinder - Bypass Condition**.
	• Brake master cylinder	• CARRY OUT the **Brake Master Cylinder - Bypass Condition**.
• Excessive brake pedal effort	• Insufficient engine vacuum for brake booster operation	• CHECK engine vacuum. REFER to the Intake Manifold Vacuum Test in **ENGINE SYSTEM - GENERAL INFORMATION** article.
	• Brake booster manifold vacuum hose	• VERIFY engine vacuum at the booster. REROUTE, REPAIR or INSTALL new components as necessary.
	• Brake booster	• VERIFY engine vacuum at the booster. CARRY OUT the **Brake Booster**.
	• Brake booster check valve	• VERIFY engine vacuum at the booster. CARRY OUT the **Brake Booster Check Valve**.

Symptom Chart - Noise, Vibration and Harshness (NVH)

NOTE: **Noise, vibration and harshness (NVH) symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the**

causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Chart - Noise, Vibration and Harshness (NVH)

Condition	Possible Sources	Action
• Vibration when the brakes are applied	• Tires	• CORRECT any wheel and tire concern before diagnosing the brake or suspension systems. REFER to **WHEELS AND TIRES** article to diagnose the tires.
	• Uneven brake pad wear • Brake disc pad transfer • Uneven brake disc wear • Suspension components	• COMPLETE the brake system inspection described in **Inspection and Verification**. If the condition still exists, go to **Pinpoint Test A**.
• Brake vibration/shudder - occurs when the brake pedal is released	• Brake caliper guide pins	• INSPECT the brake caliper guide pins for correct operation. REFER to **Brake Caliper Guide Pins**.
	• Brake drag	• Go to **Symptom Chart - Brake System**.
• Rattling noise	• Caliper mounting bolts loose	• CHECK the caliper bolts. TIGHTEN to specifications. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
	• Damaged or worn caliper guide pins or retainers	• CHECK the caliper guide pins and retainers for correct operation. REFER to **Brake Caliper Guide Pins**. INSTALL new components as necessary.
	• Missing or damaged anti-rattle clips or springs	• CHECK the brake pads for missing clips or broken springs. INSTALL new components as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.

	• Loose brake disc shield	• TIGHTEN the brake disc shield bolts to specification. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
• Clicking noise - with brakes applied on vehicles equipped with ABS brakes	• ABS hydraulic control unit (HCU)	• Acceptable condition during an ABS event.
• Squealing noise - occurs on first (morning) brake application	• Brake pads	• Acceptable condition. Caused by humidity and low brake pad temperature.
• Squealing noise - a continuous squeal	• Brake pads worn below minimum thickness	• INSPECT brake pads for excessive wear, taper wear or uneven wear. VERIFY brake pads are within minimum specifications. REFER to **Brake Pads**.
• Squealing noise - an intermittent squeal brought on by cold, heat, water, mud or snow	• Brake pads	• Acceptable condition.
• Groaning noise - occurs at low speeds with brake lightly applied (creeping)	• Brake pads	• Acceptable condition.
• Grinding noise - continuous	• Brake pads worn below minimum thickness	• INSPECT the brake pads, brake discs, and attaching hardware for damage. VERIFY brake components are within specifications. REFER to **SPECIFICATIONS**.
• Moaning noise	• Brake pads contaminated with grease or oil	• INSPECT the brake pads for contamination. REPAIR or INSTALL new components as necessary. REFER to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.

Pinpoint Tests

Pinpoint Test A: Vibration When the Brakes are Applied

Normal Operation

During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS. Pedal pulsation or steering wheel nibble when the brakes are applied (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component.

PINPOINT TEST A: VIBRATION WHEN THE BRAKES ARE APPLIED

A1 ROAD TEST THE VEHICLE - LIGHT BRAKING

- Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force.
- **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**

  YES : Go to A4.

  NO : Go to A2.

A2 ROAD TEST THE VEHICLE - MODERATE TO HEAVY BRAKING

- Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force.
- **Is there a vibration/shudder?**

  YES : Go to A3.

  NO : The concern is not present at this time.

A3 CHECK ABS OPERATION

- Road test the vehicle and apply the brakes on a dry, firm surface, then apply the brakes on a wet, snowy or loose surface (such as gravel).
- **Is the vibration/shudder only present on a wet, snowy or loose surface?**

  YES : This is a normal operating condition of the ABS.

  NO : Go to A5.

A4 CHECK THE PARKING BRAKE OPERATION

- Apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89-97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test.
- **Is there a vibration/shudder?**

  YES : Go to A7.

  NO : Go to A5.

A5 CHECK THE FRONT SUSPENSION

- Check the front suspension. Refer to <u>**SUSPENSION SYSTEM - GENERAL INFORMATION**</u> article.
- **Are all the suspension components in satisfactory condition?**

  YES : Go to A6.

  NO : REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

A6 RESURFACE THE FRONT BRAKE DISCS

CAUTION: Do not use a bench lathe to machine the brake discs. A bench lathe may cause brake disc on-vehicle lateral runout and brake roughness.

NOTE: Follow the brake lathe manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification.

- Resurface the front brake discs. Refer to **Brake Disc Machining**.
- Road test the vehicle.
- **Is the vibration/shudder present?**

  YES : Go to A7.

  NO : The concern has been repaired.

A7 CHECK THE REAR SUSPENSION

- Check the rear suspension. Refer to **SUSPENSION SYSTEM - GENERAL INFORMATION** article.
- **Are all the suspension components in satisfactory condition?**

  YES : RESURFACE the rear brake discs. REFER to **Brake Disc Machining**.

  NO : REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

Component Tests

Brake Booster

1. Disconnect the check valve from the brake booster.
2. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
3. Verify that manifold vacuum is available at the check valve with the engine at idle speed and the transmission in NEUTRAL.
   - If manifold vacuum is available, stop the engine, connect the check valve and continue with Step 5.
   - If manifold vacuum is not available, continue with Step 4.
4. Disconnect the check valve from the vacuum hose and verify that manifold vacuum is available at the hose with the engine at idle speed and the transmission in NEUTRAL.
   - If manifold vacuum is available, stop the engine, install a new check valve and continue with Step 5.
   - If manifold vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the no vacuum condition.
5. Apply the brake pedal several times to exhaust all vacuum from the system.
6. Apply the brake pedal and hold it in the applied position. Start the engine and verify that the brake pedal moves downward after the engine starts.
   - If the brake pedal moves, the brake booster is operating correctly
   - If the brake pedal does not move, install a new brake booster. Refer to **POWER BRAKE**

ACTUATION article.

7. Operate the engine a minimum of 10 seconds at fast idle. Stop the engine, and let the vehicle stand for 10 minutes. Then apply the brake pedal with approximately 89 N (20 lb) of force. The brake pedal feel should be the same as that noted with the engine operating. If the brake pedal feels hard (no power assist), install a new brake booster check valve and retest. If the brake pedal feels spongy, bleed the hydraulic system to remove air. Refer to **Brake System Bleeding**.

Brake Booster Check Valve

The function of the brake booster check valve is to allow manifold vacuum to enter the brake booster and prevent the escape of vacuum in case manifold vacuum is lost during sustained full throttle operation.

1. Disconnect the vacuum booster hose from the check valve.
2. Apply the parking brake, start the engine and place the transmission in NEUTRAL.
3. Verify that manifold vacuum is available at the check valve end of the vacuum hose with the engine at idle speed and the transmission in NEUTRAL.
    - If manifold vacuum is available, stop the engine, connect the vacuum hose to the check valve and continue this test.
    - If manifold vacuum is not available, stop the engine, connect the vacuum hose to the check valve and refer to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the no vacuum condition.
4. Connect the vacuum hose to the check valve and run the engine for at least 10 seconds.
5. Operate the brake pedal to check for power assist.
    - If power assist is present, continue with this test.
    - If power assist is not present, refer to **Brake Booster**.

NOTE: Do not remove the brake booster check valve from the brake booster in this step.

6. Stop the engine and disconnect the vacuum booster hose from the brake booster check valve.
7. Apply the brake and verify that there is enough vacuum retained in the brake booster for at least one power-assisted brake application.
    - If there is enough vacuum for at least one power-asssisted brake application, the check valve is functioning correctly.
    - If there is not enough vacuum for at least one power-asssisted brake application, continue with this test.
8. Inspect the brake booster for any signs of damage that may cause a leak.
    - If any damage is found, install a new brake booster and repeat this test.
    - If no damage is found, install a new check valve.

Brake Master Cylinder - Bypass Condition

1. Disconnect the brake tubes from the master cylinder.

2. Plug the outlet ports of the master cylinder.
3. Apply the brakes. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new brake master cylinder must be installed.

Brake Master Cylinder - Compensator Port

The purpose of the compensator ports in the brake master cylinder is to:

- supply additional brake fluid from the brake master cylinder reservoir needed by the brake system due to brake lining wear.
- allow brake fluid to return to the brake master cylinder reservoir when the brakes are released. The returning brake fluid creates a slight turbulence in the brake master cylinder reservoir. This is a normal condition and indicates that the compensator ports are not clogged.

Clogged compensator ports may cause the brakes to hang up or not fully release. If clogged compensator ports are suspected, proceed as follows:

1. With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article.
2. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If an excessive amount of brake drag exists at all 4 wheels, continue with the test.
   - If an excessive amount of brake drag exists at only one wheel, it indicates a possible seized brake caliper, brake wheel cylinder or parking brake component. Repair or install new components as necessary.
3. Check the brake stoplamp switch and the brake pedal free play to verify that the brake pedal is not partially applied.
4. Loosen the brake master cylinder nuts and position the brake master cylinder away from the brake booster.
5. With the brakes released, attempt to rotate each wheel and check for any brake drag.
   - If the brake drag is no longer present, install a new brake booster. Refer to **POWER BRAKE ACTUATION** article.
   - If the brake drag is still present, install a new master cylinder. Refer to **HYDRAULIC BRAKE ACTUATION** article.

GENERAL PROCEDURES

BRAKE DISC MACHINING

NOTE: **Do not use a bench lathe to machine the brake discs. Use an on-vehicle brake lathe only. Read the entire operating manual and/or view the video shipped with the lathe before installing, operating or repairing the lathe.**

NOTE: **An on-vehicle brake lathe with an automatic runout adjustment feature is preferred. However, if the lathe is not self adjusting, the lathe oscillation must be adjusted using a dial indicator. The total indicated runout target is 0.000 mm**

(0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in). If the runout adjustment (automatic or manual) is carried out correctly prior to machining, then the final brake disc runout will be within specification and a runout measurement is not necessary after machining.

NOTE: **Do not machine new brake discs.**

NOTE: **Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe will make sure that these dimensions are within specification.**

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

   NOTE: **Do not allow the caliper to hang from the brake hose or damage to the hose may occur.**

   NOTE: **It is not necessary to disconnect the brake tube from the brake caliper.**

2. Remove the bolts and position the brake caliper or brake caliper and anchor plate assembly aside, as required.
   - Support the brake caliper using mechanic's wire.
3. Install the hub adapter using:
   - four wheel nuts on a 4-stud wheel hub.
   - five wheel nuts on a 5-stud wheel hub.
   - six wheel nuts on a 6-stud wheel hub.
   - four wheel nuts on a 7- or 8-stud wheel hub.
   - five wheel nuts on a 10-stud wheel hub.
4. Install the cutting lathe.
5. If the lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. The total indicated runout target is 0.000 mm (0.000 in). The maximum indicated runout should be no more than 0.050 mm (0.002 in).
6. Center the cutting head, adjust the cutting bits and install the chip deflector/silencer.

   NOTE: **The depth of the cut should be between 0.10 and 0.40 mm (0.004 and 0.015 in). Lighter cuts will cause the bit to heat up and wear faster. Heavier cuts will cause poor brake disc surface finish.**

7. Machine the brake disc.
8. Remove the lathe and the silencer.
9. Remove the wheel nuts and hub adapter.
10. Remove the metal shavings.

NOTE: It is not required to install new brake pads if friction material is within specifications. For additional information, refer to SPECIFICATIONS.

11. Position the brake caliper or brake caliper and anchor plate assembly.
    - Install the bolts.
    - For fastener torque specifications, refer to **FRONT DISC BRAKE** article for front disc brakes or **REAR DISC BRAKE** article for rear disc brakes.
12. Install the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.

BRAKE SYSTEM BLEEDING

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Pressure Bleeding

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: **When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.**

NOTE: **Due to the complexity of the fluid path within the rear integral parking brake calipers, it is necessary to press and release the parking brake during the bleed procedure.**

1. Clean all the dirt from around the brake fluid reservoir cap and remove the cap. Fill the brake master cylinder reservoir with clean, specified brake fluid.

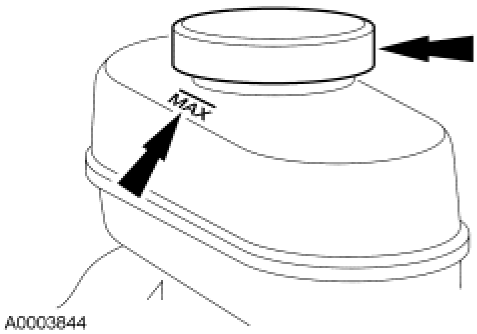

Fig. 1: Identifying Brake Master Cylinder Fluid Reservoir Cap And Max Fill Line
Courtesy of FORD MOTOR CO.

NOTE: **Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.**

2. Install the bleeder adapter to the brake master cylinder reservoir and attach the bleeder tank hose to the fitting on the adapter.
   - Pressure bleeding the brake system at 207-345 kPa (30-50 psi) is preferred to manual bleeding.
3. Open the valve on the bleeder tank.

NOTE: **Bleed the longest line first. Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.**

4. Remove the RH rear bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain tube to the RH rear bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.

5. Loosen the RH rear bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH rear bleeder screw.
   - Press and release the parking brake 5 times.
   - Repeat until clear, bubble-free fluid comes out.
6. Tighten the RH rear bleeder screw to specifications, refer to **SPECIFICATIONS**. Remove the rubber hose and install the bleeder screw cap.
7. Repeat Steps 4 through 6 for the LH rear brake caliper.
8. Remove the RH front bleeder cap and place a box-end wrench on the bleeder screw. Attach a rubber drain tube to the RH front bleeder screw and submerge the free end of the tube in a container partially filled with clean, specified brake fluid.
9. Loosen the RH front bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH front bleeder screw.
10. Tighten the LH rear bleeder screw to specifications, refer to **SPECIFICATIONS**. Remove the rubber hose and install the bleeder screw cap.
11. Repeat Steps 8 through 10 for the LH front brake caliper.
12. Close the bleeder tank valve and release the pressure. Remove the tank hose from the adapter and remove the adapter. Fill the reservoir with clean, specified brake fluid and install the reservoir cap.

Manual Bleeding

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: **When any part of the hydraulic system is disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal**

action. This requires bleeding of the hydraulic system after it is correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

NOTE: **Due to the complexity of the fluid path within the rear integral parking brake calipers, it is necessary to press and release the parking brake during the bleed procedure.**

NOTE: **Pressure bleeding the brake system is preferred to manual bleeding.**

1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with clean, specified brake fluid.

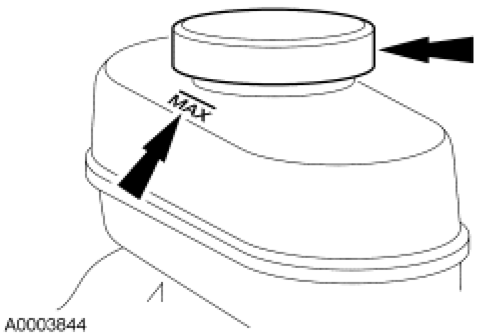

Fig. 2: Identifying Brake Master Cylinder Fluid Reservoir Cap And Max Fill Line
Courtesy of FORD MOTOR CO.

NOTE: **Bleed the brake system from the longest to the shortest brake line.**

2. Remove the RH rear brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.
3. Have an assistant slowly pump the brake pedal and then hold firm pressure on the brake pedal.
4. Loosen the RH rear brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Press and release the parking brake 5 times.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.
5. Tighten the RH rear brake caliper bleeder screw to specifications, refer to **SPECIFICATIONS**. Remove the rubber hose and install the bleeder screw cap.
6. Repeat Steps 2 through 5 for the LH rear brake caliper bleeder screw.
7. Remove the RH front brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

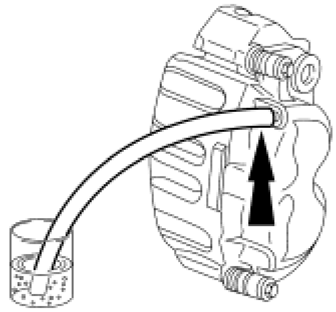

Fig. 3: Locating Rubber Drain Tube
Courtesy of FORD MOTOR CO.

8. Have an assistant slowly pump the brake pedal and then hold firm pressure on the brake pedal.
9. Loosen the RH front brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.
10. Tighten the RH front brake caliper bleeder screw to specifications, refer to **SPECIFICATIONS**. Remove the rubber hose and install the bleeder screw cap.
11. Repeat Steps 7 through 10 for the LH front brake caliper bleeder screw.

ABS Hydraulic Control Unit (HCU) Bleeding

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: **Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.**

NOTE: This procedure is only required when a new Hydraulic Control Unit (HCU) is installed.

NOTE: When any part of the hydraulic system is disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Connect the scan tool and follow the ABS HCU bleeding instructions.
2. Use the Pressure Bleeding or Manual Bleeding procedure to bleed the system. For additional information, refer to **Brake System Bleeding**.

COMPONENT BLEEDING

Special Tools

Illustration	Tool Name	Tool Number
 ST1112-A	Adapter for Adjuster, Rear Brake Caliper Piston	206-026 (T87P-2588-A)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A or WSS-M6C65-A1

Master Cylinder

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding

operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

NOTE: When any part of the hydraulic system is disconnected for repair or installation of new components, air can enter the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

NOTE: When a new brake master cylinder is installed, or the system is emptied or partially emptied, it should be primed to prevent air from entering the system.

1. Disconnect the brake tubes.

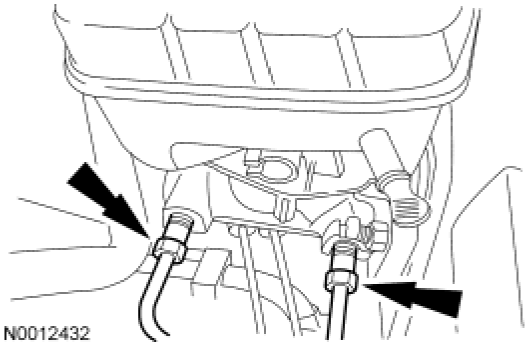

Fig. 4: Locating Brake Lines
Courtesy of FORD MOTOR CO.

2. Install short brake tubes onto the primary and secondary ports with the ends submerged in the brake master cylinder reservoir.

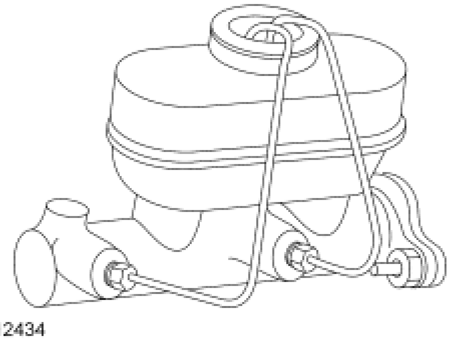

Fig. 5: Identifying Short Brake Tubes
Courtesy of FORD MOTOR CO.

3. Fill the brake master cylinder reservoir with clean, specified brake fluid.
4. Have an assistant slowly pump the brake pedal until clear fluid flows from the brake tubes, without air bubbles.
5. Remove the short brake tubes and install the master cylinder brake tubes.
    - Tighten to specifications, refer to **SPECIFICATIONS**.
6. Bleed each brake tube at the brake master cylinder as follows:
    1. Have an assistant slowly pump the brake pedal, and then hold firm pressure on the brake pedal.
    2. Loosen the rear-most brake tube fittings until brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the brake tube fitting.
    3. Repeat this operation until clear, bubble-free fluid comes out.
    4. Refill the brake master cylinder reservoir as necessary. Repeat the bleeding operation at the front brake tube.

Front Brake Caliper

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

NOTE: It is not necessary to do a complete brake system bleed if only the brake caliper was disconnected or installed new.

1. Remove the brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

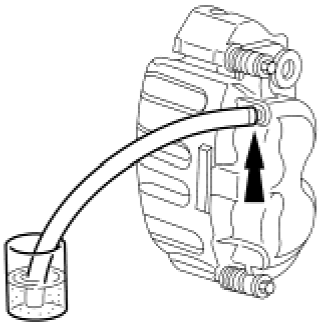

Fig. 6: Attaching Rubber Drain Hose To Disc Brake Caliper Bleeder Screw
Courtesy of FORD MOTOR CO.

2. Have an assistant pump the brake pedal at least 2 times and then hold firm pressure on the brake pedal.
3. Loosen the bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.
4. Tighten the bleeder screw to specifications, refer to **SPECIFICATIONS**. Remove the rubber hose and install the bleeder screw cap.

Rear Brake Caliper

WARNING: **Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.**

WARNING: **Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.**

NOTE: Do not spill brake fluid on painted or plastic surfaces or damage to the surface may occur. If brake fluid is spilled onto a painted or plastic surface, immediately wash the surface with water.

NOTE: When any part of the hydraulic system is disconnected for repair or installation

of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it is correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

NOTE: Due to the complexity of the fluid path within the rear integral parking brake calipers, it may be necessary to follow this procedure when new calipers are installed.

NOTE: This procedure is necessary only when installing a new rear brake caliper. To bleed the brake system, refer to Brake System Bleeding.

1. Remove the wheel and tire. For additional information, refer to **WHEELS AND TIRES** article.
2. Remove the 2 brake caliper guide pin bolts and position the brake caliper aside.

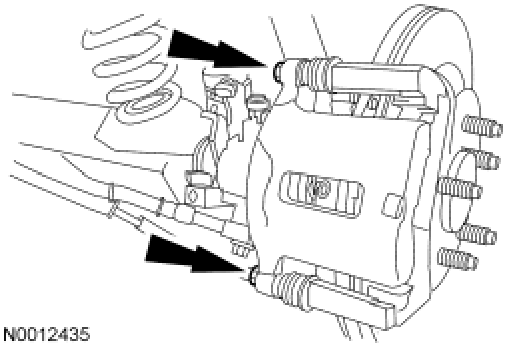

Fig. 7: Locating Brake Caliper Bolts
Courtesy of FORD MOTOR CO.

3. Remove the outer brake pad.

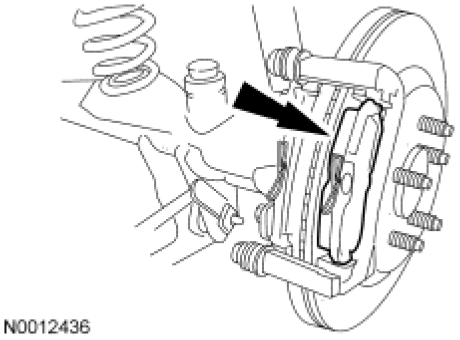

Fig. 8: Locating Outer Brake Pad
Courtesy of FORD MOTOR CO.

NOTE: Place a shop towel between the caliper and the brake disc.

4. Install the brake caliper using the 2 guide pin bolts.

- Tighten to specifications, refer to **SPECIFICATIONS**.

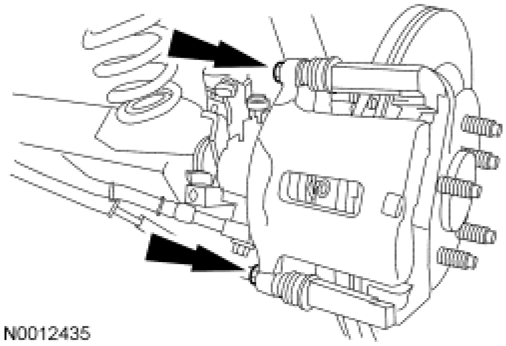

Fig. 9: Locating Brake Caliper Bolts
Courtesy of FORD MOTOR CO.

5. Slowly apply the brake pedal to extend the brake caliper piston outward.
6. Remove the 2 guide pin bolts and position the brake caliper aside.

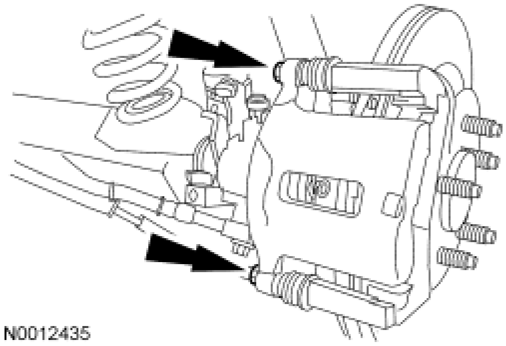

Fig. 10: Locating Brake Caliper Bolts
Courtesy of FORD MOTOR CO.

7. Remove the brake caliper bleeder screw cap and place a box-end wrench on the bleeder screw. Attach a rubber drain hose to the bleeder screw and submerge the free end of the hose in a container partially filled with clean, specified brake fluid.

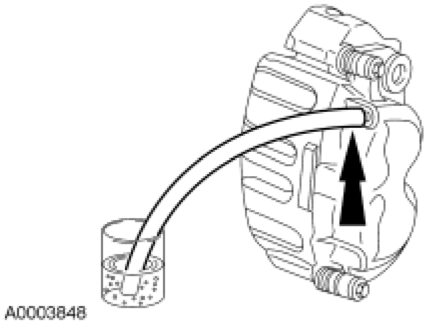

Fig. 11: Locating Rubber Drain Tube
Courtesy of FORD MOTOR CO.

8. Loosen the brake caliper bleeder screw.
9. Using the Rear Brake Caliper Piston Adjuster Adapter, fully retract the brake caliper piston and tighten the bleeder screw to specifications, refer to **SPECIFICATIONS**.

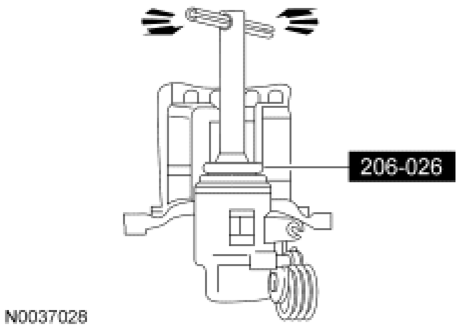

Fig. 12: Identifying Special Tools (206-026)
Courtesy of FORD MOTOR CO.

10. Repeat Steps 4 through 9 until clear, bubble free fluid comes out.
    - Refill the brake master cylinder reservoir as necessary.
    - Remove the rubber hose and install the bleeder screw cap.
11. Remove the 2 guide pin bolts and the shop towel.
12. Install the outer brake pad.

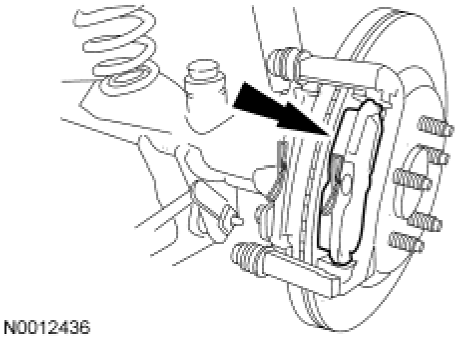

Fig. 13: Locating Outer Brake Pad
Courtesy of FORD MOTOR CO.

13. Position the brake caliper and install the 2 guide pin bolts.
    - Tighten to specifications, refer to **SPECIFICATIONS**.

5	17775	Rear bumper

REMOVAL AND INSTALLATION

1. Remove the rear bumper cover. For additional information, refer to **Bumper Cover - Rear**.
2. Remove the rear bumper isolator from the rear bumper.
   - Pull the isolator rearward to remove it from the retaining pins.
3. Remove the 4 rear bumper nuts.
   - To install, tighten to 25 N.m (18 lb-ft).
4. Remove the 2 rear bumper bolts.
   - To install, tighten to 25 N.m (18 lb-ft).
5. Remove the rear bumper.

6. To install, reverse the removal procedure.

CABIN AIR FILTER

Cabin Air Filter (Special Applications) - General Information

CABIN AIR FILTER APPLICATIONS

NOTE: This article is generic in nature and applies to many different makes and models. We do our best to determine which vehicles do and do not have a cabin air filter.

The vehicle you have selected may not be equipped with a factory-installed cabin air filter or the manufacturer does not provide a removal & installation procedure.

Some vehicles may be equipped with dealer add-on or aftermarket versions. If the vehicle you are working on is equipped with such a filter, check the availability of the replacement filter which may help with the location and replacement information as some include this information in the packaging.

Vehicle manufacturers have many names for these filters including:

- A/C Air Filter
- A/C Filter
- Activated Charcoal Filter
- Air Conditioner Filter
- Air Refiner Filter
- Cabin Air Filter
- Clean Air Filter
- Climate Control Air Filter
- Combination Filter
- Dust & Pollen Filter
- Dust Filter
- Evaporator Air Filter
- HVAC Air Filter
- HVAC Ventilation Filter
- In-Cabin Microfilter
- Microfilter
- Particle Filter
- Particle/Odor Filter
- Particulate Air Filter
- Passenger Compartment Air Cleaner
- Passenger Compartment Air Filter
- Pollen Filter

- Underhood Air Filter
- Ventilation Air Filter

2008 GENERAL INFORMATION

Charging System - General Information - Fusion, Milan & MKZ

SPECIFICATIONS

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Battery	
Voltage	12 volt
Generator, 2.3L	
Rating	90/150 amp (max) @ 1,800-6,000 generator RPM, approximately 700-2,500 engine RPM
Generator, 3.0L and 3.5L	
Rating	90/150 amp (max) @ 1,800-6,000 generator RPM, approximately 500-2,000 engine RPM

DESCRIPTION AND OPERATION

CHARGING SYSTEM

The charging system consists of the following:

- Generator
- Charging system warning indicator
- Necessary wiring and cables

The charging system is a negative ground system. The generator (including an internal voltage regulator) is belt-driven by the engine accessory drive system. When the engine is started, the generator begins to generate AC, which is internally converted to DC. This current is then supplied to the vehicle electrical system through the output (B+) terminal of the generator.

Battery

The battery is a 12V DC source connected in a negative ground system. The battery case is sealed with 2 vent holes to release gases. The battery has 3 major functions:

- Engine cranking power source
- Voltage stabilizer for the electrical system
- Temporary power source when electrical loads exceed the generator output current

DIAGNOSTIC TESTS

CHARGING SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2621-A	SABRE Premium Battery and Electrical System Tester	010-00736 or equivalent
 ST2834-A	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	
 ST2574-A	Flex Probe Kit	105-R025B

Principles of Operation

The PCM controlled charging system determines the optimal voltage set point for the charging system and communicates this information to the voltage regulator. This system is unique in that it has 2 unidirectional communication circuits between the PCM and the generator/regulator. Both of these communication circuits are pulse-width modulated (PWM). The generator communication (GENCOM) circuit communicates the desired set point from the PCM to the voltage regulator. The generator monitor (GENMON) circuit communicates the generator load and error conditions to the PCM. The third circuit on the voltage regulator, the A circuit, is a dedicated battery voltage sense circuit.

The charging system voltage is controlled by the PCM. The generator charges the battery, and at the same time supplies voltage for all of the electrical loads that are required. The battery is more effectively charged with a higher voltage when the battery is cold and a lower voltage when the battery is warm. The PCM is able to adjust the charging voltage according to the battery temperature by using a signal from the intake air temperature (IAT) sensor. This means the voltage set point is calculated by the PCM and communicated to the regulator by the GENCOM circuit.

The PCM simultaneously controls and monitors the output of the generator. When the current consumption is high or the battery is discharged (the PCM recognizes this and increases the output of the generator to accommodate), the system is also able to increase the idle speed.

To minimize the engine drag when starting the engine, the PCM does not allow the generator to produce any output until the engine has started. The PCM then progressively increases the output of the generator.

The PCM is responsible for turning the charging system warning indicator off after the engine is started and illuminating it under fault conditions (when the generator is not generating the correct amount of current/voltage with the engine running). The charging system warning indicator is also illuminated by the PCM whenever the key is ON with the engine OFF.

This is a System 4 charging system, which uses the GENMON and GENCOM circuits to control and monitor the charging system through the PCM. System 4 charging systems are virtually identical in design and therefore, share the same diagnostics. The circuit numbers and colors may be different, but the functions are the same. System 4 charging systems may use any type of generator, as the generator type usually depends on the engine packaging and/or output requirements versus cost.

Inspection and Verification

WARNING: **Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.**

WARNING: **Always lift a plastic-cased battery with a battery carrier or with hands on opposite corners. Excessive pressure on the battery end walls may cause acid to flow through the vent caps, resulting in personal injury and/or damage to the vehicle or battery.**

CAUTION: Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals, fuses or fusible links.

CAUTION: Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.

NOTE: While carrying out any pinpoint test, disregard any DTCs set while following a specific pinpoint test. After the completion of a test, be sure to clear all DTCs in the PCM.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Battery • Generator drive belt • Generator pulley	• Circuitry • Fusible links • Cables • Generator • PCM • Charging system warning indicator

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. Verify the battery condition. Refer to **BATTERY, MOUNTING AND CABLES** article.
5. Check the operation of the charging system warning indicator at the instrument cluster (IC). Normal operation is as follows:
   - With the key OFF, the charging system warning indicator should be off.
   - With the key ON and the engine OFF, the charging system warning indicator should be on.
   - With the engine running, the charging system warning indicator should be off.
6. Turn off the headlamps and the A/C system (if equipped). Turn the climate control blower to low/off. Check the battery voltage before and after starting the engine to determine if the battery voltage increases.

NOTE: Make sure to use the latest scan tool software release.

7. If the cause is not visually evident, connect the scan tool to the data link connector (DLC).

NOTE: The vehicle communication module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

8. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
9. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM.

10. Carry out the network test.
    - If the scan tool responds with no communication for one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
    - If the network test passes, retrieve and record continuous memory DTCs.
11. Clear the continuous DTCs and carry out the self-test diagnostics for the PCM and the IC.
12. If the DTCs retrieved are related to the concern, go to the DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
13. If no DTCs related to the concern are retrieved, go to **Symptom Chart**.

NOTE: DTC P0622 can be set by the loss of the communication lines between the generator and the PCM. The charging system warning indicator then illuminates until the engine is operated at greater than 4,500 RPM (approximately wide open throttle [WOT]) for a minimum of 3 seconds. At this time, the generator self-excites. The charging system warning indicator remains illuminated, and the generator operates in a default mode (approximately 13.5 volts) until the engine is turned off.

DTC CHART

DTCs	Description	Source	Action
B1317	Battery Voltage High	Various Modules	Go to **Pinpoint Test B**.
B1318	Battery Voltage Low	Various Modules	Go to **Pinpoint Test F**.
B1676	Battery Voltage Out Of Range	Various Modules	Go to **Pinpoint Test F**.
P0563	System Voltage High	PCM	Go to **Pinpoint Test B**.
P0620	Generator Control Circuit	PCM	Go to **Pinpoint Test B**.
P0625	Generator Field Terminal Circuit - Low	PCM	Go to **Pinpoint Test B**.
P0626	Generator Field Terminal Circuit - High	PCM	Go to **Pinpoint Test B**.
P065B	Generator Control Circuit Range/Performance	PCM	Go to **Pinpoint Test B**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
	• High key-off current drain(s) • Engine, generator and battery grounds	

• The battery is discharged or battery voltage is low	• Positive battery cable • Circuitry • Battery • Generator	• Go to **Pinpoint Test A**.
• The charging system warning indicator is on with the engine running and no charging system DTCs present	• Circuitry • PCM • Generator • Instrument cluster (IC)	• Go to **Pinpoint Test C**.
• The generator is noisy	• Accessory drive belt • Loose bolts/brackets • Generator/pulley	• Go to **Pinpoint Test D**.
• Radio interference	• Generator • Circuitry • In-vehicle entertainment system	• Go to **Pinpoint Test E**.

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrostatic discharge. If exposed to these charges, damage can result.

Refer to Inspection and Verification, the PCM DTC Chart and the Symptom Chart for direction to the appropriate pinpoint test.

Pinpoint Test A: The Battery is Discharged or Battery Voltage is Low

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Charging System for schematic and connector information.

Normal Operation

The generator output voltage is supplied through the positive battery output (B+), circuit SDC14 (RD) terminal on the rear of the generator to the battery and electrical system. During normal operation the charging system warning indicator is off with the key in the ON position and the engine running. The charging system warning indicator is on with the key in the ON position and the engine off.

This pinpoint test is intended to diagnose the following:

- High key-off current drain(s)
- Engine, generator and battery grounds
- Positive battery cable
- Circuit SDC14 (RD) high resistance

- Battery
- Generator

PINPOINT TEST A: THE BATTERY IS DISCHARGED OR BATTERY VOLTAGE IS LOW

A1 CHECK THE BATTERY CONDITION

- Carry out the Battery - Condition Test to determine if the battery can hold a charge and is OK for use. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Does the battery pass the condition test?**

  YES : Go to A2.

  NO : INSTALL a new battery. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

A2 CHECK THE GENERATOR OUTPUT

- Carry out the Generator On-Vehicle Load Test and No Load Test. Refer to the Component Tests in this article.
- **Does the generator pass the component tests?**

  YES : Go to A3.

  NO : REFER to Pinpoint Test B.

A3 CHECK FOR CURRENT DRAINS

- Carry out the Battery - Drain Testing. Refer to the Component Tests in this article.
- **Are any circuits causing excessive current drains?**

  YES : REPAIR as necessary. TEST the system for normal operation.

  NO : Go to A4.

A4 CHECK THE VEHICLE GROUNDS

- Key in START position.

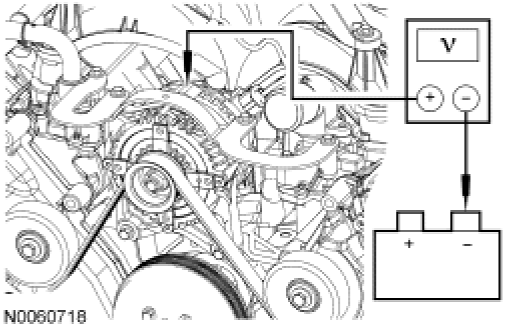

Fig. 1: Checking Vehicle Grounds
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between the generator housing and the negative battery terminal.
- **Is the voltage drop less than 0.1 volt?**

  YES : Go to A5.

NO : CHECK the engine ground, generator ground and the battery ground for corrosion. TEST the system for normal operation.

A5 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT SDC14 (RD)

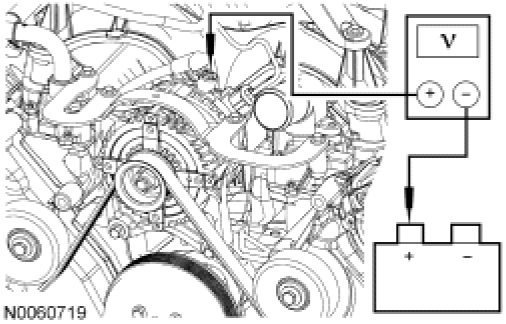

Fig. 2: Checking Voltage Drop In B+ Circuit SDC14 (RD)
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between generator B+ C102b, circuit SDC14 (RD) and the positive battery terminal.
- **Is the voltage drop less than 0.5 volt?**

  YES : CHECK if the customer left any electrical system(s) on or if there is an intermittent excessive battery draw. TEST the system for normal operation.

  NO : CHECK for any corrosion in the B+ SDC14 (RD), positive battery cable and/or connections. REPAIR as necessary. TEST the system for normal operation.

Pinpoint Test B: The Charging System Warning Indicator is On and Any Charging System DTC Stored

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Charging System for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The sense A circuit SBB17 (RD) to the generator field coil is 13-15 volts. This voltage feedback is used by the regulator to maintain the battery voltage at the desired set point. The S (stator) circuit (internal to the generator) is used to monitor generator operation. This circuit and other regulator internal conditions are checked by the regulator to allow the PCM to turn off the charging system warning indicator by sending a message over the controller area network (CAN) bus to the instrument cluster (IC). The positive battery output (B+) circuit SDC14 (RD) is the generator output voltage supplied to the battery and electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- PCM

PINPOINT TEST B: THE CHARGING SYSTEM WARNING INDICATOR IS ON AND ANY CHARGING SYSTEM DTC

STORED

NOTE: **Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.**

NOTE: **Do not have a battery charger attached during vehicle testing.**

B1 CONFIRM THE BATTERY CONDITION

- Carry out the Battery Condition Test. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Is the battery OK?**

  YES : Go to B2.

  NO : CORRECT the battery condition and Go to B2.

B2 CHECK THE BATTERY JUNCTION BOX (BJB) FUSE F17 (10A)

- Check the fuse: BJB F17 (10A)
- **Is BJB fuse F17 (10A) OK?**

  YES : Go to B3.

  NO : REPAIR circuit SBB17 (RD) and INSTALL a new fuse. INSPECT PCM and engine ground circuits and make sure they are securely attached. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B3 CHECK THE GENERATOR B+ CONNECTION

- Key in OFF position.
- Inspect generator C102b, B+ circuit SDC14 (RD) connection. Connection should be tight.

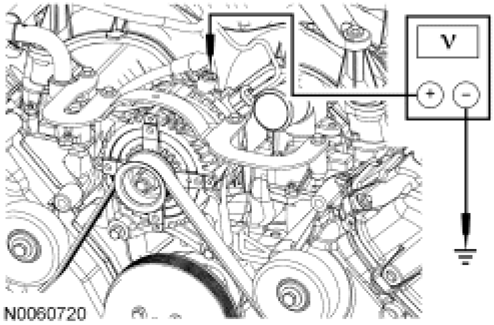

Fig. 3: Checking Generator B+ Connection
Courtesy of FORD MOTOR CO.

- Measure the voltage between generator C102b, B+ circuit SDC14 (RD) and ground.
- **Is generator C102b connection tight and does the generator B+ measure battery voltage?**

  YES : Go to B4.

  NO : TIGHTEN the generator B+ connection or REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B4 MONITOR THE PCM PID GENERATOR MONITOR WITH KEY ON/ENGINE OFF (KOEO)

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: Clear the PCM DTCs
- Enter the following diagnostic mode on the diagnostic tool: Select PCM PIDs

  NOTE: Many of the PCM PIDs selected will be monitored later in this pinpoint test.

  Select and monitor the following PCM PIDs:

  - Generator Monitor (GENMON).
  - Generator Command Duty Cycle (GENCMD).
  - Generator Voltage Desired (GENVDSD).
  - Generator Fault Indicator Lamp (GENFIL).
  - Engine Revolutions Per Minute (RPM).
  - Module Supply Voltage (VPWR).
- Monitor the GENMON PID.
- **Does the GENMON PID read 0%?**

  YES : Go to B5.

  NO : Go to B8.

B5 MONITOR THE PCM PID GENERATOR MONITOR WITH KEY ON/ENGINE RUNNING (KOER)

- Key in START position.
- With the engine at idle, wait 15 seconds for the GENVDSD PID to increase to greater than 13 volts.
- Monitor PID GENMON at idle and 3,000 RPM.
- **Does the GENMON PID read between 3% and 98% at engine idle speed and at 3,000 RPM?**

  YES : Go to B6.

  NO : Go to B8.

B6 MONITOR THE PCM PIDs GENERATOR MONITOR, MODULE SUPPLY VOLTAGE AND GENERATOR DESIRED VOLTAGE WITH THE ENGINE AT 3,000 RPM

- Turn all electrical accessories (lights, blower motor, etc.) off.

  NOTE: If GENMON PID does not remain below 85%, make sure that the battery is at an acceptable state of charge and that all electrical accessories are off.

- Increase the engine speed to 3,000 RPM (or road test).
- **Does the VPWR PID remain within ± 0.5 volt of the GENVDSD PID when the GENMON PID is less than 85%?**

  YES : Go to B7.

  NO : Go to B17.

B7 MONITOR THE PCM PIDs GENERATOR MONITOR, MODULE SUPPLY VOLTAGE AND GENERATOR DESIRED VOLTAGE WITH THE ENGINE AT IDLE

- Return the engine speed to idle.

CAUTION: On vehicles with low electrical loads, it may be necessary to add external loads (devices connected to power points, etc.) to determine the maximum GENMON value. GENMON value will not read between 95%-98% on a vehicle with minimal electrical accessories. As long as there is a significant increase in the GENMON PID following the procedure below, answer YES to the question.

- Determine the maximum GENMON PID value by lowering engine idle RPM to 500 RPM or less using output state control and turn on all electrical accessories until the VPWR PID is less than the GENVDSD PID by at least 0.7 volt. Under this condition the GENMON PID should read between 95% and 98%.
- **Does the GENMON PID read between 95% and 98%?**

  YES : Go to B19.

  NO : Go to B17.

B8 CHECK THE VOLTAGE OUTPUTS FROM THE PCM

- Key in OFF position.
- Disconnect: Generator C102a
- Key in ON position.
- Measure the voltage of the following circuits:

EXPECTED VOLTAGES

Generator Connector	Circuit	Expected Voltage (Approximate)
C102a-1	CDC15 (VT)	8-11 volts (should be less than battery voltage)
C102a-2	CDC10 (BU/OG)	0 volts
C102a-3	SBB17 (RD)	Battery voltage

- **Are the voltages as indicated for each circuit?**

  YES : Go to B13.

  NO : If a fault is detected in the GENCOM circuit CDC10 (BU/OG) or GENMON circuit CDC15 (VT), go to B9.

If a fault is detected in the A sense SBB17 (RD) circuit, go to B12.

B9 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR DAMAGE OR AN OPEN

- Key in OFF position.
- Disconnect: Generator C102a
- Disconnect: PCM C175e
- Inspect the following for damaged or pushed-out pins:

Component	Connector	Circuit
PCM	C175e-13	CDC10 (BU/OG)
PCM	C175e-26	CDC15 (VT)
Generator	C102a-2	CDC10 (BU/OG)
Generator	C102a-1	CDC15 (VT)

- Measure the resistance between circuit C175e-13 and C102a-2 and circuit C175e-26 and C102a-1.
- **Are the connectors and pins free of damage and are the resistances less than 5 ohms?**

  YES : Go to B10.

  NO : REPAIR the affected circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B10 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between circuits C102a-1, CDC15 (VT) and C102a-2, CDC10 (BU/OG).
- **Are the voltages approximately 0 volt?**

  YES : Go to B11.

  NO : REPAIR the affected circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B11 CHECK CIRCUITS CDC10 (BU/OG) AND CDC15 (VT) FOR SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between circuit C102a-1, CDC15 (VT) harness side and ground and C102a-2, CDC10 (BU/OG) harness side and ground and also measure resistance. between each other:
- **Are the resistances less than 5 ohms?**

  YES : Go to B24.

  NO : REPAIR the affected circuits. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B12 CHECK CIRCUIT SBB17 (RD) FOR DAMAGE OR AN OPEN

- Key in OFF position.
- Disconnect: Generator C102a

- Inspect C102a-3 for damaged or pushed-out pins.
- Measure the resistance of the circuit A sense circuit SBB17 (RD) between the battery and C102a-3 generator connector.
- **Are the connectors and pins free of damage and are the resistances less than 5 ohms?**

  YES : Go to B24.

  NO : REPAIR the affected circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B13 CHECK FOR SHORTED CIRCUITS

- Key in OFF position.
- Disconnect: Generator C102a
- Verify that PID GENMON reads 100%.
- Carry out the Wiggle Test of wiring to determine if PID GENMON changes from 100%.
- **Does PID GENMON change from 100%?**

  YES : REPAIR short circuit on CDC15 (VT) C102a-1.

  NO : Go to B14.

B14 CHECK THE PCM PID GENERATOR MONITOR INPUT TO THE PCM

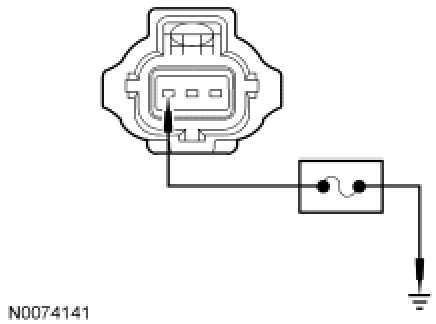

Fig. 4: Connecting PCM PID Generator Monitor Input To PCM
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and ground.
- Key in ON position.
- Monitor the GENMON PID while performing a wiggle test on the wire harness.
- **Does the GENMON PID read 0%?**

  YES : Go to B15.

  NO : REPAIR open connection on circuit CDC15 (VT). INSPECT generator C102a-1 and PCM C175b-23 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B15 COMPARE THE PCM PIDS GENERATOR MONITOR AND GENERATOR FIELD DUTY CYCLE

- Key in OFF position.

- Disconnect: Fused (10A) Jumper Wire

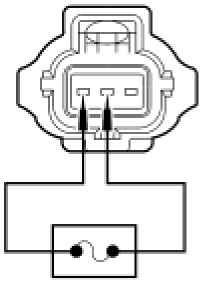

Fig. 5: Connecting PCM PIDS Generator Monitor & Generator Field Duty Cycle
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and generator C102a-2, circuit CDC10 (BU/OG), harness side.
- Key in ON position.
- Monitor the GENMON and GENCMD PIDs while performing a wiggle test on the harness.
- **Does the GENMON PID read within 2% of the GENCMD PID?**

  YES : Go to B16.

  NO : INSPECT C175b-66, circuit 120 (BK/GN), PCM ground circuit. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B16 A SENSE CIRCUIT LOAD TEST

NOTE:	**This step puts a load on the A sense circuit. If there are corroded or loose connections, loading the circuit may help show the fault.**

- Key in ON position.
- Using a 12-volt test lamp, check for voltage at C102a-3, circuit SBB17 (RD).
- **Does the test lamp illuminate?**

  YES : Go to B23.

  NO : REPAIR connection on circuit SBB17 (RD). INSPECT generator C102a-3 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B17 CHECK THE PCM VPWR PID

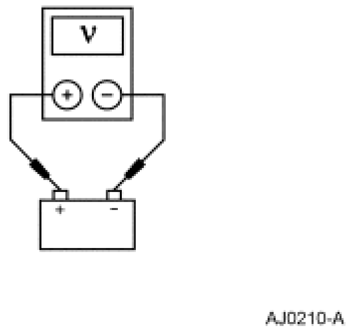

Fig. 6: Checking Charging System Voltage
Courtesy of FORD MOTOR CO.

- With the engine running, measure the battery voltage.
- Monitor the VPWR PID.
- **Are the battery voltage and VPWR PID within 0.5 volt of each other?**

  YES : Go to B19.

  NO : Go to B18.

B18 MEASURE THE PCM INPUT VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Connect a fused (10A) jumper wire between PCM C175b-35, circuit CE302 (YE/BU) and ground.
- Key in ON position.

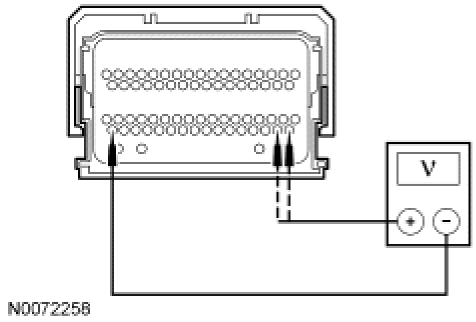

Fig. 7: Measuring PCM Input Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between PCM input voltage pins 51 and 52 to PCM ground pin 66.
- **Are voltages within 0.5 volt of PID VPWR?**

  YES : Go to B24.

  NO : REPAIR high resistance or loose connections between C175b-51 circuit CBP47 (GN/BU), C175b-52 circuit CBP47 (GN/BU) PCM power circuits or C175b-66, circuit GD120 (BK/GN), PCM ground circuit.

B19 CHECK THE GENERATOR B+ RESISTANCE

- Key in OFF position.
- Disconnect: Battery
- Disconnect: Generator C102b

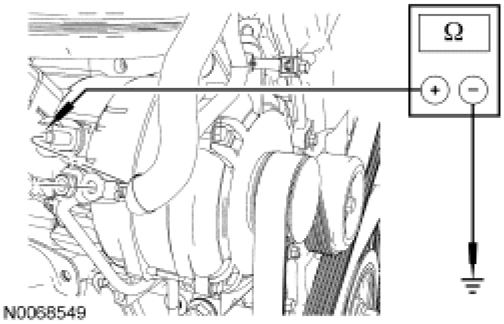

Fig. 8: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between generator C102b, component side and the generator housing.
- **Is the resistance greater than 125K ohms?**

  YES : Go to B20.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B20 CHECK THE RESISTANCE OF THE VOLTAGE REGULATOR INTERNAL CIRCUITS TO GROUND

- Measure the resistance between generator C102a, component side and ground. Refer to the following table.

Pin	Expected Resistance
1	Greater than 1000K ohms
2	Greater than 125K ohms
3	Greater than 125K ohms

- **Are the resistance values as indicated?**

  YES : Go to B21.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B21 ROAD TEST IN AN ATTEMPT TO VERIFY THE FAULT

- Connect: Generator C102b
- Connect: Generator C102a
- Connect: Battery
- Carry out a road test and monitor the following PIDs:
  - Generator monitor GENMON.
  - Generator voltage desired (GENVDSD).
  - Module supply voltage (VPWR).
- **Does the GENMON PID read either 0% or 100% during the road test?**

  YES : Go to B2.

  NO : If a road test did not cause the fault to occur, intermittent fault condition may be present. Go to B22.

B22 USE THE VEHICLE DATA RECORDER (VDR) TO CAPTURE INTERMITTENT FAULT CONDITION

- Connect a VDR to the vehicle and setup to capture the following PIDs:
  - Generator monitor (GENMON).
  - Generator command duty cycle (GENCMD).
  - Generator voltage desired (GENVDSD).
  - Generator fault indicator lamp (GENFIL).
  - Engine revolutions per minute (RPM).
  - Module supply voltage (VPWR).
- Set the VDR to trigger if any of the following events occur during vehicle operation (waiting 15 seconds after start):
  - VPWR PID reads greater than 15.2 volts.
  - GENMON PID reads 0% or 100%.
- Road test the vehicle.
- **Was a fault captured by the VDR?**

  YES : RECORD any values from the VDR that may have been captured. If no charging system DTCs are present, go to **Pinpoint Test C**. If any charging system DTCs are present, go to B3.

  NO : No problem found at this time. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B23 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS

- Key in OFF position.
- Connect: Generator C102b
- Connect: Generator C102a
- Connect: PCM C175b
- Connect the diagnostic tool.
- Key in START position.
- With the engine running, monitor the charging system warning indicator lamp and the scan tool for

DTCs.

- **Does the charging system warning indicator lamp illuminate and does any charging system DTC get stored into memory?**

  YES : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : The fault is not present and cannot be recreated at this time. This may indicate an intermittent fault. Go to B19.

B24 CHECK THE CHARGING SYSTEM CIRCUITS FOR INTERMITTENT FAULTS

- Key in OFF position.
- Connect: Generator C102b
- Connect: Generator C102a
- Connect: PCM C175b
- Connect the diagnostic tool.
- Key in START position.
- With the engine running, monitor the charging system warning indicator lamp and the scan tool for DTCs.
- **Does the charging system warning indicator lamp illuminate and does any charging system DTC get stored into memory?**

  YES : INSTALL a new PCM. REFER to **ELECTRONIC ENGINE CONTROLS - 2.3L** article for 2.3L, **ELECTRONIC ENGINE CONTROLS - 3.0L (4V)** article for 3.0L or **ELECTRONIC ENGINE CONTROLS - 3.5L** article for 3.5L engines.

  NO : The fault is not present and cannot be recreated at this time. This may indicate an intermittent fault. Go to B19.

Pinpoint Test C: The Charging System Warning Indicator is On With the Engine Running and No Charging System DTCs Present

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Charging System for schematic and connector information.

Normal Operation

With the engine running, the charging system warning indicator is off. The A circuit SBB17 (RD) from the battery B+ to the generator regulator is 13-15 volts. This voltage feedback is used by the regulator to maintain the battery voltage at the desired set point. The S (stator) circuit (internal to the generator) is used to monitor generator operation. This circuit and other regulator internal conditions are checked by the regulator to allow the PCM to turn off the charging system warning indicator by sending a message over the controller area network (CAN) bus to the instrument cluster (IC). The positive battery output (B+) circuit SDC14 (RD) is the generator output supplied to the battery and electrical system.

This pinpoint test is intended to diagnose the following:

- Generator

- Circuitry
- IC
- PCM

PINPOINT TEST C: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING AND NO CHARGING SYSTEM DTCs PRESENT

NOTE: Make sure battery voltage is greater than 12.2 volts prior to carrying out this pinpoint test.

NOTE: Do not have a battery charger attached during vehicle testing.

C1 CHECK THE BATTERY CONDITION

- Carry out the Battery - Condition Test to determine if the battery can hold a charge and is OK for use. Refer to **BATTERY, MOUNTING AND CABLES** article.
- **Does the battery pass the condition test?**

  YES : Go to C2.

  NO : INSTALL a new battery. REFER to **BATTERY, MOUNTING AND CABLES** article. TEST the system for normal operation.

C2 CHECK THE GENERATOR B+ CONNECTION

- Key in OFF position.
- Inspect generator C102b connection. Connection should be tight.

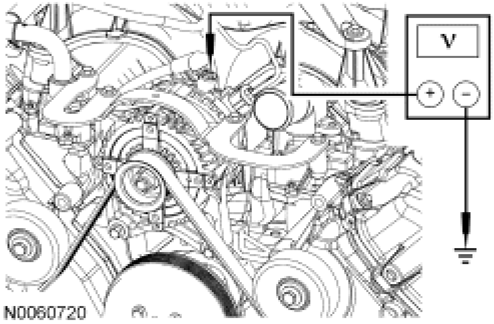

Fig. 9: Checking Generator B+ Connection
Courtesy of FORD MOTOR CO.

- Measure the voltage between generator C102b, circuit SDC14 (RD) and ground.
- **Is generator C102b connection tight and does the generator B+ measure battery voltage?**

  YES : Go to C3.

  NO : TIGHTEN the generator B+ connection or REPAIR the circuit. CLEAR the any DTCs. REPEAT the self-test. TEST the system for normal operation.

C3 CHECK THE VOLTAGE DROP IN THE B+ CIRCUIT SDC14 (RD)

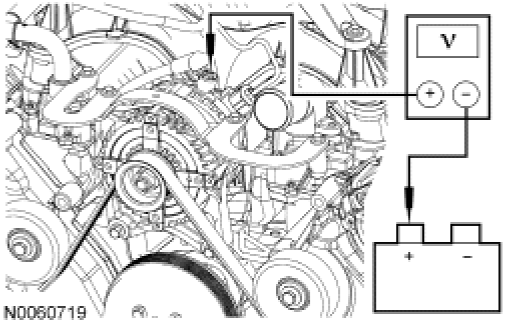

Fig. 10: Checking Voltage Drop In B+ Circuit SDC14 (RD)
Courtesy of FORD MOTOR CO.

- With the engine running, measure the voltage drop between generator B+ C102b, circuit SDC14 (RD) and the positive battery terminal.
- **Is the voltage drop less than 0.5 volt?**

  YES : Go to C4.

  NO : CHECK for any corrosion in the B+ C102b, circuit SDC14 (RD), positive battery cable and/or connections. REPAIR as necessary. TEST the system for normal operation.

C4 CHECK THE DTCs IN THE PCM

- Key in OFF position.
- Connect the diagnostic tool.
- Key in START position.
- Enter the following diagnostic mode on the diagnostic tool: Retrieve PCM DTCs
- Use the recorded PCM DTCs from the continuous and on-demand self tests.
- **Are any PCM DTCs recorded?**

  YES : For all DTCs EXCEPT charging system DTCs, REFER to the **Introduction - Gasoline Engines** article. If any charging system DTCs are present, go to **Pinpoint Test B**. If referred here by the **Introduction - Gasoline Engines** article, go to C5.

  NO : Go to C5.

C5 MONITOR PID GEN_FIL

- With the engine running, monitor PID GEN_FIL.
- **Does PID GENFIL show fault?**

  YES : Go to C6.

  NO : REPAIR/INSTALL a new IC, IC-to-PCM connection or the PCM. TEST the system for normal operation.

C6 MONITOR PID VPWR

- With the engine running, monitor PIDS VPWR, GENFIL, GENVDSD.
- **Is PID VPWR greater than 15.6 volts?**

  YES : Go to C7.

  NO : Go to C8.

C7 CHECK PCM VPWR PID

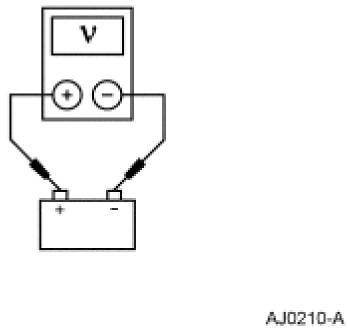

Fig. 11: Checking Charging System Voltage
Courtesy of FORD MOTOR CO.

- With the engine running, measure the battery voltage.
- Monitor the VPWR PID.
- **Are the battery voltage and VPWR PID within 0.6 volt of each other?**

  YES : Go to C8.

  NO : Go to C9.

C8 MEASURE PCM INPUT VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Connect a fused (10A) jumper wire between C175b-35, circuit CE302 (YE/BU) and ground.
- Key in ON position.

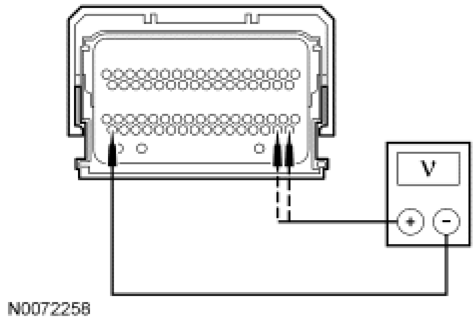

Fig. 12: Measuring PCM Input Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between PCM input voltage pins 51 and 52 to PCM ground pin 66.
- **Are voltages within 0.5 volt of PID VPWR?**

  YES : INSTALL a new PCM.

  NO : REPAIR high resistance or loose connections between C175b-51 circuit CBP47 (GN/BU), C175b-52 circuit CBP47 (GN/BU) PCM power circuits or C175b-66, circuit GD120 (BK/GN), PCM ground circuit.

C9 MONITOR THE PCM PID GENERATOR MONITOR WITH KEY ON/ENGINE RUNNING

(KOER)

- Connect: PCM C175b
- Key in START position.
- With the engine at idle, wait 15 seconds for the GENVDSD PID to increase to greater than 13 volts.
- Monitor PID GENMON at idle and 3000 RPM.
- **Does the GENMON PID read between 3% and 98% at engine idle speed and at 3,000 RPM?**

  YES : Go to C10.

  NO : Go to C11.

C10 MONITOR PID GENVDSD

- With the engine running, monitor PID GENVDSD.
- **Is PID GENVDSD greater than 15.2 volts?**

  YES : REPAIR connection on circuit SDC02 (RD). INSPECT generator C102a-3 for damage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If no problems are found, INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

  NO : REFLASH or INSTALL a new PCM.

C11 CHECK FOR SHORTED CIRCUITS

- Key in OFF position.
- Disconnect: Generator C102a
- Verify that PID GENMON reads 100%.
- Carry out the Wiggle Test of wiring to determine if PID GENMON changes from 100%.
- **Does PID GENMON change from 100%?**

  YES : REPAIR short circuit on C102a-1 CDC15 (VT).

  NO : Go to C12.

C12 CHECK THE PCM PID GENERATOR MONITOR INPUT TO THE PCM

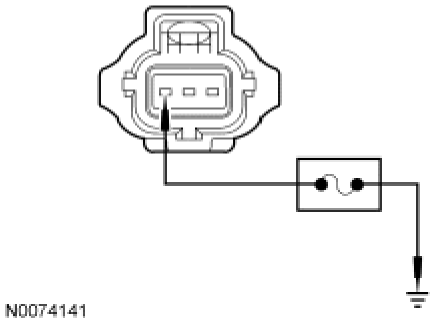

Fig. 13: Connecting Fused Jumper Wire
Courtesy of FORD MOTOR CO.

- Connect a fused (10A) jumper wire between generator C102a-1, circuit CDC15 (VT), harness side and ground.

- Key in ON position.
- Monitor the GENMON PID while carrying out a Wiggle Test on the wire harness.
- **Does the GENMON PID read 0%?**

  YES : REPAIR open connection on circuit CDC15 (VT) C102a-1, and PCM C175e-26. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test D: The Generator is Noisy

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Charging System for schematic and connector information.

Normal Operation

The generator is belt-driven by the engine accessory drive system.

This pinpoint test is intended to diagnose the following:

- Accessory drive belt
- Loose bolts/brackets
- Generator/pulley

PINPOINT TEST D: THE GENERATOR IS NOISY

D1 CHECK FOR ACCESSORY DRIVE BELT NOISE AND LOOSE MOUNTING BRACKETS

- Key in OFF position.
- Check the accessory drive belt for damage and correct installation. Refer to **ACCESSORY DRIVE - 2.3L** article for 2.3L, **ACCESSORY DRIVE - 3.0L (4V)** article for 3.0L or **ACCESSORY DRIVE - 3.5L** article for 3.5L engines.
- Check the accessory mounting brackets and generator pulley for looseness or misalignment.
- **Is the accessory drive OK?**

  YES : Go to D2.

  NO : REPAIR as necessary. REFER to **ACCESSORY DRIVE - 2.3L** article for 2.3L, **ACCESSORY DRIVE - 3.0L (4V)** article for 3.0L or **ACCESSORY DRIVE - 3.5L** article for 3.5L engines for diagnosis and testing of the accessory drive system. TEST the system for normal operation.

D2 CHECK THE GENERATOR MOUNTING

- Check the generator mounting for loose bolts or misalignment.
- **Is the generator mounted correctly?**

  YES : Go to D3.

  NO : REPAIR as necessary. TEST the system for normal operation.

D3 CHECK THE GENERATOR FOR ELECTRICAL NOISE

- Disconnect: Generator C102b
- Key in START position.
- With the engine running, use a stethoscope or equivalent listening device to probe the generator.
- **Is the noise still present?**

  YES : Go to D4.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

D4 CHECK THE GENERATOR FOR MECHANICAL NOISE

- With the engine running, use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise.
- **Is the generator the noise source?**

  YES : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

  NO : REFER to **ENGINE SYSTEM - GENERAL INFORMATION** article to diagnose the source of the engine noise.

Pinpoint Test E: Radio Interference

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Charging System for schematic and connector information.

Normal Operation

The generator radio suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

This pinpoint test is intended to diagnose the following:

- Generator
- Circuitry
- In-vehicle entertainment system

PINPOINT TEST E: RADIO INTERFERENCE

E1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE

NOTE: **If the OEM audio unit has been replaced with an aftermarket unit, the vehicle may not pass this test. Return the vehicle to OEM condition before following this pinpoint test.**

- Key in START position.
- Start and run the engine.

- Tune the audio unit to a station where the interference is present.
- Key in OFF position.
- Disconnect: Generator C102b
- Key in START position.
- With the engine running, determine if the interference is still present.
- **Is the interference present with the generator disconnected?**

  YES : REFER to **INFORMATION AND ENTERTAINMENT SYSTEMS** article for diagnosis and testing of the in-vehicle entertainment system.

  NO : INSTALL a new generator. REFER to **GENERATOR AND REGULATOR** article. TEST the system for normal operation.

Pinpoint Test F: DTC B1318 or B1676 - Battery Voltage Low or Battery Voltage Out of Range

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Charging System for schematic and connector information.

Normal Operation

Various control modules within the vehicle operate at a voltage between 10-17 volts. Voltage to these modules is supplied through the vehicle harness to the module(s). Ground for the modules is provided by the modules ground circuit(s). If voltages to these modules rise above 17 volts, DTC B1317 or B1676 may set, or if voltage drops below 10 volts, DTC B1318 or B1676 may set.

This pinpoint test is intended to diagnose the following:

- Battery
- Charging System
- Module Voltage Supply
- Module Ground

NOTE: DTC B1317 or B1318 can be set if the vehicle has had a discharged battery, has recently been jump-started or has had the vehicle battery charged.

PINPOINT TEST F: DTC B1318 OR B1676 - BATTERY VOLTAGE LOW OR BATTERY VOLTAGE OUT OF RANGE

F1 CHECK FOR DTCs

- Key in OFF position.
- Connect the diagnostic tool.
- Enter the following diagnostic mode on the diagnostic tool: Retrieve all continuous DTCs
- **Is DTC B1318 or B1676 present in only one module?**

  YES : If DTC B1317 or B1676 are recorded in only ONE module, go to F2.

  NO : If DTC B1318 or B1676 are recorded in more than one module, go to **Pinpoint Test B**.

F2 CHECK THE BATTERY VOLTAGE

- Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running, all accessory loads OFF.
- **Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running?**

  YES : Go to F3.

  NO : CHECK and/or REPAIR the charging system as necessary. Go to **Pinpoint Test B**. TEST the system for normal operation. CLEAR the DTCs. REPEAT the self-test.

F3 CHECK THE VOLTAGE TO THE MODULE

- Key in OFF position.
- Disconnect: Affected module which recorded DTC B1317 or B1676
- Key in ON position.
- Measure all of the affected module's power circuits, harness side to ground. Refer to affected module Wiring Diagrams Cell for schematic and connector information.
- **Is the voltage greater than 10 volts?**

  YES : Go to F4.

  NO : REPAIR the module power circuit(s). CLEAR the DTCs. REPEAT the self-test.

F4 CHECK THE MODULE GROUNDS

- Key in OFF position.
- Measure the resistance between all of the affected module's ground circuits, harness side to ground. Refer to affected module Wiring Diagrams Cell for schematic and connector information.
- **Is the resistance less than 5 ohms?**

  YES : Go to F5.

  NO : REPAIR the module ground circuit(s). CLEAR the DTCs. REPEAT the self-test.

F5 CHECK THE MODULE FOR CORRECT OPERATION

- Key in OFF position.
- Disconnect: All of the affected module connectors
- Check the connector and module for:
  - corrosion.
  - pushed-out or damaged pins.
  - connector or module damage.
- Connect: All of the affected module connectors
- CLEAR all DTCs.
- OPERATE the system and verify the concern is still present.
- **Is the concern still present?**

  YES : INSTALL a new module. REFER to the removal and installation procedure in the affected module's part. CLEAR the DTCs. REPEAT the self-test.

  NO : The system is operating correctly at this time. The concern may have been the result of a loose connection, may recently have had a discharged battery or may have been jump started.

CLEAR the DTCs. REPEAT the self-test.

Component Tests

Battery - Drain Testing

WARNING: Batteries contain sulfuric acid and produce explosive gases. Work in a well-ventilated area. Do not allow the battery to come in contact with flames, sparks or burning substances. Avoid contact with skin, eyes or clothing. Shield eyes when working near the battery to protect against possible splashing of acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes, then get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in serious personal injury.

CAUTION: To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

NOTE: Many electronic modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Use an inline ammeter between the negative battery post and its respective cable.

NOTE: Typically, a drain of approximately 1 amp can be attributed to a glove compartment lamp or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading falls to an acceptable level. If the drain is still not located after checking all the fuses, it is due to the generator.

NOTE: To accurately test the drain on a battery, an inline ammeter must be used. Use of a test lamp or voltmeter is not an accurate method due to the number of electronic modules.

Check for current drains on the battery in excess of 50 mA (0.050 amp) with all of the electrical accessories off and the vehicle at rest for at least 40 minutes. Current drains can be tested with the following procedure:

1. Make sure the battery junction box (BJB) and smart junction box (SJB) are accessible without turning on the interior lights or the underhood lights.
2. Drive the vehicle at least 5 minutes and over 48 km/h (30 mph) to turn on and activate the vehicle systems.

3. Allow the vehicle to sit with the key off for at least 40 minutes to allow modules to time out/power down.
4. Connect a fused jumper wire (30A) between the negative battery cable and the negative battery post to prevent the modules from resetting and to catch capacitive drains.
5. Disconnect the battery ground cable from the battery post without breaking the connection of the jumper wire.

NOTE: It is very important that continuity is not broken between the battery and the battery ground cable when connecting the meter. If this happens, the entire procedure must be repeated.

6. Connect the battery tester between the battery ground cable and the post. The meter must be capable of reading milliamps and should have a 10 amp capability.

NOTE: If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

7. Remove the jumper wire.

NOTE: Amperage draw varies from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

NOTE: No factory-equipped vehicle should have more than a 50 mA (0.050 amp) draw.

8. Note the amperage draw.
9. If the draw is found to be excessive, remove the fuses from the SJB one at a time and note the current reading. Do not reinstall the fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed and install one fuse, note the amperage draw, then remove the fuse and install the next fuse until each circuit is tested. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located.
10. If the current draw is still excessive, remove the fuses from the BJB one at a time and note the current drop. Do not reinstall the fuses until you have finished testing. To correctly isolate each of the circuits, all of the fuses may need to be removed and install one fuse, note the amperage draw, then remove the fuse and install the next fuse until each circuit is tested. When the current level drops to an acceptable level after removing a fuse, the circuit containing the excessive draw has been located.
11. Check the wiring diagrams for any circuits that run from the battery without passing through the BJB or the SJB. If the current draw is still excessive, disconnect these circuits until the draw is found. Also disconnect the generator electrical connections if the draw cannot be located. The generator may be internally shorted, causing the current drain.

Generator On-Vehicle Tests

CAUTION: To prevent damage to the generator, do not make the jumper wire

connections except as directed.

CAUTION: Do not allow any metal object to come in contact with the housing and the internal diode cooling fins with the key in the ON or OFF positions. A short circuit may result and burn out the diodes.

NOTE: Battery posts and cable clamps must be clean and tight for accurate meter indications.

NOTE: Refer to the battery tester article for complete directions for testing the charging system.

1. Turn off all lamps and electrical components.
2. Place the transmission in NEUTRAL and apply the parking brake.
3. Carry out the Load Test and No Load Test according to the following component tests:

Generator On-Vehicle Tests - Load Test

1. Switch the tester to the ammeter function.
2. Connect the positive and negative leads of the tester to the corresponding battery terminals.
3. Connect the current probe to the generator B+ output terminal, circuit SDC14 (RD).
4. With the engine running at approximately 2,500 RPM (2.3L), 2,000 RPM (3.0L and 3.5L), adjust the tester load bank to determine the output of the generator. Generator output should be greater than the graph shown below. If not, refer back to the pinpoint test or Go to **Symptom Chart**.

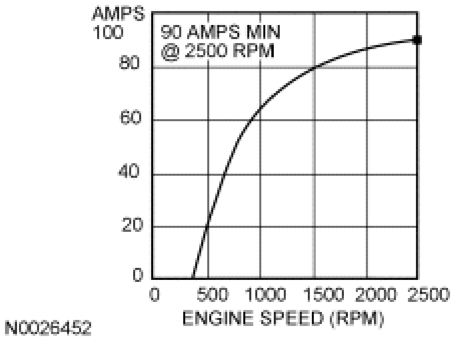

Fig. 14: Generator Output Graph - 2.3L
Courtesy of FORD MOTOR CO.

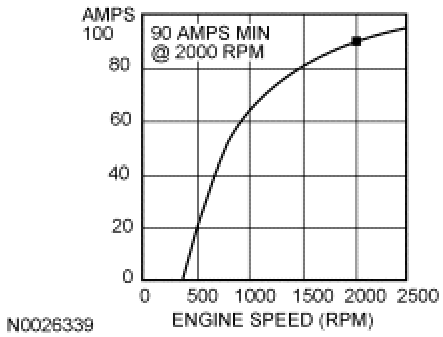

Fig. 15: Generator Output Graph - 3.0L & 3.5L
Courtesy of FORD MOTOR CO.

Generator On-Vehicle Tests - No Load Test

1. Switch the tester to the voltmeter function.
2. Connect the voltmeter positive lead to the generator B+ terminal, circuit SDC14 (RD) and the negative lead to ground.
3. Turn all of the electrical accessories off.
4. With the engine running at approximately 2,000 RPM, check the generator output voltage. The voltage should be between 13.2 and 15.5 volts. If not, refer back to the pinpoint test or Go to **Symptom Chart**.

DESCRIPTION AND OPERATION

CLIMATE CONTROL SYSTEM

Climate Control System

WARNING: Take the following precautions when repairing an air conditioning system containing R-134a:

- **Always wear safety goggles.**
- **Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and will freeze skin tissue.**
- **Never allow refrigerant R-134a gas to escape in quantity in an occupied space. It will displace the oxygen needed to support life.**
- **Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but it decomposes when exposed to high temperatures such as a torch flame. During decomposition it releases irritating and toxic gasses (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.**

Failure to follow these instructions may result in serious personal injury.

NOTE: To avoid damaging the vehicle or air conditioning (A/C) components, the following precautions must be observed.

- **The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to do so may contaminate the shop bulk refrigerant and other vehicles.**
- **Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These 2 types of refrigerant must never be mixed. Doing so may damage the A/C system.**
- **Charge the A/C system with R-134a refrigerant gas while the engine is running only at the low-pressure side, to prevent refrigerant slugging from damaging the A/C compressor.**
- **Use only R-134a refrigerant. Due to environmental concerns, when the A/C system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. Federal, State/Provincial and/or local laws REQUIRE that R-134a be recovered into appropriate recovery equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as Automotive Service Excellence (ASE) or Mobile Air Conditioning Society (MACS). Use of a recovery machine dedicated to R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the**

instructions provided by the equipment manufacturer when removing refrigerant from or charging the A/C system.

- **Refrigerant R-134a must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.**
- **A number of manufacturers are producing refrigerant products that are described as direct substitutes for refrigerant R-134a. The use of any unauthorized substitute refrigerant may severely damage the A/C components. If repair is required, use only new or recycled refrigerant R-134a.**

NOTE: **To avoid contamination of the air conditioning (A/C) system, the following precautions must be observed.**

- **Never open or loosen a connection before recovering the refrigerant.**
- **When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.**
- **Evacuate a system that has been opened to install a new component or one that has discharged through leakage before charging.**
- **Seal open fittings with a cap or plug immediately after disconnecting a component from the system.**
- **Clean the outside of the fittings thoroughly before disconnecting a component from the system.**
- **Do not remove the sealing caps from a new component until ready to install.**
- **Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use and install the cap immediately after using. Store the oil in a clean, moisture-free container.**
- **Install a new O-ring seal before connecting an open fitting. Coat the fitting and O-ring seal with mineral oil before connecting.**
- **When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that may chafe the line.**
- **Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system will not tolerate overtightening.**
- **When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.**
- **Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.**

The system components are the following:

- A/C compressor
- A/C compressor clutch assembly
- A/C condenser core with A/C receiver/drier
- A/C evaporator core
- Connecting refrigerant lines
- Thermostatic Expansion Valve (TXV)
- A/C pressure transducer
- Heater core and evaporator core housing
- HVAC module - Electronic Manual Temperature Control (EMTC)
- HVAC module - Electronic Automatic Temperature Control (EATC)
- HVAC module - Dual Automatic Temperature Control (DATC)
- Blower switch (EMTC systems)
- Temperature blend door actuators
- Floor/defrost/panel door actuator
- Air inlet door actuator
- Blower motor resistor or speed control module
- Blower motor
- Ambient temperature sensor
- In-vehicle temperature sensor
- Solar radiation sensor
- Evaporator discharge air temperature sensor

External Temperature Display

The external temperature is displayed when the EXT button is pressed. While the actual external temperature can vary continuously, the value that is displayed will update at a specific rate depending on whether or not the engine is "hot" and whether or not the vehicle is moving.

When the external temperature is rising, the display will update slowly. Updates (when the actual external temperature is higher than currently displayed value) will be limited to 0.6°C (1°F) every 20 seconds while the vehicle is moving at 40 km/h (25 mph) or greater for more than 90 seconds, or 0.6°C (1°F) every 20 minutes if the vehicle is not moving at this speed. This is to prevent the heat from the engine compartment from affecting the accuracy of the display.

When the external temperature is dropping, the display will update quickly.

Updates (when the actual external temperature is lower than currently displayed value) will only be limited to 0.6°C (1°F) every 2 seconds (regardless of vehicle speed). Consequently, the display will essentially follow the drop experienced by the external temperature thermistor.

Climate Control System Operation

Electronic Manual Temperature Control (EMTC) System

The EMTC system heats or cools the vehicle depending on the HVAC module - EMTC panel selection.

- The HVAC module - EMTC panel selections determine heating or cooling, air distribution and enables blower motor operation.
- The temperature control setting determines the air temperature.
- The blower motor switch varies the blower motor speed.
- During A/C operation the system also reduces the relative humidity of the air.

The EMTC system operation is determined by the settings on the climate control module. The EMTC system is composed of the HVAC module - EMTC, blower motor resistor, mode door actuator, air inlet door actuator and temperature blend door actuator to control the various functions.

The blower motor switch:

- sets the blower motor speed.
- directs the blower motor path to ground through the blower motor resistor to allow blower motor operation in LO, MED LO and MED HI.
- directs the blower motor path directly to ground, bypassing the blower motor resistor to allow blower motor operation in HI.

The A/C request button:

- can request the A/C compressor ON (when the function selector switch is in PANEL, FLOOR/PANEL and FLOOR) when the A/C request switch is pressed. Indicator illuminates when A/C request switch is toggled ON.
- indicator illuminates when the function selector switch is in MAX A/C and cannot be toggled.
- indicator does not illuminate in OFF and cannot be toggled.
- indicator can be toggled ON or OFF in FLOOR/DEFROST and DEFROST. The A/C compressor will operate regardless of indicator status if the outside air temperature is above 6°C (43°F).
- is serviced only with the climate control assembly.

The function selector:

- selects airflow direction.
- is serviced only with the HVAC module - EMTC.

The air recirculation button:

- selects either recirculated or outside air source.
- recirculates air in any mode except DEFROST, if requested.
- is disabled in MAX A/C or OFF mode where recirculated air only is used.
- is disabled in DEFROST mode where outside air only is used.

- is serviced only with the HVAC module - EMTC.
- may be a timed function in FLOOR/DEFROST and DEFROST.

The EMTC module also includes:

- a rear window DEFROST button, refer to **GLASS, FRAMES AND MECHANISMS** article.
- heated/cooled seat controls, refer to **SEATING** article.

Electronic Automatic Temperature Control (EATC) and Dual Automatic Temperature Control (DATC) System

The EATC and DATC system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation, the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.
- The temperature control setting determines the air temperature.
- The blower motor control override buttons vary the blower motor speed.
- The driver side and passenger side temperature settings can be individually controlled (DATC only).

The EATC and DATC system operation is determined by the settings on the HVAC module - EATC or HVAC module - DATC. The DATC/EATC system automatically maintains a selected temperature for vehicle interior comfort. The DATC/EATC system is composed of the HVAC module - EATC or HVAC module - DATC, blower motor speed control, mode door actuator, air inlet door actuator, temperature blend door actuator, in-vehicle temperature sensor and solar radiation sensor to control the various functions.

When the HVAC module - EATC or HVAC module - DATC is set to AUTO:

- the air distribution direction, blower motor speed and A/C compressor operation are automatically controlled based on the temperature(s) selected.

The HVAC module - EATC or HVAC module - DATC manual override settings:

- allow the air distribution direction to be manually selected.
- allow the blower motor speed to be manually selected.
- allow RECIRCULATION mode to be manually selected in all modes except DEFROST. The A/C request can be cancelled by pressing the A/C request switch, turning the indicator OFF.
- allow A/C compressor operation to be manually selected except in FLOOR/DEFROST or DEFROST.

The DATC/EATC module also includes:

- a rear window DEFROST button, refer to **GLASS, FRAMES AND MECHANISMS** article.
- heated/cooled seat controls, refer to **SEATING** article.

External Temperature Display

The external temperature is displayed when the EXT button is pressed. While the actual external temperature can vary continuously, the value that is displayed will update at a specific rate depending on whether or not the engine is "hot" and whether or not the vehicle is moving.

When the external temperature is rising, the display will update slowly.

Updates (when the actual external temperature is higher than currently displayed value) will be limited to 0.6°C (1°F) every 20 seconds while the vehicle is moving at greater than 40 km/h (25 mph) for more than 90 seconds OR 0.6°C (1°F) every 20 minutes if the vehicle is not moving at this speed. This is to prevent the heat from the engine compartment from affecting the accuracy of the display.

When the external temperature is dropping, the display will update quickly.

Updates (when the actual external temperature is lower than currently displayed value) will only be limited to 0.6°C (1°F) every 2 seconds (regardless of vehicle speed). Consequently the display will essentially follow the drop experienced by the external temperature thermistor.

System Airflow Description - Electronic Manual Temperature Control (EMTC)

Max A/C

When MAX A/C is selected:

- the air inlet door actuator closes off outside air and admits only recirculated air.
- the recirc button is disabled and the indicator is illuminated.
- the floor/defrost/panel door directs airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is illuminated and will be disabled.
- the A/C compressor will operate if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL

When PANEL is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the instrument panel A/C registers.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct and the instrument panel registers. A small amount of airflow from the side window demisters and defrost duct will be present.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

OFF

When OFF is selected:

- the recirc request button is disabled.
- the air inlet door actuator closes off outside air and admits only recirculated air.
- the A/C request button is disabled.
- the blower motor is OFF.

FLOOR

When FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters will be present.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor can operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR/DEFROST

When FLOOR/DEFROST is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button

is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.

- the floor/defrost/panel door directs airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

DEFROST

When DEFROST is selected:

- the air inlet door actuator opens, admitting only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct will be present.
- blended air temperature is available.
- the A/C request button and the indicator can be toggled. To reduce fogging, the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

System Airflow Description - Dual Automatic Temperature Control (DATC)/Electronic Automatic Temperature Control (EATC)

AUTO

When AUTO is selected:

- the temperature control setting is manually set to the desired setting.
- the air inlet door actuator is automatically controlled by the HVAC module - EATC or HVAC module - DATC, based on the temperature setting.
- the mode door actuators are automatically controlled by the HVAC module - EATC or HVAC module - DATC based on the temperature setting.
- the A/C compressor is automatically controlled by the HVAC module - EATC or HVAC module - DATC based on the temperature setting. The A/C compressor will not operate if the outside temperature is below approximately 6°C (43°F).
- the A/C request is controlled by the HVAC module - EATC or HVAC module - DATC based on the temperature settings. The A/C compressor will not operate if the outside air temperature is below 6°C (43°F). The A/C indicator automatically turns ON when the outside air temperature rises above 14°C (58°F) and automatically turns OFF when the outside air temperature falls below 11°C (51°F).
- the A/C request button and the RECIRC request button can be manually selected. When manually selected the A/C indicator will not change state with changing outside air temperature.
- the blower motor is ON. The blower motor speed is automatically controlled by the HVAC module -

EATC or HVAC module - DATC based on the temperature setting, but can be manually overridden.

OFF

When OFF is selected:

- the recirc request button is disabled.
- the air inlet door actuator closes off outside air and admits only recirculated air.
- the floor/defrost/panel door actuator is in the DEFROST position.
- the A/C request button is disabled.
- the blower motor is OFF.

PANEL

When PANEL is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the instrument panel A/C registers.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor may operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

PANEL/FLOOR

When PANEL/FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the floor duct and the instrument panel A/C registers. A small amount of airflow from the side window demisters and defrost duct will be present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor may operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR

When FLOOR is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment. The recirc function may time out and the air inlet door will change to the outside air position.
- the floor/defrost/panel door directs airflow to the floor duct. A small amount of airflow from the defroster duct and side window demisters will be present.
- blended air temperature is available. Only when A/C compressor operation has been selected by pressing the A/C request button (indicator ON), can the airflow temperature be cooled below the outside air temperature.
- the A/C request button is enabled. The A/C compressor may operate and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

FLOOR/DEFROST

When FLOOR/DEFROST is selected:

- the recirc request button is enabled. If the recirc request button is selected (indicator ON), the air inlet door actuator closes off outside air from entering the passenger compartment. If the recirc request button is not selected (indicator OFF), the air inlet door actuator admits only outside air into the passenger compartment. The recirc function may time out and the air inlet door will change to the outside air position.
- the floor/defrost/panel door directs airflow to the floor duct, the defroster duct and the side window demisters.
- blended air temperature is available.
- the A/C request button is enabled. The A/C compressor will operate automatically and the indicator will illuminate if the A/C request button is selected and the outside temperature is above approximately 6°C (43°F).
- the blower motor is ON.

DEFROST

When DEFROST is selected:

- the recirc request button and indicator is disabled. Regardless of button and indicator status, the air inlet door actuator admits only outside air into the passenger compartment.
- the floor/defrost/panel door directs airflow to the defroster duct and side window demisters. A small amount of airflow from the floor duct will be present.
- blended air temperature is available.
- the A/C request button will indicate the last status and the indicator can be toggled. To reduce fogging,

the A/C compressor will operate automatically, regardless of indicator status, if the outside temperature is above approximately 6°C (43°F).

- the blower motor is ON.

DIAGNOSTIC TESTS

CLIMATE CONTROL SYSTEM

Special Tools

Illustration	Tool Name	Tool Number
 ST1298-A	A/C Flush Adapter Kit	219-00074 or equivalent

	Vehicle Communication Module (VCM) and Integrated Diagnostic System (IDS) software with appropriate hardware, or equivalent scan tool	

Principles of Operation

There are 4 main principles involved with the basic theory of operation:

- Heat transfer
- Latent heat of vaporization
- Relative humidity
- Effects of pressure

Heat Transfer

If 2 substances of different temperature are placed near each other, the heat in the warmer substance will transfer to the colder substance.

Latent Heat of Vaporization

When a liquid boils (converts to gas) it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (converts back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

Relative Humidity

The amount of moisture (water vapor content) that the air can hold is directly related to the air temperature. The more heat there is in the air, the more moisture the air can hold. The lower the moisture content in the air, the more comfortable occupants feel. Removing the moisture from the air lowers its relative humidity and improves personal comfort.

Effects of Pressure on Boiling or Condensation

As the pressure is increased on a liquid, the temperature at which the liquid boils (converts to gas) also increases. Conversely, when the pressure on a liquid is reduced, its boiling point is also reduced. When in the gas state, an increase in pressure causes an increase in temperature, while a decrease in pressure will decrease the temperature of the gas.

Compressor Anti-Slugging Strategy (CASS)

Liquid refrigerant may accumulate in the A/C compressor under certain conditions. To alleviate damage to the A/C compressor, the Compressor Anti-Slugging Strategy (CASS) is utilized.

CASS is initiated only under specific conditions:

- Ignition is OFF for more than 8 hours
- Ambient temperature is above -4°C (25°F)
- Battery voltage is above 8.5 volts during engine cranking

When these conditions are present, the PCM will activate the A/C control relay prior to cranking of the engine. The A/C control relay engages the A/C compressor for approximately 4-15 A/C compressor revolutions or a maximum of 2 seconds (depending upon vehicle application), allowing the liquid refrigerant to be pushed from the A/C compressor. CASS is initiated by the PCM regardless of the HVAC system settings.

The Refrigerant Cycle

During stabilized conditions (A/C system shutdown), the refrigerant pressures are equal throughout the system. When the A/C compressor is in operation, it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the A/C condenser core.

The A/C condenser, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser and enters the inlet side of the A/C receiver/drier. The receiver/drier is designed to remove moisture from the refrigerant.

The outlet of the receiver/drier is connected to the Thermostatic Expansion Valve (TXV). The TXV provides the orifice which is the restriction in the refrigerant system and separates the high- and low-pressure sides of the A/C system. As the liquid refrigerant passes across this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator, it absorbs heat from the airflow passing over the plate/fin sections of the A/C evaporator. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.

A thermistor which monitors the temperature of the air that has passed through the evaporator core controls A/C clutch cycling. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the vehicle PCM.

The high-side line pressure is also monitored so that A/C compressor operation will be interrupted if the system pressure becomes too high or is determined to be too low (low charge condition).

The A/C compressor thermal protection switch will interrupt compressor operation if the compressor housing exceeds temperature limits.

The A/C compressor relief valve will open and vent refrigerant to relieve unusually high system pressure.

Courtesy of FORD MOTOR CO.

Item	Description
1	A/C evaporator core

2	A/C evaporator core outlet temperature thermistor
3	Thermostatic Expansion Valve (TXV)
4	Manifold and tube assembly - TXV
5	A/C charge valve port (low side)
6	Manifold and tube assembly - A/C compressor
7	A/C compressor
8	A/C pressure relief valve
9	A/C pressure transducer
10	Low-pressure vapor
11	High-pressure vapor
12	Low-pressure liquid
13	High-pressure liquid
14	A/C desiccant cartridge
15	A/C condenser core with A/C receiver/drier
16	Evaporator-to-condenser line
17	A/C charge valve port (high side)

Inspection and Verification

1. Verify the customer's concern by operating the climate control system to duplicate the condition.
2. Inspect to determine if one of the following mechanical or electrical concerns apply:

VISUAL INSPECTION CHART

Mechanical	Electrical

• Loose, missing or damaged A/C compressor drive belt
• Loose or disconnected A/C clutch
• Broken or binding door/actuator
• Broken or leaking refrigerant lines
• Obstructed in-vehicle temperature sensor
• Disconnected in-vehicle temperature aspirator hose
	• Smart Junction Box (SJB) fuse(s):
	  ○ 13 (7.5A)
	  ○ 23 (7.5A)
	  ○ 27 (7.5A)
	• Battery Junction Box (BJB) fuse(s):
	  ○ 4 (40A)
	  ○ 25 (10A)
	• Blower motor inoperative
	• A/C compressor inoperative
	• Circuitry open/shorted
	• Disconnected electrical connectors
	• Cooling fan inoperative

3. As pinpoint tests and measurements are being carried out, be sure to inspect for any disconnected, loose-fitting or incorrectly installed component, module and inline electrical connectors and pins.
4. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

NOTE: Make sure to use the latest scan tool software release.

5. If the cause is not visually evident, connect the scan tool to the Data Link Connector (DLC).

NOTE: The Vehicle Communication Module (VCM) LED prove out confirms power and ground from the DLC are provided to the VCM.

6. If the scan tool does not communicate with the VCM:
   - check the VCM connection to the vehicle.
   - check the scan tool connection to the VCM.
   - refer to **MODULE COMMUNICATIONS NETWORK** article, No Power To The Scan Tool, to diagnose no communication with the scan tool.
7. If the scan tool does not communicate with the vehicle:
   - verify the ignition key is in the ON position.
   - verify the scan tool operation with a known good vehicle.
   - refer to **MODULE COMMUNICATIONS NETWORK** article to diagnose no response from the PCM, HVAC module - Electronic Automatic Temperature Control (EATC) or HVAC module - Dual Automatic Temperature Control (DATC).
8. Carry out the network test.
   - If the scan tool responds with no communication from one or more modules, refer to **MODULE COMMUNICATIONS NETWORK** article.
   - If the network test passes, retrieve and record continuous memory DTCs.
9. Carry out the self-test diagnostics for the PCM, HVAC module - EATC or HVAC module - DATC.

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.

10. If any of the HVAC module - EATC or HVAC module - DATC DTCs retrieved are related to the concern, refer to the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) DTC Chart. If the PCM DTCs retrieved are related to the concern, refer to the PCM DTC Chart. For all other DTCs, refer to **MULTIFUNCTION ELECTRONIC MODULES** article.
11. If no DTCs related to the concern are retrieved, go to **Symptom Chart - Climate Control Systems** or Go to **Symptom Chart - NVH**

Alternate Diagnostic Methods - HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC)

The EATC and DATC system must be diagnosed by first retrieving any DTCs, if present.

- An on-demand (hard fault) DTC indicates that the fault is currently present. An on-demand DTC suggests a wiring fault, disconnected connector or component failure.
- A continuous (intermittent) DTC alone (corresponding on-demand DTC is not present) indicates that the fault is an intermittent condition and may not be currently present. A continuous only DTC suggests a poor wiring connection, loose pin or terminal or intermittent component failure.

On-demand (hard fault) or continuous (intermittent fault) DTCs can be retrieved using a scan tool. If using a scan tool, refer to the scan tool operating manual.

On-demand DTCs can also be retrieved by carrying out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test. To retrieve and/or clear continuous DTCs, carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) - Retrieve Continuous DTCs procedure. Always retrieve both on-demand and continuous DTCs before proceeding with diagnosis and/or repair.

If no on-demand or continuous DTCs are present, go to **Symptom Chart - Climate Control Systems** for the appropriate diagnostic action.

HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test

The HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test will retrieve on-demand (hard fault) DTCs only, it will not retrieve continuous DTCs. Continuous DTCs can be cleared when exiting the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test. Make sure to retrieve continuous DTCs by carrying out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) - Retrieve Continuous DTCs procedure before clearing any continuous DTCs.

- The HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test will not detect concerns associated with data link messages like engine coolant temperature or vehicle speed signals. A scan tool must be used to retrieve these concerns.
- The HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test will detect concerns in the system control functions and will display on-demand (hard fault) DTCs for concerns that are present during the self-test. The vehicle interior temperature should be between 4°C-38°C (40°F-100°F) when carrying out the self-test. If the temperatures are not within the specified ranges, false DTCs may be displayed.
- The self-test can be initiated after cycling the ignition switch from OFF to ON. Normal operation of the climate control system stops when the self-test is activated.
- To enter the self-test, press the OFF and DEFROST buttons simultaneously and release, then press the AUTO button within 2 seconds. The display will show a flashing blower icon for 20 seconds, after which all vacuum fluorescent segments will be displayed if there are no on-demand DTCs present. If DTCs are present, the HVAC module -EATC or HVAC module -DATC will display "00 00" and then on-demand DTCs. Record all DTCs displayed.
- If any DTCs appear during the self-test, carry out the diagnostic procedure. Refer to the HVAC Module -

Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) DTC Chart and follow the ACTION for each DTC given.

- To exit the self-test and **retain** all DTCs, press any button **except** DEFROST. The HVAC module - EATC or HVAC module - DATC will exit the self-test and retain all DTCs.
- Always exit the self-test before powering the system down (system turned OFF). Once the self-test is exited, the ignition switch must remain ON for at least 30 seconds to allow the door actuators to automatically recalibrate.
- If a condition exists, but no on-demand DTCs appear during the self-test, carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) - Retrieve Continuous DTCs procedure.

HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) - Retrieve Continuous DTCs

The HVAC module -EATC or HVAC module - DATC will retrieve only continuous (intermittent) DTCs when carrying out this procedure.

- Retrieval of continuous DTCs can be initiated after cycling the ignition switch from OFF to ON. Normal operation of the climate control system stops when retrieving continuous DTCs.
- To retrieve continuous DTCs, press the OFF and DEFROST buttons simultaneously and release, then press the RECIRC button within 2 seconds. All vacuum fluorescent segments will be displayed if there are no continuous DTCs present. Continuous DTCs are indicated by the presence of the Celsius symbol (° C) on the HVAC module - EATC or HVAC module - DATC display. Record all DTCs displayed.
- If any DTCs appear, carry out the diagnostic procedure. Refer to the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) DTC Chart and follow the ACTION for each DTC given.
- If a condition exists but no DTCs appear, go to **Symptom Chart - Climate Control Systems** condition: The DATC/EATC System is Inoperative, Intermittent or Incorrect Operation.
- To exit and **retain** all continuous DTCs, press any button **except** DEFROST. The HVAC module - EATC or HVAC module -DATC will exit the retrieved continuous DTCs mode and retain all continuous DTCs.
- To exit and **clear** all continuous DTCs, press the DEFROST button. The HVAC module -EATC or HVAC module - DATC will exit the retrieve continuous DTCs mode and all continuous DTCs will be cleared.
- Always exit the procedure before powering the system down (system turned OFF). Once the procedure is exited, the ignition switch must remain ON for at least 30 seconds to allow the door actuators to automatically recalibrate.
- Continuous DTCs will be deleted after 80 ignition switch ON cycles after the intermittent fault occurs.

HVAC Module Cold Boot Process

The purpose of the cold boot process is to allow the HVAC module to reinitializes and calibrate the actuators. To carry out the cold boot process, follow the steps below.

1. Turn the ignition switch to the OFF position.
2. Disconnect the HVAC module electrical connectors.

3. Wait one minute.
4. Connect the HVAC module electrical connectors.
5. Turn the ignition switch to the ON position.
6. Select any position except OFF on the HVAC module.

   The HVAC will now initialize and calibrate the actuators. Calibration of the actuators will take approximately 30 seconds.

PCM DTC Chart

PCM DTC CHART

DTC	Description	Action to Take
P0532	A/C Refrigerant Pressure Sensor A Circuit Low	Go to **Pinpoint Test A**.
P0533	A/C Refrigerant Pressure Sensor A Circuit High	Go to **Pinpoint Test A**.
P0537	A/C Evaporator Temperature Sensor Low	Go to **Pinpoint Test B**.
P0538	A/C Evaporator Temperature Sensor High	Go to **Pinpoint Test B**.
P0645	Air Conditioning Clutch Relay (A/CCR) Control Circuit	Go to **Pinpoint Test C**.
P1464	A/C Demand Out Of Self Test Range	If the HVAC selector was not in the OFF position, PLACE it in the OFF position, CLEAR the DTCs and REPEAT the self-test. If the DTC does not return, IGNORE the DTC and continue diagnostics. If the DTC returns, go to **Pinpoint Test O**. [a]
All Other DTCs	-	REFER to the **Introduction - Gasoline Engines** article.

[a] PCM DTC P1464 will set if the function selector is in PANEL with A/C button pressed, DEFROST or MAX A/C mode when the on-demand self-test is being run.

HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) DTC Chart

NOTE: **Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to the PCM DTC Chart.**

HVAC MODULE - ELECTRONIC AUTOMATIC TEMPERATURE CONTROL (EATC) AND HVAC MODULE - DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) DTC CHART

DTC	Description	Action to Take
B1003	Mode Door Circuit Failure	Go to **Pinpoint Test F**.

B1200	Stuck Button	Button held too long may set DTC. ATTEMPT to clean buttons. If code returns, INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article.
B1251	Air Temperature Internal Sensor Circuit Open	Go to **Pinpoint Test D**.
B1253	Air Temperature Internal Sensor Circuit Short To Ground	Go to **Pinpoint Test D**.
B1255	Air Temperature External Sensor Circuit Open	Go to **Pinpoint Test E**.
B1257	Air Temperature External Sensor Circuit Short To Ground	Go to **Pinpoint Test E**.
B1342	Module Faulted	INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article.
B1676	Battery Voltage Out of Range	Go to **Pinpoint Test J**.
B2266	Left Side Blend Door Circuit Failure	Go to **Pinpoint Test Q**.
B2267	Right Side Blend Door Circuit Failure	Go to **Pinpoint Test Q**.
B2426	Passenger Solar Radiation Sensor Circuit Open	Go to **Pinpoint Test F**.
B2427	Passenger Solar Radiation Sensor Circuit Short to Ground	Go to **Pinpoint Test F**.
B2795	Driver Solar Radiation Sensor Circuit Short to Ground	Go to **Pinpoint Test F**.
B2796	Driver Solar Radiation Sensor Circuit Open	Go to **Pinpoint Test F**.
B2826	Front Evaporator Temp Sensor Circuit Failure	Go to **Pinpoint Test G**.
B2827	Front Evaporator Temp Sensor Short to Ground	Go to **Pinpoint Test G**.

Symptom Chart - Climate Control System

Symptom Chart - Climate Control System

Condition	Possible Sources	Action
• No communication with the HVAC module - Dual Automatic Temperature Control (DATC) or HVAC module - Electronic Automatic Temperature Control (EATC)	• Fuse(s) • Circuitry open • HVAC module - DATC communication network • HVAC module - EATC communication network	• REFER to **MODULE COMMUNICATIONS NETWORK** article.
• HVAC functions verification	• HVAC system and/or related components	• Go to **Pinpoint Test K**.
• Air inlet door is inoperative	• Circuitry open/shorted • HVAC module - EATC • HVAC module - DATC • HVAC module - Electronic Manual	• Go to **Pinpoint Test H**.

	Temperature Control (EMTC) • Air inlet door actuator/linkage	
• Incorrect/erratic direction of airflow from outlets	• Circuitry short/open • Door actuator • Mode door binding or stuck • HVAC module - EATC • HVAC module - DATC • HVAC module - EMTC • Door actuator arm not connected to the door crank	• Go to **Pinpoint Test I**.
• Reduced outlet airflow	• Circuitry short • A/C compressor clutch air gap • A/C cycling switch • A/C clutch relay • Blower motor • Blower motor control • Blower motor resistor • Blower motor switch • PCM	• If the A/C compressor does not cycle, go to **Pinpoint Test N**. • EMTC systems, if the A/C compressor cycles normally, go to **Pinpoint Test S**. • EATC/DATC systems, if the A/C compressor cycles normally, Go to **Pinpoint Test U**.
• Insufficient, erratic or no heat	• Low engine coolant level • Engine overheating • Plugged or partially plugged heater core • Temperature blend door is binding or stuck • Temperature blend door actuator • Heater hose is kinked or binding	• Go to **Pinpoint Test L**.
	• Open fuse • Circuitry short/open • A/C system discharged/low charge • PCM	

• The air conditioning (A/C) is inoperative	• HVAC module - EATC • HVAC module - DATC • HVAC module - EMTC • A/C compressor clutch air gap • A/C clutch relay	• Go to **Pinpoint Test M**.
• The air conditioning (A/C) is always on - A/C compressor does not cycle	• Circuitry short/open • PCM • A/C compressor clutch air gap • A/C clutch relay	• Go to **Pinpoint Test N**.
• The air conditioning (A/C) is always on - A/C mode always commanded ON	• Circuitry short/open • HVAC module - EATC • HVAC module - DATC • HVAC module - EMTC • PCM	• Go to **Pinpoint Test O**.
• Temperature control is inoperative/does not operate correctly - EMTC	• Circuitry open/shorted • HVAC module - EMTC • Temperature blend door • Temperature blend door actuator • Door actuator arm not connected to the door crank	• Go to **Pinpoint Test P**.
• Temperature control is inoperative/does not operate correctly - EATC/DATC	• Circuitry open/shorted • HVAC module - EATC • HVAC module - DATC • Temperature blend door • Temperature blend door actuator • Door actuator arm not connected to the door crank	• Go to **Pinpoint Test Q**.
• The blower motor is inoperative - EMTC	• Fuse(s) • Circuitry open/shorted • A/C blower motor switch • Blower motor relay • A/C blower motor	• Go to **Pinpoint Test R**.

	• HVAC module - EMTC	
• The blower motor does not operate correctly - EMTC	• Circuitry shorted • A/C blower motor resistor • A/C blower motor switch	• Go to **Pinpoint Test S**.
• The blower motor is inoperative - DATC/EATC	• Fuse(s) • Circuitry short/open • Blower motor relay • A/C blower motor • HVAC module - EATC • HVAC module - DATC • A/C blower motor speed control	• Go to **Pinpoint Test T**.
• The blower motor does not operate correctly - DATC/EATC	• Circuitry short • A/C blower motor speed control • HVAC module - EATC • HVAC module - DATC • A/C blower motor speed control	• Go to **Pinpoint Test U**.
• The dual temperature control is inoperative/does not operate correctly	• Temperature blend door/actuator broken/binding • HVAC module - DATC • Low A/C refrigerant charge	• CHECK that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), REFER to **Fluorescent Dye Leak Detection**. CHECK the temperature blend doors/actuators for a binding or broken condition. If no condition is found, INSTALL a new DATC module.
• The temperature set point does not repeat after turning the ignition switch OFF	• Open fuse • Circuitry short/open • HVAC module - EATC • HVAC module - DATC	• CHECK circuit SBP07 (WH/RD) for a short or open and repair as necessary. If OK, INSTALL a new HVAC module.
• The temperature display will not switch between Celsius and Fahrenheit	• HVAC module - EATC • HVAC module - DATC • Instrument Cluster (IC) module	• If the IC does not switch between English and Metric, REFER to **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article. • If only the HVAC module does not switch between English and Metric,

		INSTALL a new HVAC module.
• Inaccurate external temperature display	• HVAC module - EATC • HVAC module - DATC	• REFER to Description and Operation of the External Temperature Display. If the external temperature display is not operating as described and no DTC is present, CARRY OUT the **Ambient Temperature Sensor**. If the sensor tests OK, CARRY OUT the HVAC Module Cold Boot Process. If the condition returns, INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.
• A/C pressure relief valve discharging	• High system pressure • A/C pressure relief valve	• CHECK the high-side system pressure. If the pressure is below the A/C pressure relief valve open pressure, REPLACE the A/C pressure relief valve. If the system pressure is above the A/C pressure relief valve open pressure, REPAIR the system for a restriction.

Symptom Chart - NVH

NOTE: **NVH symptoms will be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.**

Symptom Chart - NVH

Condition	Possible Sources	Action
• Noisy A/C compressor clutch	• A/C compressor clutch air gap out of specification	• CHECK and ADJUST the A/C compressor clutch gap if necessary. REFER to **Air Conditioning (A/C) Clutch Air Gap Adjustment**. TEST the system for normal operation. • If the A/C compressor clutch gap is OK, INSTALL an A/C

		compressor clutch. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

Pinpoint Tests

Pinpoint Test A: DTC P0532 or P0533

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Electronic Engine Controls - 2.3L for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Electronic Engine Controls - 3.0L for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Electronic Engine Controls - 3.5L for schematic and connector information.

Normal Operation

Under normal operation, the A/C pressure transducer receives a ground from the PCM through circuit RE407 (YE/VT). A 5-volt reference voltage is supplied to the A/C pressure transducer from the PCM through circuit LE424 (YE/GN). The A/C pressure transducer sends a voltage to the PCM through circuit VH433 (VT/OG) to indicate the A/C pressure.

- DTC P0532 A/C Pressure Refrigerant Sensor A Circuit Low - The A/C pressure transducer inputs a voltage to the PCM. If the voltage is below the calibrated level, this DTC sets.
- DTC P0533 A/C Pressure Refrigerant Sensor A Circuit High - The A/C pressure transducer inputs a voltage to the PCM. If the voltage is above the calibrated level, this DTC sets.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- A/C pressure transducer
- PCM

PINPOINT TEST A: DTC P0532 OR DTC P0533

NOTE: **When disconnecting and reconnecting the pressure transducer electrical connector, make sure that the connector-locking device is in place and that the locking device and connector are correctly and fully seated.**

A1 CHECK THE PCM OUTPUT VOLTAGE

- Key in OFF position.
- Disconnect: A/C Pressure Transducer C1260
- Key in ON position.

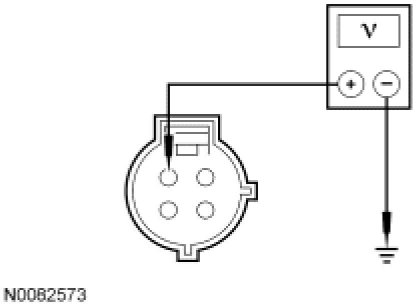

Fig. 2: Checking PCM Output Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and A/C pressure transducer C2160-2, circuit LE424 (YE/GN), harness side.
- **Is the voltage between 4.7 and 5.1 volts?**

  YES : Go to A2.

  NO : REPAIR circuit LE424 (YE/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A2 CHECK THE PCM SENSOR GROUND

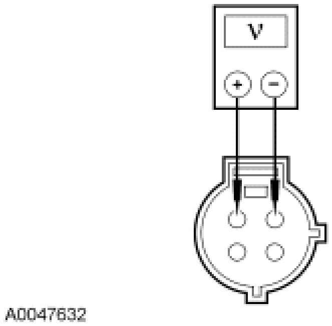

Fig. 3: Checking PCM Sensor Ground
Courtesy of FORD MOTOR CO.

- Measure the voltage between A/C pressure transducer C2160-1, circuit RE407 (YE/VT), harness side and A/C pressure transducer C2160-2, circuit LE424 (YE/GN), harness side.
- **Is the voltage between 4.7 and 5.1 volts?**

  YES : If diagnosing DTC P0532, go to A3. If diagnosing DTC P0533, go to A5.

  NO : REPAIR circuit RE407 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A3 CHECK THE A/C PRESSURE TRANSDUCER HIGH

- Enter the following diagnostic mode on the diagnostic tool: A/C Pressure (ACP_PRESS) PCM PID

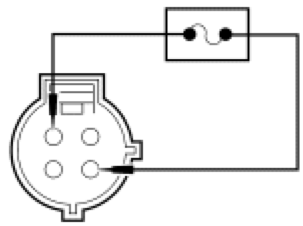

Fig. 4: Checking A/C Pressure Transducer High
Courtesy of FORD MOTOR CO.

- While observing the ACP_PRESS PCM PID, connect a fused jumper between A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C2160-2, circuit LE424 (YE/GN), harness side.
- **Does the ACP_PRESS PCM PID voltage read greater than 4 volts?**

  YES : INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to A4.

A4 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: PCM C175b

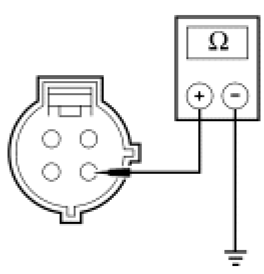

Fig. 5: Checking Circuit VH433 (VT/OG) For A Short To Ground
Courtesy of FORD MOTOR CO.

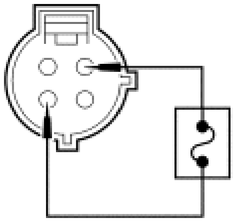
- Measure the resistance between ground and A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to A7.

  NO : REPAIR circuit VH433 (VT/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A5 CHECK THE A/C PRESSURE TRANSDUCER HIGH

- Enter the following diagnostic mode on the diagnostic tool: A/C Pressure (ACP_PRESS) PCM PID



A0008126

Fig. 6: Connecting A Fused Jumper Between A/C Cycling Switch C130-4 And C130-1
Courtesy of FORD MOTOR CO.

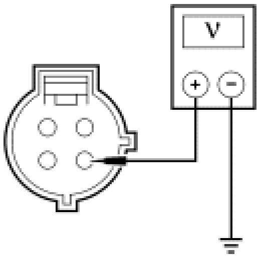
- While observing the ACP_PRESS PCM PID, connect a fused jumper between A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C2160-1, circuit RE407 (YE/VT), harness side.
- **Does the ACP_PRESS PCM PID voltage read less than 4.9 volts?**

  YES : INSTALL a new A/C pressure transducer. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to A6.

A6 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Key in ON position.



A0047689

Fig. 7: Checking Circuit VH433 (VT/OG) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side.
- **Is any voltage present?**

  YES : REPAIR circuit VH433 (VT/OG) for a short to voltage. CLEAR the DTCs. REPEAT the

self-test. TEST the system for normal operation.

NO : Go to A7.

A7 CHECK CIRCUIT VH433 (VT/OG) FOR A SHORT TO CIRCUIT LE424 (YE/GN) OR RE407 (YE/VT)

- Key in OFF position.

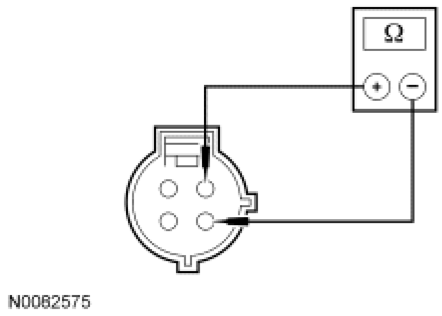


Fig. 8: Checking Circuit VH433 (VT/OG) For A Short To Circuit LE424 (YE/GN) Or RE407 (YE/VT)
Courtesy of FORD MOTOR CO.

NOTE: **For DTC P0532 only.**

- Measure the resistance between A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C2160-1, circuit RE407 (YE/VT), harness side.

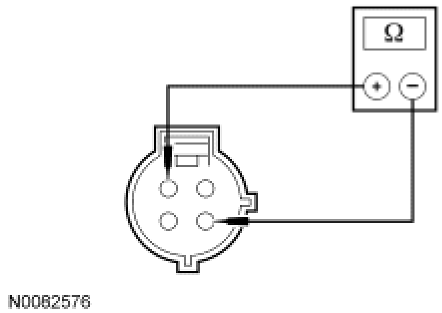

Fig. 9: Measuring Resistance Between A/C Pressure Transducer C2160-3 & C2160-1, Circuit VH433 (VT/OG) & RE407 (YE/VT)
Courtesy of FORD MOTOR CO.

NOTE: **For DTC P0533 only.**

- Measure the resistance between A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side and A/C pressure transducer C2160-2, circuit LE424 (YE/GN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to A8.

NO : REPAIR circuit VH433 (VT/OG) for a short to circuit LE424 (YE/GN) or RE407 (YE/VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A8 CHECK CIRCUIT VH433 (VT/OG) FOR AN OPEN

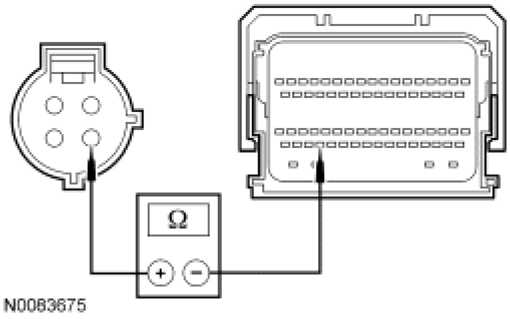

Fig. 10: Checking Circuit VH433 (VT/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between A/C pressure transducer C2160-3, circuit VH433 (VT/OG), harness side and PCM C175b-63, circuit VH433 (VT/OG), harness side
- **Is the resistance less than 5 ohms?**

  YES : Go to A9.

  NO : REPAIR circuit VH433 (VT/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

A9 CHECK THE PCM CONNECTION

- Clear the DTCs.
- Disconnect all the PCM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - incorrectly seated connector.
- Connect and correctly seat all the PCM connectors.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new PCM. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test B: DTC P0537 or P0538

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Electronic Engine Controls - 2.3L for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the evaporator discharge air temperature sensor receives a ground from the PCM through circuit RE407 (YE/VT). A 5-volt reference voltage is supplied to the evaporator discharge air temperature sensor from the PCM through circuit VH406 (VT/BN).

- DTC P0537 A/C Evaporator Temperature Sensor Low - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
- DTC P0538 A/C Evaporator Temperature Sensor High - The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Evaporator discharge air temperature sensor
- PCM

PINPOINT TEST B: DTC P0537 OR DTC P0538

B1 CHECK THE SENSOR RESISTANCE

- Key in OFF position.
- Disconnect: Evaporator Discharge Temperature Sensor C2295
- Carry out the **Temperature Sensor - Evaporator Discharge**.
- **Is the resistance within the specified values for the temperatures?**

  YES : Go to B2.

  NO : INSTALL a new in-vehicle temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B2 CHECK THE HVAC MODULE OUTPUT VOLTAGE

- Key in ON position.
- Press the AUTO button.

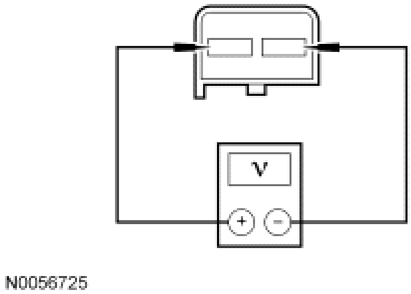

Fig. 11: Checking EATC Sensor Output Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between evaporator discharge temperature sensor C2295-2, circuit VH406 (VT/BN), harness side and C2295-1, circuit RE407 (YE/VT), harness side.
- **Is the voltage between 4.7 and 5.1 volts?**

  YES : INSTALL a new evaporator discharge sensor. If code returns, go to B7.

  NO : If diagnosing DTC P0538, go to B3.

  If diagnosing DTC P0537, go to B5.

B3 CHECK CIRCUIT VH406 (VT/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: PCM C175b

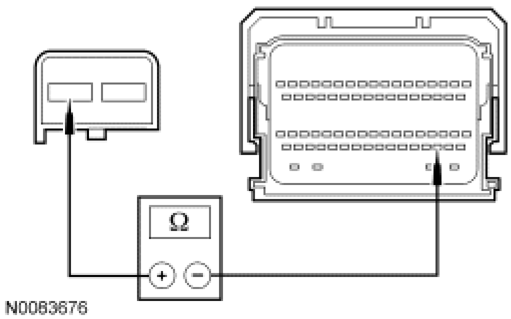

Fig. 12: Checking Circuit VH406 (VT/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM C175b-53, circuit VH406 (VT/BN), harness side and evaporator discharge temperature sensor C2295-2, circuit VH406 (VT/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B4.

  NO : REPAIR circuit VH406 (VT/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B4 CHECK CIRCUIT RE407 (YE/VT) FOR AN OPEN

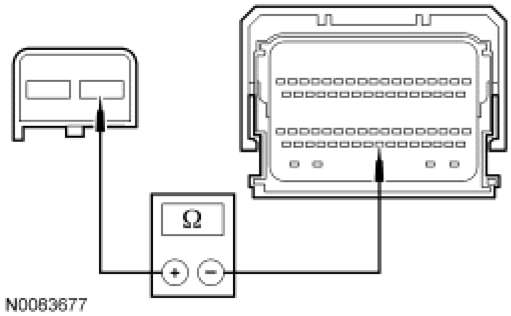

Fig. 13: Checking Circuit RE407 (YE/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM C175b-58, circuit RE407 (YE/VT), harness side and evaporator discharge temperature sensor C2295-1, circuit RE407 (YE/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to B7.

  NO : REPAIR circuit RE407 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B5 CHECK CIRCUITS VH406 (VT/BN) AND RE407 (YE/VT) FOR A SHORT TOGETHER

- Key in OFF position.
- Disconnect: PCM C175b

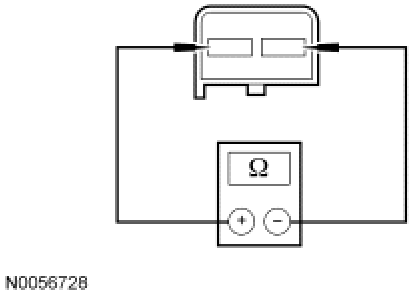

Fig. 14: Checking Circuit VH406 (VT/BN) For A Short To Circuit RH104 (BU/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between evaporator discharge temperature sensor C2295-2, circuit VH406 (VT/BN), harness side and C2295-1, circuit RE407 (YE/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B6.

  NO : REPAIR circuits VH406 (VT/BN) and RE407 (YE/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B6 CHECK CIRCUIT VH406 (VT/BN) FOR A SHORT TO GROUND

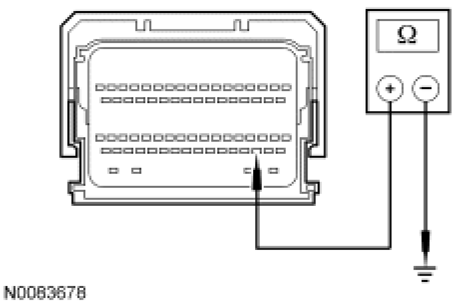

Fig. 15: Checking Circuit VH406 (VT/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between PCM C175b-53, circuit VH406 (VT/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to B7.

  NO : REPAIR circuit VH406 (VT/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

B7 CHECK THE PCM CONNECTION

- Clear the DTCs.
- Disconnect all the PCM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - incorrectly seated connector.
- Connect and correctly seat all the PCM connectors.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new PCM. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test C: DTC P0645

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, voltage is provided to the A/C clutch relay coil through circuit CBP47 (GN/BU). When A/C is requested, and A/C line pressures allow, a ground is provided to the A/C clutch relay coil from the PCM through circuit CH302 (WH/BN), energizing the A/C clutch relay.

- DTC P0645 - A/C Clutch Relay Control Circuit - The DTC sets when the PCM grounds the relay circuit, excessive current draw is detected on the relay circuit or, with the relay circuit not grounded by the PCM, voltage is not detected on the relay circuit the PCM expects to detect voltage coming through the relay coil to the relay circuit.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- A/C clutch relay
- PCM

PINPOINT TEST C: DTC P0645

C1 CHECK THE VOLTAGE TO THE A/C CLUTCH RELAY

- Key in OFF position.
- Disconnect: A/C Clutch Relay
- Key in ON position.

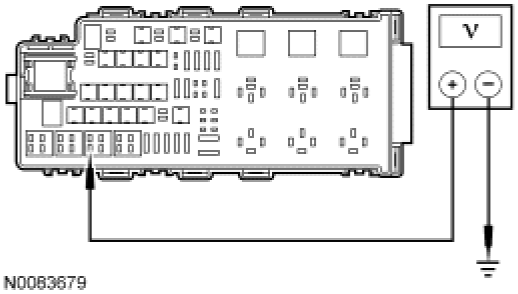

Fig. 16: Checking Voltage To A/C Clutch Relay
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and the A/C clutch relay socket, circuit CBP47 (GN/BU).
- **Is the voltage greater than 10 volts?**

  YES : CARRY OUT the A/C clutch relay component test. Refer to COMPONENT TESTING. If the relay tests OK, go to C2.

  NO : REPAIR circuit CBP47 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C2 CHECK CIRCUIT CH302 (WH/BN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: PCM C175b
- Key in ON position.

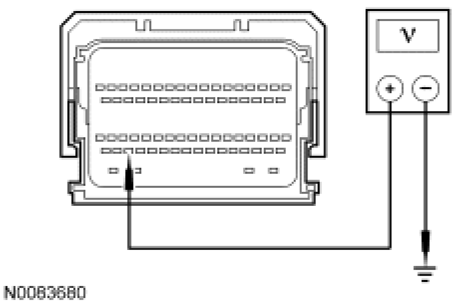

Fig. 17: Checking Circuit CH302 (WH/BN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and PCM C175b-64, circuit CH302 (WH/BN), harness side.
- **Is any voltage present?**

  YES : REPAIR circuit CH302 (WH/BN) for a short to voltage. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to C3.

C3 CHECK CIRCUIT CH302 (WH/BN) FOR A SHORT TO GROUND

- Key in OFF position.

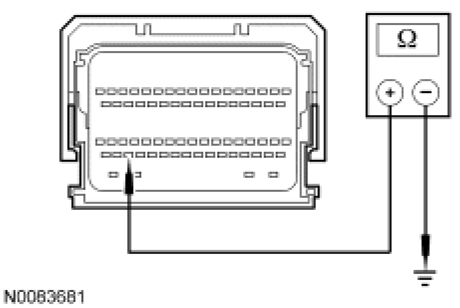

Fig. 18: Checking Circuit CH302 (WH/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and PCM C175b-64, circuit CH302 (WH/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to C4.

  NO : REPAIR circuit CH302 (WH/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C4 CHECK CIRCUIT CH302 (WH/BN) FOR AN OPEN

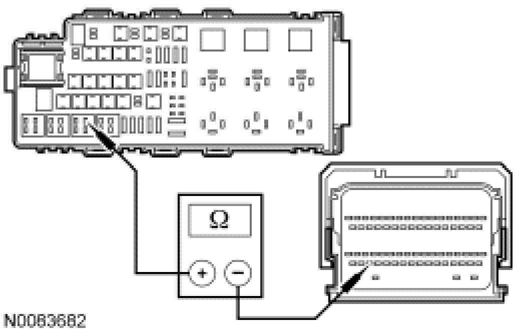

Fig. 19: Checking Circuit CH302 (WH/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between A/C clutch relay socket, circuit CH302 (WH/BN) and PCM C175b-64, circuit CH302 (WH/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to C5.

  NO : REPAIR circuit 321 (GY/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

C5 CHECK THE PCM CONNECTION

- Clear the DTCs.
- Disconnect all the PCM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - incorrectly seated connector.
- Connect and correctly seat all the PCM connectors.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new PCM. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test D: DTC B1251 or B1253

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the in-vehicle air temperature sensor receives a ground from the HVAC module - Electronic Automatic Temperature Control (EATC) or HVAC module - Dual Automatic Temperature Control (DATC) through circuit RH104 (BU/BN). A 5-volt reference voltage is supplied to the in-vehicle air

temperature sensor from the HVAC module - DATC or HVAC module - EATC through circuit VH414 (GN/BU).

- DTC B1251 Air Temperature Internal Sensor Circuit Open - The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
- DTC B1253 Air Temperature Internal Sensor Circuit Short to Ground - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- In-vehicle air temperature sensor
- HVAC module - EATC
- HVAC module - DATC

PINPOINT TEST D: DTC B1251 OR DTC B1253

D1 CHECK THE SENSOR RESISTANCE

- Key in OFF position.
- Disconnect: In-Vehicle Temperature Sensor C233
- Carry out the **In-Vehicle Temperature Sensor**.
- **Does the in-vehicle temperature sensor test OK?**

  YES : Go to D2.

  NO : INSTALL a new in-car temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D2 CHECK THE HVAC MODULE OUTPUT VOLTAGE

- Key in ON position.
- Press the AUTO button.

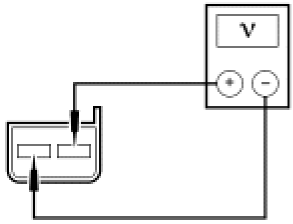

Fig. 20: Checking EATC Sensor Output Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between in-vehicle temperature sensor C233-2, circuit VH414 (GN/BU), harness side and C233-1, circuit RH104 (BU/BN), harness side.

- **Is the voltage between 4.7 and 5.1 volts?**

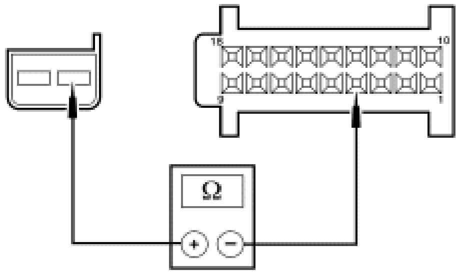
  YES : INSTALL a new in-vehicle sensor. CLEAR the DTCs. REPEAT the self-test. If code returns, go to D7.

  NO : If diagnosing **DTC B1251** , go to D3.

  If diagnosing **DTC B1253** , go to D5.

D3 CHECK CIRCUIT VH414 (GN/BU) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module - DATC C2356b or HVAC Module - EATC C228b

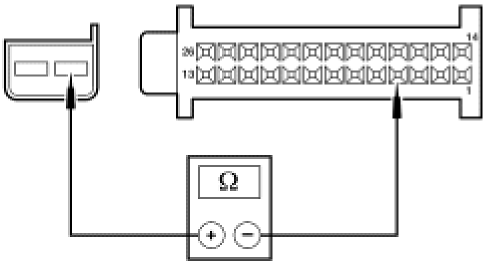


N0083683

Fig. 21: Checking Circuit VH414 (GN/BU) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228b-4, circuit VH414 (GN/BU), harness side and in-vehicle temperature sensor C233-2, circuit VH414 (GN/BU), harness side.



N0083684

Fig. 22: Checking Circuit VH414 (GN/BU) For An Open (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356b-4, circuit VH414 (GN/BU), harness side and in-vehicle temperature sensor C233-2, circuit VH414 (GN/BU), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to D4.

  NO : REPAIR circuit VH414 (GN/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D4 CHECK CIRCUIT RH104 (BU/BN) FOR AN OPEN

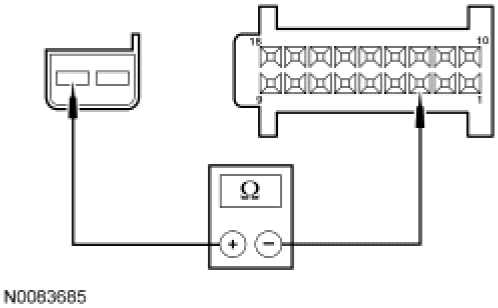


Fig. 23: Checking Circuit RH104 (BU/BN) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228b-3, circuit RH104 (BU/BN), harness side and in-vehicle temperature sensor C233-1, circuit RH104 (BU/BN), harness side.

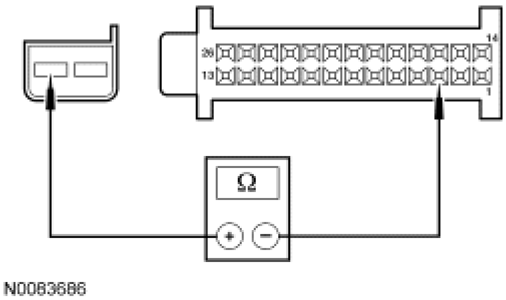

Fig. 24: Checking Circuit RH104 (BU/BN) For An Open (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

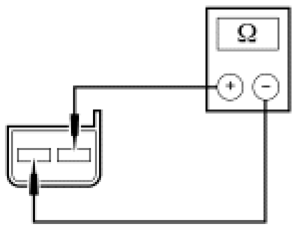
- Measure the resistance between HVAC module - DATC C2356b-3, circuit RH104 (BU/BN), harness side and in-vehicle temperature sensor C233-1, circuit RH104 (BU/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to D7.

  NO : REPAIR circuit RH104 (BU/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D5 CHECK CIRCUITS VH414 (GN/BU) AND RH104 (BU/BN) FOR A SHORT TOGETHER

- Key in OFF position.
- Disconnect: HVAC Module - DATC C2356b or HVAC Module - EATC C228b



N0041872

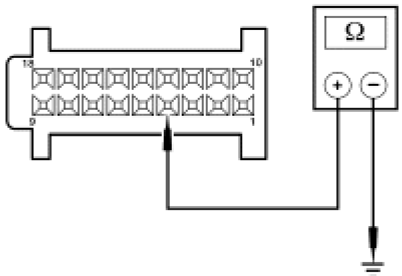
Fig. 25: Checking Circuit VH414 (GN/BU) For Short To Circuit RH104 (BU/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between in-vehicle temperature sensor C233-2, circuit VH414 (GN/BU), harness side and C233-1, circuit RH104 (BU/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D6.

  NO : REPAIR circuits VH414 (GN/BU) and RH104 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D6 CHECK CIRCUIT VH414 (GN/BU) FOR A SHORT TO GROUND



N0063667

Fig. 26: Checking Circuit VH414 (GN/BU) For A Short To Ground (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228b-4, circuit VH414 (GN/BU), harness side and ground.

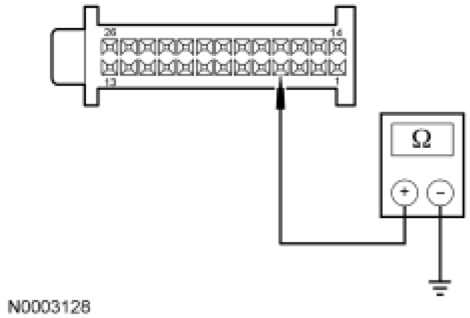


Fig. 27: Checking Circuit VH414 (GN/BU) For A Short To Ground (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356b-4, circuit VH414 (GN/BU), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to D7.

  NO : REPAIR circuit VH414 (GN/BU) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

D7 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test E: DTC B1255 or B1257

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the ambient air temperature sensor receives a ground from the HVAC module - Electronic Automatic Temperature Control (EATC) or HVAC module - Dual Automatic Temperature Control (DATC) through circuit RH104 (BU/BN). A 5-volt reference voltage is supplied to the ambient air temperature sensor from the DATC/EATC module through circuit VH407 (YE/GN).

- DTC B1255 Air Temperature External Sensor Circuit Open - The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
- DTC B1257 Air Temperature External Sensor Circuit Short To Ground - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Ambient air temperature sensor
- HVAC module - EATC
- HVAC module - DATC

PINPOINT TEST E: DTC B1255 OR DTC B1257

E1 CHECK THE SENSOR RESISTANCE

- Key in OFF position.
- Disconnect: Ambient Temperature Sensor C132
- Carry out the **Ambient Temperature Sensor**.
- **Does the ambient temperature sensor test OK?**

  YES : Go to E2.

  NO : INSTALL a new ambient temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E2 CHECK THE HVAC MODULE OUTPUT VOLTAGE

- Key in ON position.
- Press the AUTO button.

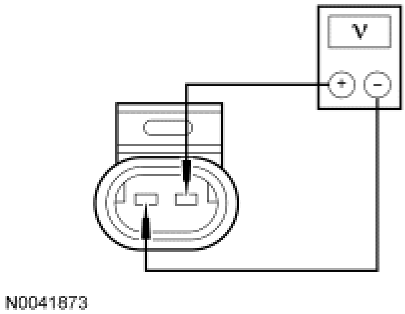

Fig. 28: Checking EATC Sensor Output Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ambient temperature sensor C132-A, circuit VH407 (YE/GN), harness side and C132-B, circuit RH104 (BU/BN), harness side.
- **Is the voltage between 4.7 and 5.1 volts?**

  YES : INSTALL a new ambient sensor. CLEAR the DTCs. REPEAT the self-test. If code returns, go to E7.

NO : If diagnosing **DTC B1255** , go to E3.

If diagnosing **DTC B1257** , go to E5.

E3 CHECK CIRCUIT VH407 (YE/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module - DATC C2356b or HVAC Module - EATC C228b

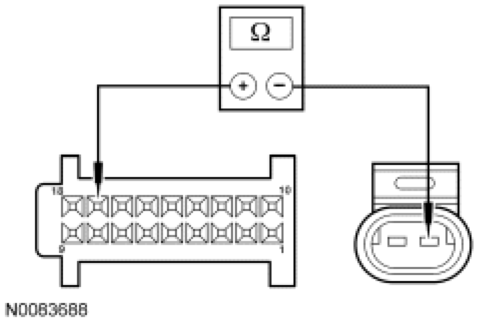

Fig. 29: Checking Circuit VH407 (YE/GN) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: **EATC systems only.**

- Measure the resistance between HVAC module - EATC C228b-17, circuit VH407 (YE/GN), harness side and ambient temperature sensor C132-A, circuit VH407 (YE/GN), harness side.

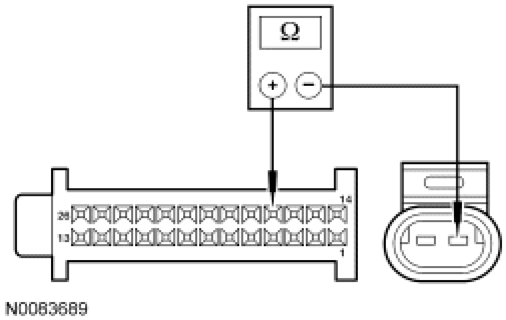

Fig. 30: Checking Circuit VH407 (YE/GN) For An Open (DATC)
Courtesy of FORD MOTOR CO.

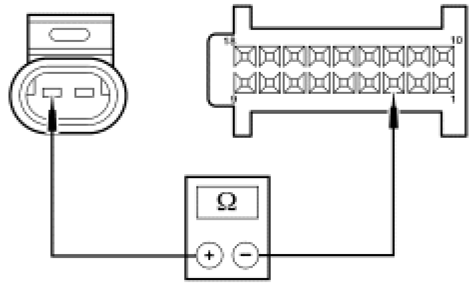
NOTE: **DATC systems only.**

- Measure the resistance between HVAC module - DATC C2356b-17, circuit VH407 (YE/GN), harness side and ambient temperature sensor C132-A, circuit VH407 (YE/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to E4.

NO : REPAIR circuit VH407 (YE/GN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E4 CHECK CIRCUIT RH104 (BU/BN) FOR AN OPEN

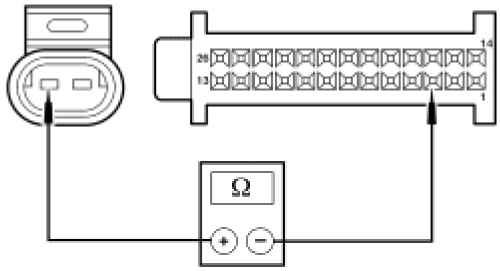


N0083690

Fig. 31: Checking Circuit RH104 (BU/BN) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: **EATC systems only.**

- Measure the resistance between HVAC module - EATC C228b-3, circuit RH104 (BU/BN), harness side and ambient temperature sensor C132-B, circuit RH104 (BU/BN), harness side.



N0083691

Fig. 32: Checking Circuit RH104 (BU/BN) For An Open (DATC)
Courtesy of FORD MOTOR CO.

NOTE: **DATC systems only.**

- Measure the resistance between HVAC module - DATC C2356b-3, circuit RH104 (BU/BN), harness side and ambient temperature sensor C132-B, circuit RH104 (BU/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to E7.

  NO : REPAIR circuit RH104 (BU/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E5 CHECK CIRCUITS VH407 (YE/GN) AND RH104 (BU/BN) FOR A SHORT TOGETHER

- Key in OFF position.

- Disconnect: HVAC Module - DATC C2356b or HVAC Module - EATC C228b

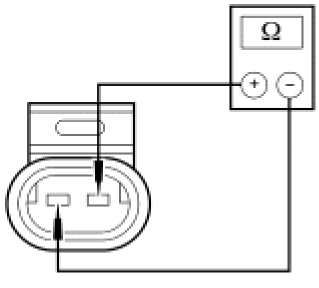


Fig. 33: Checking Circuit VH407 (YE/GN) For Short To Circuit RH104 (BU/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between ambient temperature sensor C132-A, circuit VH407 (YE/GN), harness side and C132-B, circuit RH104 (BU/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E6.

  NO : REPAIR circuits VH407 (YE/GN) and RH104 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E6 CHECK CIRCUIT VH407 (YE/GN) FOR A SHORT TO GROUND

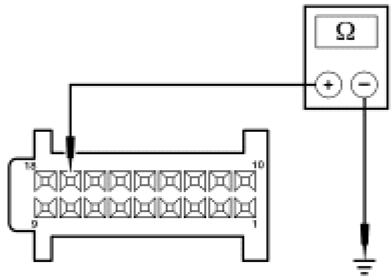

Fig. 34: Checking Circuit VH407 (YE/GN) For A Short To Ground (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228b-17, circuit VH407 (YE/GN), harness side and ground.

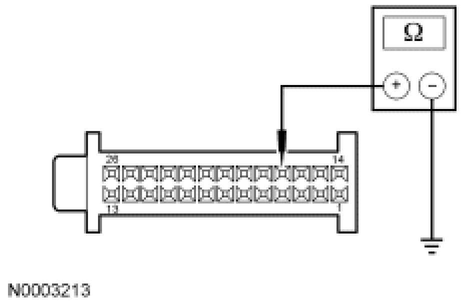

Fig. 35: Checking Circuit VH407 (YE/GN) For A Short To Ground (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356b-17, circuit VH407 (YE/GN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to E7.

  NO : REPAIR circuit VH407 (YE/GN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

E7 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: DTC B2426, B2427, B2795 or B2796

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the solar radiation sensor receives a ground through circuit GD116 (BK/VT). A 5-volt reference voltage is supplied to the solar radiation sensor from the HVAC module - Electronic Automatic Temperature Control (EATC) or HVAC module - Dual Automatic Temperature Control (DATC) through circuits (LH) VH416 (VT/GY) and (RH) VH417 (YE/OG).

DTC	Description	Fault Trigger Conditions
B2795	Driver Solar Radiation Sensor Circuit Short to Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.
B2796	Driver Solar Radiation Sensor Circuit Open	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
B2426	Passenger Solar Radiation Sensor Circuit Open	The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
B2427	Passenger Solar Radiation Sensor Circuit Short to Ground	The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Solar radiation sensor
- HVAC module - EATC
- HVAC module - DATC

PINPOINT TEST F: DTC B2426, B2427, B2795 or DTC B2796

F1 CHECK THE SOLAR RADIATION SENSOR REFERENCE VOLTAGE

- Key in OFF position.
- Disconnect: Solar Radiation Sensor C286
- Key in ON position.
- Press the AUTO button.

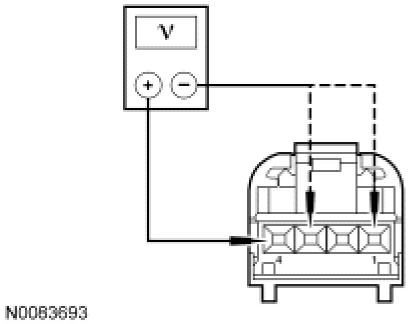

Fig. 36: Checking Solar Radiation Sensor Reference Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between solar radiation sensor C286-4, circuit GD116 (BK/VT), harness side

and:

- **For DTC B2426 or B2427** , C286-1, circuit VH417 (YE/OG), harness side.
- **For DTC B2795 or B2796** , C286-3, circuit VH416 (VT/GY), harness side.

- **Are the voltages between 4.7 and 5.1 volts?**

  YES : INSTALL a new solar radiation sensor. CLEAR the DTCs. REPEAT the self-test. If the DTC returns, go to F5.

  NO : If diagnosing DTC B2426 or B2796, go to F2.

  If diagnosing DTC B2427 or B2795, go to F4.

F2 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.

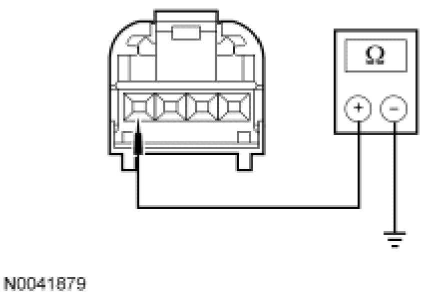

Fig. 37: Checking Circuit GD116 (BK/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between solar radiation sensor C286-4, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to F3.

  NO : REPAIR circuit GD116 (BK/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

F3 CHECK CIRCUIT VH416 (VT/GY) OR VH417 (YE/OG) FOR AN OPEN

- Disconnect: HVAC Module - DATC C2356b or HVAC Module - EATC C228b

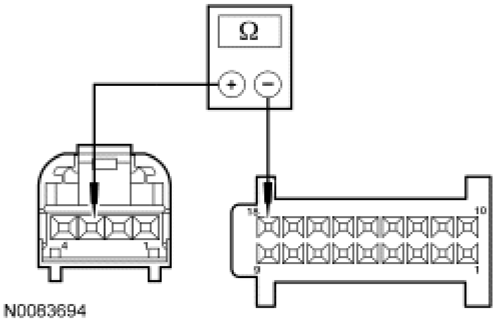

Fig. 38: Checking Circuit VH416 (VT/GY) OR VH417 (YE/OG) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228b-18, circuit VH416 (VT/GY), harness side and solar radiation sensor C286-3, circuit VH416 (VT/GY), harness side.

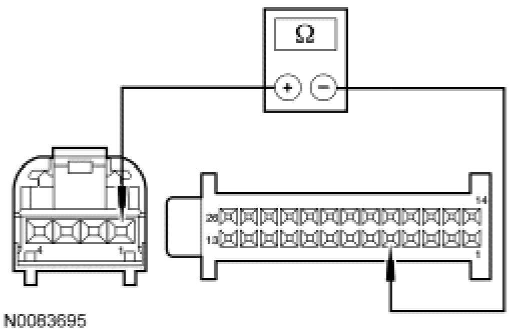

Fig. 39: Checking Circuit VH416 (VT/GY) OR VH417 (YE/OG) For An Open (DATC, DTC B2426)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356b-5, circuit VH417 (YE/OG), harness side and solar radiation sensor C286-1, circuit VH417 (YE/OG), harness side.

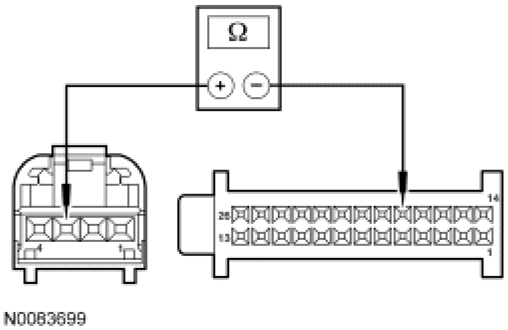

Fig. 40: Checking Circuit VH416 (VT/GY) OR VH417 (YE/OG) For An Open (DATC, DTC B2796)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356b-18, circuit VH416 (VT/GY), harness side and solar radiation sensor C286-3, circuit VH416 (VT/GY), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to F5.

NO : REPAIR circuit VH416 (VT/GY) or VH417 (YE/OG) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

F4 CHECK CIRCUIT VH416 (VT/GY) OR VH417 (YE/OG) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: HVAC Module - DATC C2356b or HVAC Module - EATC C228b

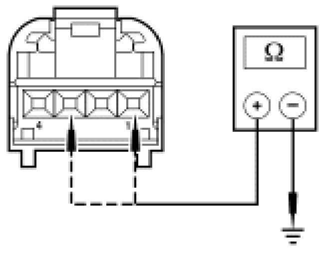

Fig. 41: Checking Circuit VH416 (VT/GY) OR VH417 (YE/OG) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and:
  - **For DTC B2427** , solar radiation sensor C286-1, circuit VH417 (YE/OG), harness side.
  - **For DTC B2795** , solar radiation sensor C286-3, circuit VH416 (VT/GY), harness side.
- **Are the resistances greater than 10,000 ohms?**

  YES : Go to F5.

  NO : REPAIR circuit VH416 (VT/GY) or VH417 (YE/OG) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

F5 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test G: DTC B2826 or B2827

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic

and connector information.

Normal Operation

Under normal operation, the evaporator discharge air temperature sensor receives a ground from the HVAC module - Dual Automatic Temperature Control (DATC) through circuit RH104 (BU/BN). A 5-volt reference voltage is supplied to the evaporator discharge air temperature sensor from the HVAC module - DATC through circuit VH406 (VT/BN).

- DTC B2826 Front Evaporator Temp Sensor Circuit Failure - The module senses no voltage drop on the sensor reference voltage circuit, indicating an open circuit.
- DTC B2827 Front Evaporator Temp Sensor Short to Ground - The module senses excessive voltage drop on the sensor reference voltage circuit, indicating a short directly to ground.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Evaporator discharge air temperature sensor
- HVAC module - DATC

PINPOINT TEST G: DTC B2826 OR DTC B2827

G1 CHECK THE SENSOR RESISTANCE

- Key in OFF position.
- Disconnect: Evaporator Discharge Temperature Sensor C2295
- Carry out the **Temperature Sensor - Evaporator Discharge**.
- **Is the resistance within the specified values for the temperatures?**

  YES : Go to G2.

  NO : INSTALL a new in-vehicle temperature sensor. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G2 CHECK THE HVAC MODULE OUTPUT VOLTAGE

- Key in ON position.
- Press the AUTO button.

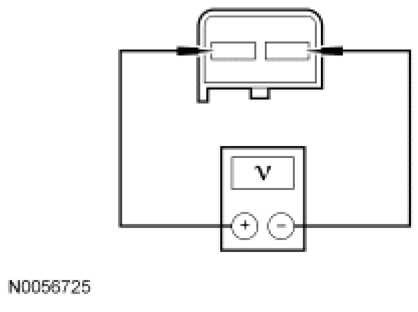

Fig. 42: Checking EATC Sensor Output Voltage

Courtesy of FORD MOTOR CO.

- Measure the voltage between evaporator discharge temperature sensor C2295-2, circuit VH406 (VT/BN), harness side and C2295-1, circuit RH104 (BU/BN), harness side.
- **Is the voltage between 4.7 and 5.1 volts?**

  YES : INSTALL a new evaporator discharge sensor. If code returns, go to G7.

  NO : If diagnosing DTC B2826, go to G3.

  If diagnosing DTC B2827, go to G5.

G3 CHECK CIRCUIT VH406 (VT/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module - DATC 2356b

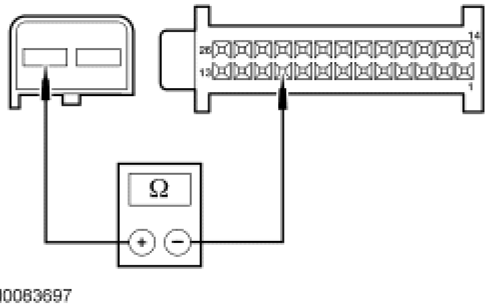

Fig. 43: Checking Circuit VH406 (VT/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - DATC C2356b-10, circuit VH406 (VT/BN), harness side and evaporator discharge temperature sensor C2295-2, circuit VH406 (VT/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to G4.

  NO : REPAIR circuit VH406 (VT/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G4 CHECK CIRCUIT RH104 (BU/BN) FOR AN OPEN

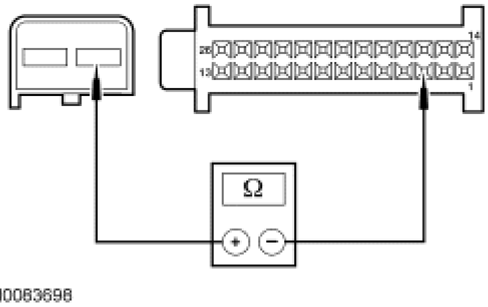

Fig. 44: Checking Circuit RH104 (BU/BN) For An Open
Courtesy of FORD MOTOR CO.

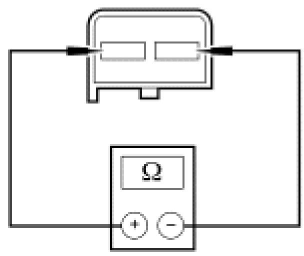
- Measure the resistance between HVAC module - DATC C2356b-3, circuit RH104 (BU/BN), harness side and evaporator discharge temperature sensor C2295-1, circuit RH104 (BU/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to G7.

  NO : REPAIR circuit RH104 (BU/BN) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G5 CHECK CIRCUITS VH406 (VT/BN) AND RH104 (BU/BN) FOR A SHORT TOGETHER

- Key in OFF position.
- Disconnect: HVAC Module - DATC 2356b



N0056728

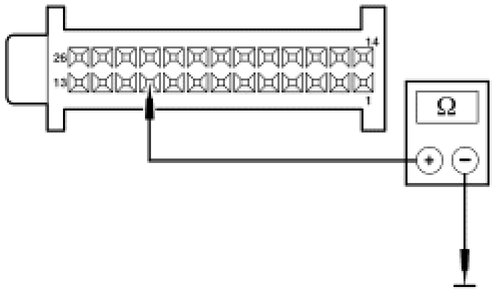
Fig. 45: Checking Circuit VH406 (VT/BN) For A Short To Circuit RH104 (BU/BN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between evaporator discharge temperature sensor C2295-2, circuit VH406 (VT/BN), harness side and C2295-1, circuit RH104 (BU/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to G6.

  NO : REPAIR circuits VH406 (VT/BN) and RH104 (BU/BN) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G6 CHECK CIRCUIT VH406 (VT/BN) FOR A SHORT TO GROUND



N0083700

Fig. 46: Checking Circuit VH406 (VT/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - DATC C2356b-10, circuit VH406 (VT/BN), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to G7.

  NO : REPAIR circuit VH406 (VT/BN) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

G7 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test H: Air Inlet Door is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the air inlet door actuator, the HVAC module supplies voltage to the air inlet door actuator motor through circuit CH208 (GN/OG), and supplies ground through circuit CH207 (BU/GY). To reverse the air inlet door actuator rotation, the HVAC module reverses the voltage and ground circuits.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Air inlet door actuator motor
- HVAC module - Electronic Automatic Temperature Control (EATC)
- HVAC module - Dual Automatic Temperature Control (DATC)
- HVAC module - Electronic Manual Temperature Control (EMTC)

- Stuck or bound linkage or door

PINPOINT TEST H: AIR INLET DOOR IS INOPERATIVE

H1 CHECK DOOR ACTUATOR OPERATION

NOTE: If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.

- Disconnect: HVAC Module - DATC C2356a, HVAC Module - EATC C228a or HVAC Module - EMTC C2357a

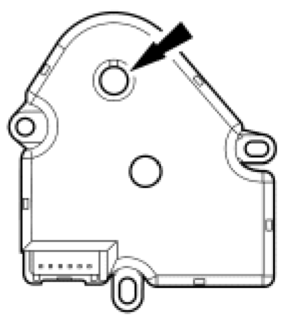


Fig. 47: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Observe the air inlet door actuator drive shaft.
- Key in ON position.

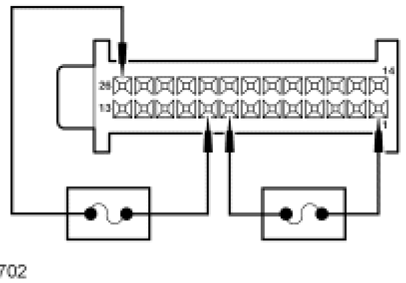

Fig. 48: Checking Door Actuator Operation (EMTC)
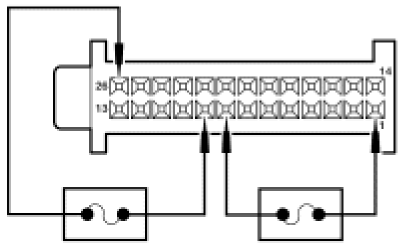
Courtesy of FORD MOTOR CO.

NOTE: EMTC systems only.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-9, circuit CH208 (GN/OG), harness side.

- HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-8, circuit CH207 (BU/GY), harness side.

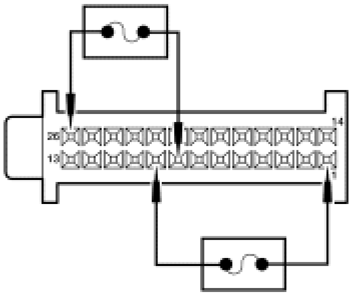


N0063702

Fig. 49: Checking Door Actuator Operation (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-9, circuit CH208 (GN/OG), harness side.
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module - EATC C228a-8, circuit CH207 (BU/GY), harness side.



N0063703

Fig. 50: Checking Door Actuator Operation (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

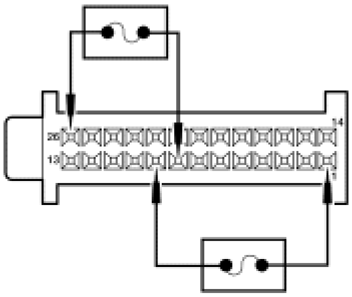
- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-8, circuit CH208 (GN/OG), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-9, circuit CH207 (BU/GY), harness side.
- **Does the actuator motor rotate?**

YES : Go to H2.

NO : Go to H3.

H2 CHECK DOOR ACTUATOR OPERATION

NOTE: If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.

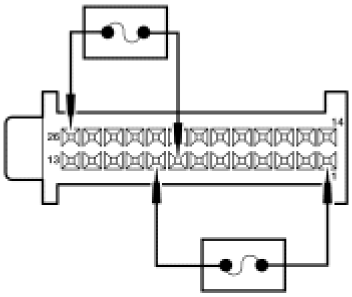


N0083703

Fig. 51: Checking Door Actuator Operation (EMTC)
Courtesy of FORD MOTOR CO.

NOTE: EMTC systems only.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-9, circuit CH208 (GN/OG), harness side.
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-8, circuit CH207 (BU/GY), harness side.



N0083703

Fig. 52: Checking Door Actuator Operation (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module -

EATC C228a-9, circuit CH208 (GN/OG), harness side.

- HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-8, circuit CH207 (BU/GY), harness side.

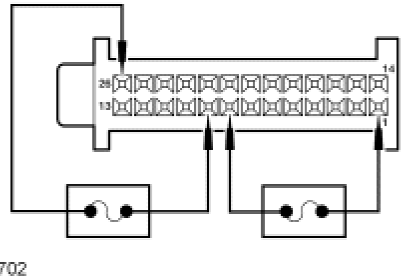


Fig. 53: Checking Door Actuator Operation (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-8, circuit CH208 (GN/OG), harness side.
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-9, circuit CH207 (BU/GY), harness side.
- **Does the actuator motor reverse rotation?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to H4.

  NO : Go to H3.

H3 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN

- Disconnect: Air Inlet Door Actuator C289

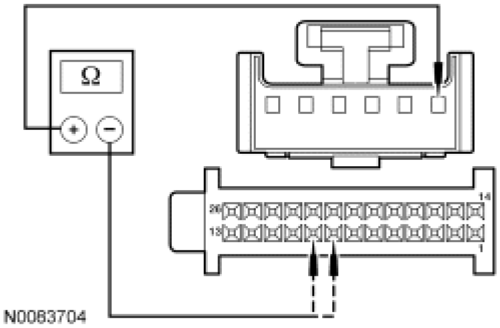

Fig. 54: Checking Actuator Motor Drive Circuits For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between air inlet door actuator C289-5, circuit CH207 (BU/GY), harness side and:

NOTE: EMTC systems only.

- HVAC module - EMTC C2357a-8, circuit CH207 (BU/GY), harness side.

NOTE: EATC systems only.

- HVAC module - EATC C228a-8, circuit CH207 (BU/GY), harness side.

NOTE: DATC systems only.

- HVAC module - DATC C2356a-9, circuit CH207 (BU/GY), harness side.

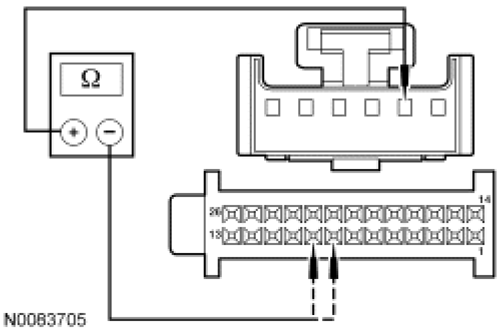

Fig. 55: Checking Actuator Motor Drive Circuits For An Open (DATC)
Courtesy of FORD MOTOR CO.

- Measure the resistance between air inlet door actuator C289-6, circuit CH208 (GN/OG), harness side and:

NOTE: EMTC systems only.

- HVAC module - EMTC C2357a-9, circuit CH208 (GN/OG), harness side.

NOTE: EATC systems only.

- HVAC module - EATC C228a-9, circuit CH208 (GN/OG), harness side.

NOTE: DATC systems only.

- HVAC module - DATC C2356a-8, circuit CH208 (GN/OG), harness side.

- **Are the resistances less than 5 ohms?**

  YES : INSPECT for binding or broken linkage. If no condition is found, INSTALL a new door actuator. TEST the system for normal operation.

  NO : REPAIR the circuit(s) for an open. TEST the system for normal operation.

H4 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.

NOTE: DATC/EATC systems only.

- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test I: Incorrect/Erratic Direction of Airflow From Outlet(s)

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the mode door actuator, the HVAC module supplies voltage to the floor/defrost/panel mode door actuator motor through the circuit CH229 (WH/BU), and supplies ground through circuit CH228 (YE/GY). To reverse the mode door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The mode door actuator feedback resistor is supplied a ground from the HVAC module through circuit RH111 (GY/BU) and a 5-volt reference voltage on circuit LH111 (BN/WH). The HVAC module reads the voltage on the mode door actuator feedback circuit VH436 (YE/VT) to determine the mode door actuator position, by the position of the actuator feedback resistor wiper arm.

- DTC B1003 Mode Door Failure - The module senses no change in actuator feedback voltage when the actuator motor has been energized.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Floor/defrost/panel mode door actuator motor
- HVAC module - Electronic Manual Temperature Control (EMTC)
- HVAC module - Electronic Automatic Temperature Control (EATC)

- HVAC module - Dual Automatic Temperature Control (DATC)
- Stuck or bound linkage or door

PINPOINT TEST I: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLET(S)

I1 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE

- Disconnect: HVAC Module - DATC C2356a, HVAC Module - EATC C228a, or HVAC Module - EMTC C2357a

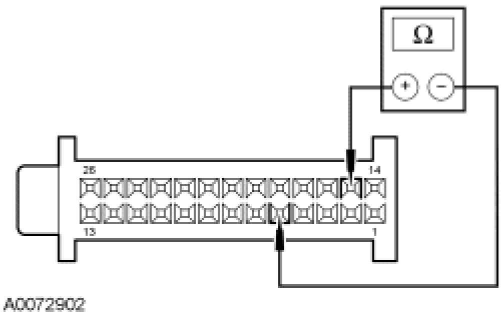

Fig. 56: Checking Feedback Potentiometer Total Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

  NOTE: EMTC systems only.

  - HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side.

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side.
- **Is the resistance between 4,000 and 6,000 ohms for EMTC/EATC systems or between 2,667 and 4,000 ohms for DATC systems?**

  YES : Go to I2.

  NO : If resistance is greater than 4,000 ohms for EMTC/EATC systems or 6,000 ohms for DATC systems, go to I4.

  If resistance is less than 4,000 ohms for EMTC/EATC systems or 2,667 ohms for DATC systems,

go to I6.

I2 CHECK THE POTENTIOMETER LOW-SIDE RESISTANCE

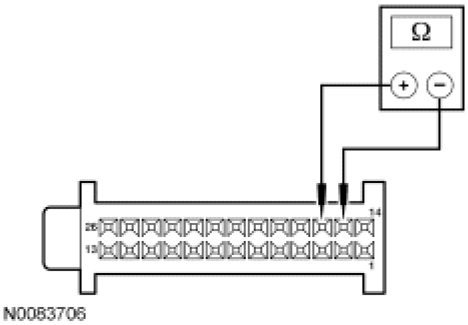

Fig. 57: Checking Potentiometer Low-Side Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

  NOTE: EMTC systems only.

  - HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side and HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side and HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and HVAC module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.
- **Is the resistance between 1 and 10,000 ohms?**

  YES : Go to I3.

  NO : If the resistance is greater than 10,000 ohms, go to I7.

  If the resistance is less than 1 ohm, go to I8.

I3 CHECK THE POTENTIOMETER HIGH-SIDE RESISTANCE

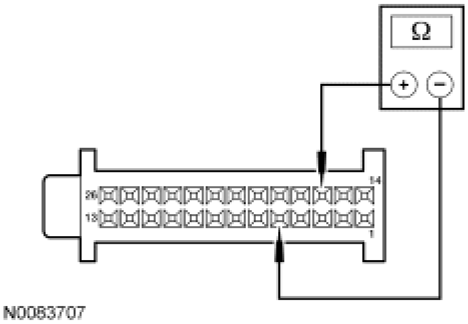

Fig. 58: Checking Potentiometer High-Side Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

  NOTE: EMTC systems only.

  - HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and HVAC module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.
- **Is the resistance between 1 and 10,000 ohms?**

  YES : Go to I10.

  NO : If the resistance is greater than 10,000 ohms, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  If the resistance is less than 1 ohm, go to I9.

I4 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: Floor/Defrost/Panel Door Actuator C2278

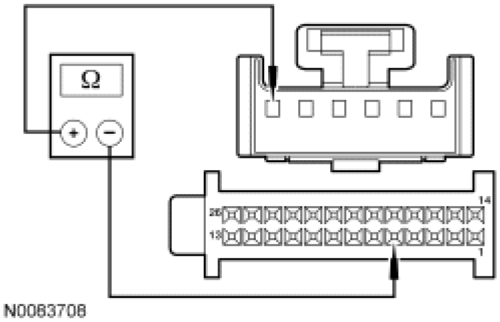

Fig. 59: Checking Circuit LH111 (BN/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between floor/defrost/panel door actuator C2278-10, circuit LH111 (BN/WH), harness side and:

  NOTE: EMTC systems only.

  - HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side.

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to I5.

  NO : REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I5 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN

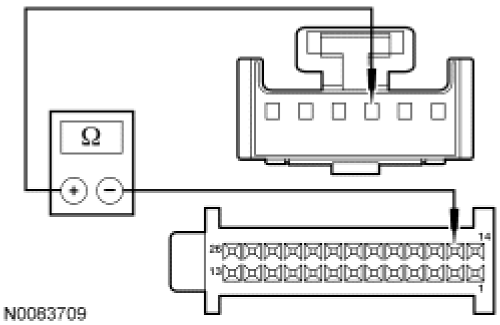

Fig. 60: Checking Actuator Return Circuit RH111 (GY/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between floor/defrost/panel door actuator C2278-7, circuit RH111 (GY/BU), harness side and:

  NOTE: EMTC systems only.

  - HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side.

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I6 CHECK CIRCUITS RH111 (GY/BU) AND LH111 (BN/WH) FOR A SHORT TOGETHER

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: Floor/Defrost/Panel Door Actuator C2278

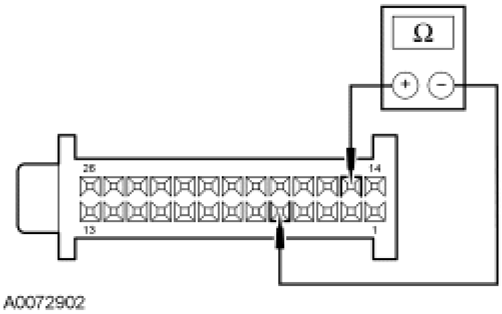

Fig. 61: Checking Circuits RH111 (GY/BU) & LH111 (BN/WH) For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

  NOTE: EMTC systems only.

- HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side.

NOTE: EATC systems only.

- HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side.

NOTE: DATC systems only.

- HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side.

- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits RH111 (GY/BU) and LH111 (BN/WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I7 CHECK CIRCUIT VH436 (YE/VT) FOR AN OPEN

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: Floor/Defrost/Panel Door Actuator C2278

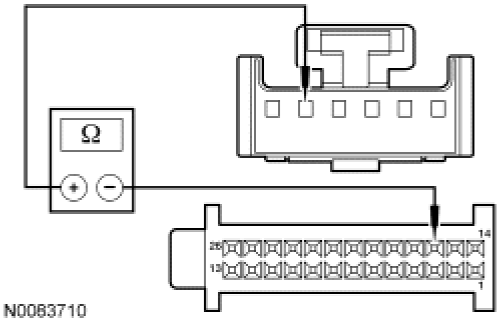

Fig. 62: Checking Circuit VH436 (YE/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between floor/defrost/panel door actuator C2278-9, circuit VH436 (YE/VT), harness side and:

NOTE: EMTC systems only.

- HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

NOTE: EATC systems only.

- HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

NOTE: DATC systems only.

- HVAC module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.

- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuit VH436 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I8 CHECK CIRCUITS RH111 (GY/BU) AND VH436 (YE/VT) FOR A SHORT TOGETHER

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: Floor/Defrost/Panel Door Actuator C2278

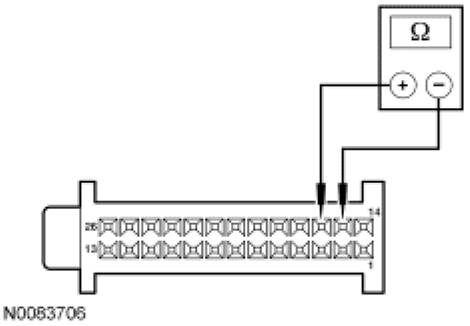

Fig. 63: Checking Circuits RH111 (GY/BU) & VH436 (YE/VT) For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

NOTE: EMTC systems only.

- HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side and HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

NOTE: EATC systems only.

- HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side and HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

NOTE: DATC systems only.

- HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and HVAC module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.

- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits RH111 (GY/BU) and VH436 (YE/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I9 CHECK CIRCUITS LH111 (BN/WH) AND VH436 (YE/VT) FOR A SHORT TOGETHER

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: Floor/Defrost/Panel Door Actuator C2278

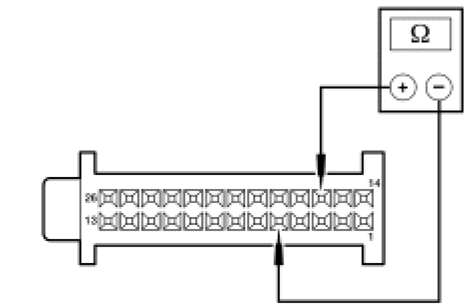

Fig. 64: Checking Circuits LH111 (BN/WH) & VH436 (YE/VT) For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

NOTE: EMTC systems only.

- HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

NOTE: EATC systems only.

- HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

NOTE: DATC systems only.

- HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and HVAC

module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.

- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits LH111 (BN/WH) and VH436 (YE/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I10 CHECK CIRCUITS LH111 (BN/WH) AND VH436 (YE/VT) FOR A SHORT TO GROUND

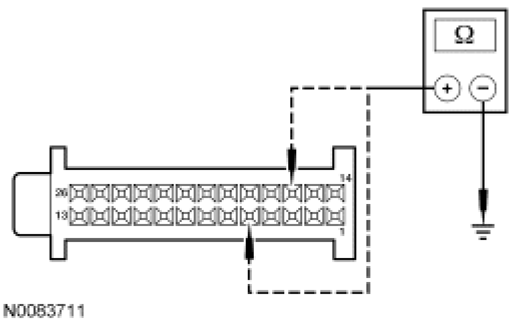

Fig. 65: Checking Circuits LH111 (BN/WH) & VH436 (YE/VT) For A Short To Ground (EMTC)
Courtesy of FORD MOTOR CO.

NOTE: **EMTC systems only.**

- Measure the resistance between ground and the following:
  - HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side.
  - HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

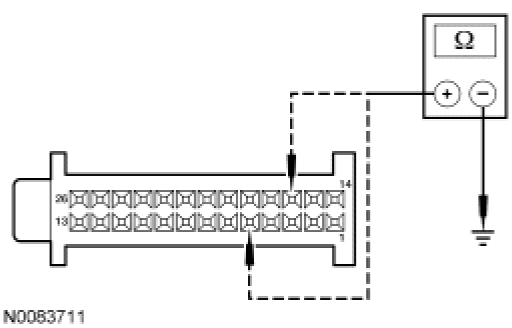

Fig. 66: Checking Circuits LH111 (BN/WH) & VH436 (YE/VT) For A Short To Ground (EATC)
Courtesy of FORD MOTOR CO.

NOTE: **EATC systems only.**

- Measure the resistance between ground and the following:

- HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side.
- HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

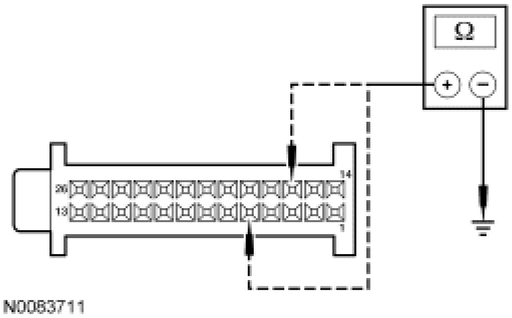

Fig. 67: Checking Circuits LH111 (BN/WH) & VH436 (YE/VT) For A Short To Ground (DATC)
Courtesy of FORD MOTOR CO.

NOTE: **DATC systems only.**

- Measure the resistance between ground and the following:
  - HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side.
  - HVAC module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to I11.

  NO : REPAIR circuit(s) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I11 CHECK CIRCUITS RH111 (GY/BU) AND VH436 (YE/VT) FOR A SHORT TO POWER

- Key in ON position.

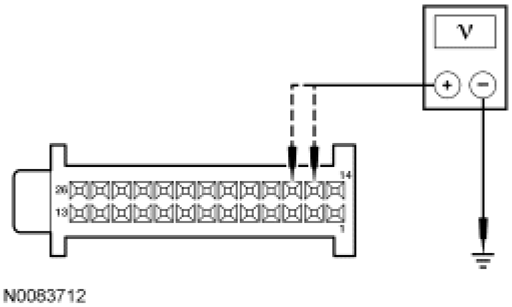

Fig. 68: Checking Circuits RH111 (GY/BU) & VH436 (YE/VT) For A Short To Power (EMTC)
Courtesy of FORD MOTOR CO.

NOTE: **EMTC systems only.**

- Measure the voltage between ground and the following:
  - HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side.
  - HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

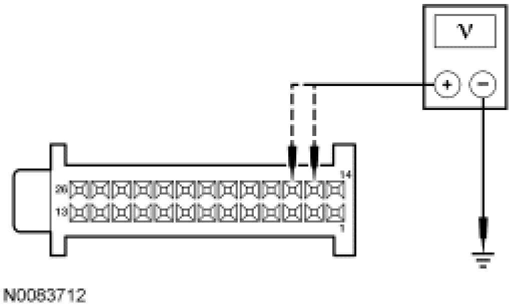

Fig. 69: Checking Circuits RH111 (GY/BU) & VH436 (YE/VT) For A Short To Power (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the voltage between ground and the following:
  - HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side.
  - HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

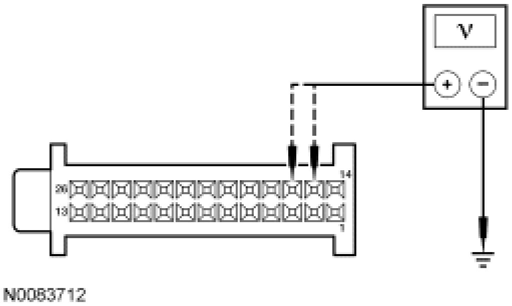

Fig. 70: Checking Circuits RH111 (GY/BU) & VH436 (YE/VT) For A Short To Power (DATC)
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and the following:

NOTE: DATC systems only.

  - HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side.
  - HVAC module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.
- **Is any voltage present?**

YES : REPAIR circuit(s) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

NO : For EMTC systems, go to I12.

For EATC systems, go to I13.

For DATC systems, go to I14.

I12 CHECK THE DOOR ACTUATOR OPERATION

NOTE: **If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.**

- Key in ON position.

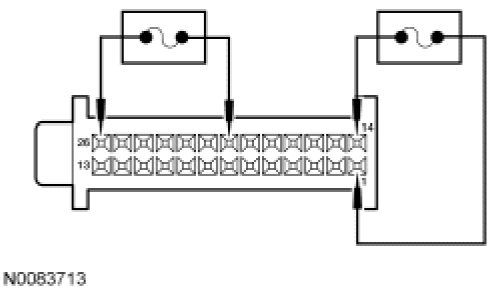

Fig. 71: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-14, circuit CH229 (WH/BU), harness side.

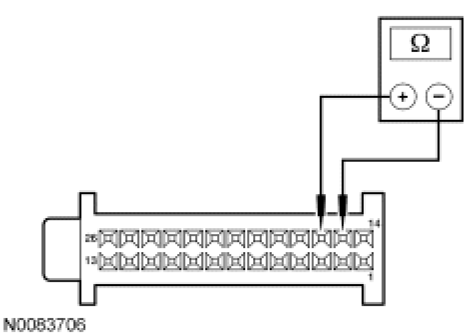

Fig. 72: Measuring Resistance Between C2357A-1 & C2357A-14, Circuit GD116 (BK/VT) & CH229 (WH/BU)

Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side and HVAC module - EMTC C2357a-16, circuit VH436 (YE/VT), harness side.

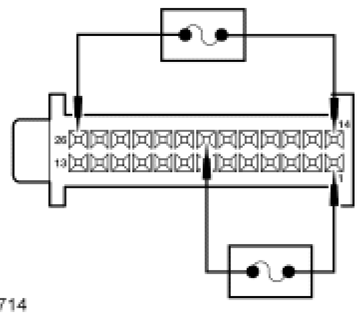

Fig. 73: Measuring Resistance Between C2357A-15 & C2357A-16, Circuit RH111 (GY/BU) & VH436 (YE/VT)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-14, circuit CH229 (WH/BU), harness side.

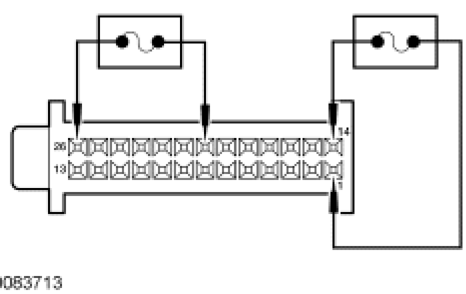

Fig. 74: Measuring Resistance Between C2357A-26 & C2357A-14, Circuit SBP07 (WH/RD) & CH229 (WH/BU)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-14, circuit CH229 (WH/BU), harness side.
- **Does the resistance increase and decrease when the jumpers are connected?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to I17.

NO : Go to I15.

I13 CHECK THE DOOR ACTUATOR OPERATION

NOTE: If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.

- Key in ON position.

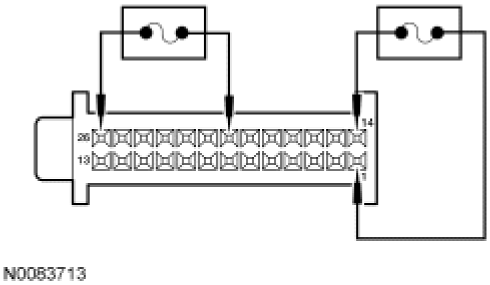

Fig. 75: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module - EATC C228a-14, circuit CH229 (WH/BU), harness side.

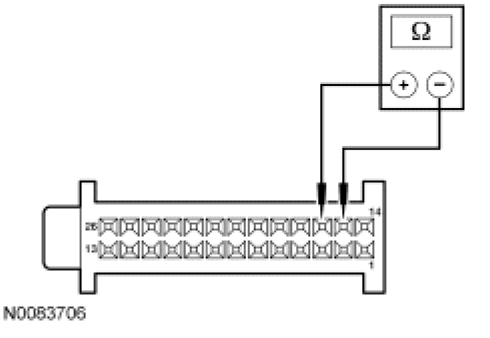

Fig. 76: Measuring Resistance Between C228A-1 & C228A-14, Circuit GD116 (BK/VT) & CH229 (WH/BU)
Courtesy of FORD MOTOR CO.

- Measure the resistance between:
  - HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side and HVAC module - EATC C228a-16, circuit VH436 (YE/VT), harness side.

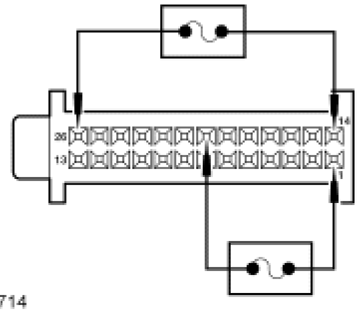

Fig. 77: Measuring Resistance Between C228A-15 & C228A-16, Circuit RH111 (GY/BU) & VH436 (YE/VT)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module - EATC C228a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-14, circuit CH229 (WH/BU), harness side.

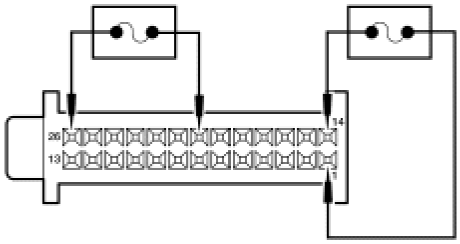

Fig. 78: Measuring Resistance Between C228A-26 & C228A-14, Circuit SBP07 (WH/RD) & CH229 (WH/BU)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module - EATC C228a-14, circuit CH229 (WH/BU), harness side.
- **Does the resistance increase and decrease when the jumpers are connected?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to I17.

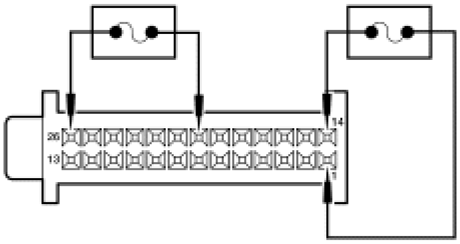
  NO : Go to I15.

I14 CHECK THE DOOR ACTUATOR OPERATION

NOTE: If a jumper fuse opens while carrying out this test step, repair the circuit(s)

for a short.

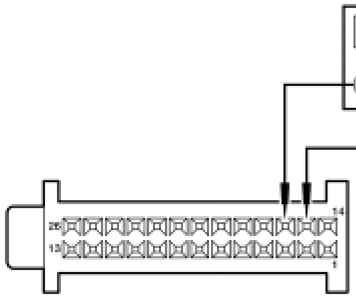
- Key in ON position.



N0083713

Fig. 79: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-14, circuit CH229 (WH/BU), harness side.



N0083706

- Measure the resistance between:
  - HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and HVAC module - DATC C2356a-16, circuit VH436 (YE/VT), harness side.

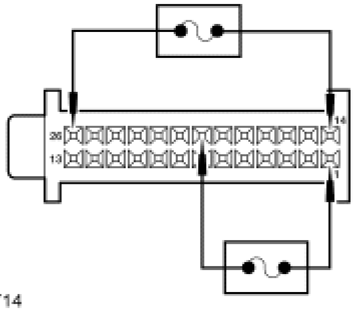

Fig. 81: Measuring Resistance Between C2356A-15 & C2356A-16, Circuit RH111 (GY/BU) & VH436 (YE/VT)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-14, circuit CH229 (WH/BU), harness side.

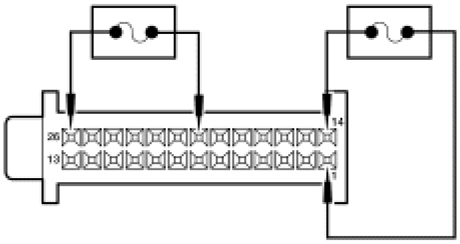

Fig. 82: Measuring Resistance Between C2356A-26 & C2356A-14, Circuit SBP07 (WH/RD) & CH229 (WH/BU)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-20, circuit CH228 (YE/GY), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-14, circuit CH229 (WH/BU), harness side.
- **Does the resistance increase and decrease when the jumpers are connected?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to I17.

  NO : Go to I15.

I15 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS

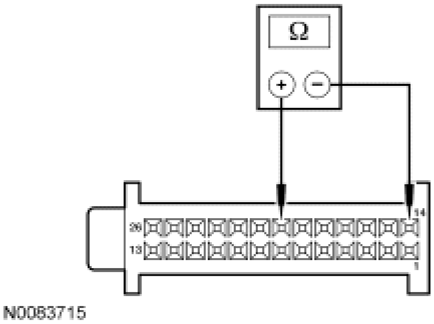

Fig. 83: Checking Actuator Motor Drive Circuits
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

  NOTE: EMTC systems only.

  - HVAC module - EMTC C2357a-20, circuit CH228 (YE/GY), harness side and HVAC module - EMTC C2357a-14, circuit CH229 (WH/BU), harness side.

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-20, circuit CH228 (YE/GY), harness side and HVAC module - EATC C228a-14, circuit CH229 (WH/BU), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-20, circuit CH228 (YE/GY), harness side and HVAC module - DATC C2356a-14, circuit CH229 (WH/BU), harness side.
- **Is the resistance between approximately 38-48 ohms?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to I16.

I16 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: Floor/Defrost/Panel Door Actuator C2278

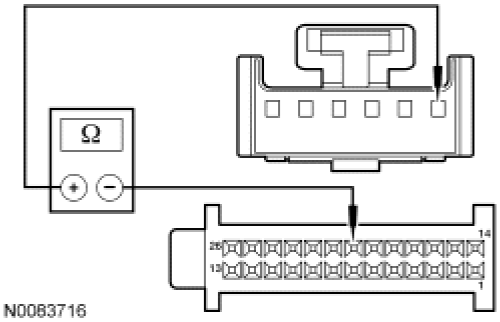

Fig. 84: Checking Actuator Motor Drive Circuits For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between floor/defrost/panel door actuator C2278-5, circuit CH228 (YE/GY), harness side and:

  NOTE: EMTC systems only.

  - HVAC module - EMTC C2357a-20, circuit CH228 (YE/GY), harness side.

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-20, circuit CH228 (YE/GY), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-20, circuit CH228 (YE/GY), harness side.

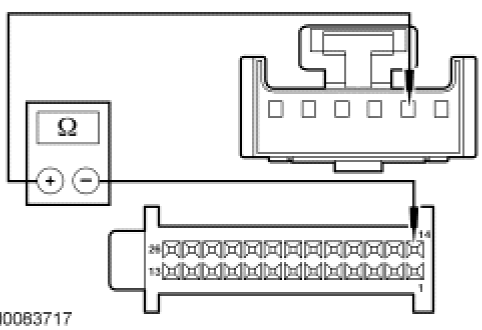

Fig. 85: Measuring Resistance Between Floor/Defrost/Panel Door Actuator C2278-5, Circuit CH228 (YE/GY)
Courtesy of FORD MOTOR CO.

- Measure the resistance between floor/defrost/panel door actuator C2278-6, circuit CH229 (WH/BU), harness side and:

  NOTE: EMTC systems only.

- HVAC module - EMTC C2357a-14, circuit CH229 (WH/BU), harness side.

  NOTE: EATC systems only.

- HVAC module - EATC C228a-14, circuit CH229 (WH/BU), harness side.

  NOTE: DATC systems only.

- HVAC module - DATC C2356a-14, circuit CH229 (WH/BU), harness side.

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR the circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

I17 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.

  NOTE: DATC/EATC systems only.

- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test J: DTC: B1676 - Battery Voltage Out of Range

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

NOTE: DTC B1676 can be set if the vehicle has been recently jump started, the battery has been recently charged or the battery has been discharged due to excessive load on the charging system from aftermarket accessories.

Normal Operation

Under normal operation, the HVAC module - Electronic Automatic Temperature Control (EATC) or HVAC module - Dual Automatic Temperature Control (DATC) module receives a ground through circuit GD116 (BK/VT). The HVAC module - EATC or HVAC module - DATC is supplied constant battery voltage through

circuit SBP07 (WH/RD) and ignition switched voltage through circuit CBP20 (YE/VT).

- DTC B1676 Battery Voltage Out of Range- The module senses when battery voltage is less than 9 volts or greater than 16 volts.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- HVAC module - EATC module
- HVAC module - DATC module

PINPOINT TEST J: DTC: B1676 - BATTERY VOLTAGE OUT OF RANGE

J1 RETRIEVE ALL Continuous Memory Diagnostic Trouble Codes (CMDTCs) IN ALL MODULES

- Enter the following diagnostic mode on the diagnostic tool: Self Test - All CMDTCs
- **Is B1317, B1318 or B1676 present in more than one module AND P0563, P0620, P0625, P0626 or P065B present in the PCM?**

  YES : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article for diagnosis of the battery and charging system. CLEAR all CMDTCs. TEST the system for normal operation.

  NO : Go to J2.

J2 CHECK BATTERY CONDITION

- Refer to **BATTERY, MOUNTING AND CABLES** article and carry out the Battery - Condition Test
- **Does the battery pass the condition test?**

  YES : If the battery passed the condition test but required a recharge, REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the charging system. CLEAR all CMDTCs. TEST the system for normal operation.

  If the battery passed the condition test and did not require a recharge, go to J3.

  NO : INSTALL a new battery. CLEAR all continuous memory DTCs. TEST the system for normal operation.

J3 CHECK CHARGING SYSTEM VOLTAGE

NOTE: Do not allow the engine speed to increase above 2,000 RPM while performing this step or the generator may self excite and result in default charging system output voltage. If engine speed goes above 2,000 RPM, shut the vehicle OFF and restart the engine before performing this step.

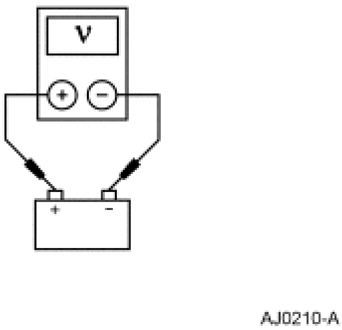

Fig. 86: Checking Charging System Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage of the battery with and without a load on the charging system as follows:
  - Turn off all accessories and run the engine at 1,500 RPM for a minimum of 2 minutes while measuring battery voltage.
  - Turn on headlights and HVAC fan on high and run engine at 1,500 RPM for a minimum of 2 minutes while measuring battery voltage.
- **Are the voltages between 13 and 15.2 volts?**

  YES : Go to J4.

  NO : REFER to **CHARGING SYSTEM - GENERAL INFORMATION** article to diagnose the charging system. CLEAR all CMDTCs. TEST the system for normal operation.

J4 CHECK FOR VOLTAGE MONITORING THE MODULE SUPPLY VOLTAGE (VBAT_CC) HVAC PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: VBAT_CC HVAC PID
- Monitor the battery voltage VBAT_CC HVAC PID.
- **Is the battery voltage less than 9 or greater than 15.5 volts?**

  YES : If voltage is less than 9 volts, go to J5.

  If voltage is greater than 15.5 volts, INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. CLEAR all CMDTCs. REPEAT the self-test.

  NO : Go to J7.

J5 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module - DATC C2356a or HVAC Module - EATC C228a
- Measure the resistance between HVAC module - DATC C2356a-1 or HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to J6.

  NO : REPAIR circuit GD116 (BK/VT). CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

J6 CHECK CIRCUITS SBP07 (WH/RD) AND CBP20 (YE/VT) FOR AN OPEN

- Key in ON position.

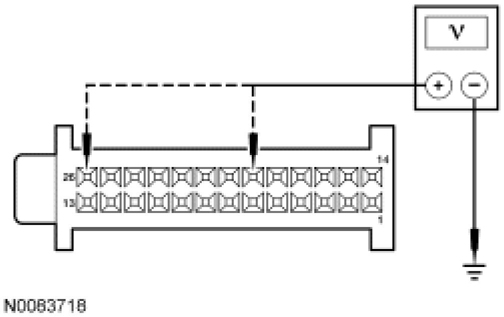

Fig. 87: Checking Circuits SBP07 (WH/RD) & CBP20 (YE/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between HVAC module - DATC C2356a-26 or HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side, HVAC module - DATC C2356a-19 or HVAC module - EATC C228a-19, circuit CBP20 (YE/VT), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to J7.

  NO : VERIFY Smart Junction Box (SJB) fuses 13 (7.5A) and 27 (7.5A) are OK. If OK, REPAIR circuit SBP07 (WH/RD) or CBP20 (YE/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

J7 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test K: HVAC Functions Verification

This pinpoint test is intended to diagnose the following:

- HVAC system

PINPOINT TEST K: HVAC FUNCTIONS VERIFICATION

NOTE: Diagnose any HVAC module DTCs before carrying out the following pinpoint test.

NOTE: Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to PCM DTC Chart.

K1 CHECK THE BLOWER MOTOR OPERATION

- Key in ON position.
- Select PANEL mode.
- Observe blower motor operation and select each blower motor speed.
- **Does the blower motor operate in all selections and change speed in each?**

  YES : Go to K2.

  NO : Electronic Manual Temperature Control (EMTC) systems, If the blower motor does not operate in any setting, go to **Pinpoint Test R**.

  Electronic Automatic Temperature Control (EATC) /Dual Automatic Temperature Control (DATC) systems, If the blower motor does not operate in any setting, go to **Pinpoint Test T**.

  EMTC systems, If the blower motor does not properly change speeds or shut OFF, go to **Pinpoint Test S**.

  EATC /DATC systems, If the blower motor does not properly change speeds or shut OFF, go to **Pinpoint Test U**.

K2 CHECK AIRFLOW OPERATION

- Select the highest blower motor setting.

  NOTE: Refer to DESCRIPTION AND OPERATION for proper airflow descriptions.

- While observing the airflow, select each of the airflow positions (PANEL, PANEL/FLOOR, FLOOR, FLOOR/DEFROST, DEFROST).
- **Is the airflow directed to the proper outlets?**

  YES : Go to K3.

  NO : Go to **Pinpoint Test I**.

K3 VERIFY TEMPERATURE CONTROL OPERATION

- Start the vehicle and allow it to reach normal operating temperature.
- With the A/C OFF, select PANEL mode.
- Change the temperature setting from the coldest to the warmest and back to the coldest
- **Does the temperature change between very warm to cool?**

  YES : Go to K4.

  NO : If the temperature does not get very warm, go to **Pinpoint Test L**.

EMTC systems, If the temperature does not change at all, go to **Pinpoint Test P**.

EATC /DATC systems, If the temperature does not change at all, Go to **Pinpoint Test Q**.

K4 VERIFY THE A/C CLUTCH DOES NOT ENGAGE WITH A/C OFF

- With the A/C OFF, select PANEL mode.
- Select the coldest temperature setting.
- **Is the outlet temperature close to ambient temperature?**

  YES : Go to K5.

  NO : EMTC systems, If the temperature is warmer than ambient temperature, go to **Pinpoint Test P** and diagnose for inoperative blend door.

  EATC /DATC systems, If the temperature is warmer than ambient temperature, go to **Pinpoint Test Q** and diagnose for inoperative blend door.

  If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch cycles normally, go to **Pinpoint Test O**.

  If the outlet temperature is significantly colder than ambient temperature and the A/C compressor clutch does not cycle, go to **Pinpoint Test N**.

K5 VERIFY A/C CLUTCH ENGAGEMENT IN THE A/C MODE

- Make sure the ambient air temperature is above 2°C (35°F).
- Select PANEL mode.
- Press the A/C button (indicator ON).
- **Does the A/C clutch engage when the PANEL and A/C button (indicator ON) is pressed?**

  YES : Go to K6.

  NO : Go to **Pinpoint Test M**.

K6 CHECK THE RECIRC OPERATION

- Press the RECIRC button (indicator OFF).
- Select PANEL mode.
- Select the highest blower motor setting.
- Observe airflow noise.
- Press the RECIRC button (indicator ON).
- **Does the airflow noise increase when the RECIRC mode is selected (indicator ON)?**

  YES : The system is operating normally.

  NO : Go to **Pinpoint Test H**.

Pinpoint Test L: Insufficient, Erratic or No Heat

Normal Operation

Under normal operation, warm coolant flows from the engine through the heater core and back to the engine.

This pinpoint test is intended to diagnose the following:

- Plugged heater core
- Coolant level
- Temperature blend door

PINPOINT TEST L: INSUFFICIENT, ERRATIC OR NO HEAT

L1 CHECK FOR CORRECT ENGINE COOLANT LEVEL

- Key in OFF position.
- Check the engine coolant level when hot and cold.
- **Is the engine coolant at the correct level (hot/cold) as indicated on the engine coolant recovery reservoir?**

  YES : Go to L3.

  NO : Go to L2.

L2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS

- Pressure test the cooling system for leaks. Refer to **ENGINE COOLING** article.
- **Does the engine cooling system leak?**

  YES : REPAIR the engine coolant leak. TEST the system for normal operation.

  NO : Go to L3.

L3 CHECK FOR COOLANT FLOW TO THE HEATER CORE

- Key in ON position.
- Run the engine until it reaches normal operation temperature. Select the FLOOR position on the control assembly. Set the temperature control to full warm and the blower to the lowest setting.

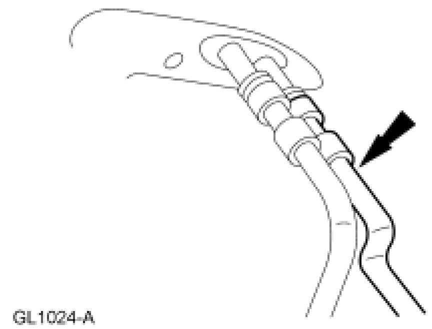

Fig. 88: Checking Coolant Flow To Heater Core
Courtesy of FORD MOTOR CO.

- Using a suitable thermo-couple temperature measuring device, check the heater core inlet hose to see if it is hot.
- **Is the heater core inlet hose hot?**

  YES : Go to L4.

  NO : REFER to **ENGINE COOLING** article to check cooling system function.

L4 CHECK FOR A PLUGGED OR RESTRICTED HEATER CORE

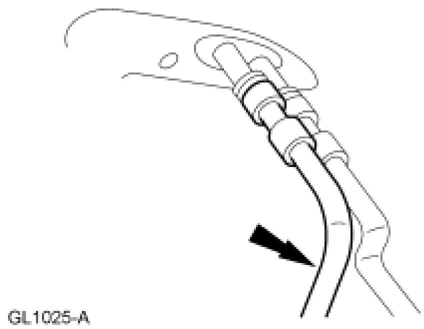

Fig. 89: Check Plugged Or Restricted Heater Core
Courtesy of FORD MOTOR CO.

- Using a suitable thermo-couple temperature measuring device, measure the heater core outlet hose temperature.
- **Is the heater core outlet hose temperature similar to the inlet hose temperature (within approximately 6-17°C [10-30°F])?**

  YES : Go to **Pinpoint Test L** and diagnose for a blend door actuator.

  NO : INSTALL a new heater core. TEST the system for normal operation.

Pinpoint Test M: The Air Conditioning (A/C) is Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, when A/C is requested, in Electronic Automatic Temperature Control (EATC) or Dual Automatic Temperature Control (DATC) system, a message is sent over the Medium Speed Controller Area Network (MS-CAN) bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM; or a voltage is sent to the IC through circuit CH434 (GY/YE), then a message is sent from the IC through the HS-CAN bus to the PCM in Electronic Manual Temperature Control (EMTC) systems.

Ignition voltage for the A/C clutch relay switch is provided through circuit SBB25 (RD). When the PCM energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD121 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- PCM
- HVAC module - EATC
- HVAC module - DATC
- HVAC module - EMTC
- A/C evaporator discharge temperature sensor
- A/C pressure transducer
- A/C compressor clutch field coil
- A/C control relay
- A/C clutch air gap

PINPOINT TEST M: THE AIR CONDITIONING (A/C) IS INOPERATIVE

NOTE: **It is important to install relays in their correct position in the Battery Junction Box (BJB). Installing a relay incorrectly may cause wiring shorts or damage to modules. While carrying out diagnostics on BJB relays, have only one BJB relay removed at a time. Failure to follow these instructions may result in damage to the vehicle circuitry or to control modules.**

NOTE: **Some PCM DTCs may inhibit A/C operation. If any PCM DTCs are retrieved, diagnose those first. Refer to Introduction - Gasoline Engines article.**

NOTE: **When disconnecting and reconnecting the pressure transducer electrical connector, make sure that the connector-locking device is in place and that the locking device and connector are correctly and fully seated.**

NOTE: **Before carrying out the following test, check that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), refer to Fluorescent Dye Leak Detection.**

M1 CHECK THE A/C PRESSURE SENSOR (ACP_PRESS) PCM PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ACP_PRESS PCM PID
- With the R-134a Manifold Gauge Set connected, compare the pressure readings of the R-134a Manifold Gauge Set and the ACP_PRESS PCM PID.
- **Are the pressure values of the R-134a Manifold Gauge Set and the ACP_PRESS PCM PID similar?**

  YES : Go to M2.

  NO : INSTALL a new A/C pressure transducer. TEST the system for normal operation.

M2 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID (3.5L ONLY) OR EVAPORATOR TEMPERATURE (A/CT) PCM PID

- Allow the vehicle exterior and interior to stabilize to an ambient temperature above 16°C (60°F).
- Enter the following diagnostic mode on the diagnostic tool: EVAP_TEMP HVAC PID (3.5L only) or A/CT PCM PID
- **Does the EVAP_TEMP HVAC PID (3.5L ONLY) or A/CT PCM PID read similar to the ambient temperature?**

  YES : DATC/EATC, go to M3.

  EMTC, go to M4.

  NO : INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.

M3 CHECK THE AIR CONDITIONING SWITCH STATUS (CC_AC) HVAC PID WITH THE A/C ON

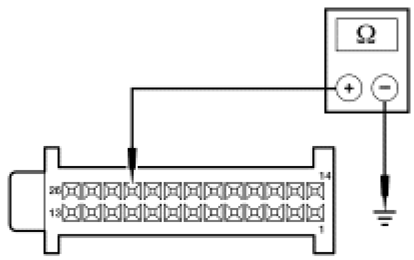
- Enter the following diagnostic mode on the diagnostic tool: CC_AC HVAC PID
- Press and hold the A/C manual override button on the HVAC module - DATC or HVAC module - EATC module.
- **Does the CC_AC HVAC PID read DEPRESSED?**

  YES : Go to M5.

  NO : Go to M14.

M4 CHECK THE EMTC A/C SIGNAL WITH THE A/C ON

- Key in OFF position.
- Disconnect: IC C220
- Key in ON position.
- Select panel mode and press the A/C button on the HVAC module - EMTC.



N0083719

Fig. 90: Checking EMTC A/C Signal With A/C ON
Courtesy of FORD MOTOR CO.

- Measure the resistance between IC C220-23, circuit CH434 (GY/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to M5.

  NO : Go to M7.

M5 CHECK THE AIR CONDITIONING COMPRESSOR CYCLING SWITCH (ACCS) PCM

PID WITH THE A/C ON

- Key in OFF position.

NOTE: For EMTC systems only.

- Disconnect: For EMTC systems only, IC C220
- Key in ON position.

NOTE: For EMTC systems only.

- Enter the following diagnostic mode on the diagnostic tool: ACCS PCM PID
- Press the PANEL and A/C manual override buttons on the HVAC module - DATC and HVAC module - EATC or select MAX A/C on the HVAC module - EMTC.
- **Does the ACCS PCM PID read ON?**

  YES : Go to M6.

  NO : Go to M15.

M6 CHECK THE AIR CONDITIONING CLUTCH (WAC/ACCR) PCM PID WITH THE A/C ON

- Enter the following diagnostic mode on the diagnostic tool: WAC/ACCR PCM PID
- **Does the WAC/ACCR PCM PID read ON?**

  YES : Go to M9.

  NO : Go to M15.

M7 CHECK CIRCUIT CH434 (GY/YE) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module - EMTC C2357a

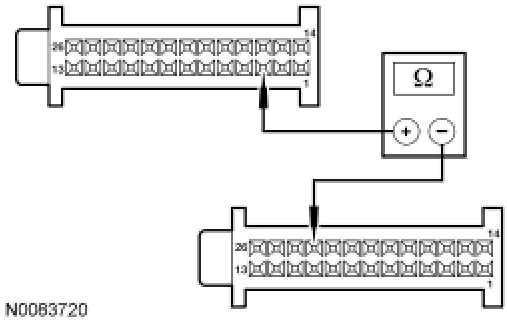


Fig. 91: Checking Circuit CH434 (GY/YE) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-3, circuit CH434 (GY/YE), harness side and IC C220-23, circuit CH434 (GY/YE), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to M8.

NO : REPAIR circuit CH434 (GY/YE) for an open. TEST the system for normal operation.

M8 CHECK CIRCUIT CH434 (GY/YE) FOR A SHORT TO VOLTAGE

- Key in ON position.

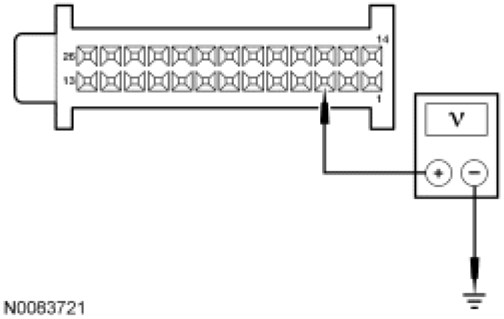

Fig. 92: Checking Circuit CH434 (GY/YE) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between HVAC module - EMTC C2357a-3, circuit CH434 (GY/YE), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to M15.

  NO : REPAIR circuit CH434 (GY/YE) for a short to voltage. TEST the system for normal operation.

M9 CHECK THE VOLTAGE AT THE A/C COMPRESSOR CLUTCH FIELD COIL

- Key in OFF position.
- Disconnect: A/C Compressor Clutch Field Coil C100
- Key in ON position.
- Press the PANEL and A/C manual override buttons on the HVAC module - EATC and HVAC module - DATC or select MAX A/C on the HVAC module - EMTC.

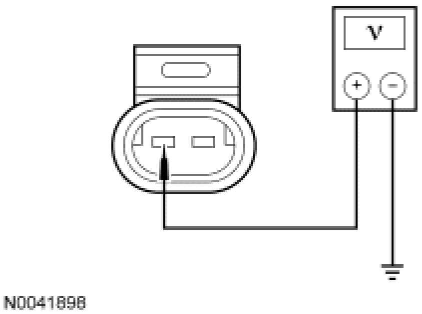

Fig. 93: Checking Circuit CH401 (VT/WH) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side and ground.

- **Is the voltage greater than 10 volts?**

  YES : Go to M10.

  NO : Go to M12.

M10 CHECK THE GROUND AT THE A/C COMPRESSOR CLUTCH FIELD COIL

- Key in OFF position.

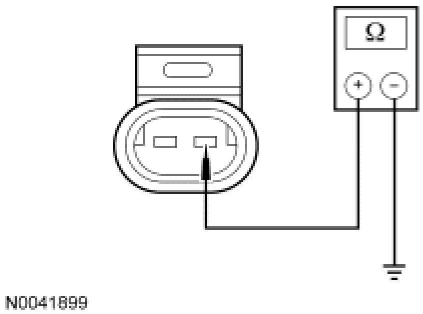

Fig. 94: Checking Ground At A/C Compressor Clutch Field Coil
Courtesy of FORD MOTOR CO.

- Measure the resistance between A/C compressor clutch field coil C100-A, circuit GD121 (BK/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to M11.

  NO : REPAIR circuit GD121 (BK/YE) for an open. TEST the system for normal operation.

M11 CHECK THE A/C COMPRESSOR CLUTCH AIR GAP

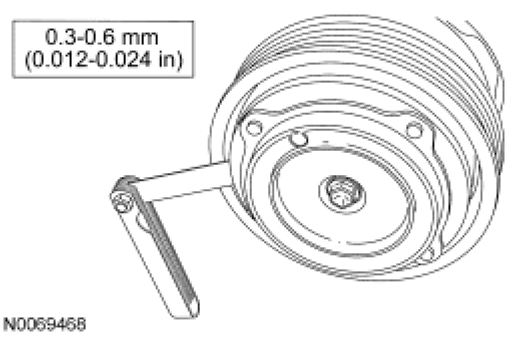

Fig. 95: Checking A/C Compressor Clutch Air Gap
Courtesy of FORD MOTOR CO.

- Measure the A/C compressor clutch air gap at 3 equally spaced locations between the clutch hub and the A/C compressor clutch pulley.
- **Is the A/C compressor clutch air gap greater than 0.6 mm (0.024 in)?**

  YES : ADJUST the A/C compressor clutch gap. REFER to **Air Conditioning (A/C) Clutch Air Gap Adjustment**. TEST the system for normal operation.

  NO : INSTALL a new A/C compressor clutch field coil. TEST the system for normal operation.

M12 CHECK CIRCUIT SBB25 (RD) FOR VOLTAGE

- Key in OFF position.
- Disconnect: A/C Clutch Relay
- Key in ON position.

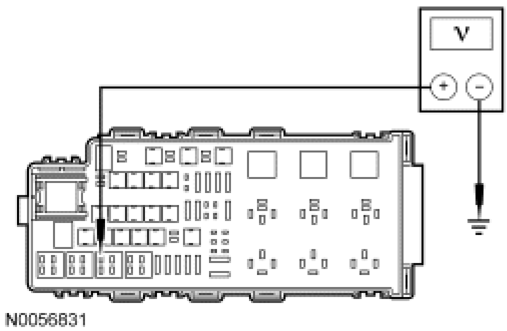

Fig. 96: Checking Circuit SBB25 (RD) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between A/C clutch relay socket, circuit SBB25 (RD) and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to M13.

  NO : VERIFY Battery Junction Box (BJB) fuse 25 (10A) is OK. If OK, REPAIR circuit SBB25 (RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams article to identify the possible causes of the circuit short.

M13 CHECK CIRCUIT CH401 (VT/WH) FOR AN OPEN

- Key in OFF position.

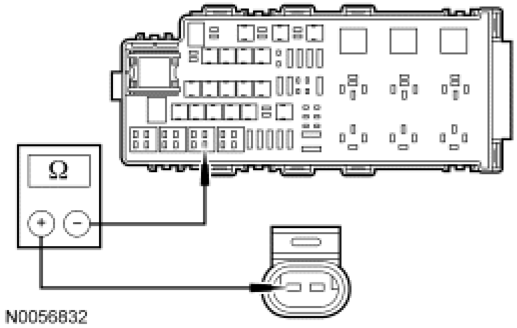

Fig. 97: Checking Circuit CH401 (VT/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between A/C clutch relay socket pin 5, circuit CH401 (VT/WH) and A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to M15.

  NO : REPAIR circuit CH401 (VT/WH) for an open. TEST the system for normal operation.

M14 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.

NOTE: DATC/EATC systems only.

- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

M15 CHECK THE PCM CONNECTION

- Check the DTCs.
- Disconnect all the PCM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - incorrectly seated connector.
- Connect and correctly seat all the PCM connectors.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new PCM. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been cause by a loose or corroded connector.

Pinpoint Test N: The Air Conditioning (A/C) is Always On - A/C Compressor Does Not Cycle

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, when A/C is requested in Electronic Automatic Temperature Control (EATC) or Dual Automatic Temperature Control (DATC) systems, a message is sent over the Medium Speed Controller Area Network (MS-CAN) bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller

Area Network (HS-CAN) bus to the PCM; or a voltage is sent to the IC through circuit CH434 (GY/YE), then a message is sent from the IC through the HS-CAN bus to the PCM Electronic Manual Temperature Control (EMTC) systems.

Ignition voltage for the A/C clutch relay switch is provided through circuit SBB25 (RD). When the PCM energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD121 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- A/C evaporator discharge temperature sensor
- A/C pressure transducer
- A/C control relay
- A/C clutch air gap

PINPOINT TEST N: THE AIR CONDITIONING (A/C) IS ALWAYS ON - A/C COMPRESSOR DOES NOT CYCLE

NOTE: **When disconnecting and reconnecting the pressure transducer electrical connector, make sure that the connector-locking device is in place and that the locking device and connector are correctly and fully seated.**

N1 CHECK THE A/C PRESSURE SENSOR (ACP_PRESS) PCM PID

- Key in ON position.
- Enter the following diagnostic mode on the diagnostic tool: ACP_PRESS PCM PID
- With the R-134a Manifold Gauge Set connected, compare the pressure readings of the R-134a Manifold Gauge Set and the ACP_PRESS PCM PID.
- **Are the pressure values of the R-134a Manifold Gauge Set and the ACP_PRESS PCM PID similar?**

  YES : Go to N2.

  NO : INSTALL a new A/C pressure transducer. TEST the system for normal operation.

N2 CHECK THE A/C EVAPORATOR TEMPERATURE (EVAP_TEMP) HVAC PID (3.5L ONLY) OR EVAPORATOR TEMPERATURE (A/CT) PCM PID

- Allow the vehicle exterior and interior to stabilize to an ambient temperature above 16°C (60°F).
- Enter the following diagnostic mode on the diagnostic tool: EVAP_TEMP HVAC PID (3.5L only) or A/CT PCM PID
- **Does the EVAP_TEMP HVAC PID (3.5L ONLY) or A/CT PCM PID read similar to the ambient temperature?**

  YES : Go to N3.

  NO : INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.

N3 CHECK AIR CONDITIONING CLUTCH (WAC/ACCR) PCM PID WITH THE A/C OFF

- Enter the following diagnostic mode on the diagnostic tool: WAC/ACCR PCM PID
- Select the OFF position on the HVAC module.
- **Does the WAC/ACCR PCM PID read ON?**

  YES : Go to N6.

  NO : Go to N4.

N4 CHECK FOR VOLTAGE TO THE A/C COMPRESSOR CLUTCH FIELD COIL

- Key in OFF position.
- Disconnect: A/C Compressor Clutch Field Coil C100
- Key in ON position.

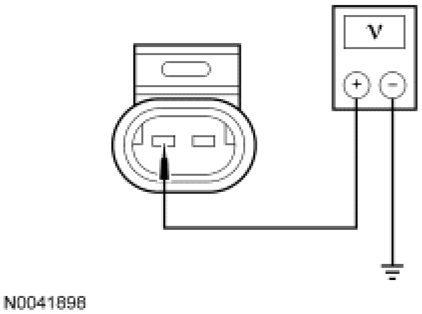

Fig. 98: Checking Circuit CH401 (VT/WH) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side and ground.
- **Is any voltage present?**

  YES : Go to N5.

  NO : ADJUST the A/C compressor clutch gap. REFER to **Air Conditioning (A/C) Clutch Air Gap Adjustment**. TEST the system for normal operation.

N5 CHECK CIRCUIT CH401 (VT/WH) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: A/C Clutch Relay
- Key in ON position.

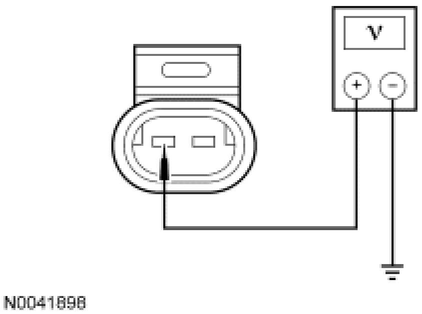

Fig. 99: Checking Circuit CH401 (VT/WH) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between A/C compressor clutch field coil C100-B, circuit CH401 (VT/WH), harness side and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CH401 (VT/WH) for a short to voltage. TEST the system for normal operation.

  NO : INSTALL a new A/C clutch relay. CHECK the A/C clutch diode. INSTALL a new diode if necessary. TEST the system for normal operation.

N6 CHECK THE PCM CONNECTION

- Clear the DTCs.
- Disconnect all the PCM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - incorrectly seated connector.
- Connect and correctly seat all the PCM connectors.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new PCM. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test O: The Air Conditioning (A/C) is Always On - A/C Mode Always Commanded ON

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, when A/C is requested in Electronic Automatic Temperature Control (EATC) or Dual Automatic Temperature Control (DATC) systems, a message is sent over the Medium Speed Controller Area Network (MS-CAN) bus to the Instrument Cluster (IC), then from the IC through the High Speed Controller Area Network (HS-CAN) bus to the PCM; or a voltage is sent to the IC through circuit CH434 (GY/YE), then a message is sent from the IC through the HS-CAN bus to the PCM Electronic Manual Temperature Control (EMTC) systems.

Ignition voltage for the A/C clutch relay switch is provided through circuit SBB25 (RD). When the PCM

energizes the relay, ignition voltage is supplied to the A/C clutch through circuit CH401 (VT/WH). Ground is supplied for the A/C clutch through circuit GD121 (BK/YE).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- PCM
- HVAC module - EATC
- HVAC module - DATC
- HVAC module - EMTC

PINPOINT TEST O: THE AIR CONDITIONING (A/C) IS ALWAYS ON - A/C MODE ALWAYS COMMANDED ON

NOTE: When disconnecting and reconnecting the pressure transducer electrical connector, make sure that the connector-locking device is in place and that the locking device and connector are correctly and fully seated.

O1 CHECK THE AIR CONDITIONING COMPRESSOR CYCLING SWITCH (ACCS) PCM PID WITH THE A/C OFF

- Enter the following diagnostic mode on the diagnostic tool: ACCS PCM PID
- Press the OFF manual override buttons on the HVAC module - DATC and HVAC module - EATC or select OFF on the HVAC module - EMTC.
- **Does the ACCS PCM PID read ON?**

  YES : DATC/EATC, go to O2.

  EMTC, go to O3.

  NO : Go to O6.

O2 CHECK THE AIR CONDITIONING SWITCH STATUS (CC_AC) HVAC PID WITH THE A/C OFF

- Enter the following diagnostic mode on the diagnostic tool: CC_AC HVAC PID
- **Does the CC_AC HVAC PID read DEPRESSED?**

  YES : Go to O5.

  NO : Go to O6.

O3 CHECK EMTC A/C REQUEST OUTPUT

- Key in OFF position.
- Disconnect: IC C220
- Key in ON position.
- Select the OFF position on the HVAC module - EMTC.

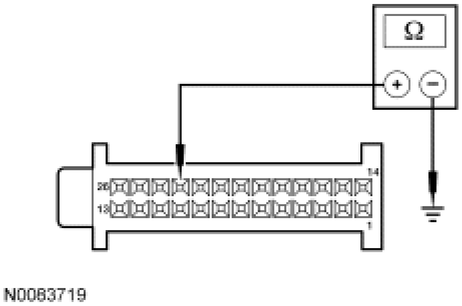

Fig. 100: Checking EMTC A/C Request Output
Courtesy of FORD MOTOR CO.

- Measure the resistance between IC C220-23, circuit CH434 (GY/YE), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to O4.

  NO : Go to O6.

O4 CHECK CIRCUIT CH434 (GY/YE) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: HVAC module - EMTC C2357a
- Key in ON position.

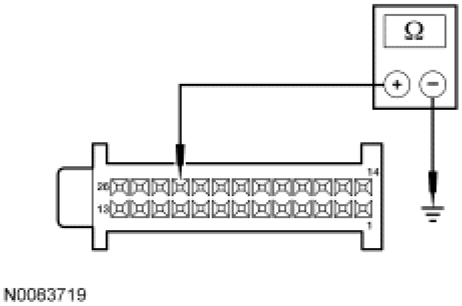

Fig. 101: Checking Circuit CH434 (GY/YE) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between IC C220-23, circuit CH434 (GY/YE), harness side and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to O5.

  NO : REPAIR circuit CH434 (GY/YE) for a short to ground. TEST the system for normal operation.

O5 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.

NOTE: **DATC/EATC systems only.**

- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

O6 CHECK THE PCM CONNECTION

- Clear the DTCs.
- Disconnect all the PCM connectors.
- Check for:
  - corrosion.
  - pushed-out pins.
  - incorrectly seated connector.
- Connect and correctly seat all the PCM connectors.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new PCM. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector.

Pinpoint Test P: Temperature Control is Inoperative/Does Not Operate Correctly - EMTC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the blend door actuator, the HVAC module supplies voltage to the blend door actuator motor through circuit CH233 (VT/BN), and supplies ground through circuit CH234 (YE/GN). To reverse the blend door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The blend door actuator feedback resistors are supplied a ground from the HVAC module by circuit RH111 (GY/BU) and a 5-volt reference voltage circuit LH111 (BN/WH). The HVAC module reads the voltage on circuit VH439 (GY/VT) to determine the blend door actuator position, by the position of the actuator feedback resistor wiper arm.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Blend door actuator motor
- HVAC module - Electronic Manual Temperature Control (EMTC)
- Stuck or bound linkage or door

PINPOINT TEST P: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - EMTC

P1 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE

- Key in OFF position.
- Disconnect: HVAC Module - EMTC C2357a

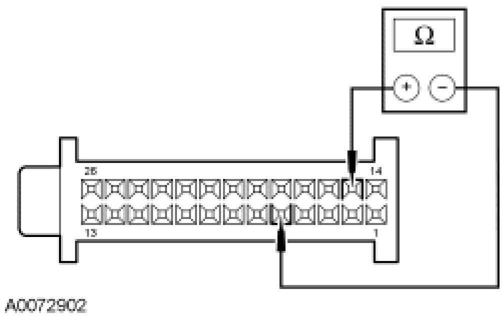

Fig. 102: Checking Feedback Potentiometer Total Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side.
- **Is the resistance between 4,000 and 6,000 ohms?**

  YES : Go to P2.

  NO : If resistance is greater than 6,000 ohms, go to P4.

  If resistance is less than 4,000 ohms, go to P5.

P2 CHECK THE POTENTIOMETER LOW-SIDE RESISTANCE

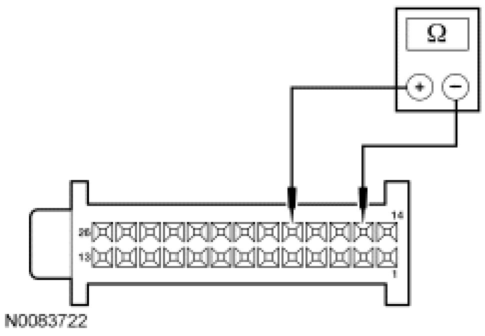

Fig. 103: Checking Potentiometer Low-Side Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side and HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side.
- **Is the resistance between 1 and 10,000 ohms?**

  YES : Go to P3.

  NO : If resistance is greater than 10,000 ohms, go to P6.

  If resistance is less than 1 ohm, go to P7.

P3 CHECK THE POTENTIOMETER HIGH-SIDE RESISTANCE

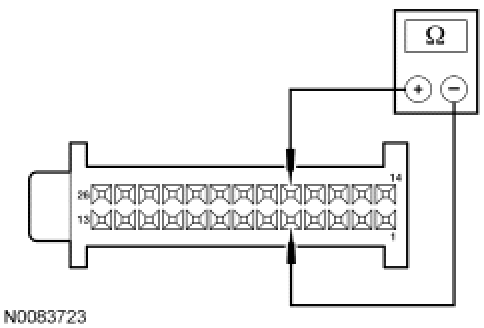

Fig. 104: Checking Potentiometer High-Side Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side.
- **Is the resistance between 1 and 10,000 ohms?**

  YES : Go to P9.

  NO : If resistance is greater than 10,000 ohms, INSTALL a new door actuator. TEST the system for normal operation.

  If resistance is less than 1 ohm, go to P8.

P4 CHECK CIRCUITS LH111 (BN/WH) AND RH111 (GY/BU) FOR AN OPEN

NOTE:	**Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.**

- Disconnect: LH Blend Door Actuator C2091

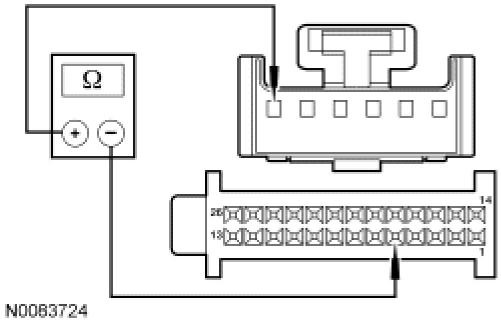

Fig. 105: Checking Circuits LH111 (BN/WH) & RH111 (GY/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and LH blend door actuator C2091-10, circuit LH111 (BN/WH), harness side.

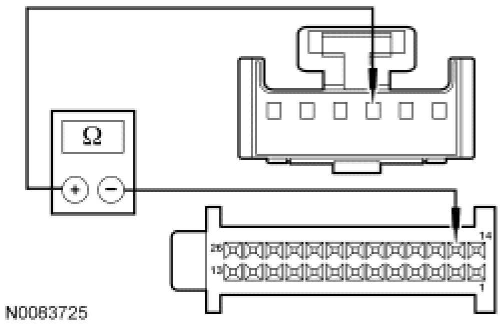

Fig. 106: Measuring Resistance Between C2357A-5 & C2091-10, Circuit LH111 (BN/WH) & LH111 (BN/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side and LH blend door actuator C2091-7, circuit RH111 (GY/BU), harness side.
- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuit LH111 (BN/WH) or RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P5 CHECK CIRCUITS RH111 (GY/BU) AND LH111 (BN/WH) FOR A SHORT TOGETHER

NOTE:	**Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.**

- Disconnect: LH Blend Door Actuator C2091

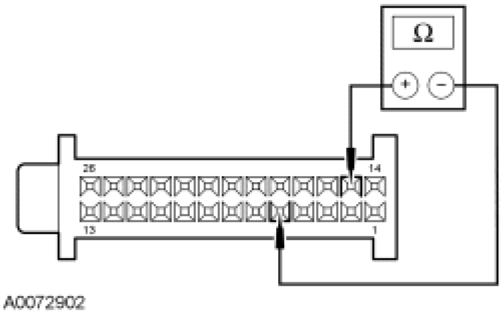

Fig. 107: Checking Circuits RH111 (GY/BU) & LH111 (BN/WH) For A Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits RH111 (GY/BU) and LH111 (BN/WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P6 CHECK CIRCUIT VH439 (GY/VT) FOR AN OPEN

NOTE:	Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: LH Blend Door Actuator C2091

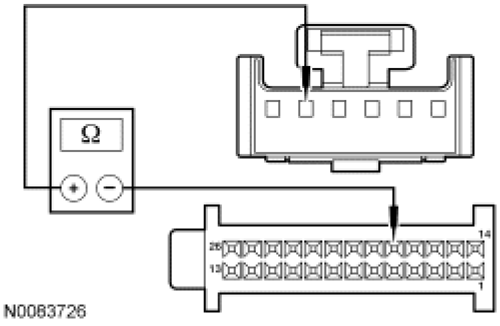

Fig. 108: Checking Circuit VH439 (GY/VT) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side and LH blend door actuator C2091-9, circuit VH439 (GY/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

NO : REPAIR circuit VH439 (GY/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P7 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH439 (GY/VT)

NOTE:	**Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.**

- Disconnect: LH Blend Door Actuator C2091

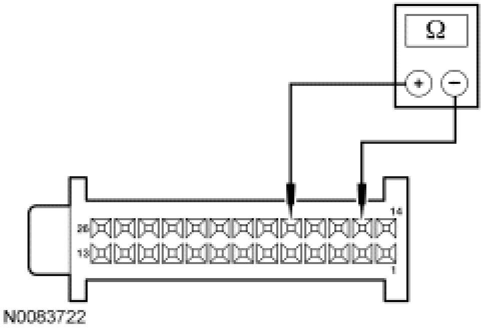

Fig. 109: Checking Circuit RH111 (GY/BU) For A Short To Circuit VH439 (GY/VT)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side and HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits RH111 (GY/BU) and VH439 (GY/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P8 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH439 (GY/VT)

NOTE:	**Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.**

- Disconnect: LH Blend Door Actuator C2091

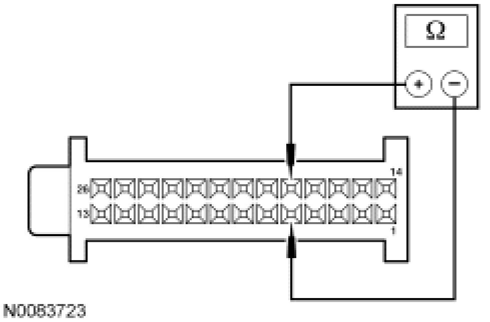

Fig. 110: Checking Circuit LH111 (BN/WH) For A Short To Circuit VH439 (GY/VT)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side and HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits LH111 (BN/WH) and VH439 (GY/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P9 CHECK CIRCUITS LH111 (BN/WH) AND VH439 (GY/VT) FOR A SHORT TO GROUND

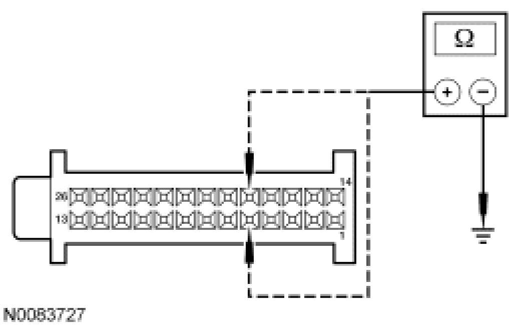

Fig. 111: Checking Circuits LH111 (BN/WH) & VH439 (GY/VT) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and the following:
  - HVAC module - EMTC C2357a-5, circuit LH111 (BN/WH), harness side.
  - HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to P10.

  NO : REPAIR circuit(s) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P10 CHECK CIRCUITS RH111 (GY/BU) AND VH439 (GY/VT) FOR A SHORT TO POWER

- Key in ON position.

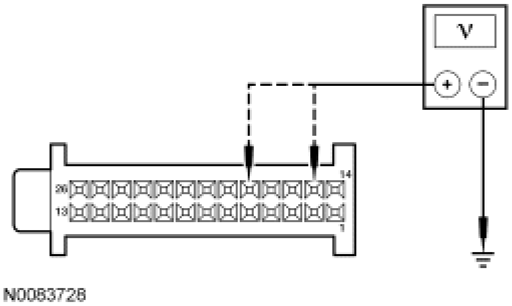

Fig. 112: Checking Circuits RH111 (GY/BU) & VH439 (GY/VT) For A Short To Power
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and the following:
  - HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side.
  - HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side.
- **Is any voltage present?**

  YES : REPAIR circuit(s) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to P11.

P11 CHECK THE DOOR ACTUATOR OPERATION

NOTE: **If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.**

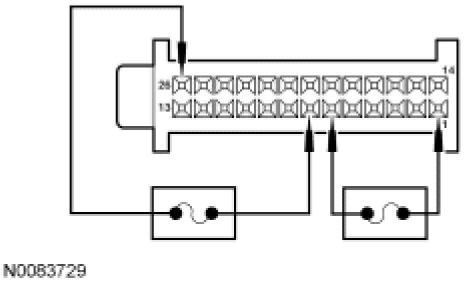

Fig. 113: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-7, circuit CH233 (VT/BN), harness side.
  - HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-6, circuit CH234 (YE/GN), harness side.

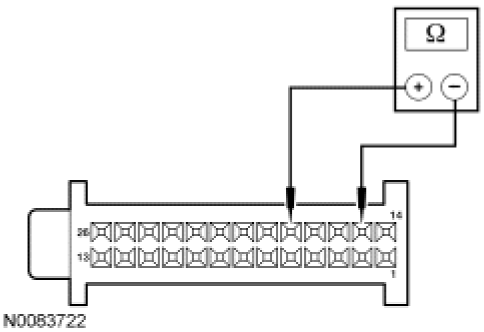

Fig. 114: Measuring Resistance Between C2357A-1 & C2357A-6, Circuit GD116 (BK/VT) & CH234 (YE/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EMTC C2357a-15, circuit RH111 (GY/BU), harness side and HVAC module - EMTC C2357a-18, circuit VH439 (GY/VT), harness side.

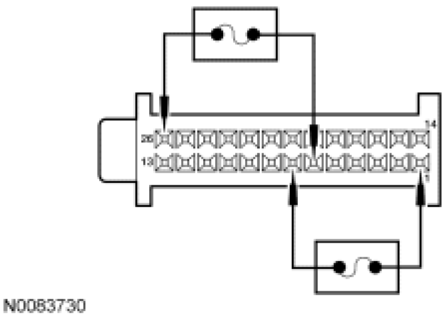

Fig. 115: Measuring Resistance Between C2357A-15 & C2357A-18, Circuit RH111 (GY/BU) & VH439 (GY/VT)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-6, circuit CH234 (YE/GN), harness side.
  - HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-7, circuit CH233 (VT/BN), harness side.

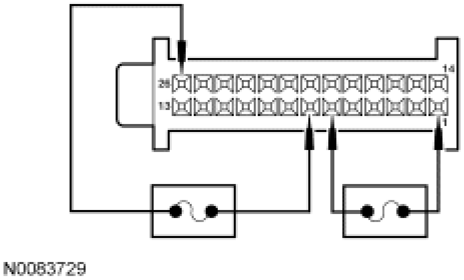

Fig. 116: Measuring Resistance Between C2357A-1 & C2357A-7, Circuit GD116 (BK/VT) & CH233 (VT/BN)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EMTC C2357a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EMTC C2357a-7, circuit CH233 (VT/BN), harness side.
  - HVAC module - EMTC C2357a-1, circuit GD116 (BK/VT), harness side and HVAC module - EMTC C2357a-6, circuit CH234 (YE/GN), harness side.
- **Does the resistance increase and decrease when the jumpers are connected?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to P14.

  NO : Go to P12.

P12 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS

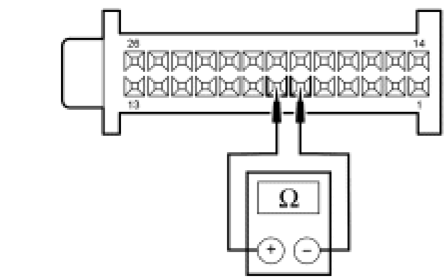

Fig. 117: Checking Actuator Motor Drive Circuits
Courtesy of FORD MOTOR CO.

- Measure the resistance between the HVAC module - EMTC C2357a-7, circuit CH233 (VT/BN), harness side and HVAC module - EMTC C2357a-6, circuit CH234 (YE/GN), harness side.
- **Is the resistance between approximately 59-73 ohms?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to P13.

P13 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN

NOTE:	Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: LH Blend Door Actuator C2091

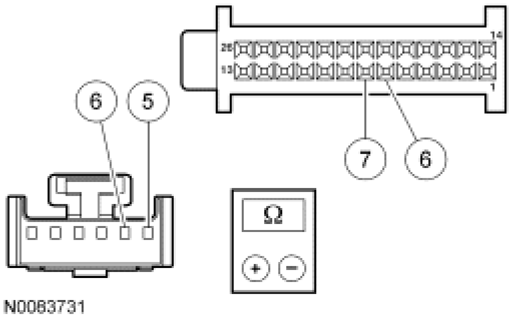

Fig. 118: Checking Actuator Motor Drive Circuits For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the HVAC module - EMTC connector, harness side and LH blend door actuator, harness side using the following chart.

HVAC Module Connector	Circuit	LH Blend Door Actuator Connector
C2357a-7	CH233 (VT/BN)	C2091-5
C2357a-6	CH234 (YE/GN)	C2091-6

- **Are the resistances less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR the circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

P14 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test Q: Temperature Control is Inoperative/Does Not Operate Correctly - EATC/DATC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, to rotate the blend door actuator, the HVAC module supplies voltage to the blend door actuator motors through the door actuator feed A circuits, and supplies ground through the door actuator feed B circuits. To reverse the blend door actuator rotation, the HVAC module reverses the voltage and ground circuits.

The blend door actuator feedback resistors are supplied a ground from the HVAC module by the blend door actuator return circuits and a 5-volt reference voltage on the blend door actuator reference circuits. The HVAC module reads the voltage on the blend door actuator feedback circuits to determine the blend door actuator position, by the position of the actuator feedback resistor wiper arm.

Door actuator feed A circuits

- (Dual Automatic Temperature Control (DATC)/Electronic Automatic Temperature Control (EATC)) LH Blend - CH238 (YE/OG)
- RH Blend - CH212 (BU/OG)

Door actuator feed B circuits

- (DATC/EATC) LH Blend - CH239 (BU/WH)
- RH Blend - CH213 (BN/GN)

Door actuator return circuits

- LH Blend - RH111 (GY/BU)
- RH Blend - RH111 (GY/BU)

Door actuator reference circuits

- LH Blend - LH111 (BN/WH)
- RH Blend - LH111 (BN/WH)

Door actuator feedback circuits

- (DATC/EATC) LH Blend - VH440 (BN/BU)
- RH Blend - VH441 (WH/BN)

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Blend door actuator motor

- HVAC module - EATC
- HVAC module - DATC
- Stuck or bound linkage or door

PINPOINT TEST Q: TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY - EATC/DATC

Q1 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE

- Disconnect: HVAC Module - DATC C2356a or HVAC Module - EATC C228a

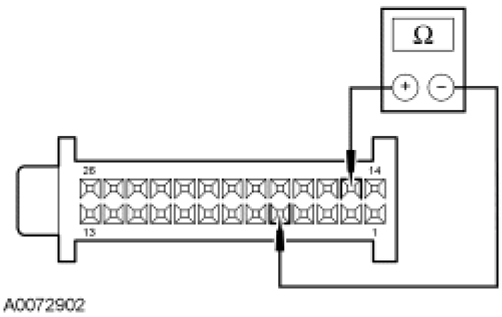

Fig. 119: Checking Feedback Potentiometer Total Resistance
Courtesy of FORD MOTOR CO.

- Measure the resistance between:

  NOTE: EATC systems only.

  - HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side.

  NOTE: DATC systems only.

  - HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side.
- **Is the resistance between 4,000 and 6,000 ohms for EATC systems or between 2,667 and 4,000 ohms for DATC systems?**

  YES : Go to Q2.

  NO : For EATC systems, if resistance is greater than 4,000 ohms, go to Q4.

  For EATC systems, if resistance is less than 4,000 ohms, go to Q6.

  For DATC systems, if resistance is greater than 6,000 ohms, go to Q4.

  For DATC systems, If resistance is less than 2,667 ohms, go to Q6.

Q2 CHECK THE POTENTIOMETER LOW-SIDE RESISTANCE

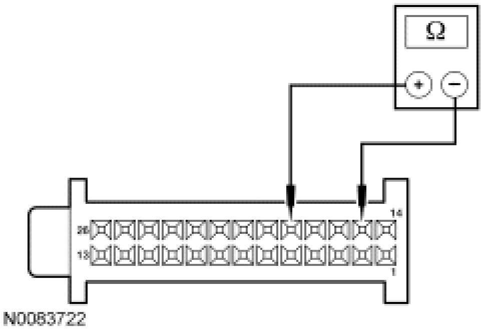

Fig. 120: Checking Potentiometer Low-Side Resistance (EATC)
Courtesy of FORD MOTOR CO.

NOTE: **EATC systems only.**

- Measure the resistance between HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side and HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side.

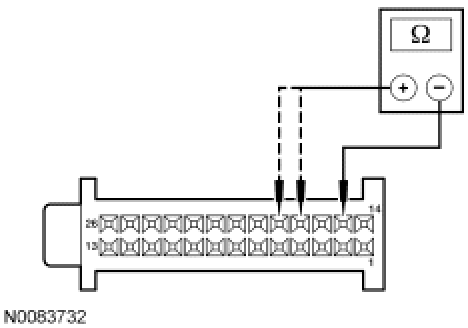

Fig. 121: Checking Potentiometer Low-Side Resistance (DATC)
Courtesy of FORD MOTOR CO.

NOTE: **DATC systems only.**

- Measure the resistance between HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and the following:
  - **For DTC B2266** , HVAC module - DATC C2356a-18, circuit VH440 (BN/BU), harness side.
  - **For DTC B2267** , HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side.
- **Is the resistance between 1 and 10,000 ohms?**

  YES : Go to Q3.

  NO : If resistance is greater than 10,000 ohms, go to Q7.

  If resistance is less than 1 ohm, go to Q8.

Q3 CHECK THE POTENTIOMETER HIGH-SIDE RESISTANCE

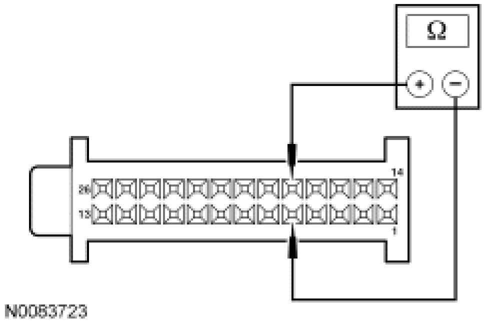

Fig. 122: Checking Potentiometer High-Side Resistance (EATC)
Courtesy of FORD MOTOR CO.

NOTE: **EATC systems only.**

- Measure the resistance between HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side.

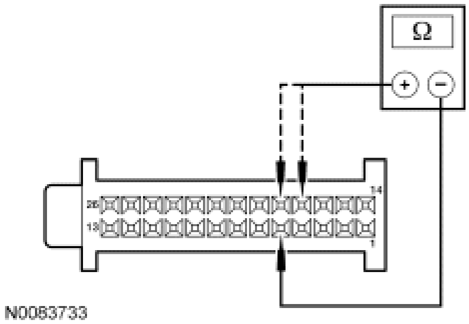

Fig. 123: Checking Potentiometer High-Side Resistance (DATC)
Courtesy of FORD MOTOR CO.

NOTE: **DATC systems only.**

- Measure the resistance between HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and the following:
  - **For DTC B2266** , HVAC module - DATC C2356a-18, circuit VH440 (BN/BU), harness side.
  - **For DTC B2267** , HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side.
- **Is the resistance between 1 and 10,000 ohms?**

  YES : Go to Q10.

  NO : If resistance is greater than 10,000 ohms, INSTALL a new door actuator. TEST the system for normal operation.

  If resistance is less than 1 ohm, go to Q9.

Q4 CHECK CIRCUIT LH111 (BN/WH) FOR AN OPEN

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: **For DTC B2266** , LH Blend Door Actuator C2091
- Disconnect: **For DTC B2267** , RH Blend Door Actuator C2092

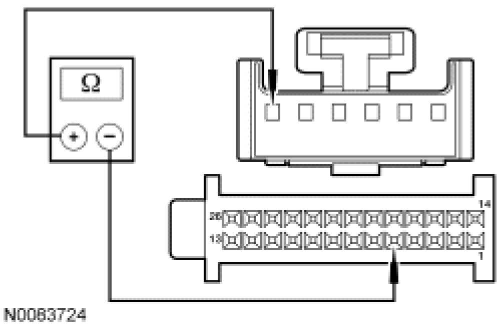

Fig. 124: Checking Circuit LH111 (BN/WH) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and LH blend door actuator C2091-10, circuit LH111 (BN/WH), harness side.

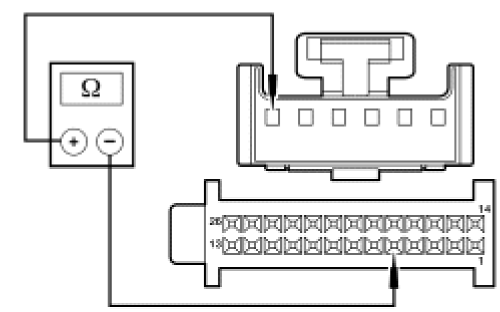

Fig. 125: Checking Circuit LH111 (BN/WH) For An Open (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and the following:
    - **For DTC B2266** , LH blend door actuator C2091-10, circuit LH111 (BN/WH), harness side.
    - **For DTC B2267** , RH blend door actuator C2092-10, circuit LH111 (BN/WH), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to Q5.

  NO : REPAIR circuit LH111 (BN/WH) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Q5 CHECK THE ACTUATOR RETURN CIRCUIT RH111 (GY/BU) FOR AN OPEN

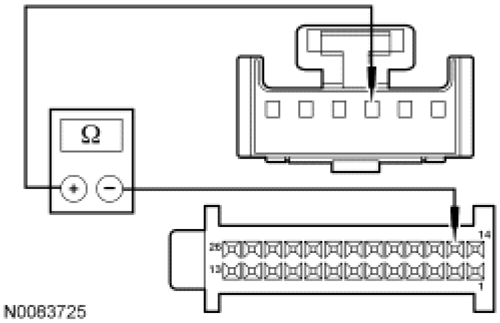

Fig. 126: Checking Actuator Return Circuit RH111 (GY/BU) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side and LH blend door actuator C2091-7, circuit RH111 (GY/BU), harness side.

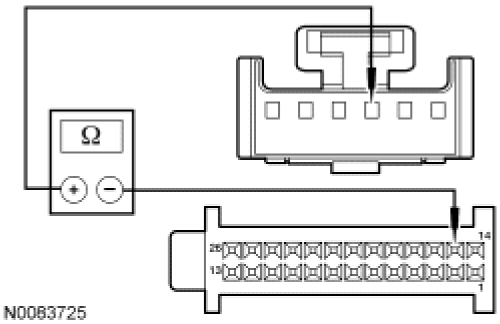

Fig. 127: Checking Actuator Return Circuit RH111 (GY/BU) For An Open (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and the following:
  - **For DTC B2266** , LH blend door actuator C2091-7, circuit RH111 (GY/BU), harness side.
  - **For DTC B2267** , RH blend door actuator C2092-7, circuit RH111 (GY/BU), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system

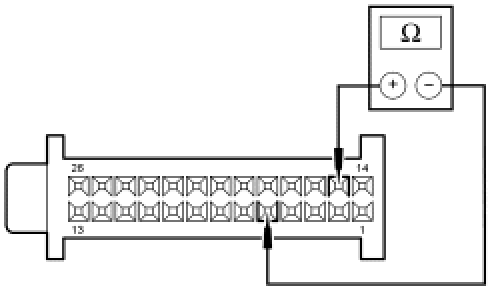
for normal operation.

NO : REPAIR circuit RH111 (GY/BU) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Q6 CHECK CIRCUITS RH111 (GY/BU) AND LH111 (BN/WH) FOR A SHORT TOGETHER

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: **For DTC B2266** , LH Blend Door Actuator C2091
- Disconnect: **For DTC B2267** , RH Blend Door Actuator C2092

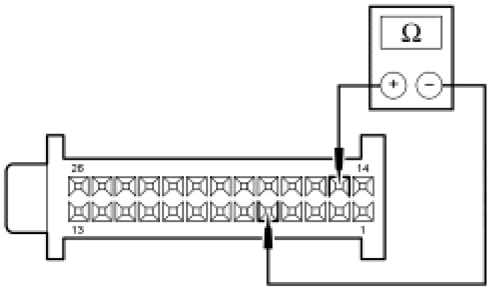


A0072902

Fig. 128: Checking Circuits RH111 (GY/BU) & LH111 (BN/WH) For A Short Together (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side.



A0072902

Fig. 129: Checking Circuits RH111 (GY/BU) & LH111 (BN/WH) For A Short Together (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits RH111 (GY/BU) and LH111 (BN/WH) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Q7 CHECK CIRCUIT VH440 (BU/BN), VH441 (WH/BN) OR VH439 (GY/VT) FOR AN OPEN

NOTE: Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: **For DTC B2266** , LH Blend Door Actuator C2091
- Disconnect: **For DTC B2267** , RH Blend Door Actuator C2092

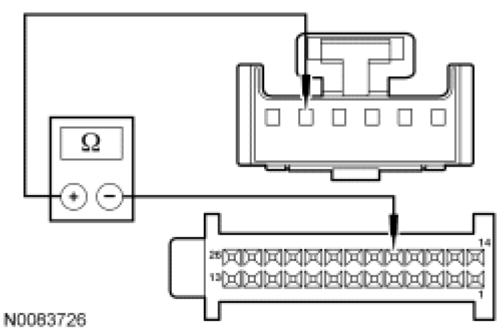


Fig. 130: Checking Circuit VH440 (BU/BN), VH441 (WH/BN) Or VH439 (GY/VT) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side and LH blend door actuator C2091-9, circuit VH439 (GY/VT), harness side.

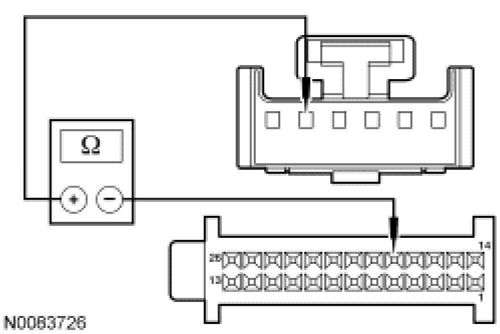

Fig. 131: Checking Circuit VH440 (BU/BN), VH441 (WH/BN) Or VH439 (GY/VT) For An Open (DATC, DTC B2266)
Courtesy of FORD MOTOR CO.

NOTE:	**DATC systems only.**

NOTE:	**For DTC B2266**

- Measure the resistance between HVAC module - DATC C2356a-18 , circuit VH440 (BU/BN), harness side and LH blend door actuator C2091-9, circuit VH440 (BU/BN), harness side.

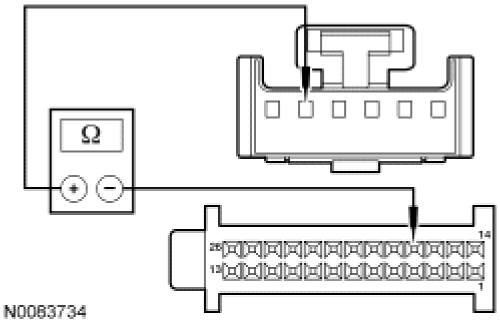

Fig. 132: Checking Circuit VH440 (BU/BN), VH441 (WH/BN) Or VH439 (GY/VT) For An Open (DATC, DTC B2267)
Courtesy of FORD MOTOR CO.

NOTE:	**DATC systems only.**

NOTE:	**For DTC B2267**

- Measure the resistance between HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side and RH blend door actuator C2092-9, circuit VH441 (WH/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuit VH440 (BU/BN), VH441 (WH/BN) or VH439 (GY/VT) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Q8 CHECK CIRCUIT RH111 (GY/BU) FOR A SHORT TO CIRCUIT VH440 (BU/BN), VH441 (WH/BN) OR VH439 (GY/VT)

NOTE:	**Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.**

- Disconnect: **For DTC B2266** , LH Blend Door Actuator C2091
- Disconnect: **For DTC B2267** , RH Blend Door Actuator C2092

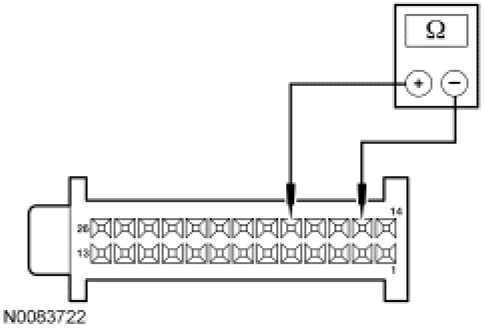

Fig. 133: Checking Circuit RH111 (GY/BU) For A Short To Circuit VH440 (BU/BN), VH441 (WH/BN) Or VH439 (GY/VT) (EATC)
Courtesy of FORD MOTOR CO.

NOTE: **EATC systems only.**

- Measure the resistance between HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side and HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side.

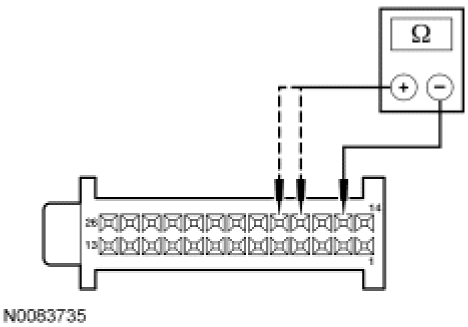

Fig. 134: Checking Circuit RH111 (GY/BU) For A Short To Circuit VH440 (BU/BN), VH441 (WH/BN) Or VH439 (GY/VT) (DATC)
Courtesy of FORD MOTOR CO.

NOTE: **DATC systems only.**

- Measure the resistance between HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and the following:
  - **For DTC B2266** , HVAC module - DATC C2356a-18, circuit VH440 (BU/BN), harness side.
  - **For DTC B2267** , HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits RH111 (GY/BU) and circuit VH440 (BU/BN), VH441 (WH/BN) or VH439 (GY/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for

normal operation.

Q9 CHECK CIRCUIT LH111 (BN/WH) FOR A SHORT TO CIRCUIT VH440 (BU/BN), VH441 (WH/BN) OR VH439 (GY/VT)

NOTE:	Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.

- Disconnect: **For DTC B2266** , LH Blend Door Actuator C2091
- Disconnect: **For DTC B2267** , RH Blend Door Actuator C2092

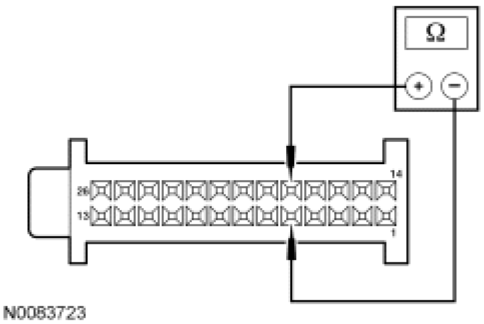

Fig. 135: Checking Circuit LH111 (BN/WH) For A Short To Circuit VH440 (BU/BN), VH441 (WH/BN) Or VH439 (GY/VT) (EATC)
Courtesy of FORD MOTOR CO.

NOTE:	EATC systems only.

- Measure the resistance between HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side and HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side.

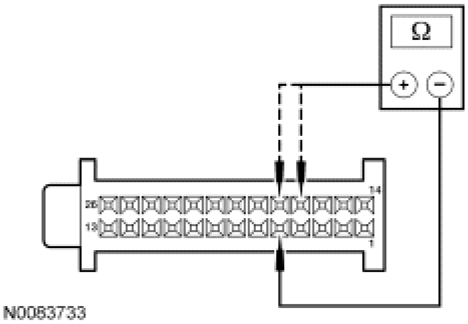

Fig. 136: Checking Circuit LH111 (BN/WH) For A Short To Circuit VH440 (BU/BN), VH441 (WH/BN) Or VH439 (GY/VT) (DATC)
Courtesy of FORD MOTOR CO.

NOTE:	DATC systems only.

- Measure the resistance between HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side and the following:
  - **For DTC B2266** , HVAC module - DATC C2356a-18, circuit VH440 (BU/BN), harness side.
  - **For DTC B2267** , HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR circuits LH111 (BN/WH) and VH440 (BU/BN), VH441 (WH/BN) or VH439 (GY/VT) for a short together. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Q10 CHECK CIRCUIT LH111 (BN/WH), VH439 (GY/VT), VH440 (BU/BN) OR VH441 (WH/BN) FOR A SHORT TO GROUND

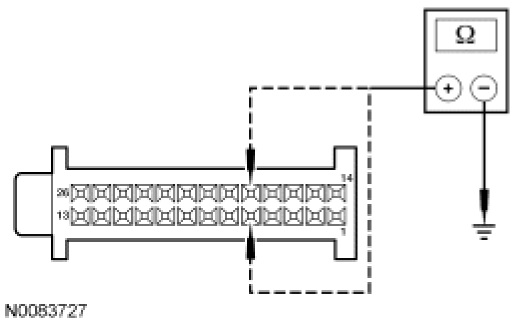

Fig. 137: Checking Circuit LH111 (BN/WH), VH439 (GY/VT), VH440 (BU/BN) Or VH441 (WH/BN) For A Short To Ground (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between ground and the following:
  - HVAC module - EATC C228a-5, circuit LH111 (BN/WH), harness side.
  - HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side.

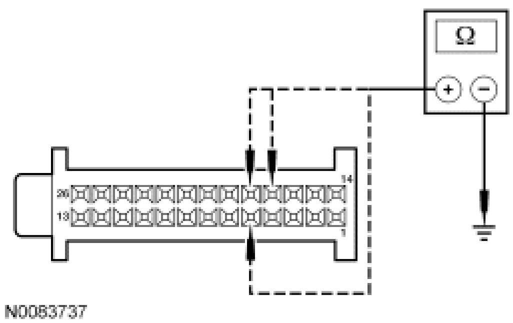

Fig. 138: Checking Circuit LH111 (BN/WH), VH439 (GY/VT), VH440 (BU/BN) Or VH441 (WH/BN) For A Short To Ground (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between ground and the following:
  - HVAC module - DATC C2356a-5, circuit LH111 (BN/WH), harness side.
  - **For DTC B2266** , HVAC module - DATC C2356a-18, circuit VH440 (BU/BN), harness side.
  - **For DTC B2267** , HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to Q11.

  NO : REPAIR circuit(s) for a short to ground. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Q11 CHECK CIRCUIT RH111 (GY/BU), VH439 (GY/VT), VH440 (BU/BN) OR VH441 (WH/BN) FOR A SHORT TO POWER

- Key in ON position.

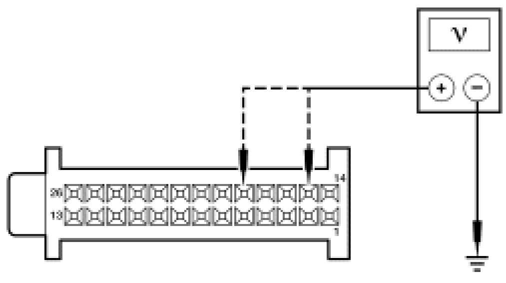

Fig. 139: Checking Circuit RH111 (GY/BU), VH439 (GY/VT), VH440 (BU/BN) Or VH441 (WH/BN) For A Short To Power (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the voltage between ground and the following:
  - HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side.
  - HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side.

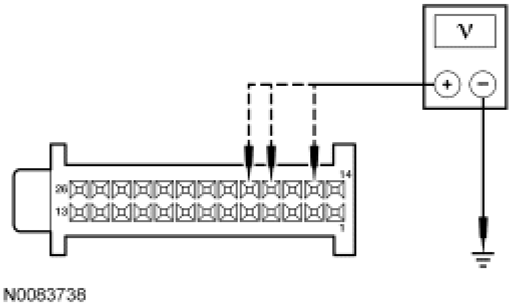

Fig. 140: Checking Circuit RH111 (GY/BU), VH439 (GY/VT), VH440 (BU/BN) Or VH441 (WH/BN) For A Short To Power (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the voltage between ground and the following:
  - HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side.
  - **For DTC B2266** , HVAC module - DATC C2356a-18, circuit VH440 (BU/BN), harness side.
  - **For DTC B2267** , HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side.
- **Is any voltage present?**

  YES : REPAIR circuit(s) for a short to power. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : For EATC systems, go to Q12.

  For DATC systems, **DTC B2266** , go to Q13.

  For DATC systems, **DTC B2267** , go to Q14.

Q12 CHECK THE DOOR ACTUATOR OPERATION

NOTE: If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.

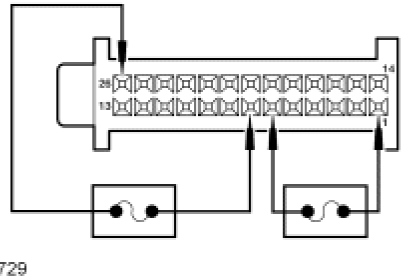

Fig. 141: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-7, circuit CH233 (VT/BN), harness side.
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module - EATC C228a-6, circuit CH234 (YE/GN), harness side.

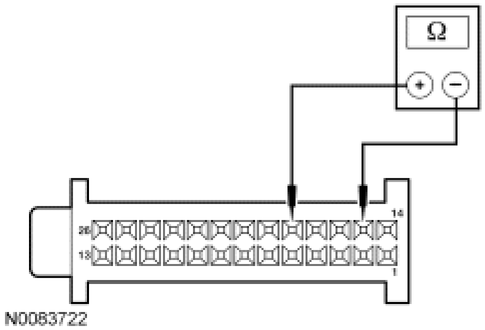

Fig. 142: Measuring Resistance Between C228A-1 & C228A-6, Circuit GD116 (BK/VT) & CH234 (YE/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - EATC C228a-15, circuit RH111 (GY/BU), harness side and HVAC module - EATC C228a-18, circuit VH439 (GY/VT), harness side.

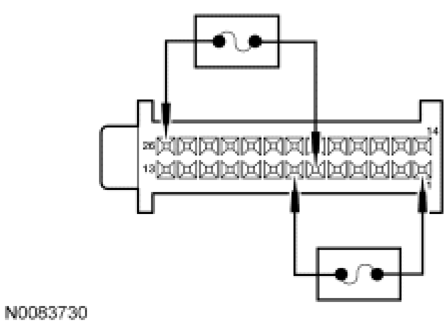

Fig. 143: Measuring Resistance Between C228A-15 & C228A-18, Circuit RH111 (GY/BU) & VH439 (GY/VT)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-6, circuit CH234 (YE/GN), harness side.
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module - EATC C228a-7, circuit CH233 (VT/BN), harness side.

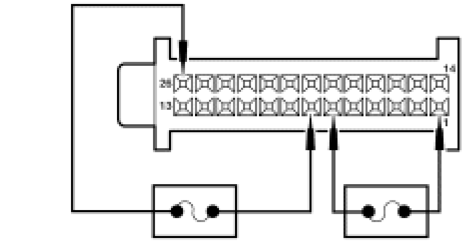

Fig. 144: Measuring Resistance Between C228A-1 & C228A-7, Circuit GD116 (BK/VT) & CH233 (VT/BN)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - EATC C228a-26, circuit SBP07 (WH/RD), harness side and HVAC module - EATC C228a-7, circuit CH233 (VT/BN), harness side.
  - HVAC module - EATC C228a-1, circuit GD116 (BK/VT), harness side and HVAC module - EATC C228a-6, circuit CH234 (YE/GN), harness side.
- **Does the resistance increase and decrease when the jumpers are connected?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to Q17.

  NO : Go to Q15.

Q13 CHECK THE DOOR ACTUATOR OPERATION

NOTE:	**If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.**

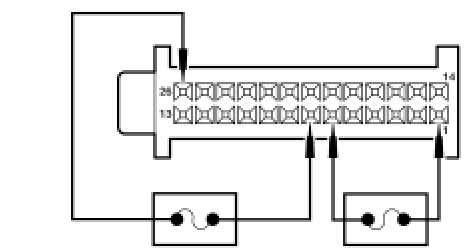

Fig. 145: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-7, circuit CH238 (YE/OG), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-6, circuit CH239 (BU/WH), harness side.

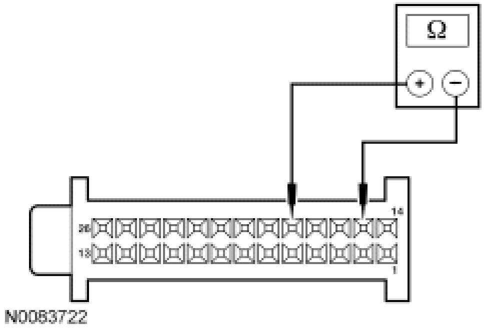

Fig. 146: Measuring Resistance Between C2356A-1 & C2356A-6, Circuit GD116 (BK/VT) & CH239 (BU/WH)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and HVAC module - DATC C2356a-18, circuit VH440 (BN/BU), harness side.

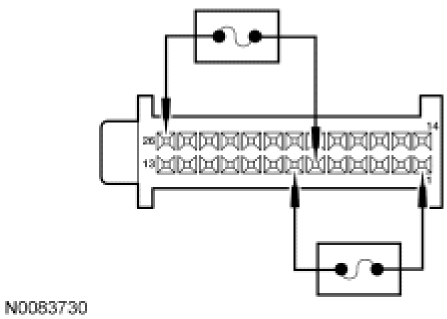

Fig. 147: Measuring Resistance Between C2356A-15 & C2356A-18, Circuit RH111 (GY/BU) & VH440 (BN/BU)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-6, circuit CH239 (BU/WH), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-7, circuit CH238 (YE/OG), harness side.

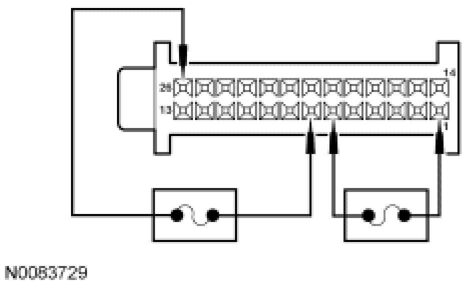

Fig. 148: Measuring Resistance Between C2356A-1 & C2356A-7, Circuit GD116 (BK/VT) & CH238 (YE/OG)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-7, circuit CH238 (YE/OG), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-6, circuit CH239 (BU/WH), harness side.
- **Does the resistance increase and decrease when the jumpers are connected?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to Q17.

  NO : Go to Q15.

Q14 CHECK THE DOOR ACTUATOR OPERATION

NOTE: **If a jumper fuse opens while carrying out this test step, repair the circuit(s) for a short.**

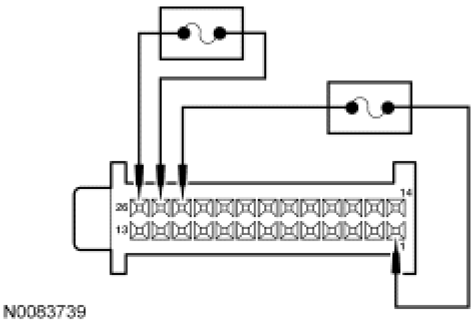

Fig. 149: Checking Door Actuator Operation
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-25, circuit CH212 (BU/OG), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-24, circuit CH213 (BN/GN), harness side.

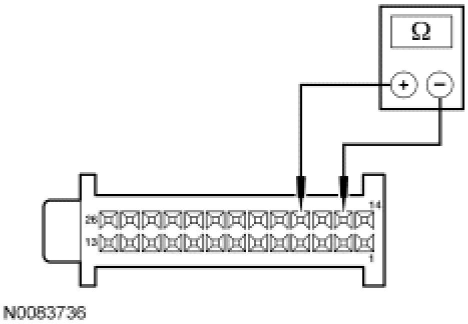

Fig. 150: Measuring Resistance Between C2356A-1 & C2356A-24, Circuit GD116 (BK/VT) & CH213 (BN/GN)
Courtesy of FORD MOTOR CO.

- Measure the resistance between HVAC module - DATC C2356a-15, circuit RH111 (GY/BU), harness side and HVAC module - DATC C2356a-17, circuit VH441 (WH/BN), harness side.

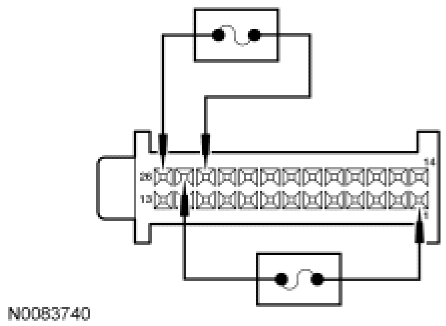

Fig. 151: Measuring Resistance Between C2356A-15 & C2356A-17, Circuit RH111 (GY/BU) & VH441 (WH/BN)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-24, circuit CH213 (BN/GN), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-25, circuit CH212 (BU/OG), harness side.

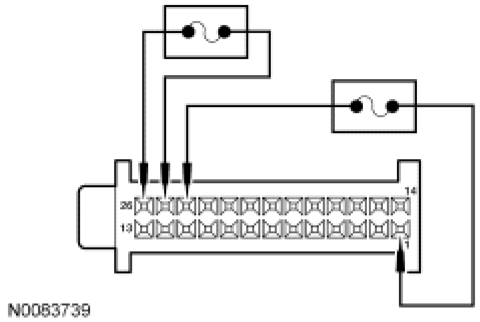

Fig. 152: Measuring Resistance Between C2356A-1 & C2356A-25, Circuit GD116 (BK/VT) & CH212 (BU/OG)
Courtesy of FORD MOTOR CO.

- Connect a fused jumper wire between:
  - HVAC module - DATC C2356a-26, circuit SBP07 (WH/RD), harness side and HVAC module - DATC C2356a-25, circuit CH212 (BU/OG), harness side.
  - HVAC module - DATC C2356a-1, circuit GD116 (BK/VT), harness side and HVAC module - DATC C2356a-24, circuit CH213 (BN/GN), harness side.

- **Does the resistance increase and decrease when the jumpers are connected?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, go to Q17.

  NO : Go to Q15.

Q15 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS

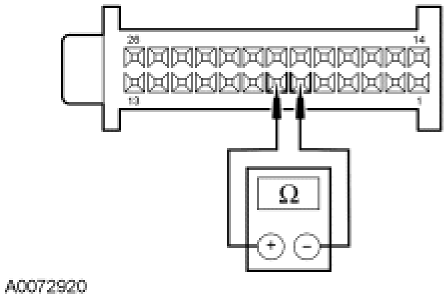

Fig. 153: Checking Actuator Motor Drive Circuits (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between HVAC module - EATC C228a-6, circuit CH234 (YE/GN), harness side and HVAC module - EATC C228a-7, circuit CH233 (VT/BN), harness side.

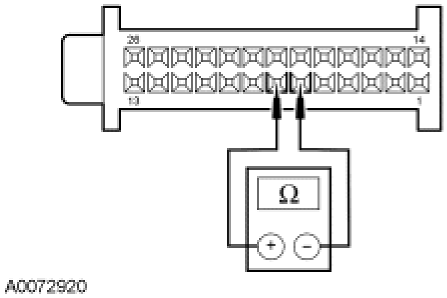

Fig. 154: Checking Actuator Motor Drive Circuits (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

NOTE: For DTC B2266

- Measure the resistance between HVAC module - DATC C2356a-7, circuit CH238 (YE/OG), harness side and HVAC module - DATC C2356a-6, circuit CH239 (BU/WH), harness side.

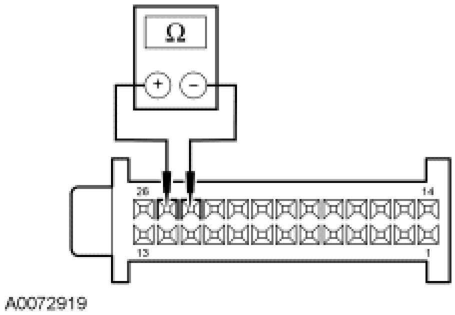

Fig. 155: Checking Actuator Motor Drive Circuits (DATC, DTC B2267)
Courtesy of FORD MOTOR CO.

NOTE:	**DATC systems only.**

NOTE:	**For DTC B2267**

- Measure the resistance between HVAC module - DATC C2356a-25, circuit CH212 (BU/OG), harness side and HVAC module - DATC C2356a-24, circuit CH213 (BN/GN), harness side.
- **Is the resistance between approximately 59-73 ohms?**

  YES : INSPECT for binding or broken door and linkage. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : Go to Q16.

Q16 CHECK THE ACTUATOR MOTOR DRIVE CIRCUITS FOR AN OPEN

NOTE:	**Due to limited connector accessibility, before carrying out this test step, visually inspect the wiring between the HVAC module and actuator for opens or shorts. If no damage is visually evident, proceed with the test.**

- Disconnect: **For DTC B2266** , LH Blend Door Actuator C2091
- Disconnect: **For DTC B2267** , RH Blend Door Actuator C2092

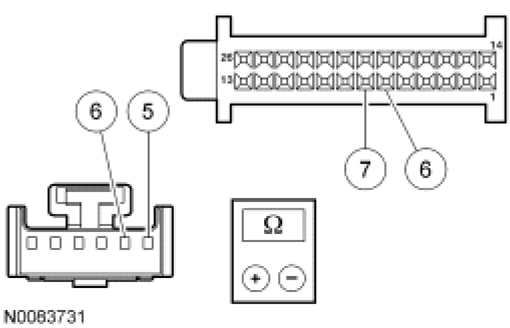

Fig. 156: Checking Actuator Motor Drive Circuits For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between the HVAC module - EATC connector, harness side and LH blend door actuator, harness side using the following chart.

HVAC Module Connector	Circuit	LH Blend Door Actuator Connector
C228a-7	CH233 (VT/BN)	C2091-5
C228a-6	CH234 (YE/GN)	C2091-6

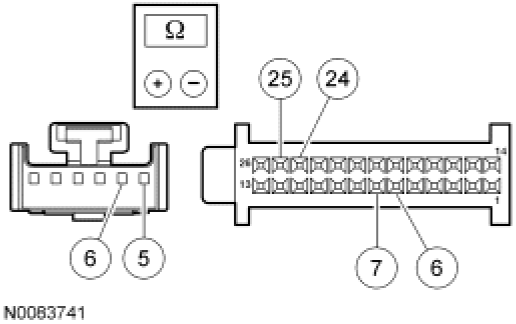

Fig. 157: Checking Actuator Motor Drive Circuits For An Open (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between the HVAC module - DATC connector, harness side and LH blend door actuator, harness side or RH blend door actuator, harness side using the following chart.

DTC	HVAC Module Connector	Circuit	LH/RH Blend Door Actuator Connector
B2266	C2356a-7	CH238 (YE/OG)	LH, C2091-5
B2266	C2356a-6	CH239 (BU/WH)	LH, C2091-6
B2267	C2356a-25	CH212 (BU/OG)	RH, C2092-5
B2267	C2356a-24	CH213 (BN/GN)	RH, C2092-6

- **Are the resistances less than 5 ohms?**

  YES : INSPECT for binding or broken linkage. If no condition is found, INSTALL a new door actuator. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

  NO : REPAIR the circuit(s) for an open. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Q17 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test R: The Blower Motor is Inoperative - EMTC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor relay coil receives ignition voltage through circuit CBP23 (BN/YE). The coil receives ground from the HVAC module - Electronic Manual Temperature Control (EMTC) through circuit CH123 (VT/GN) if any function selector position but OFF is selected. Voltage is supplied to the relay switch contact through circuit SBB04 (GN/RD). When the relay coil is energized, voltage is delivered to the blower motor through circuit CH402 (YE/GN). Ground for the blower motor is provided through circuit CH430 (VT/OG) from the blower resistor or the blower switch (HI). The blower resistor and blower switch are grounded through circuit GD115 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Blower motor
- HVAC module - EMTC
- Blower motor relay
- Blower motor switch

PINPOINT TEST R: THE BLOWER MOTOR IS INOPERATIVE - EMTC

NOTE: It is important to install relays in their correct position in the Battery Junction Box (BJB). Installing a relay incorrectly may cause wiring shorts or damage to modules. While carrying out diagnostics on BJB relays, have only one BJB relay removed at a time. Failure to follow these instructions may result in damage to the vehicle circuitry or to control modules.

R1 CHECK CIRCUIT CH430 (VT/OG) FOR GROUND

- Disconnect: Blower Motor C288
- Turn the function selector switch to the VENT position.
- Turn the blower motor switch to the HI position.

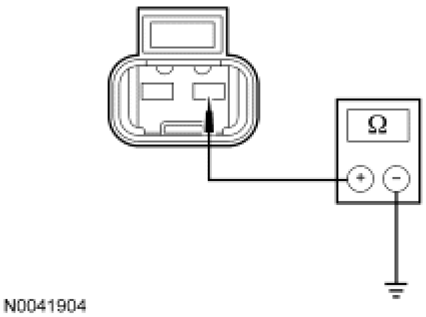

Fig. 158: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between A/C blower motor C288-B, circuit CH430 (VT/OG), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to R4.

  NO : Go to R2.

R2 CHECK CIRCUIT CH430 (VT/OG) FOR AN OPEN

- Disconnect: Blower Motor Switch C2357b

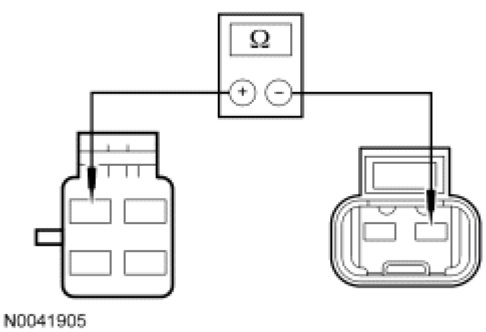

Fig. 159: Checking Circuit CH430 (VT/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor switch C2357b-2, circuit CH430 (VT/OG), harness side and blower motor C288-B, circuit CH430 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R3.

  NO : REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.

R3 CHECK CIRCUIT GD115 (BK/GY) FOR AN OPEN

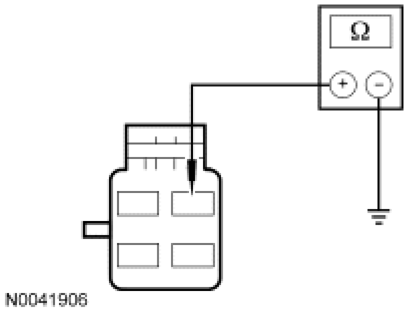

Fig. 160: Checking Circuit GD115 (BK/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor switch C2357b-1, circuit GD115 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new blower motor switch. TEST the system for normal operation.

  NO : REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.

R4 CHECK A/C BLOWER MOTOR CIRCUIT CH402 (YE/GN) FOR VOLTAGE

- Key in ON position.

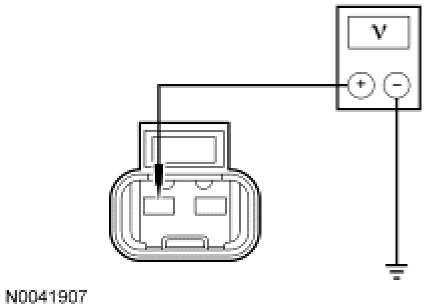

Fig. 161: Checking A/C Blower Motor Circuit CH402 (YE/GN) For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between A/C blower motor connector C288-A, circuit CH402 (YE/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new blower motor. TEST the system for normal operation.

NO : Go to R5.

R5 CHECK CIRCUIT CH402 (YE/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Blower Motor Relay

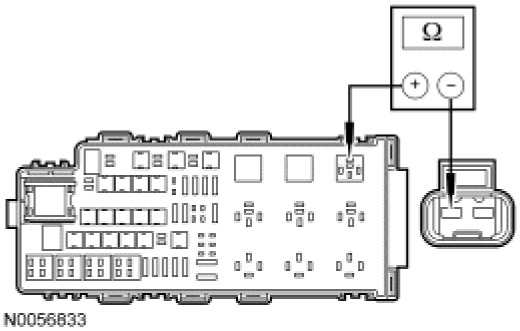

Fig. 162: Checking Circuit CH402 (YE/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor relay connector pin 87, circuit CH402 (YE/GN) and blower motor C288-A, circuit CH402 (YE/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R6.

  NO : REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.

R6 CHECK THE BLOWER MOTOR RELAY

- Connect: Blower Motor C288
- Key in ON position.

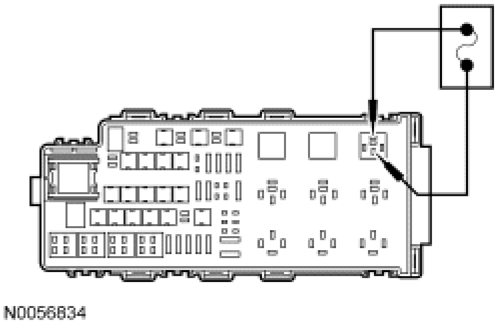

Fig. 163: Checking Blower Motor Relay
Courtesy of FORD MOTOR CO.

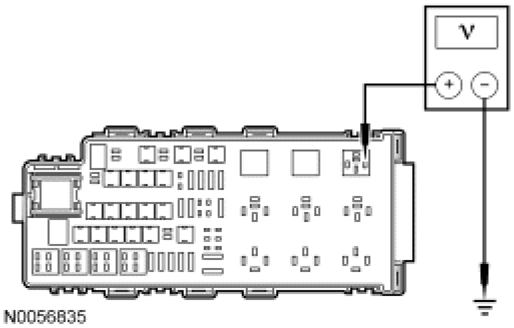
- Connect a fused jumper lead between blower motor relay socket pin 30, circuit SBB04 (GN/RD) and pin 87, circuit CH402 (YE/GN).
- **Does the blower motor operate?**

  YES : Go to R7.

NO : VERIFY BJB fuse 4 (40A) is OK. If OK, REPAIR circuit SBB04 (GN/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams Manual to identify the possible causes of the circuit short.

R7 CHECK THE RELAY COIL SUPPLY VOLTAGE

- Key in OFF position.



N0056835

Fig. 164: Checking Relay Coil Supply Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between blower motor relay socket pin 86, circuit CBP23 (BN/YE) and ground.
- **Is the voltage greater than 10 volts?**

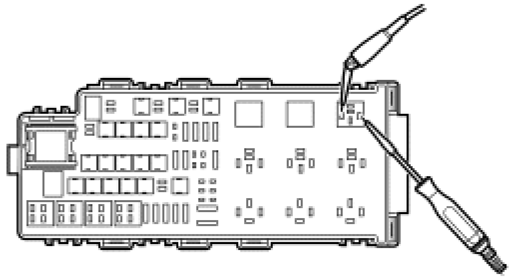
YES : Go to R8.

NO : VERIFY Smart Junction Box (SJB) fuse 23 (7.5A) is OK. If OK, REPAIR circuit CBP23 (BN/YE) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams article to identify the possible causes of the circuit short.

R8 CHECK THE BLOWER MOTOR RELAY

NOTE: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use the test lamp probe.

- Key in ON position.



N0063742

Fig. 165: Checking Blower Motor Relay
Courtesy of FORD MOTOR CO.

- With the engine running, connect a 12-volt test lamp between blower motor relay socket pin 85, circuit CH123 (VT/GN) and socket pin 86, circuit CBP23 (BN/YE).
- **Does the test lamp illuminate?**

  YES : INSTALL a new blower motor relay. TEST the system for normal operation.

  NO : Go to R9.

R9 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: HVAC Module - EMTC C2357a

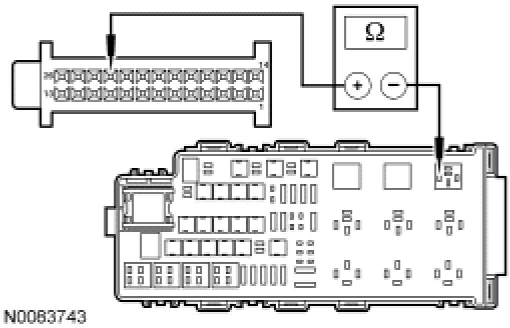


Fig. 166: Checking Circuit CH123 (VT/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor relay connector pin 85, circuit CH123 (VT/GN) and HVAC Module - EMTC C2357a-23, circuit CH123 (VT/GN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to R10.

  NO : REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation.

R10 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. TEST the system for normal operation.

Pinpoint Test S: The Blower Motor Does Not Operate Correctly - EMTC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Manual Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor is provided a ground from the blower resistor through circuit CH430 (VT/OG). The resistor gets a ground from circuit GD115 (BK/GY) in the lowest blower setting. In MED-LO and MED-HI the resistor gets a ground from the blower motor switch through circuit CH428 (GN/WH) or CH429 (GY/BN), depending on selected speed. In HI, the blower motor is grounded directly through the blower motor switch from circuit CH430 (VT/OG) to circuit GD115 (BK/GY). The blower switch receives its ground from circuit GD115 (BK/GY).

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors
- Blower motor resistor
- Blower motor switch

PINPOINT TEST S: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY - EMTC

S1 CHECK THE BLOWER MOTOR OPERATION

- Key in ON position.
- Turn the function selector switch to the floor position.
- Select all blower speed positions.
- **Does the blower motor operate in any position?**

YES : If the blower motor does not operate in HI, go to S2.

If the blower motor does not operate in MED-HI, go to S3.

If the blower motor does not operate in MED-LO, go to S4.

If the blower motor does not operate in LO, go to S5.

For all other symptoms, go to S9.

NO : Go to **Pinpoint Test R**.

S2 CHECK CIRCUIT CH430 (VT/OG) FOR AN OPEN

- Key in OFF position.
- Disconnect: Blower Motor Switch C2357b
- Disconnect: Blower Motor C288

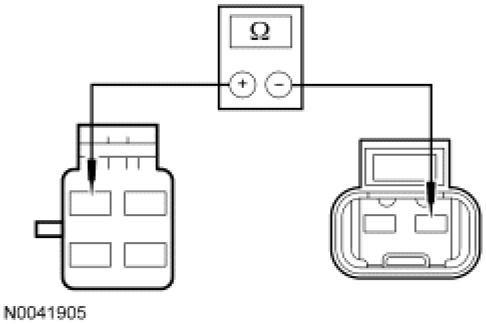

Fig. 167: Checking Circuit CH430 (VT/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor switch C2357b-2, circuit CH430 (VT/OG), harness side and blower motor C288-B, circuit CH430 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to S6.

  NO : REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.

S3 CHECK CIRCUIT CH429 (GY/BN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Blower Motor Switch C2357b
- Disconnect: Blower Motor Resistor C293

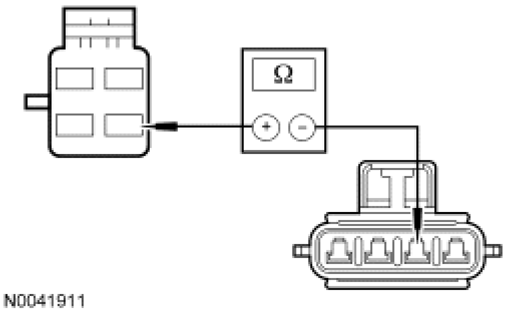

Fig. 168: Checking Circuit CH429 (GY/BN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor switch C2357b-3, circuit CH429 (GY/BN), harness side and blower motor resistor C293-B, circuit CH429 (GY/BN), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to S6.

  NO : REPAIR circuit CH429 (GY/BN) for an open. TEST the system for normal operation.

S4 CHECK CIRCUIT CH428 (GN/WH) FOR AN OPEN

- Key in OFF position.
- Disconnect: Blower Motor Switch C2357b

- Disconnect: Blower Motor Resistor C293

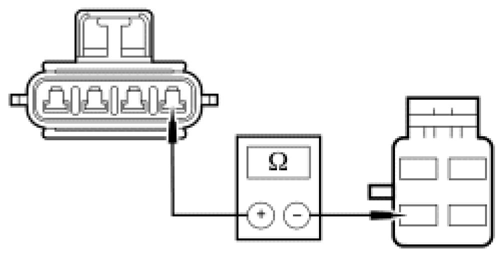

Fig. 169: Checking Circuit CH428 (GN/WH) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor switch C2357b-4, circuit CH428 (GN/WH), harness side and blower motor resistor C293-A, circuit CH428 (GN/WH), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to S6.

  NO : REPAIR circuit CH428 (GN/WH) for an open. TEST the system for normal operation.

S5 CHECK BLOWER MOTOR RESISTOR GROUND CIRCUIT GD115 (BK/GY) FOR AN OPEN

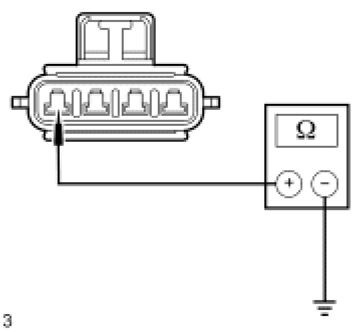

Fig. 170: Checking Blower Motor Resistor Ground Circuit GD115 (BK/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor resistor C293-D, circuit GD115 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to S6.

  NO : REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.

S6 CHECK THE BLOWER MOTOR RESISTOR CIRCUIT CH430 (VT/OG) FOR AN OPEN

- Connect: Blower Motor C288

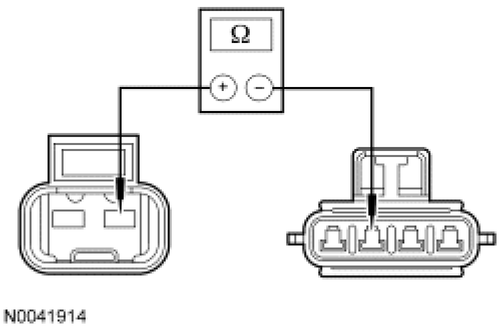

Fig. 171: Checking Blower Motor Resistor Circuit CH430 (VT/OG) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor resistor C293-C, circuit CH430 (VT/OG), harness side and blower motor C288-B, circuit CH430 (VT/OG), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to S7.

  NO : REPAIR circuit CH430 (VT/OG) for an open. TEST the system for normal operation.

S7 CHECK THE BLOWER MOTOR RESISTOR

- Carry out the **Blower Motor Resistor**.
- **Does the blower motor resistor test good?**

  YES : Go to S8.

  NO : INSTALL a new blower motor resistor. TEST the system for normal operation.

S8 CHECK THE BLOWER MOTOR SWITCH CIRCUIT GD115 (BK/GY) FOR AN OPEN

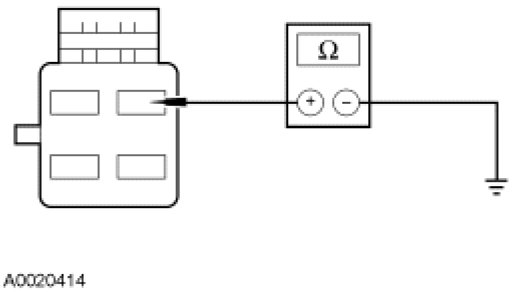

Fig. 172: Checking Blower Motor Switch Circuit 57 (BK) For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor switch C2357b-1, circuit GD115 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

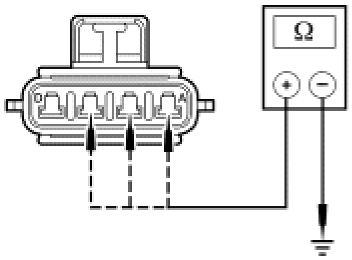
  YES : INSTALL a new blower motor switch. TEST the system for normal operation.

  NO : REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.

S9 CHECK CIRCUITS CH430 (VT/OG), CH428 (GN/WH) AND CH429 (GY/BN) FOR A SHORT

TO GROUND

- Key in OFF position.
- Disconnect: Blower Motor C288
- Disconnect: Blower Motor Resistor C293
- Place the blower switch in the lowest setting.



N0083744

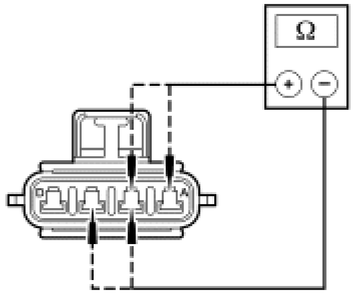
Fig. 173: Checking Circuits CH430 (VT/OG), CH428 (GN/WH) & CH429 (GY/BN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and blower motor resistor:
  - C293-A, circuit CH428 (GN/WH), harness side.
  - C293-B, circuit CH429 (GY/BN), harness side.
  - C293-C, circuit CH430 (VT/OG), harness side.
- **Are the resistances less than 5 ohms?**

  YES : Go to S10.

  NO : REPAIR the affected circuit. TEST the system for normal operation.

S10 CHECK THE BLOWER MOTOR CIRCUITS FOR SHORTS TOGETHER



N0083745

Fig. 174: Checking Blower Motor Circuits For Shorts Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor resistor:
  - C293-A, circuit CH428 (GN/WH), harness side and C293-B, circuit CH429 (GY/BN), harness side.

- C293-A, circuit CH428 (GN/WH), harness side and C293-C, circuit CH430 (VT/OG), harness side.
- C293-B, circuit CH429 (GY/BN), harness side and C293-C, circuit CH430 (VT/OG), harness side.

- **Are the resistances greater than 10,000 ohms?**

  YES : INSTALL a new blower motor switch. TEST the system for normal operation.

  NO : REPAIR the affected circuits. TEST the system for normal operation.

Pinpoint Test T: The Blower Motor is Inoperative - DATC/EATC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the HVAC module - Electronic Automatic Temperature Control (EATC) or HVAC module - Dual Automatic Temperature Control (DATC) module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit CBP23 (BN/YE). Voltage is supplied to the relay switch contact through circuit SBB04 (GN/RD). When the relay coil is energized, voltage is delivered to the blower motor control module through circuit CH402 (YE/GN). Ground for the blower control module is provided by circuit GD115 (BK/GY). The HVAC module - DATC or HVAC module - EATC module provides a pulsed ground to the blower control module through circuit VH101 (WH/VT) to control the blower speed. Voltage for the motor is provided through circuit CH218 (GN/VT) from the blower control module. Ground for the motor is provided through circuit VH301 (YE/BU) from the blower control module.

This pinpoint test is intended to diagnose the following:

- Fuse(s)
- Wiring, terminals or connectors
- Blower motor relay
- Blower motor control
- HVAC module - EATC
- HVAC module - DATC
- Blower motor

PINPOINT TEST T: THE BLOWER MOTOR IS INOPERATIVE - DATC/EATC

NOTE:	**It is important to install relays in their correct position in the Battery Junction Box (BJB). Installing a relay incorrectly may cause wiring shorts or damage to modules. While carrying out diagnostics on BJB relays, have only one BJB relay removed at a time. Failure to follow these instructions may result in damage to the vehicle circuitry or to control modules.**

T1 VERIFY THE BLOWER MOTOR OPERATION

- Key in ON position.
- Press the PANEL button on the HVAC module. Adjust the blower motor setting to LO and then to HI.
- **Is the blower motor inoperative in all settings?**

  YES : Go to T2.

  NO : Go to **Pinpoint Test U**.

T2 CHECK FOR VOLTAGE TO THE BLOWER MOTOR

- Key in OFF position.
- Disconnect: Blower Motor C288
- Key in ON position.

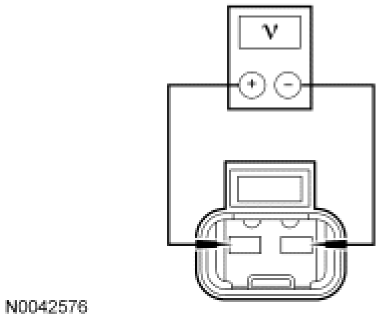


Fig. 175: Checking For Voltage To Blower Motor
Courtesy of FORD MOTOR CO.

- Measure the voltage between blower motor C288-A, circuit CH123 (VT/GN), harness side and blower motor C288-B, circuit VH301 (YE/BU), harness side.
- **Is the voltage greater than 10 volts?**

  YES : INSTALL a new blower motor. TEST the system for normal operation.

  NO : Go to T3.

T3 CHECK FOR VOLTAGE TO THE BLOWER MOTOR CONTROLLER

- Key in OFF position.
- Disconnect: Blower Motor Speed Control C271
- Key in ON position.
- Press the PANEL button on the HVAC module.

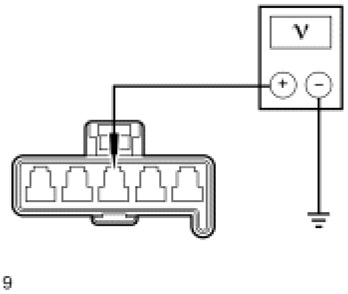

Fig. 176: Checking For Voltage To Blower Motor Controller
Courtesy of FORD MOTOR CO.

- Measure the voltage between blower motor speed control C271-C, circuit CH402 (YE/GN), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to T4.

  NO : Go to T12.

T4 CHECK CIRCUIT GD115 (BK/GY) FOR AN OPEN

- Key in OFF position.

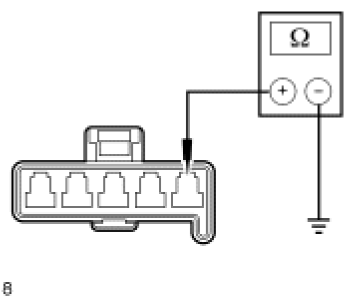

Fig. 177: Checking Circuit GD115 (BK/GY) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor speed control C271-A, circuit GD115 (BK/GY), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : Go to T5.

  NO : REPAIR circuit GD115 (BK/GY) for an open. TEST the system for normal operation.

T5 CHECK CIRCUIT VH101 (WH/VT) FOR GROUND SIGNAL

- Key in ON position.
- Press the PANEL button on the HVAC module. Adjust the blower motor setting to HI.

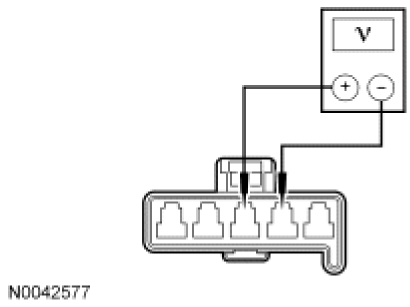

Fig. 178: Checking Circuit VH101 (WH/VT) For Ground Signal
Courtesy of FORD MOTOR CO.

- Measure the voltage between blower motor speed control C271-B, circuit VH101 (WH/VT), harness side and blower motor speed control C271-C, circuit CH402 (YE/GN), harness side.
- **Is the voltage greater than 10 volts?**

  YES : Go to T8.

  NO : Go to T6.

T6 CHECK CIRCUIT VH101 (WH/VT) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: HVAC Module - EATC C228b or HVAC Module - DATC C2356b
- Key in ON position.

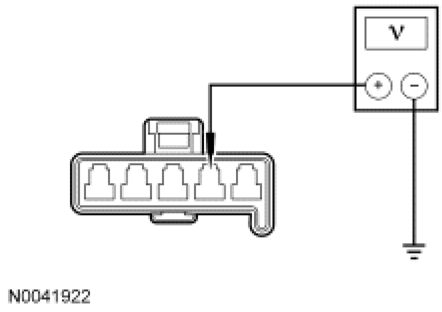

Fig. 179: Checking Circuit VH101 (WH/VT) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and blower motor speed control C271-B, circuit VH101 (WH/VT), harness side.
- **Is any voltage present?**

  YES : REPAIR circuit VH101 (WH/VT) for a short to voltage. TEST the system for normal operation.

  NO : Go to T7.

T7 CHECK CIRCUIT VH101 (WH/VT) FOR AN OPEN

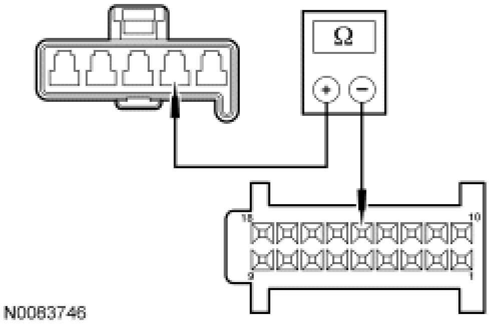

Fig. 180: Checking Circuit VH101 (WH/VT) For An Open (EATC)
Courtesy of FORD MOTOR CO.

NOTE: EATC systems only.

- Measure the resistance between blower motor control C271-B, circuit VH101 (WH/VT), harness side and HVAC module - EATC C228b-14, circuit VH101 (WH/VT), harness side.

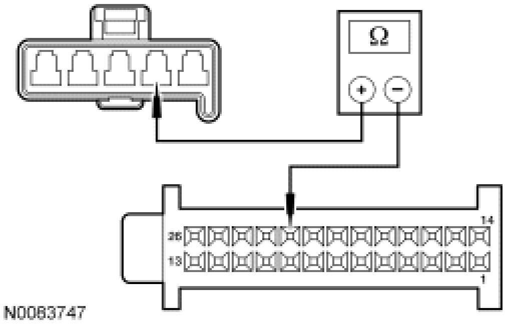

Fig. 181: Checking Circuit VH101 (WH/VT) For An Open (DATC)
Courtesy of FORD MOTOR CO.

NOTE: DATC systems only.

- Measure the resistance between blower motor control C271-B, circuit VH101 (WH/VT), harness side and HVAC module - DATC C2356b-22, circuit VH101 (WH/VT), harness side.
- **Is the resistance less than 5 ohms?**

  YES : Go to T18.

  NO : REPAIR circuit VH101 (WH/VT) for an open. TEST the system for normal operation.

T8 CHECK CIRCUITS CH218 (GN/VT) AND VH301 (YE/BU) FOR AN OPEN

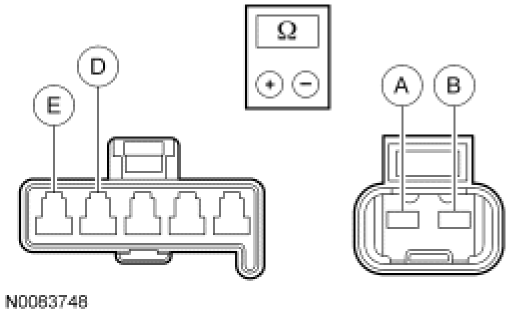

Fig. 182: Checking Circuits CH218 (GN/VT) & VH301 (YE/BU) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the blower motor connector, harness side and blower motor speed control, harness side using the following chart.

Blower Motor Connector	Circuit	Blower Motor Speed Control Connector
C288-A	CH218 (GN/VT)	C271-E
C288-B	VH301 (YE/BU)	C271-D

- **Are the resistances less than 5 ohms?**

  YES : Go to T9.

  NO : REPAIR circuit CH218 (GN/VT) or VH301 (YE/BU) for an open. TEST the system for normal operation.

T9 CHECK CIRCUITS CH218 (GN/VT) AND VH301 (YE/BU) FOR A SHORT TOGETHER

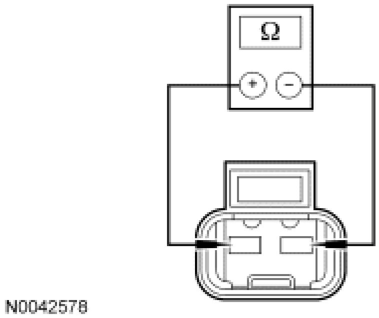

Fig. 183: Checking Circuits CH218 (GN/VT) And VH301 (YE/BU) For Short Together
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor C288-A, circuit CH218 (GN/VT), harness side and

blower motor C288-B, circuit VH301 (YE/BU), harness side.

- **Is the resistance greater than 10,000 ohms?**

  YES : Go to T10.

  NO : REPAIR circuits CH218 (GN/VT) and VH301 (YE/BU) for a short together. TEST the system for normal operation.

T10 CHECK CIRCUIT CH218 (GN/VT) FOR A SHORT TO GROUND

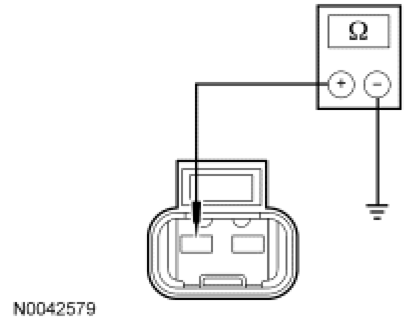

Fig. 184: Checking Circuit CH218 (GN/VT) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and blower motor C288-A, circuit CH218 (GN/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to T11.

  NO : REPAIR circuit CH218 (GN/VT) for a short to ground. TEST the system for normal operation.

T11 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO VOLTAGE

- Key in ON position.

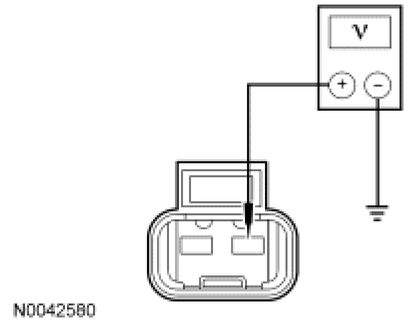

Fig. 185: Checking Circuit VH301 (YE/BU) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and blower motor C288-B, circuit VH301 (YE/BU), harness side.
- **Is any voltage present?**

YES : REPAIR circuit VH301 (YE/BU) for a short to voltage. TEST the system for normal operation.

NO : INSTALL a new blower motor speed control. TEST the system for normal operation.

T12 CHECK CIRCUIT CH402 (YE/GN) FOR AN OPEN

- Key in OFF position.
- Disconnect: Blower Motor Relay

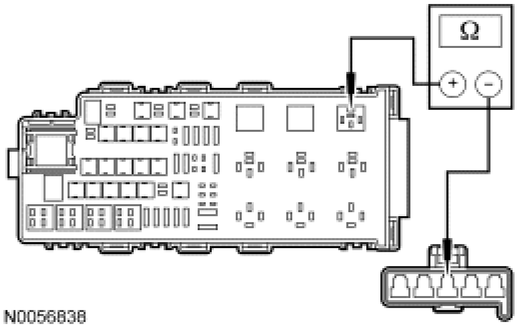

Fig. 186: Checking Circuit CH402 (YE/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor relay socket pin 87, circuit CH402 (YE/GN) and blower motor control C271-C, circuit CH402 (YE/GN), harness side.
- **Is the resistance less than 5 ohms?**

YES : Go to T13.

NO : REPAIR circuit CH402 (YE/GN) for an open. TEST the system for normal operation.

T13 CHECK THE RELAY COIL SUPPLY VOLTAGE

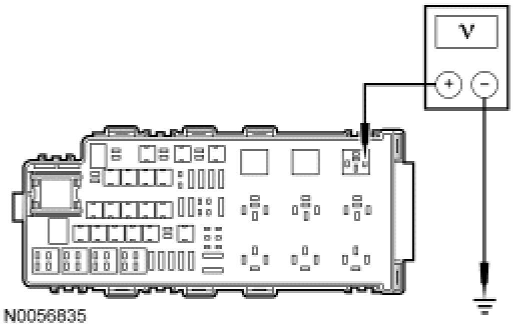

Fig. 187: Checking Relay Coil Supply Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between blower motor relay socket pin 86, circuit CBP23 (BN/YE) and ground.
- **Is the voltage greater than 10 volts?**

YES : Go to T14.

NO : VERIFY Smart Junction Box (SJB) fuse 23 (7.5A) is OK. If OK, REPAIR circuit CBP23

(BN/YE) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams article to identify the possible causes of the circuit short.

T14 CHECK THE RELAY SWITCH POWER CIRCUIT FOR AN OPEN

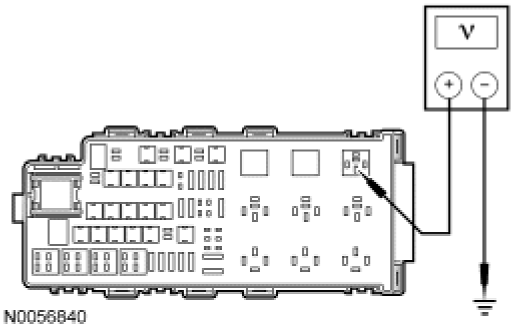

Fig. 188: Checking Relay Switch Power Circuit For An Open
Courtesy of FORD MOTOR CO.

- Measure the voltage between blower motor relay socket pin 30, circuit SBB04 (GN/RD) and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to T15.

  NO : VERIFY Battery Junction Box (BJB) fuse 4 (40A) is OK. If OK, REPAIR circuit SBB04 (GN/RD) for an open. TEST the system for normal operation. If not OK, REFER to the Wiring Diagrams article to identify the possible causes of the circuit short.

T15 CHECK THE MODULE OUTPUT

NOTE:	**Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use the test lamp probe.**

- Key in ON position.

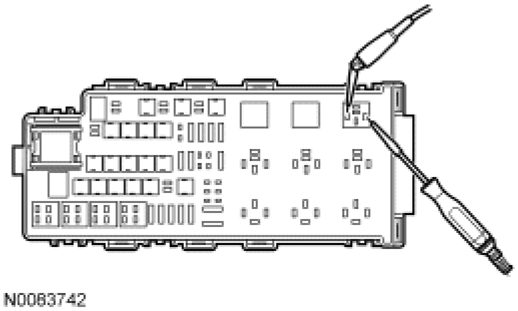

Fig. 189: Checking Module Output
Courtesy of FORD MOTOR CO.

- With the engine running, connect a 12-volt test lamp between blower motor relay socket pin 85, circuit CH123 (VT/GN) and socket pin 86, circuit CBP23 (BN/YE).

- **Does the test lamp illuminate?**

  YES : INSTALL a new blower motor relay. TEST the system for normal operation.

  NO : Go to T16.

T16 CHECK CIRCUIT CH123 (VT/GN) FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Disconnect: HVAC Module - DATC C2356a or HVAC Module - EATC C228a
- Key in ON position.

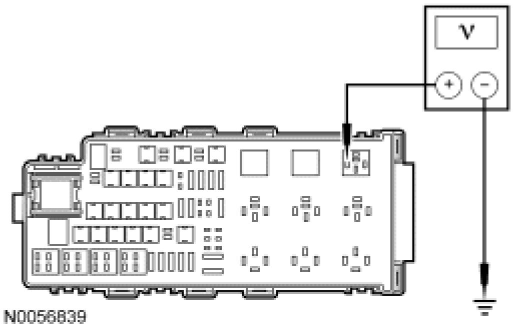

Fig. 190: Checking Circuit CH123 (VT/GN) For A Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between blower motor relay socket pin 85, circuit CH123 (VT/GN) and ground.
- **Is any voltage present?**

  YES : REPAIR circuit CH123 (VT/GN) for a short to voltage. TEST the system for normal operation.

  NO : Go to T17.

T17 CHECK CIRCUIT CH123 (VT/GN) FOR AN OPEN

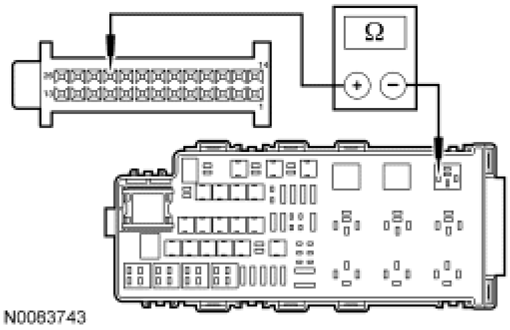

Fig. 191: Checking Circuit CH123 (VT/GN) For An Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor relay socket pin 85, circuit CH123 (VT/GN) and: or and .

NOTE: EATC systems only.

- HVAC module - EATC C228a-23, circuit CH123 (VT/GN), harness side.

NOTE: DATC systems only.

- HVAC module - DATC C2356a-23, circuit CH123 (VT/GN), harness side.

- **Is the resistance less than 5 ohms?**

  YES : Go to T18.

  NO : REPAIR circuit CH123 (VT/GN) for an open. TEST the system for normal operation.

T18 CHECK THE MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test U: The Blower Motor Does Not Operate Correctly - DATC/EATC

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Automatic Climate Control System for schematic and connector information.

Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the HVAC module -Electronic Automatic Temperature Control (EATC) or HVAC module - Dual Automatic Temperature Control (DATC) module through circuit CH123 (VT/GN). The coil receives ignition voltage through circuit A_CBP23 (BN/YE). Voltage is supplied to the relay switch contact through circuit SBB04 (GN/RD). When the relay coil is energized, voltage is delivered to the blower motor control module through circuit CH402 (YE/GN). Ground for the blower control module is provided by circuit GD115 (BK/GY). The HVAC module - DATC or HVAC module - EATC module provides a pulsed ground to the blower control module through circuit VH101 (WH/VT) to control the blower speed. Voltage for the motor is provided through circuit CH218 (GN/VT) from the blower control module. Ground for the motor is provided through circuit VH301 (YE/BU) from the blower control module.

This pinpoint test is intended to diagnose the following:

- Wiring, terminals or connectors

- Blower motor control module
- Blower motor relay
- HVAC module - EATC
- HVAC module - DATC

PINPOINT TEST U: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY - DATC/EATC

NOTE: It is important to install relays in their correct position in the Battery Junction Box (BJB). Installing a relay incorrectly may cause wiring shorts or damage to modules. While carrying out diagnostics on BJB relays, have only one BJB relay removed at a time. Failure to follow these instructions may result in damage to the vehicle circuitry or to control modules.

U1 VERIFY THE BLOWER MOTOR OPERATION

- Key in ON position.
- Press the panel button on the HVAC module. Adjust the blower motor setting to LO and then to HI.
- **Does the blower motor operate at any setting?**

  YES : If the blower motor operates always in HI, go to U2.

  If the blower motor is always ON, go to U5.

  NO : Go to **Pinpoint Test T**.

U2 CHECK CIRCUIT VH101 (WH/VT) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Blower Motor Speed Control C271
- Disconnect: HVAC Module - DATC Module C2356b or HVAC Module - EATC C228b

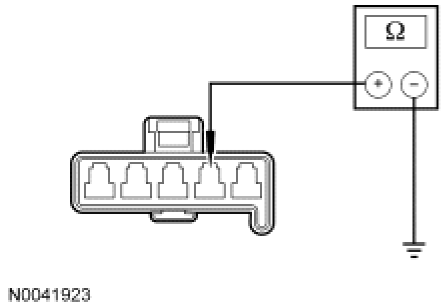

Fig. 192: Checking Circuit VH101 (WH/VT) For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and blower motor speed control C271-B, circuit VH101 (WH/VT), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : Go to U3.

NO : REPAIR circuit VH101 (WH/VT) for a short to ground. TEST the system for normal operation.

U3 CHECK CIRCUIT CH218 (GN/VT) FOR A SHORT TO VOLTAGE

- Disconnect: Blower Motor C288
- Key in ON position.

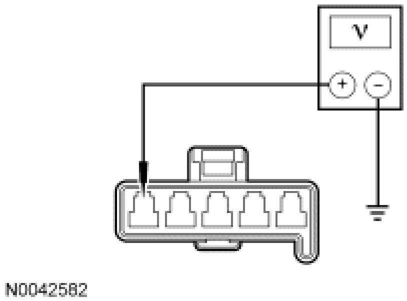

Fig. 193: Checking Circuit CH218 (GN/VT) For Short To Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between ground and blower motor speed control C271-E, circuit CH218 (GN/VT), harness side.
- **Is any voltage present?**

  YES : REPAIR circuit CH218 (GN/VT) for a short to voltage. TEST the system for normal operation.

  NO : Go to U4.

U4 CHECK CIRCUIT VH301 (YE/BU) FOR A SHORT TO GROUND

- Key in OFF position.

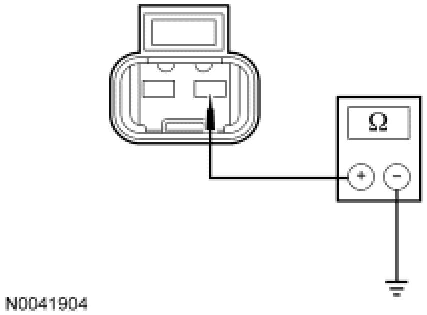

Fig. 194: Checking Circuit For Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between ground and blower motor C288-B, circuit VH301 (YE/BU), harness side.
- **Is the resistance greater than 10,000 ohms?**

  YES : INSTALL a new blower control. TEST the system for normal operation. If the condition

returns, go to U6.

NO : REPAIR circuit VH301 (YE/BU) for a short to voltage. TEST the system for normal operation.

U5 CHECK CIRCUIT CH123 (VT/GN) FOR A SHORT TO GROUND

- Key in OFF position.
- Disconnect: Blower Motor Relay
- Disconnect: HVAC Module - DATC Module C2356a or HVAC module - EATC C228a

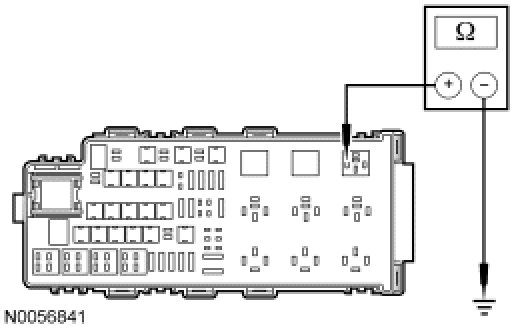

Fig. 195: Checking Circuit CH123 (VT/GN) For A Short To Ground
Courtesy of FORD MOTOR CO.

- Measure the resistance between blower motor relay socket pin 85, circuit CH123 (VT/GN) and ground.
- **Is the resistance greater than 10,000 ohms?**

  YES : CARRY OUT the blower motor relay component test. Refer to COMPONENT TESTING. If the relay tests OK, go to U6.

  NO : REPAIR circuit CH123 (VT/GN) for a short to ground. TEST the system for normal operation.

U6 CHECK MODULE CONNECTION

- Carry out the HVAC Module Cold Boot Process.
- Carry out the HVAC Module - Electronic Automatic Temperature Control (EATC) and HVAC Module - Dual Automatic Temperature Control (DATC) On-Demand Self Test.
- Operate the system.
- **Does the concern return?**

  YES : INSTALL a new HVAC module. REFER to **CLIMATE CONTROL** article. TEST the system for normal operation.

  NO : The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.

Component Tests

Temperature Sensor - Evaporator Discharge

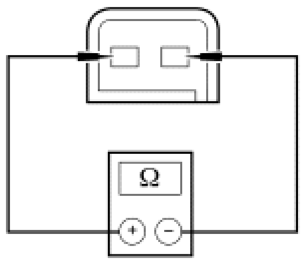

Fig. 196: Temperature Sensor - Evaporator Discharge
Courtesy of FORD MOTOR CO.

Ambient Temperature	Approximate Resistance
-40°C (-40°F)	925,021 ohms
-35°C (-31°F)	673,787 ohms
-30°C (-22°F)	496,051 ohms
-25°C (-13°F)	368,896 ohms
-20°C (-4°F)	276,959 ohms
-15°C (5°F)	209,816 ohms
-10°C (14°F)	160,313 ohms
-5°C (23°F)	123,485 ohms
0°C (32°F)	95,851 ohms
5°C (41°F)	74,940 ohms
10°C (50°F)	59,016 ohms
15°C (59°F)	46,797 ohms
20°C (68°F)	37,352 ohms
25°C (77°F)	30,000 ohms
30°C (86°F)	24,239 ohms
35°C (95°F)	19,696 ohms
40°C (104°F)	16,092 ohms
45°C (113°F)	13,216 ohms
50°C (122°F)	10,908 ohms
55°C (131°F)	9,056 ohms
60°C (140°F)	7,556 ohms
65°C (149°F)	6,335 ohms
70°C (158°F)	5,337 ohms
75°C (167°F)	4,515 ohms
80°C (176°F)	3,837 ohms
85°C (185°F)	3,273 ohms
90°C (194°F)	2,804 ohms
95°C (203°F)	2,411 ohms
100°C (212°F)	2,080 ohms

105°C (221°F)	1,801 ohms
110°C (231°F)	1,564 ohms
115°C (239°F)	1,363 ohms
120°C (248°F)	1,191 ohms

Blower Motor Resistor

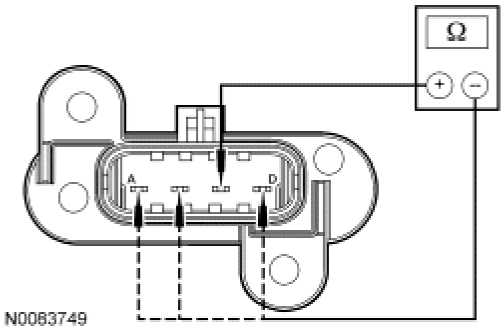

Fig. 197: Blower Motor Resistor
Courtesy of FORD MOTOR CO.

Blower Motor Resistor Pins	Approx. Resistance
C and B	1.27 ohms
C and A	2.45 ohms
C and D	4.5 ohms

In-Vehicle Temperature Sensor

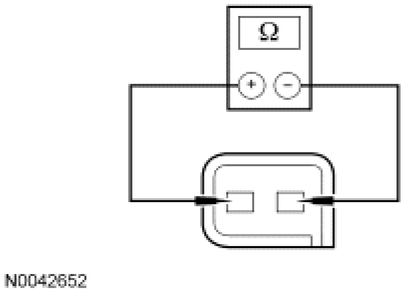

Fig. 198: In-Vehicle Temperature Sensor
Courtesy of FORD MOTOR CO.

Temperature	Resistance
-40°C (-40°F)	100,865 ohms
-20°C (-4°F)	28,582 ohms
0°C (32°F)	9,399 ohms
25°C (77°F)	2,795 ohms

40°C (104°F)	1,465 ohms
60°C (140°F)	671 ohms
85°C (185°F)	283 ohms

Ambient Temperature Sensor

Ambient Temperature	Resistance
-40°C (-40°F)	100,865 ohms
-20°C (-4°F)	28,582 ohms
0°C (32°F)	9,399 ohms
25°C (77°F)	2,795 ohms
40°C (104°F)	1,465 ohms
60°C (140°F)	671 ohms
85°C (185°F)	283 ohms

Heater Core

NOTE: Testing of returned heater cores reveals that a large percentage of heater cores are good and did not require the installation of a new heater core. If a heater core leak is suspected, the heater core must be tested by following the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

1. Inspect for evidence of coolant leakage at the heater hose to heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

NOTE: Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the heater hose connection and damage the heater core.

2. Check the integrity of the heater hose clamps.

Heater Core - Plugged

1. Check to see that the engine coolant is at the correct level.
2. Start the engine and turn on the heater.
3. When the engine coolant reaches operating temperature, feel the heater core inlet and outlet hoses to see if they are hot.
4. If the outlet only is not hot:
   - the heater core may have an air pocket.
   - the heater core may be plugged.
5. If the inlet only is not hot:
   - the thermostat may not be working correctly.

Heater Core - Pressure Test

Use the Pressure Test Kit to carry out the pressure test.

NOTE: Due to space limitations, a bench test may be necessary for pressure testing.

1. Drain the coolant from the cooling system.
2. Disconnect the heater hoses from the heater core.
3. Install a short piece of heater hose, approximately 101 mm (4 in) long on each heater core tube.
4. Fill the heater core and heater hoses with water and install plug BT-7422-B and the adapter BT-7422-A from the Pressure Test Kit. Secure the heater hoses, plug and adapter with hose clamps.

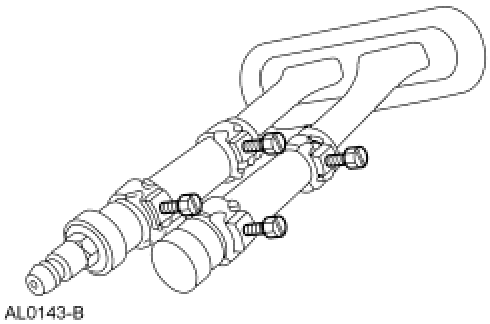

Fig. 200: Heater Core With Adapter & Plug
Courtesy of FORD MOTOR CO.

5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter.
6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core.
7. Observe the pressure gauge for a minimum of 3 minutes.
8. If the pressure drops, check the heater hose connections to the core tubes for leaks. If the heater hoses do not leak, remove the heater core from the vehicle and carry out the bench test.

Heater Core - Bench Test

1. Remove the heater core from the vehicle.
2. Drain all of the coolant from the heater core.
3. Connect the 101 mm (4 in) test heater hoses with plug and adapter to the core tubes. Then connect the Pressure Test Kit to the adapter.
4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water.
5. If a leak is observed, install a new heater core.

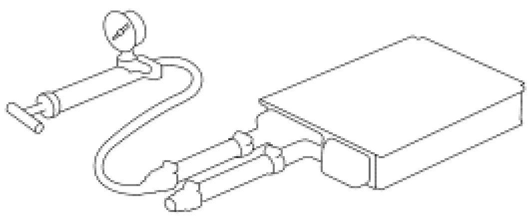

Fig. 201: Bench Testing Heater Core
Courtesy of FORD MOTOR CO.

Evaporator/Condenser Core - On-Vehicle Leak Test

1. Discharge and recover the refrigerant. Refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
2. Disconnect the suspect evaporator core or condenser core from the A/C system.
3. Clean the manifold fittings.
4. Connect the appropriate test fittings from the A/C Fittings Set to the condenser or evaporator core tube connections.

NOTE: **The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter that will activate the valve. The test is not valid if the shut-off valve does not open.**

5. Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the evaporator core or condenser core. Connect the yellow hose to a known good vacuum pump.
6. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low pressure gauge indicates 101 kPa (30 in-Hg). The 45-minute evacuation is necessary to remove any refrigerant from oil left in the evaporator core or condenser core. If the refrigerant is not completely removed from the oil, out gassing will degrade the vacuum and appear as a refrigerant leak.
7. If the low pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves and observe the low

pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before installing a new evaporator core or condenser core.

8. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
    - If the low pressure gauge reading rises 34 or more kPa (10 or more in-Hg) of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
    - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
    - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the evaporator core or condenser core. Then recheck for loss of vacuum.
    - If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check for vacuum loss.
9. If the evaporator core or condenser core does leak, as verified by the above procedure, install a new evaporator core or condenser core.

A/C Compressor - External Leak Test

1. Install the A/C Pressure Test Adapter on the port of the A/C compressor, using the existing manifold retaining bolt.
2. Connect the high and low pressure lines of a R-134a Manifold Gauge Set or a refrigerant recovery/recycling station such as the R-134a A/C service center to the corresponding fittings on the A/C Pressure Test Adapter.
3. Attach the center hose of a R-134a Manifold Gauge Set to a refrigerant container standing in an upright position.
4. Hand-rotate the compressor shaft 10 complete revolutions to distribute the oil inside the A/C compressor.
5. Open the low pressure gauge valve, the high pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.
6. Using the Refrigerant Leak Detector, check for leaks at the compressor shaft.
7. If a shaft seal leak is found, replace the compressor shaft seal. If an external leak is found, install a new A/C compressor.
8. When the leak test is complete, recover the refrigerant from the compressor.

GENERAL PROCEDURES

REFRIGERANT SYSTEM TESTS

Special Tools

Illustration	Tool Name	Tool Number
 ST1287-A	R-134a Manifold Gauge Set	023-00047 or equivalent

 ST2738-A	R-134a Refrigerant Management Center	176-00002 or equivalent
 ST2739A	R-134a Refrigerant Management Center	023-00174 or equivalent

Procedure 1 - Ambient Temperature at or Below 38°C (100°F)

NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.

NOTE: If the A/C compressor cycles at any time during this test, refer to the diagnostic table.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.
2. Connect an R-134a Manifold Gauge Set or R-134a Refrigerant Management Service Center with high-pressure and low-pressure gauges to the refrigerant system.
3. Set the climate controls.
    - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, HI blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
    - If equipped with Electronic Automatic Temperature Control (EATC) or Dual Automatic Temperature Control (DATC), set temperature to 15°C (60°F) (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on HI. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
4. Open all vehicle windows and leave the hood open for the test. Open the rear doors.
5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.
6. Record the ambient (shop) temperature.
7. Record the discharge pressure. If the pressure is fluctuating, record the average value.
8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant

Discharge Pressures chart.

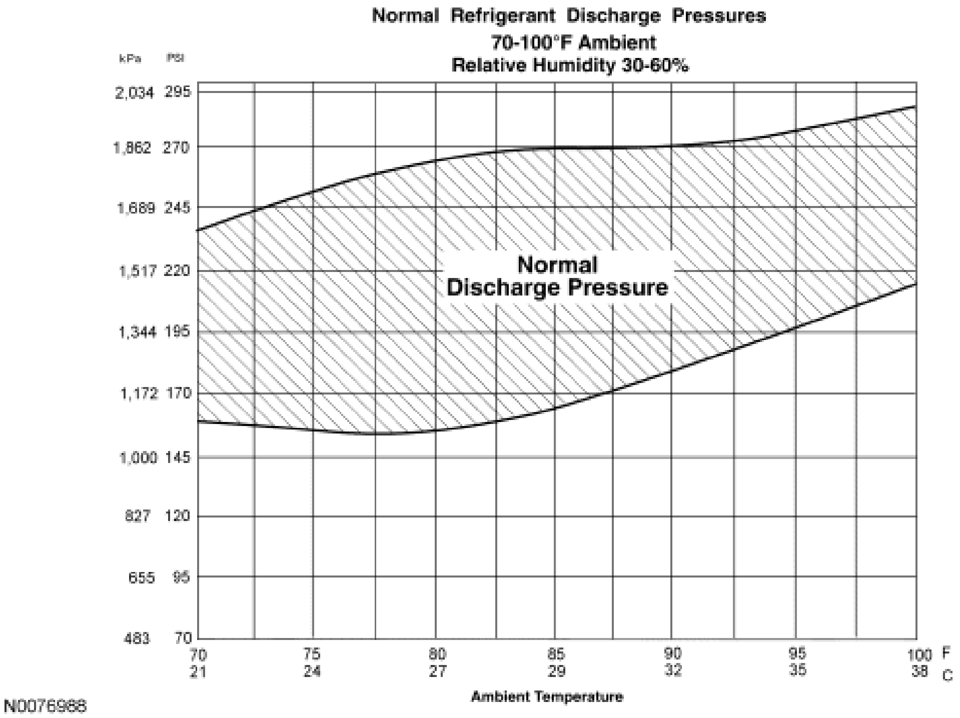

Fig. 202: Normal Refrigerant Discharge Pressures Chart [Ambient Temperature At Or Below 38°C (100°F)]
Courtesy of FORD MOTOR CO.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.
10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

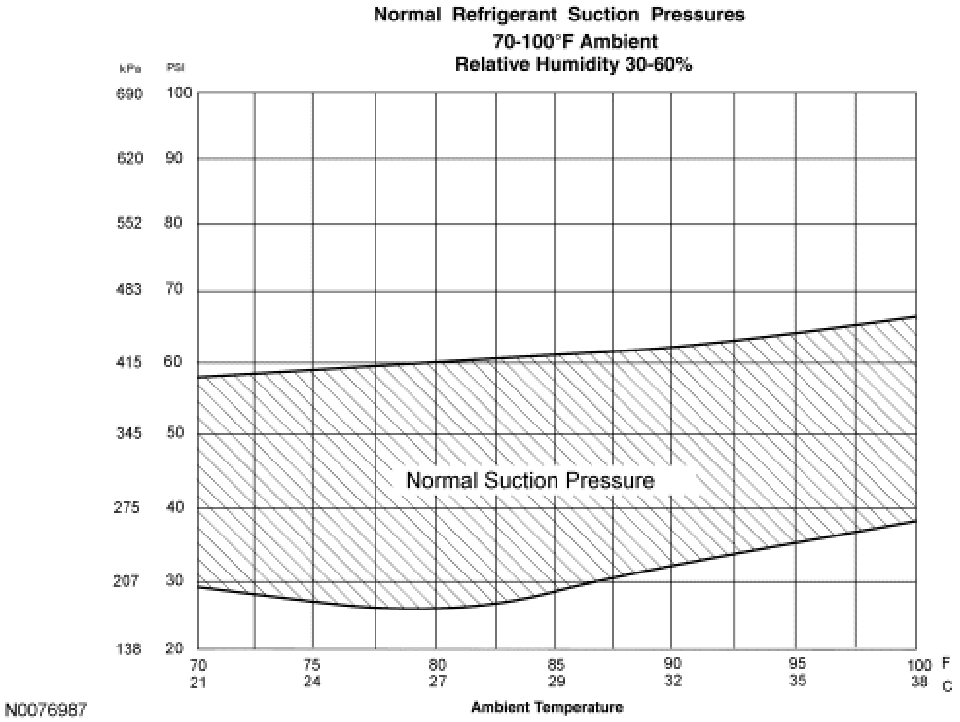

Fig. 203: Normal Refrigerant Suction Pressures Chart [Ambient Temperature At Or Below 38°C (100°F)]
Courtesy of FORD MOTOR CO.

11. Proceed to the Diagnostic Table.

Procedure 2 - Ambient Temperature Above 38°C (100°F)

NOTE: **The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.**

NOTE: **The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow Procedure 1. If the ambient temperature is over 38°C (100°F), follow Procedure 2.**

1. Drive the vehicle or run the engine until it reaches normal operating temperature.
2. Connect an R-134a Manifold Gauge Set or R-134a Refrigerant Management Center with high-pressure and low-pressure gauges to the refrigerant system.
3. Set the climate controls.
   - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, MED LO blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If equipped with Electronic Automatic Temperature Control (EATC) or Dual Automatic Temperature Control (DATC), set temperature to 15°C (60°F) (lowest possible temp setting).

Manually set blower to MED LO (3 to 4 bars). If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.

4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).
5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.
6. Record the ambient (shop) temperature.
7. Record the discharge pressure. If the pressure is fluctuating, record the average value.
8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.

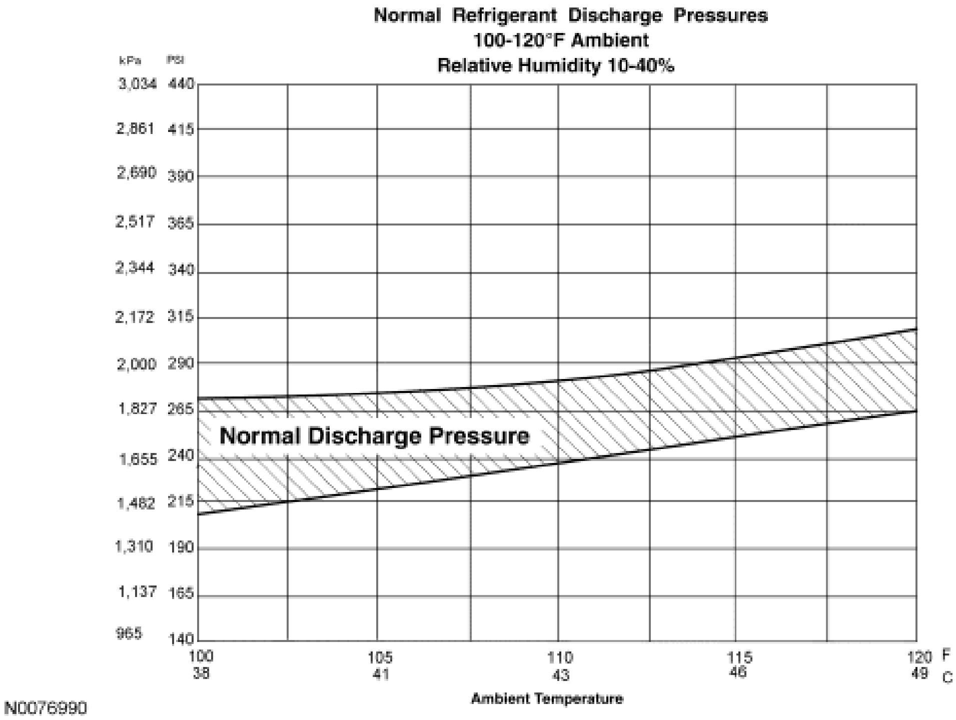

Fig. 204: Normal Refrigerant Discharge Pressures Chart [Ambient Temperature Above 38°C (100°F)]
Courtesy of FORD MOTOR CO.

9. Record the suction pressure. If the pressure is fluctuating, record the average value.
10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.

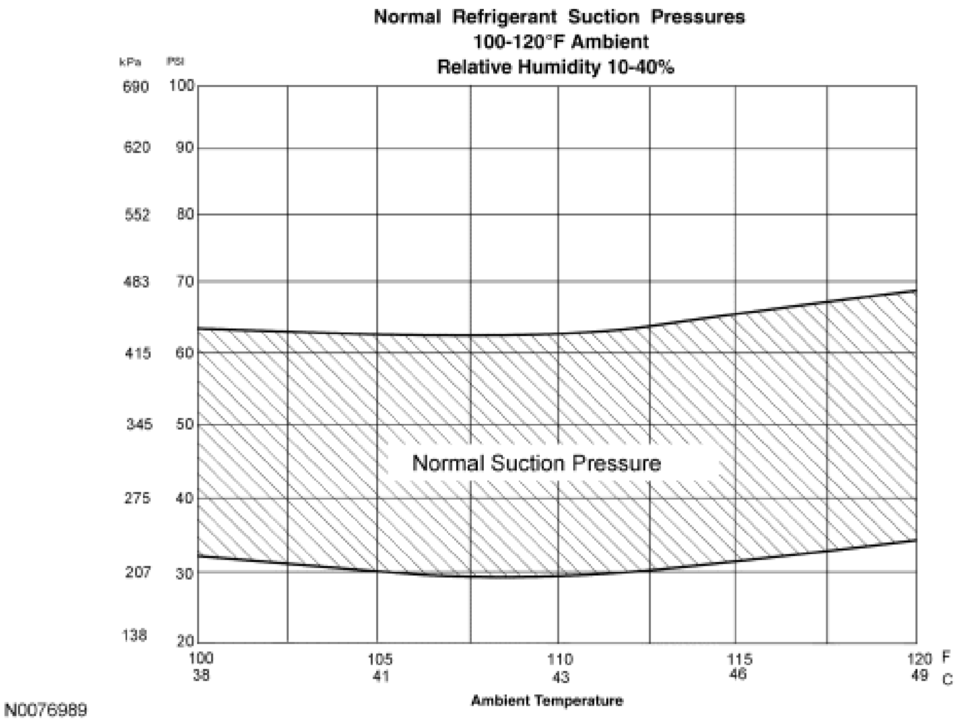

Fig. 205: Normal Refrigerant Suction Pressures Chart [Ambient Temperature Above 38°C (100°F)]
Courtesy of FORD MOTOR CO.

11. Proceed to the Diagnostic Table.

Diagnostic Table

NOTE: The following table is used to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

1. Refer to the chart below.

High (Discharge) Pressure	Low (Suction) Pressure	Component - Causes
High or Clutch Cycling	High	Condenser - inadequate airflow.
High	Normal to High	Engine - overheating.
Normal to High	Normal	Refrigerant overcharge - air in refrigerant.
		A/C suction line -

Normal to Low	Normal to High	partially restricted or plugged[a] .
Normal to Low	Low or Clutch Cycling	Low refrigerant charge, A/C suction line - partially restricted or plugged[b] A/C cycling switch - sticking closed (if equipped).
Erratic Operation or Compressor Not Running		A/C cycling switch - poor connection at A/C clutch connector or clutch cycling switch connector. A/C electrical circuit erratic - see A/C Electrical Circuit Wiring Diagram.
Normal to Low	High	Compressor - low performance.
Additional Possible Cause Components Associated With Inadequate Compressor Operation		
• Compressor Drive Belt - loose • Compressor Clutch - slipping • Clutch Coil Open - shorted, or loose mounting		

• Control Assembly Switch - dirty contacts or sticking open • Clutch Wiring Circuit - high resistance, open or blown fuse • Compressor Operation Interrupted by Engine Computer
Additional Possible Cause Components Associated With a Damaged Compressor
• Incorrect Clutch Air-gap • Suction Accumulator - refrigerant oil bleed hose plugged • Refrigerant Leaks

[a] Low pressure reading will be normal to high if pressure is taken at accumulator and if restriction is downstream of service access valve.

[b] Low pressure reading will be low if pressure is taken near the compressor and restriction is upstream of service access valve.

AIR CONDITIONING (A/C) CLUTCH AIR GAP ADJUSTMENT

1. Check the A/C clutch air gap at 3 equally spaced places between the clutch plate and the A/C clutch pulley.

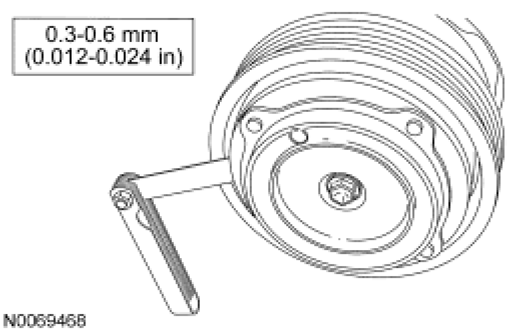

Fig. 206: Checking A/C Compressor Clutch Air Gap
Courtesy of FORD MOTOR CO.

2. If the A/C clutch air gap is out of range, remove the clutch plate. Add or remove spacers between the clutch plate hub and the compressor shaft until the clearance is within specification.

FLUORESCENT DYE LEAK DETECTION

Special Tools

Illustration	Tool Name	Tool Number
 ST3073-A	Cordless/Rechargable True UV LED Light ES	023-00182 or equivalent
 ST1278-A	R-134a Leak Detection Dye	164-R6060
 ST1326-A	R-134a Loop/Add On Injector Kit-Set	219-00069 or equivalent
 ST1287-A	R-134a Manifold Gauge Set	023-00047 or equivalent
 ST2739A	R-134a Refrigerant Center	023-00174 or equivalent
 ST2738-A	R-134a Refrigerant Center	176-00002 or equivalent

Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line and fitting in the refrigerant system for a leak.

1. Check for leaks using a Rotunda-approved UV lamp.
   - Inspect all components, lines and fittings of the refrigerant system.
2. If a leak is found, recover the refrigerant. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
3. Repair the refrigerant system leak(s).
4. Evacuate and charge the refrigerant system. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
5. After the leak(s) is/are repaired, remove any traces of fluorescent dye with a general purpose oil solvent.
6. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp.

Fluorescent Dye Injection - Using an R-134a Refrigerant Management Center and Dye/Lubricant Injector

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved ultraviolet black light. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

NOTE: Before using the dye/lubricant injector from the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the manufacturer's instructions on evacuation of any non-condensable gases from the hoses.

NOTE: Only connect the dye/lubricant injector when fluorescent dye is to be injected. The injector has a one-way check valve that will prevent refrigerant system recovery and evacuation.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

1. Connect an R-134a Refrigerant Center or a R-134a Manifold Gauge Set to the refrigerant system service port valves.

   NOTE: The dye/lubricant injector is included as part of the 219-00069 R-134a Loop/Add On Injector Kit-Set.

2. Verify that the valves on the dye/lubricant injector are closed.

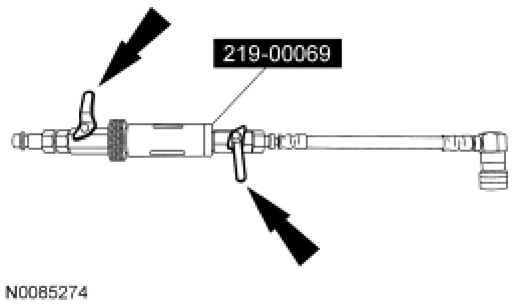

Fig. 207: Verifying Valves On Dye/Lubricant Injector Are Closed
Courtesy of FORD MOTOR CO.

3. Fill the fluorescent dye injector reservoir with 7 ml (0.25 oz.) of fluorescent dye.

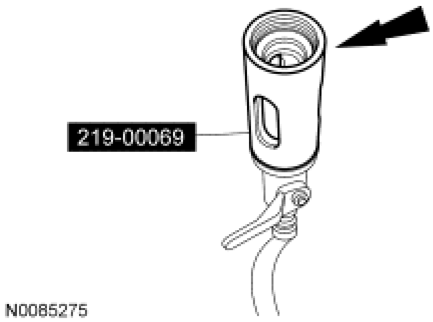

Fig. 208: Filling Fluorescent Dye Injector Reservoir With 7 ml (0.25 oz.) Of Fluorescent Dye
Courtesy of FORD MOTOR CO.

4. Install the dye/lubricant injector between the low-pressure service gauge port valve and the R-134a Refrigerant Center or R-134a Manifold Gauge Set.
5. Open all valves and inject the fluorescent dye into the refrigerant system.
6. When fluorescent dye injection is complete, close all valves.
7. Recover the refrigerant from the dye/lubricant injector.
8. Remove the dye/lubricant injector from the low-pressure service gauge port valve and the R-134a Refrigerant Center or R-134a Manifold Gauge Set.

Fluorescent Dye Injection - Using an R-134a Loop/Add On Injector Kit-Set

NOTE: **Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved ultraviolet black light. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.**

NOTE: **Before using the R-134a Loop/Add On Injector Kit-Set for the first time, refer to the equipment manufacturer's instructions on evacuation of non-condensable gases from the hoses.**

NOTE: **Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F).**

1. Verify that the valves on the deluxe injector loop kit are closed.

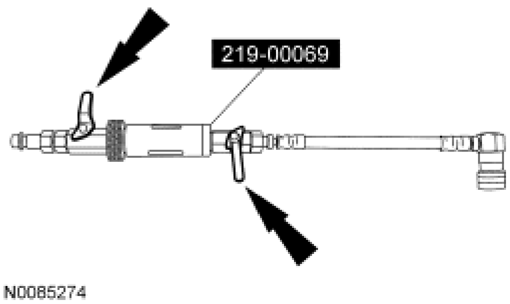

Fig. 209: Verifying Valves On Dye/Lubricant Injector Are Closed
Courtesy of FORD MOTOR CO.

2. Fill the R-134a Loop/Add On Injector Kit-Set reservoir with 7 ml (0.25 oz.) of fluorescent dye.

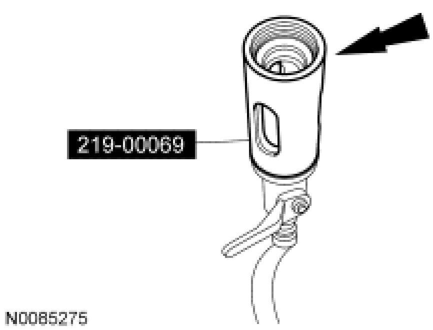

Fig. 210: Filling Fluorescent Dye Injector Reservoir With 7 ml (0.25 oz.) Of Fluorescent Dye
Courtesy of FORD MOTOR CO.

3. Install the R-134a Loop/Add On Injector Kit-Set between the high-pressure and low-pressure service gauge port valves.

NOTE: **Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine.**

4. Start the engine.
5. Open the high-pressure service valve.

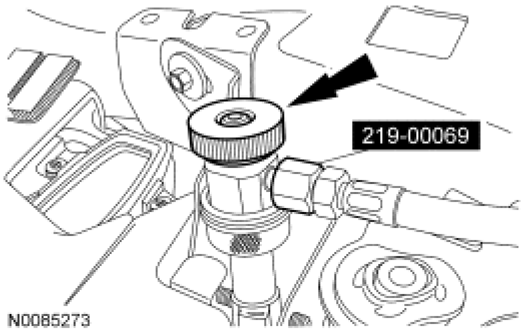

Fig. 211: Installing R-134A Loop/Add On Injector Kit-Set Between High-Pressure & Low-Pressure Service Gauge Port Valves
Courtesy of FORD MOTOR CO.

6. Open all valves and inject the fluorescent dye into the refrigerant system.

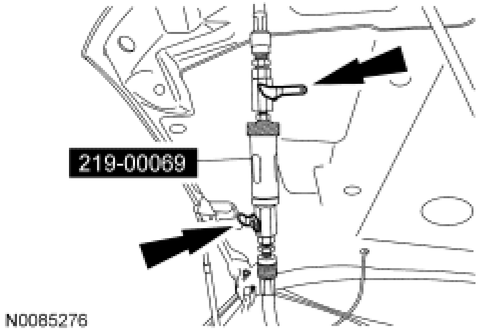

Fig. 212: Opening All Valves & Inject Fluorescent Dye Into Refrigerant System
Courtesy of FORD MOTOR CO.

7. Close the high-pressure service valve to allow the pressure inside the R-134a Loop/Add On Injector Kit-Set to equalize with the suction side of the refrigerant system.

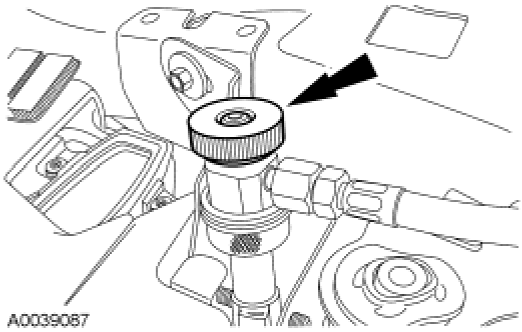

Fig. 213: Identifying High-Pressure Service Valve
Courtesy of FORD MOTOR CO.

NOTE: Close the valves on the R-134a Loop/Add On Injector Kit-Set while the A/C compressor is operating.

8. Close the valves on the R-134a Loop/Add On Injector Kit-Set.

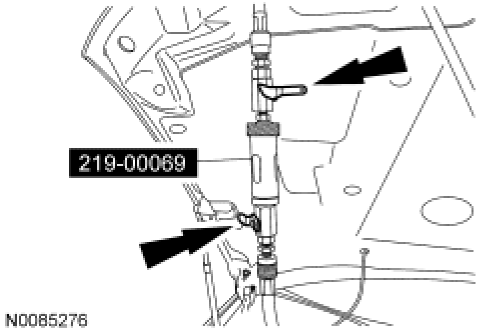

Fig. 214: Closing Valves On R-134A Loop/Add On Injector Kit-Set
Courtesy of FORD MOTOR CO.

NOTE: Leave all valves on the R-134a Loop/Add On Injector Kit-Set closed when not in use.

9. Disconnect the high-pressure and low-pressure service valves and remove the R-134a Loop/Add On Injector Kit-Set from the vehicle.

ELECTRONIC LEAK DETECTION

Special Tools

Illustration	Tool Name	Tool Number
	Heated Pentode Halogen Leak Detector	023-00178 or equivalent

NOTE: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the Heated Pentode Halogen Leak Detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

NOTE: R-134a is heavier than air, and will tend to move downward from the source of the leak if present. It is possible that a leak may not be detected if the leak detector tip is held above the leaking fitting, line or component. Always be sure to thoroughly leak test below the fitting, line or component for the presence of R-134a as well as leak testing above and around.

NOTE: The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

1. Leak test the refrigerant system using the leak detector. Follow the instructions included with the leak detector for handling and operation techniques.

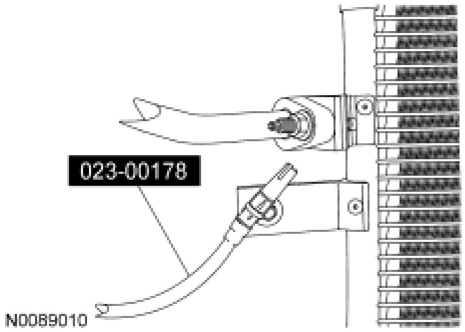

Fig. 215: Leak Test The Refrigerant System Using Leak Detector
Courtesy of FORD MOTOR CO.

2. If a leak is found, recover the refrigerant. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
   - Repair the system.
   - Test the system for normal operation.

AIR CONDITIONING (A/C) SYSTEM RECOVERY, EVACUATION AND CHARGING

Special Tools

Illustration	Tool Name	Tool Number
	1.2 CFM Vacuum Pump	023-00162 or equivalent
	4.0 CFM Vacuum Pump	023-00163 or equivalent

 ST3081-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant)	199-00067 or equivalent
 ST3080-A	R-134a Refrigerant Management Machine (SAE J-2788 Compliant)	265-00012 or equivalent

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Refrigerant System Recovery

NOTE: **An air conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTE: **Ford Motor Company recommends use of an R-134a Refrigerant Management Machine to carry out recovery. If an R-134a Refrigerant Management Machine is not available, refrigerant system recovery may be accomplished using a separate recovery station.**

NOTE: **Leaks in refrigerant system service equipment, hoses or gauges can cause a**

leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Prior to recovering, the purity of the refrigerant must be verified. For additional information, refer to **Refrigerant Identification Testing**.
2. Connect an R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.
3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer. Note the amount of oil removed during the refrigerant recovery (if any). Add that same amount back into the system once repairs are complete.
4. Once the R-134a Refrigerant Center has recovered the refrigerant, switch OFF the power supply.
5. Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.
6. If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.
7. Carry out the required repairs.

Refrigerant System Evacuation Using an R-134a Refrigerant Management Machine

NOTE: Ford Motor Company recommends use of an R-134a Refrigerant Management Machine to carry out recovery, evacuation and charging of the refrigerant system. If an R-134a Refrigerant Management Machine is not available, evacuation may be accomplished using a separate Vacuum Pump and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect an R-134a Refrigerant Management Machine to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.
2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.
3. Turn OFF the Vacuum Pump. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Evacuation Using an R-134a Manifold Gauge Set

NOTE: Ford Motor Company recommends use of an R-134a Refrigerant Management Machine to carry out evacuation of the refrigerant system. If an R-134a Refrigerant Management Machine is not available, refrigerant system evacuation may be accomplished using a separate Vacuum Pump and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect the R-134a Manifold Gauge Set to the low-side and high-side service gauge port valves.
2. Connect the center (yellow) hose from the R-134a Manifold Gauge Set to the suction port on the Vacuum Pump.
3. Open all valves on the R-134a Manifold Gauge Set and both service gauge port valves.
4. Turn on the Vacuum Pump and evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the Vacuum Pump for a minimum of 45 minutes.
5. Close the high-side and low-side valves on the R-134a Manifold Gauge Set (not the service gauge port valves) and turn OFF the Vacuum Pump.
6. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Charging Using an R-134a Refrigerant Management Machine

NOTE: Ford Motor Company recommends use of an R-134a Refrigerant Management Machine to carry out charging of the refrigerant system. If an R-134a Refrigerant Management Machine is not available, refrigerant system charging may be accomplished using a separate Automatic Refrigerant Charging Meter and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **Refrigerant Oil Adding**.
2. Connect an R-134a Refrigerant Management Machine to the low-side and high-side service gauge port valves following the operating instructions provided by the equipment manufacturer.
3. Set the refrigerant charge amount, and charge the refrigerant system following the instructions provided by the equipment manufacturer.

Refrigerant System Charging Using an R-134a Manifold Gauge Set and Automatic Refrigerant Charging Motor

NOTE: Ford Motor Company recommends use of an R-134a Refrigerant Management Machine to carry out charging of the refrigerant system. If an R-134a Refrigerant Management Machine is not available, refrigerant system charging may be accomplished using a separate Automatic Refrigerant Charging Meter and R-134a Manifold Gauge Set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **Refrigerant Oil Adding**.
2. Assemble the R-134a Manifold Gauge Set, Automatic Refrigerant Charging Meter and R-134a supply tank following the Automatic Refrigerant Charging Meter operating instructions.
3. Charge the refrigerant system following the Automatic Refrigerant Charging Meter operating instructions.
4. If the refrigerant flow stops before the refrigerant charge is complete, start the engine, select MAX A/C operation and allow the refrigerant charge to complete.

AIR CONDITIONING (A/C) SYSTEM FLUSHING

Special Tools

Illustration	Tool Name	Tool Number
	A/C Flush Adapter Kit	219-00074 or equivalent
	A/C Flush and Purge Fitting Kit	219-00024 or equivalent
	A/C Flush and Purge Machine	219-00022 (part of 219-00023) or equivalent

Material

Item	Specification
A/C System Flushing Solvent	-

YN-23	
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

WARNING: **Take the following precautions when repairing an air conditioning system containing R-134a:**

- **Always wear safety goggles.**
- **Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and will freeze skin tissue.**
- **Never allow refrigerant R-134a gas to escape in quantity in an occupied space. It will displace the oxygen needed to support life.**
- **Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but it decomposes when exposed to high temperatures such as a torch flame. During decomposition it releases irritating and toxic gasses (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.**

Failure to follow these instructions may result in serious personal injury.

NOTE: **An air conditioning (A/C) refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.**

NOTE: **Receiver/drier cartridge, Thermostatic Expansion Valve (TXV), and hoses with mufflers should be removed when flushing the air conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The 3.785L (1 gal) of A/C System Flushing Solvent YN-23 and FL1-A filter used in A/C Flush and Purge Machine 219-00022 are intended for use on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.**

NOTE: **Only the A/C Flush and Purge Machine 219-00022 and A/C Systems Flushing Solvent, is approved for use on Ford vehicles. No other flushing device or**

solvent is approved for flushing heat exchangers (air conditioning [A/C] condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.

NOTE: Prior to using the A/C Flush and Purge Machine 219-00022 for the first time, review the operating instructions.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed while installed in their normal in-vehicle location. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a 2-step procedure that involves the use of an A/C Flush and Purge Machine 219-00022 to:

- **circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.**
- **remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and evaporate any remaining flush solvent from the heat exchanger.**

1. Remove the receiver/drier cartridge. For additional information, refer to **CLIMATE CONTROL** article.

   NOTE: The condenser core must be flushed with the receiver/drier cartridge removed. Do not install a new receiver/drier cartridge at this time.

2. With the receiver/drier cartridge removed, reinstall the receiver/drier plug and snap ring into the condenser core.
3. Remove the condenser inlet and outlet fitting nuts and disconnect the fittings.
4. Connect the A/C Flush and Purge Machine to the condenser inlet and outlet fittings using the correct adapters from the A/C Flush Adapter Kit.
5. Flush the condenser core for a minimum of 30 minutes.
6. Turn the A/C Flush and Purge machine to the PURGE mode and run for a minimum of 20 minutes.
7. Disconnect the A/C Flush and Purge machine and adapters from the condenser core.
8. Install new gasket seals and connect the A/C condenser inlet and outlet fittings.
9. Remove the snap ring and receiver/drier plug.

   NOTE: Do not charge the refrigerant system after the condenser core is installed.

10. Install a new receiver/drier cartridge. For additional information, refer to **CLIMATE CONTROL** article.

11. Remove the Thermostatic Expansion Valve (TXV).
12. Connect the A/C Flush and Purge Machine to the evaporator core fitting using the correct adapter from the A/C Flush and Purge Fitting Kit.
13. Flush the evaporator core for a minimum of 20 minutes.
14. Turn the A/C Flush and Purge Machine to the PURGE mode and run for a minimum of 20 minutes.
15. Disconnect the A/C Flush and Purge Machine and adapter from the evaporator core fitting.
16. Install a new front TXV. For additional information, refer to **CLIMATE CONTROL** article.

NOTE: It is necessary to evacuate the refrigerant system for a minimum of one hour to evaporate any traces of flush solvent that may remain in the system.

17. Evacuate the refrigerant system for one hour. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
18. If a new A/C compressor is not to be installed, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **Refrigerant Oil Adding**.
19. If a new A/C compressor is not to be installed, evacuate, leak test and charge the refrigerant system. For additional information, refer to**Air Conditioning (A/C) System Recovery, Evacuation and Charging** .

REFRIGERANT SYSTEM FILTERING FOLLOWING AIR CONDITIONING (A/C) COMPRESSOR INSTALLATION

Special Tools

Illustration	Tool Name	Tool Number
 ST1298-A	A/C Flush Adapter Kit	219-00074 or equivalent
 ST1185-A	A/C Flush and Purge Fitting Kit	219-00024 or equivalent

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

NOTE: On vehicles being serviced for an internal compressor or desiccant failure, a new Thermostatic Expansion Valve (TXV) and any hoses containing mufflers

must be installed prior to filtering the air conditioning (A/C) system. Internal plumbing of these devices makes it impossible to correctly remove any foreign material/debris. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The F8VZ-19E773-AB filter is intended for use on one vehicle only.

1. Remove the receiver/drier cartridge. For additional information, refer to **CLIMATE CONTROL** article.

NOTE: The refrigerant system must be filtered with the receiver/drier cartridge removed. Do not install a new receiver/drier cartridge at this time.

2. With the receiver/drier cartridge removed, reinstall the receiver/drier plug and snap ring into the condenser core.
3. Remove the condenser outlet fitting nut and disconnect the fitting.
   - Discard the gasket seal.

NOTE: The flexible extension adapters included in the A/C Flush Adapter Kit (219-00074) are designed for low-pressure flushing and are not designed for use with a charged refrigerant system. Do not make the condenser fitting connections using the flexible extension adapters or damage to the adapters and loss of refrigerant will occur.

NOTE: Use flexible refrigerant hose of 17,238 kPa (2,500 psi) burst rating.

4. Using the correct adapters and service hoses, install the pancake filter between the condenser and the condenser outlet fitting.
5. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **Refrigerant Oil Adding**.
6. Evacuate and charge the refrigerant system. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
7. Provide adequate airflow to the front of the vehicle (with a fan, if necessary). Start the engine and allow it to idle briefly. Select A/C operation and set the blower speed to HI. Verify that the A/C is operating correctly.
8. Gradually bring the engine up to 1,200 RPM by running it at lower RPM for short periods (first at 800 RPM, then at 1,000 RPM). Set the engine at 1,200 RPM and run it for one hour with the A/C system operating.
9. Stop the engine.
10. Recover the refrigerant. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
11. Remove the pancake filter, hoses and adapters from the vehicle.
12. Install a new gasket seal and connect the condenser outlet fitting.
13. Remove and discard the receiver/drier plug snap ring and the receiver/drier plug.

14. Install a new receiver/drier cartridge. For additional information, refer to **CLIMATE CONTROL** article.
15. Evacuate, leak test and charge the refrigerant system. For additional information refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.

REFRIGERANT OIL ADDING

Special Tools

Illustration	Tool Name	Tool Number
	R-134a Loop/Add On Injector Kit-Set	219-00069 or equivalent

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Refrigerant Oil Adding

NOTE: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

1. Refer to the chart below for refrigerant oil adding amounts and methods of installation.

Component	PAG Oil Amount	Method of Adding
A/C Compressor	See heading below	Add directly to A/C compressor before installation
Receiver/Drier Desiccant Cartridge	60 ml (2 fl. oz.) added to the amount collected during refrigerant	Inject to low-side service port during system charging

	recovery	
Evaporator Core	45 ml (1.5 fl. oz.) added to the amount collected during refrigerant recovery	Add directly to evaporator core inlet tube or inject to low-side service port during system charging
Condenser Core	60 ml (2 fl. oz.) added to the amount collected during refrigerant recovery	Add directly to condenser core inlet or inject to low-side service port during system charging
Evaporator Core Orifice or Thermostatic Expansion Valve	The amount collected during refrigerant recovery	Inject to low-side service port during system charging
A/C Pressure Relief Valve	60 ml (2 fl. oz.) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging
Refrigerant Hose/Line	60 ml (2 fl. oz.) added to the amount collected during refrigerant recovery[a]	Inject to low-side service port during system charging
	60 ml (2	

O-ring Leak Repair	fl. oz.) added to the amount collected during refrigerant recovery[b]	Inject to low-side service port during system charging
Service Port Leak Repair	60 ml (2 fl. oz.) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging

[a] If an excessive amount of refrigerant oil is lost due to a hose rupture/separation or other damage, the total system refrigerant oil capacity must be added.

[b] The amount specified may be used for one or multiple O-ring leak repairs. Do not multiply the refrigerant oil amount by the number of O-ring leaks being repaired.

Refrigerant Oil Adding for New A/C Compressor Installation

NOTE: Service A/C compressors are shipped without refrigerant oil.

1. Rotate the old A/C compressor shaft 8 to 10 full rotations (clockwise) while collecting the refrigerant oil in a clean measuring cup.
    - Add the same amount plus the amount collected during refrigerant recovery.

Oil Injection Using a Dye/Lubricant Injector

NOTE: The dye/lubricant injector is included as part of the 219-00069 R-134a Loop/Add On Injector Kit-Set.

NOTE: If fluorescent leak detection dye is also to be added during A/C charging, the dye may be added to the dye/lubricant injector along with the refrigerant oil.

1. Evacuate the refrigerant system. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.
2. Assemble the dye/lubricant injector using the correct adapters to match the amount of refrigerant compressor oil to be injected.
3. Verify that all the valves on the dye/lubricant injector are closed.

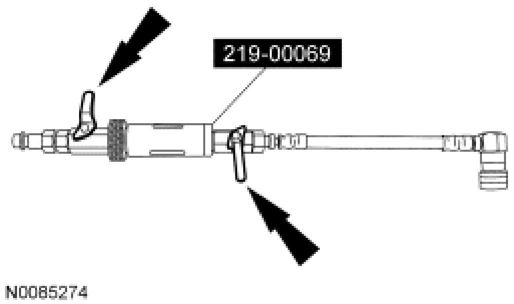

Fig. 216: Verifying All Valves On Dye/Lubricant Injector Are Closed
Courtesy of FORD MOTOR CO.

4. Fill the dye/lubricant injector with the correct amount of new refrigerant compressor oil.

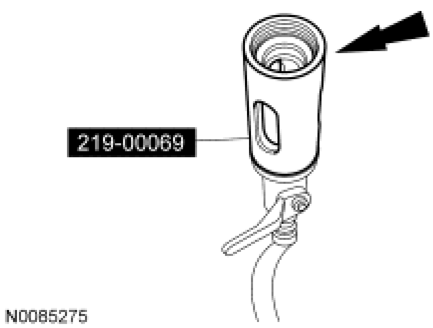

Fig. 217: Filling Dye/Lubricant Injector With Correct Amount Of New Refrigerant Compressor Oil
Courtesy of FORD MOTOR CO.

5. Install the dye/lubricant injector between the low-side service gauge port valve and the refrigerant service station or manifold gauge set.
6. Open all valves and charge the refrigerant system. For additional information, refer to **Air Conditioning (A/C) System Recovery, Evacuation and Charging**.

REFRIGERANT IDENTIFICATION TESTING

Special Tools

Illustration	Tool Name	Tool Number
	Refrigerant Identifier with Air-Radiator	198-00003 or equivalent

Refrigerant Identification

NOTE: A Refrigerant Identifier with Air-Radiator must be used to identify gas samples taken directly from the refrigeration system or storage containers prior to recovering or charging the refrigerant system.

1. Follow the instructions included with the Refrigerant Identifier with Air-Radiator to obtain the sample for testing.
2. The Refrigerant Identifier with Air-Radiator will display one of the following:
   - If the purity level of R-134a is 98% or greater by weight, the green PASS LED will light. The weight concentrations of R-134a, R-12, R-22, hydrocarbons and air will be displayed on the digital display.
   - If refrigerant R-134a does not meet the 98% purity level, the red FAIL LED will light and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will be displayed on the digital display.
   - If hydrocarbon concentrations are 2% or greater by weight, the red FAIL LED will light, "Hydrocarbon High" will be displayed on the digital display, and an alarm will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22 and hydrocarbons will also be displayed on the digital display.
3. The percentage of air contained in the sample will be displayed if the R-134a content is 98% or greater. The scan tool eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the scan tool has determined that a refrigerant source is pure (R-134a is 98% or greater by weight) and air concentration levels are 2% or greater by weight, the scan tool will prompt the user if an air purge is desired.
4. If contaminated refrigerant is detected, repeat the refrigerant identification test to verify that the refrigerant is indeed contaminated.

Contaminated Refrigerant Handling

NOTE: If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a recovery/recycling equipment. Recovery of contaminated refrigerant will contaminate the recovered refrigerant supply and may damage the recovery/recycling equipment.

NOTE: A new suction accumulator or receiver/drier must be installed as directed by the A/C system flushing procedure.

1. Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant only.
   - If this equipment is not available, contact an A/C service facility in the area with the correct equipment to carry out this service.
2. Determine and correct the cause of the customers initial concern.
3. Flush the A/C system.
4. Dispose of the contaminated refrigerant in accordance with all federal, state and local regulations.

A/C Odor Treatment

WARNING: Carry out this procedure in a well-ventilated area with all vehicle windows and doors opened. Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION, seek medical advice. On Ford/Motorcraft products in the USA or Canada call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS), if available. Failure to follow these instructions may result in serious personal injury.

NOTE: There are typically 4 types of objectionable odors found in a vehicle:

- **Chemical odors**
- **Environmental odors**
- **Human and other interior-generated odors**
- **Microbiological odors**

Before determining that A/C order treatment is required, the source and the circumstances under which the odor occurs must be determined.

NOTE: Chemical odors are usually constant regardless of the climate control system setting although they may be enhanced by A/C operation. Most chemical odors are caused by fluid leaks or incorrectly cured adhesives. Chemical odors can be eliminated by repairing the leaking component and removing any residue.

NOTE: **Environmental odors usually occur for a short time and diminish after the vehicle passes through the affected area. These odors are typically only detected when the vehicle windows are open, or when the climate control system is operating in a mode that allows for fresh air. Environmental odors cannot be eliminated because they are external in source, but they may be minimized by switching to a climate control setting that uses recirculated air.**

NOTE: **Human and other interior-generated odors occur while the source is present and may linger for a short time after. These odors may be more noticeable during A/C operation. Human odors may be eliminated by removing the source and cleaning the affected area.**

NOTE: **Microbiological odors, if in the A/C system, usually last for about 30 seconds after the system is turned on. They will be detected while the A/C is turned on and using either outside or recirculated air. Microbiological odors that occur in areas other than the A/C system (for example, water in doors or wet carpeting) may last indefinitely and will be more intense when recirculated air is used. Microbiological odors will not be present at temperatures at or below 10°C (50° F).**

Microbiological odors can be eliminated by removing the source and treating the affected area. Standing water must be allowed to drain and dry out. A/C systems may be treated by using A/C cooling coil coating as described in the service procedure below.

Microbiological odors result from microbial growth supported by warm temperatures and moisture. Microbiological odors are described as musty/mildew type smells and may occur on/in:

- **foam seals.**
- **rubber seals.**
- **adhesives.**
- **standing water.**
- **water soaked carpet/trim.**

1. Identify the type of odor present in the vehicle. Do not proceed with A/C odor treatment if the odor source is found to be outside of the A/C system. Refer to the following chart for examples.

Odor Source	Odor Description
Chemical Odors	
Coolant	Sweet smell
Fuel	Gasoline or diesel fuel smell

Oil	Oil type or burning smell
Power Steering Fluid	Oil type or burning smell
Transmission Fluid	Oil type or burning smell
Washer Fluid	Alcohol type smell
Gear Lube	Garlic/sulfur smell
Refrigerant Oil	Ether type smell
Carpet/trim Adhesives	Fishy, urine or sweet smell
Evaporator Core Coating	Wet cement type smell
Environmental Odors	
Exhaust	Exhaust, fuel or burning type smell
Industrial Pollutants	Various smells
Dust	Musty, mildew or wet cement type smell
Pollen	Sweet smell
Tobacco	Burning, tar smell
Human and Other Interior Generated Odors	
Body Secretions	Body odor
Perfuming Agents	Sweet or fragrance smell
Clothing	Musty, mildew or body odors
	Sweet,

Food/Beverage	musty, mildew or fishy smell
Microbiological Odors	
Microbiological Odors Occurring Inside of A/C System	Musty, mildew smell lasting about 30 seconds after A/C is turned on
Microbiological Odors Occurring Outside of A/C System	Musty, mildew smell lasting indefinitely and possibly more pronounced when using recirculated air

2. Identify the source of the odor.
   - Check the passenger and driver side carpet for moisture. Continue diagnosis if moisture is found.
   - Check the blower motor and blower motor cover (if equipped) for moisture resulting from water bypassing the cowl baffling system. Continue diagnosis if moisture is present.
   - Check the evaporator core drain tube for restriction.
   - Check the cowl top panel and air inlet screen for standing water or foreign material. If possible, remove any standing water and clean the air inlet screen using a wet/dry vacuum.
3. Open all vehicle windows.
4. Disconnect the A/C pressure transducer electrical connector.
5. Set the following.
   - Enable the A/C using fresh air inlet.
   - Adjust the temperature setting to full warm.
   - Adjust the blower motor speed to HI.
6. Run the engine for 25 minutes to dry out the A/C system.
7. Turn the ignition OFF.
8. Remove the blower motor.
9. Remove the blower motor resistor (if equipped) or blower motor speed control (if equipped).

CAUTION: To avoid damage to the vehicle interior, do not spill or spray this product on any interior surface.

10. Add one full bottle of A/C cooling coil coating to the applicator or sprayer.
11. Insert the nozzle into the evaporator housing and direct the spray toward the evaporator core face. Spray the entire evaporator core face until empty.
12. Install the blower motor and blower motor resistor (if equipped) or blower motor speed control (if equipped).
13. Repeat Steps 6 through 8 to cure the evaporator core coating.
14. Connect the A/C pressure transducer electrical connector.

DESCRIPTION AND OPERATION

AIR CONDITIONING

The refrigerant system components include the following:

- A/C compressor
- A/C clutch assembly
- A/C condenser core
- A/C evaporator core
- Receiver/drier cartridge
- Connecting refrigerant lines
- Thermostatic Expansion Valve (TXV)

The refrigerant system incorporates an A/C compressor controlled by the PCM through an A/C clutch relay. The climate control assembly sends an A/C request signal to the instrument cluster module, which relays the request to the PCM. An evaporator discharge air temperature sensor is used to disengage the A/C compressor clutch when the evaporator core temperature falls below an acceptable temperature.

The A/C compressor clutch will only be engaged by the PCM if all of the following conditions are met:

- The HVAC module is set to a mode which provides an A/C request to the PCM via the Instrument Cluster (IC).
- The evaporator discharge air temperature sensor is reading an acceptable temperature.
- The A/C pressure transducer is reading an acceptable pressure in the high side of the refrigerant system.
- The A/C compressor relay is switched to the closed position by the PCM.
- The engine coolant temperature is not excessively high.
- The PCM has not detected a Wide Open Throttle (WOT) condition.

An A/C pressure relief valve is installed in the A/C compressor to protect the refrigerant system against excessively high refrigerant pressures.

Refrigerant flow into the evaporator core is metered by a TXV.

A/C Compressor and Clutch Assembly

NOTE: **Internal A/C compressor components are not serviced separately. The A/C compressor is serviced only as an assembly. The clutch disc and hub, A/C**

compressor pulley and bearing and clutch field coil are serviceable.

The A/C compressor has the following characteristics:

- A non-serviceable shaft seal
- A pressure relief valve is installed in the rear of the compressor to protect the refrigerant system against excessively high refrigerant pressures
- The A/C compressor uses PAG oil or equivalent. This oil contains special additives required for the A/C compressor
- The A/C compressor oil may have some slightly dark-colored streaks while maintaining normal oil viscosity. This is normal for this A/C compressor because of break-in wear that can discolor the oil
- Use standard oil matching procedures when installing new compressors

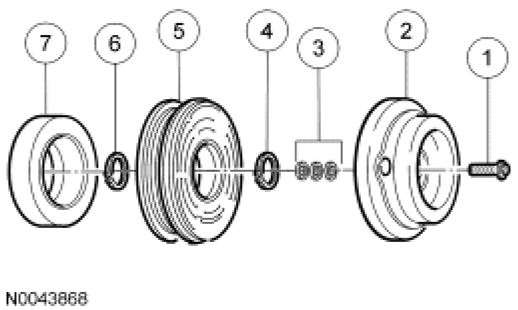

Fig. 1: A/C Compressor Clutch Assembly
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712303	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19D648	A/C clutch disc and hub spacers
4	W712302	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W712301	A/C clutch field coil snap ring
7	19D798	A/C clutch field coil

When battery voltage is applied to the A/C compressor clutch field coil, the clutch plate and hub assembly is drawn toward the A/C clutch pulley. The magnetic force locks the clutch plate and hub assembly and the A/C clutch pulley together as one unit, causing the compressor shaft to rotate. When battery voltage is removed from the A/C compressor clutch field coil, springs in the clutch plate and hub assembly move the clutch plate away from the A/C clutch pulley.

A/C Pressure Relief Valve

NOTE: **If the A/C compressor is operating within limits and the A/C pressure relief valve is venting, or if the A/C pressure relief valve is leaking around the threads,**

replace the A/C pressure relief valve and O-ring. If the A/C pressure relief valve still vents after it is replaced, diagnose the refrigerant system for a restriction.

An A/C pressure relief valve is incorporated in the A/C compressor to prevent damage to the A/C compressor and other system components by relieving unusually high system discharge pressure buildups. For specifications regarding operating pressure(s), refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

The A/C pressure relief valve is a separate component and can be replaced separately from the A/C compressor. It is necessary to recover the refrigerant before removing the A/C pressure relief valve.

A/C Condenser/Power Steering Combo Cooler

The A/C condenser/power steering combo cooler is an aluminum fin-and-tube design heat exchanger located in front of the vehicle radiator. It cools compressed refrigerant gas by allowing air to pass over fins and tubes to extract heat and by condensing gas to liquid refrigerant as it is cooled.

The receiver/drier is incorporated onto the LH side of the condenser core. The receiver/drier cartridge is a separate component and can be removed and installed separately from the condenser core.

The top portion of the condenser/power steering combo cooler is partitioned from the refrigerant system and is used for power steering fluid cooling.

Receiver/Drier Cartridge

NOTE: **Installation of a new receiver/drier cartridge is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.**

The receiver/drier is integral to the A/C condenser/power steering combo cooler. It stores high-pressure liquid after it leaves the condenser core. A receiver/drier cartridge mounted inside the receiver/drier removes any retained moisture from the refrigerant. The receiver/drier cartridge is a separate component and can be removed and installed separately from the A/C condenser/power steering combo cooler.

Evaporator Core

The evaporator core is an aluminum plate/fin type and is located in the heater core and evaporator core housing. A mixture of refrigerant and oil enters the bottom of the evaporator core through the evaporator core inlet tube and continues out of the evaporator core through the evaporator core outlet tube. Air from the blower motor is cooled and dehumidified as it flows through the evaporator core fins.

Thermostatic Expansion Valve (TXV)

The Thermostatic Expansion Valve (TXV) is located between the evaporator core lines and the TXV manifold and tube assembly at the rear of the engine compartment. The TXV provides a restriction to the flow of refrigerant from the high-pressure side of the refrigerant system and separates the low-pressure and high-pressure sides of the refrigerant system. Refrigerant entering and exiting the evaporator core passes through the TXV through 2 separate flow paths. An internal temperature sensing bulb senses the temperature of the refrigerant flowing out of the evaporator core and adjusts an internal pin-type valve to meter the refrigerant flow into the evaporator core. The internal pin-type valve decreases the amount of refrigerant entering the evaporator core at lower temperatures and increases the amount of refrigerant entering the evaporator core at higher temperatures.

Evaporator Discharge Air Temperature Sensor

The evaporator discharge air temperature sensor contains a thermistor which receives a reference voltage from the PCM. The thermistor then varies the resistance to the reference voltage based on the evaporator discharge air temperature. The resulting voltage is returned to the PCM where it is interpreted as an evaporator air discharge temperature reading.

The PCM maintains evaporator core temperature and prevents icing of the evaporator core, by disengaging the A/C compressor clutch when the evaporator discharge air temperature sensor reading falls below acceptable levels, and by engaging the A/C compressor clutch when the discharge air temperature rises above acceptable levels.

The evaporator discharge air temperature sensor is located inside of the heater core and evaporator core housing in the air-stream leaving the evaporator core.

A/C Pressure Transducer

The A/C pressure transducer monitors the compressor discharge pressure and communicates with the PCM. The PCM will interrupt A/C compressor operation in the event that the A/C pressure transducer indicates high system discharge pressures. It is also used to sense low charge conditions. If the pressure is below a predetermined value for a given ambient temperature, the PCM will not allow the clutch to engage.

Service Gauge Port Valves

The high-pressure service gauge port valve is located on the condenser-to-evaporator line.

The low-pressure service gauge port valve is located on the TXV manifold and tube assembly.

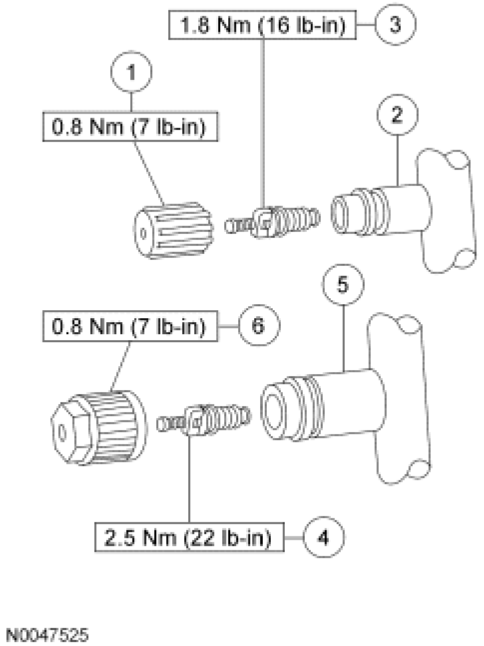

Fig. 2: Service Gauge Port Valves With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	19D702	Low-pressure service gauge port valve cap
2	-	Low-pressure service gauge port valve
3	19D701	Low-pressure Schrader-type valve
4	19D701	High-pressure Schrader-type valve
5	-	High-pressure service gauge port valve
6	19D702	High-pressure service gauge port valve cap

The fitting is an integral part of the refrigeration line or component.

- Special couplings are required for both the high-side and low-side service gauge ports.
- A very small amount of leakage will always be detectable around the Schrader-type valve with the service gauge port valve cap removed, and is considered normal. A new Schrader-type valve core can be installed if the seal leaks excessively.
- The service gauge port valve caps are used as primary seals in the refrigerant system to prevent leakage through the Schrader-type valves from reaching the atmosphere. Always install and tighten the A/C service gauge port valve caps to the correct torque after they are removed.

Refrigerant System Dye

Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved ultraviolet blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Additional refrigerant system dye should only be added if more than 50% of the refrigerant system lubricant capacity has been lost due to a fitting separation or hose rupture. Refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

AIR DISTRIBUTION AND FILTERING

NOTE: This vehicle is not equipped from the factory with a cabin air filter.

There are 2 sources of air available to the air distribution system:

- Outside air
- Recirculated air

Recirculated air is always used when the HVAC module is set to the MAX A/C mode on vehicles equipped with Electronic Manual Temperature Control (EMTC). Vehicles equipped with Electronic Automatic Temperature Control (EATC) use recirculated air only when the RECIRC function is selected in any mode other than DEFROST, or when required by the HVAC module in the AUTOMATIC mode.

Air distribution within the vehicle is determined by the EMTC systems or the EATC system in the AUTOMATIC mode. The air distribution mode on vehicles equipped with EATC can be overridden by the driver if desired. Airflow mode control doors are used to direct airflow within the heater core and evaporator core housing. Electric mode door actuators are used to position these airflow mode doors.

Vehicles equipped with dual-zone EATC use 2 separate temperature blend doors. This allows individual temperature settings to be selected for the RH and LH air outlets. The airflow mode doors are not partitioned for separate RH and LH airflow positions. Therefore, the airflow mode will always remain similar for the RH and LH sides of the vehicle regardless of the temperatures selected.

Air enters the passenger compartment from the:

- instrument panel registers.
- floor duct.
- windshield defroster.
- side window demisters.
- rear footwell duct (if equipped).

Passenger compartment air is exhausted from the vehicle through open windows or body air vents.

CONTROL COMPONENTS

Electronic Manual Temperature Control

The Electronic Manual Temperature Control (EMTC) components are used to select:

- air inlet source (outside or recirculated).
- blower motor speed.
- discharge air temperature (temperature blend).
- discharge air location (defrost, panel, floor).
- A/C compressor operation.

Control System Inputs

The EMTC system has 2 system control inputs.

HVAC Module

The HVAC module integrates the temperature control, airflow mode selection, A/C request button, recirculated air request button and rear defog switch into a single unit.

The temperature control switch setting determines air temperature. Movement of the temperature display from COOL (blue) to WARM (red) causes a corresponding movement of the temperature blend door and determines the air discharge temperature that the air distribution system will maintain. The temperature control switch is an integral part of the HVAC module and cannot be installed separately.

The A/C request button determines A/C compressor operation, except when the function selected is OFF, MAX or DEFROST. The A/C request button is an integral part of the HVAC module and cannot be installed separately.

The recirculated air request button can select recirculated air in any mode except DEFROST, and fresh air in any mode except MAX A/C or OFF.

The rear defog button signals activation of the heated backlight. The rear defog button is an integral part of the HVAC module and cannot be installed separately.

The HVAC module is not equipped with self-test capabilities.

Blower Motor Switch

The blower motor switch is mounted in the HVAC module and controls blower motor speed by adding or bypassing resistors in the blower motor resistor in all modes except OFF.

Control System Outputs

The EMTC system has 3 system outputs.

Blower Motor Resistor

The blower motor resistor:

- is located on the heater core and evaporator core housing near the blower motor.
- has 3 resistor elements mounted on the resistor board to provide 4 blower motor speeds.

- depending on the blower motor switch position, series resistance is added or bypassed in the blower motor circuit to decrease or increase blower motor speed.

Temperature Blend Door Actuator

The temperature blend door actuator:

- is located on the heater core and evaporator core housing.
- moves the temperature blend door on command from the HVAC module.
- contains a reversible electric motor and a potentiometer. The potentiometer wiper is connected to the actuator output shaft and moves with the output shaft to indicate the position of the temperature blend door.
- applies a 5-volt signal to one end of the potentiometer and ground to the other. The voltage available at the wiper indicates the position of the potentiometer. The expressed value of the actuator wiper voltage is sent to the HVAC module and is matched with an expected wiper voltage value. The HVAC module then drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage agree with the expected HVAC module wiper voltage value.

Mode Door Actuator

The mode door actuator:

- uses a cam setup to direct system airflow to the vehicle interior as determined by the HVAC module.
- contains a reversible electric motor.
- contains a potentiometer. The potentiometer wiper is connected to the actuator output shaft and moves with the output shaft to indicate the position of the mode door.
- applies a 5-volt signal to one end of the potentiometer and ground to the other. The voltage available at the wiper indicates the position of the potentiometer. The expressed value of the actuator wiper voltage is sent to the HVAC module and is matched with an expected wiper voltage value. The HVAC module then drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage agree with the expected HVAC module wiper voltage value.

Air Inlet Mode Door Actuator

The air inlet mode door actuator:

- moves the air inlet door between the FRESH and RECIRC positions on command from the HVAC module.
- contains a reversible electric motor.
- automatically stops when it reaches the full FRESH or full RECIRC position and does not report its position back to the HVAC module.

Electronic Automatic Temperature Control (EATC)

Two different Electronic Automatic Temperature Control (EATC) systems are available:

- Single-zone EATC (Fusion/Milan)
- Dual-zone EATC (MKZ)

The HVAC module analyzes input from the following major sources:

- Temperature, airflow direction, blower, A/C and RECIRC selection (made by the vehicle occupants)
- In-vehicle temperature sensor
- Ambient temperature sensor
- Solar radiation sensor
- Vehicle speed
- Engine coolant temperature

Using these inputs, the HVAC module determines the correct conditions for the following outputs:

- A/C compressor operation
- Blower speed
- Temperature blend door position
- DEFROST/PANEL/FLOOR door position
- Air inlet door position

Control System Inputs

The EATC system has 4 control system inputs.

HVAC Module

The HVAC module:

- is located in the instrument panel.
- has a vacuum fluorescent display for displaying set temperature, airflow direction, blower speed and DTCs.
- utilizes an On-Board Diagnostic (OBD) feature to supply the technician with DTCs. These DTCs direct the technician to the inoperative component.

In-Vehicle Temperature Sensor

The in-vehicle temperature sensor operates in the following manner:

- A thermistor in the in-vehicle temperature sensor measures air temperature inside the passenger compartment.
- An aspirator hose and elbow is connected between the heater core and evaporator core housing and the in-vehicle temperature sensor.
- The aspirator hose and elbow takes air from the heater core and evaporator core housing air stream to create a suction in the in-vehicle temperature sensor.

- The suction draws in-vehicle air into the in-vehicle temperature sensor and across the thermistor.

Solar Radiation Sensor (Sunload Sensor)

The solar radiation sensor supplies information to the HVAC module indicating sunload.

Ambient Temperature Sensor

The ambient temperature sensor signal is received by the HVAC module and indicates the outside air temperature. The ambient temperature sensor is located in front of the radiator on the radiator support.

Control System Outputs

The EATC system has 3 control system outputs.

Blower Motor Speed Control

The blower speed control:

- is located on the heater core and evaporator core housing near the blower motor.
- varies the blower motor speed and is controlled by the HVAC module software.

Temperature Blend Door Actuator(s)

Single-zone EATC systems use one temperature blend door actuator. Dual-zone EATC systems use 2 separate temperature blend door actuators to control 2 separate temperature blend doors for the driver and passenger sides of the vehicle. The temperature blend door actuator(s):

- is/are located on the heater core and evaporator core housing.
- move the temperature blend door(s) on command from the HVAC module.
- each contain a reversible electric motor and a potentiometer. The potentiometer wiper is connected to the actuator output shaft and moves with the output shaft to indicate the position of the temperature blend doors.

A 5-volt signal is applied to one end of the potentiometer and ground to the other. The voltage available at the wiper indicates the position of the potentiometer. The expressed value of the actuator wiper voltage is sent to the HVAC module and is matched with an expected wiper voltage value. The HVAC module then drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage agree with the expected HVAC module wiper voltage value.

Mode Door Actuator

The mode door actuator:

- uses a cam setup to position the 2 airflow mode doors to direct system airflow to the vehicle interior as determined by the HVAC module settings.
- contains a reversible electric motor.

- contains a potentiometer. The potentiometer wiper is connected to the actuator output shaft and moves with the output shaft to indicate the position of the mode door.

A 5-volt signal is applied to one end of the potentiometer and ground to the other. The voltage available at the wiper indicates the position of the potentiometer. The expressed value of the actuator wiper voltage is sent to the HVAC module and is matched with an expected wiper voltage value. The HVAC module then drives the actuator motor in whichever direction is necessary to make the actuator wiper voltage agree with the expected HVAC module wiper voltage value.

Air Inlet Mode Door Actuator

The air inlet mode door actuator:

- moves the air inlet door between the FRESH and RECIRC positions on command from the HVAC module.
- contains a reversible electric motor.
- automatically stops when it reaches the full FRESH or full RECIRC position and does not report its position back to the HVAC module.

HEATING AND VENTILATION

The heating and ventilation system has the following features:

- Controls the temperature and, during A/C operation, reduces the relative humidity of the air inside the vehicle
- Delivers heated or cooled air to maintain the vehicle interior temperature and comfort level
- Cooling or heating can be adjusted to maintain the desired temperature
- Uses a reheat method to provide conditioned air to the passenger compartment
- All airflow from the blower motor passes through the A/C evaporator core
- Temperature blending is controlled by the temperature blend door(s), which regulate(s) the amount of air that flows through and around the heater core, where it is then mixed and distributed

Heater Core

The heater core consists of fins and tubes arranged to extract heat from the engine coolant and transfer the heat to air passing through the plenum.

Blower Motor

The blower motor pulls air from the air inlet and forces it into the heater core and evaporator core housing where it is mixed and distributed.

Heater Core and Evaporator Core Housing

The heater core and evaporator core housing directs airflow from the blower motor through the evaporator core and heater core. All airflow from the blower motor passes through the evaporator core. The airflow is then

directed through or around the heater core by the temperature blend door(s). Vehicles equipped with dual-zone Electronic Automatic Temperature Control (EATC) use a partitioned heater core and evaporator core housing with 2 electric actuator-positioned temperature blend doors. This allows for separate temperatures to be selected for the driver and passenger sides of the passenger compartment. Manual systems and single-zone EATC systems use a single electric actuator-positioned temperature blend door to direct airflow through or around the heater core.

REMOVAL AND INSTALLATION

AIR CONDITIONING (A/C) COMPRESSOR - 2.3L

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

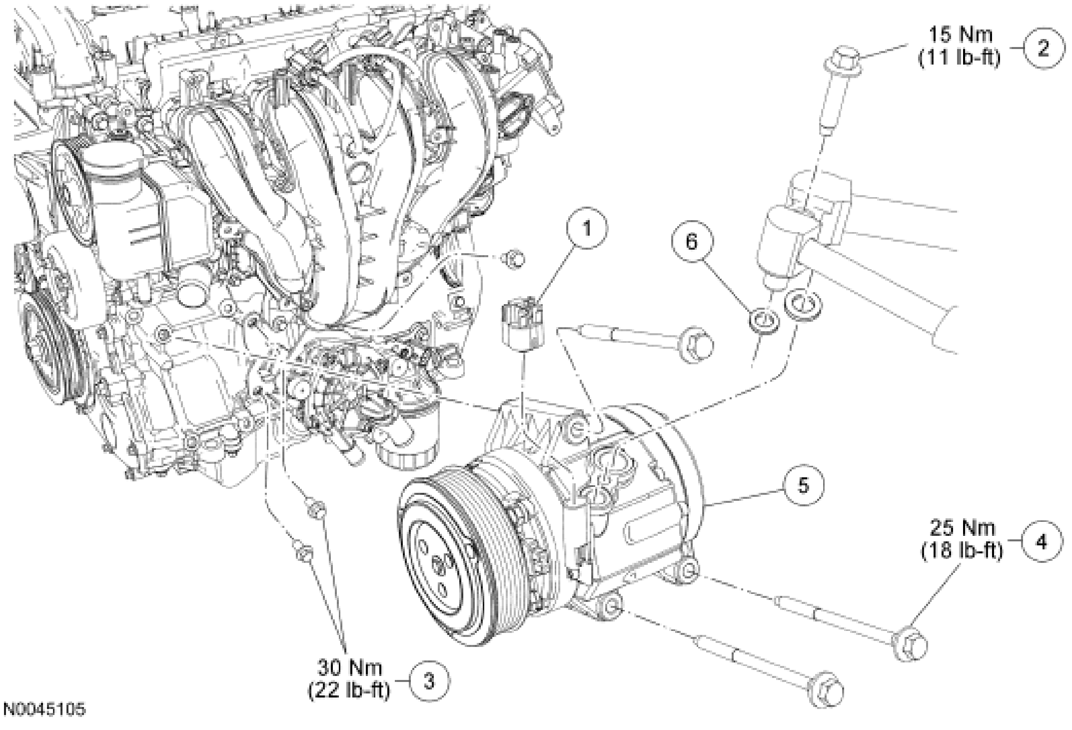

Fig. 3: Exploded View Of Air Conditioning (A/C) Compressor With Torque Specifications - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Field coil electrical connector (part of 12B637)
2	W701625	A/C compressor manifold bolt
3	W500032	Secondary air injection pump bolts (3 required)

4	W710649	A/C compressor bolt (3 required)
5	19703	A/C compressor
6	19B596	Gasket seal (2 required)

REMOVAL AND INSTALLATION

CAUTION: If installing a new air conditioning (A/C) compressor due to an internal failure of the old unit, you must carry out the following procedures to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.

- **If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS article.**
- **If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS article.**
- **Install a new thermostatic expansion valve (TXV), as directed by the A/C flushing or filtering procedure.**
- **Install a new receiver/drier cartridge as directed by the A/C flushing or filtering procedure.**

NOTE: If installing a new A/C compressor, the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil must be inspected and transferred from the old unit to the new unit if suitable for reuse.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than 1 hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.

1. If flushing of the A/C system has not been carried out, recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

3. Remove the lower engine splash shield.
4. Remove the drive belt from the A/C compressor pulley.
5. Disconnect the field coil electrical connector.
6. Remove the A/C compressor manifold bolt.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
7. Remove the 3 secondary air injection pump bolts and position the pump aside (if equipped).
   - To install, tighten to 30 Nm (22 lb-ft).
8. Remove the 3 A/C compressor bolts.
   - To install, tighten to 25 Nm (18 lb-ft).
9. Remove the A/C compressor.
10. To install, reverse the removal procedure.
    - If a new A/C compressor is to be installed, the clutch assembly must be transferred from the old unit to the new unit. For additional information, refer to **Clutch and Clutch Field Coil** in this article.
    - Install new gasket seals.
    - If filtering of the A/C system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
11. If filtering of the A/C system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

AIR CONDITIONING (A/C) COMPRESSOR - 3.0L, 3.5L

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

NOTE: 3.0L shown, 3.5L similar.

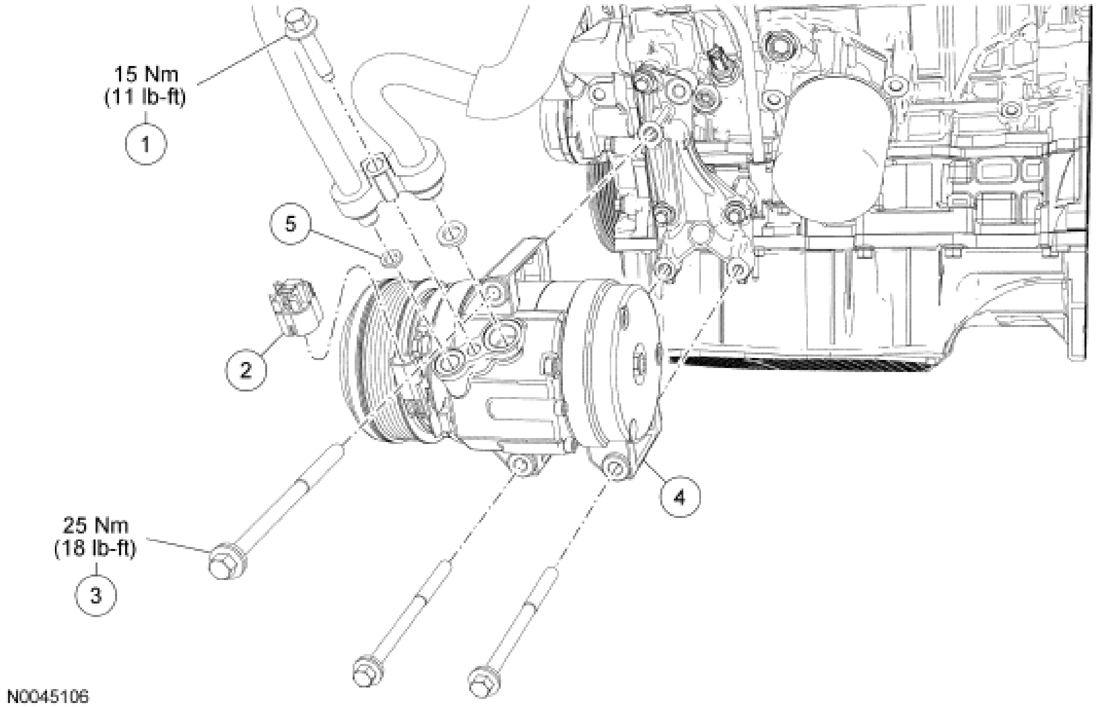

Fig. 4: Exploded View Of Air Conditioning (A/C) Compressor With Torque Specifications - 3.0L, 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701625	A/C compressor manifold bolt
2	-	Field coil electrical connector (part of 12B637)
3	W710649	A/C compressor bolt (3 required for 3.0L) (2 required for 3.5L)
4	19703	A/C compressor
5	19B596	Gasket seal (2 required)

REMOVAL AND INSTALLATION

CAUTION: If installing a new air conditioning (A/C) compressor due to an internal failure of the old unit, you must carry out the following procedures to remove contamination from the A/C system. Failure to remove contamination from the A/C system, if present, will result in poor A/C performance and/or damage to the new A/C compressor and other components.

- **If A/C flushing equipment is available, carry out flushing of the A/C system prior to installing a new A/C compressor. For additional information, refer to CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS article.**

- **If A/C flushing equipment is not available, carry out filtering of the A/C system after a new A/C compressor has been installed. For additional information, refer to CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS article.**
- **Install a new thermostatic expansion valve (TXV), as directed by the A/C flushing or filtering procedure.**
- **Install a new receiver/drier cartridge as directed by the A/C flushing or filtering procedure.**

NOTE: If installing a new A/C compressor, the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil must be inspected and transferred from the old unit to the new unit if suitable for reuse.

NOTE: Installation of a new receiver/drier cartridge is not required when repairing the air conditioning system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a period longer than 1 hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.

All vehicles

1. If flushing of the A/C system has not been carried out, recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
3. Remove the lower engine splash shield (if equipped).
4. Remove the drive belt from the A/C compressor pulley.
5. Remove the A/C compressor manifold bolt.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
6. Disconnect the field coil electrical connector.

   3.0L vehicles

7. Remove the 3 A/C compressor bolts.
   - To install, tighten to 25 Nm (18 lb-ft).

   3.5L vehicles

8. Remove the 2 A/C compressor bolts.
    - To install, tighten to 25 Nm (18 lb-ft).
9. Remove the A/C compressor stud.
    1. Remove the A/C compressor nut.
    2. Remove the A/C compressor stud.
        - To install, tighten the stud to 9 Nm (80 lb-in).
        - To install, tighten the nut to 25 Nm (18 lb-ft).

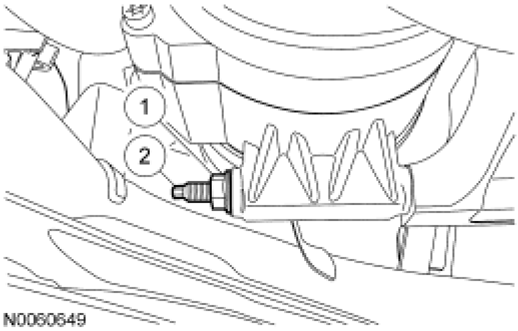

Fig. 5: Identifying A/C Compressor Nut & A/C Compressor Stud
Courtesy of FORD MOTOR CO.

All vehicles

10. Remove the A/C compressor.
11. To install, reverse the removal procedure.
    - If a new A/C compressor is to be installed, the clutch assembly must be transferred from the old unit to the new unit. For additional information, refer to **Clutch and Clutch Field Coil** in this article.
    - Install new gasket seals.
    - If filtering of the A/C system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
12. If filtering of the A/C system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

AIR CONDITIONING (A/C) EVAPORATOR DISCHARGE AIR TEMPERATURE SENSOR

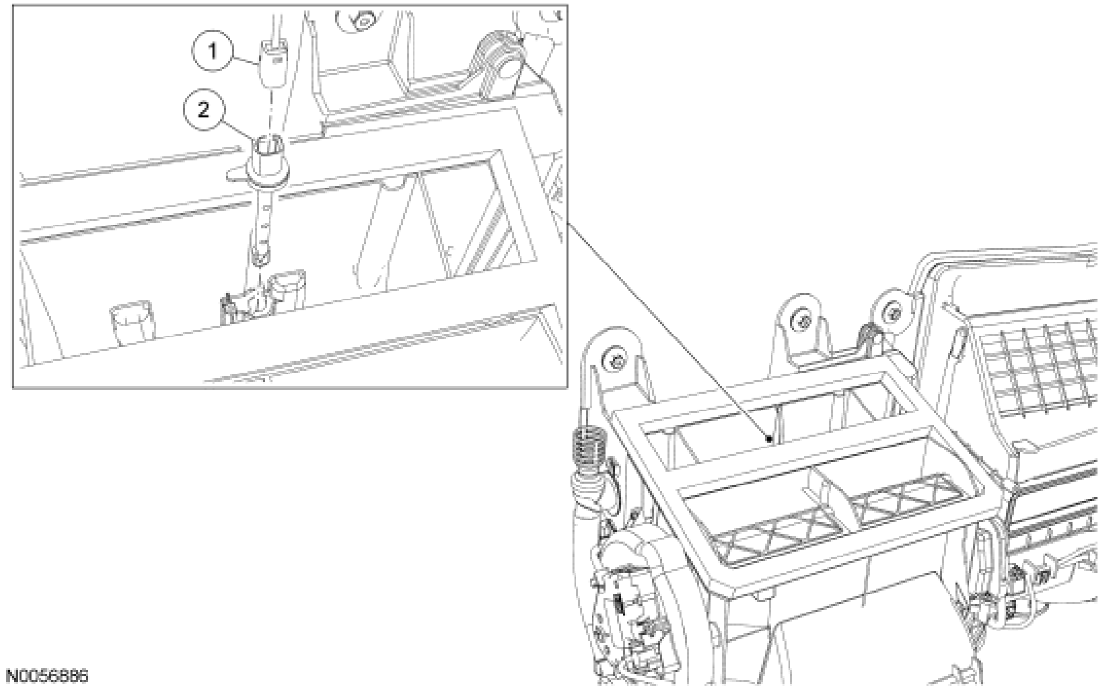

Fig. 6: Exploded View Of Air Conditioning (A/C) Evaporator Discharge Air Temperature Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	A/C evaporator discharge air temperature sensor electrical connector (part of 19D887)
2	19C734	A/C evaporator discharge air temperature sensor

REMOVAL AND INSTALLATION

1. Remove the instrument panel. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Detach the A/C evaporator discharge air temperature sensor.
3. Disconnect the A/C evaporator discharge air temperature sensor electrical connector.
4. Remove the evaporator discharge air temperature sensor.
5. To install, reverse the removal procedure.

AIR CONDITIONING (A/C) PRESSURE RELIEF VALVE

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

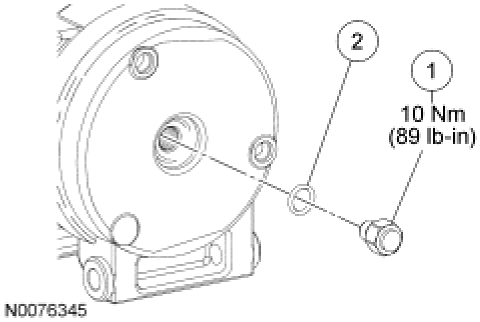

Fig. 7: Exploded View Of Air Conditioning (A/C) Pressure Relief Valve With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	19D644	A/C pressure relief valve
2	-	O-ring seal (part of 19D644)

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
3. Remove the A/C pressure relief valve and O-ring seal.
   - To install, tighten to 10 Nm (89 lb-in).

NOTE: A new O-ring seal will already be installed on the new A/C pressure relief valve service part.

4. To install, reverse the removal procedure.
   - Add the correct amount of clean PAG refrigerant oil to the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
5. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

AMBIENT AIR TEMPERATURE SENSOR

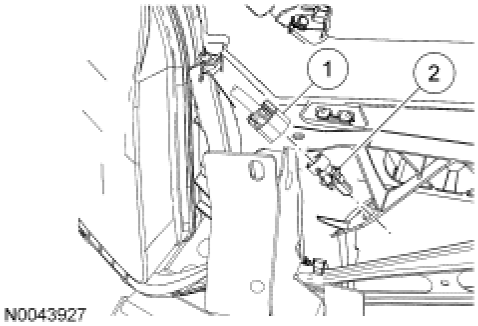

Fig. 8: Exploded View Of Ambient Air Temperature Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Ambient air temperature sensor electrical connector (part of 14290)
2	19E642	Ambient air temperature sensor

REMOVAL AND INSTALLATION

Fusion or Milan vehicles

1. Remove the front bumper cover. For additional information, refer to **BUMPERS** article.

   MKZ vehicles

2. Remove the radiator grille upper sight shield.

   All vehicles

3. Disconnect the ambient air temperature sensor electrical connector.
4. Remove the ambient air temperature sensor.
5. To install, reverse the removal procedure.

BLOWER MOTOR

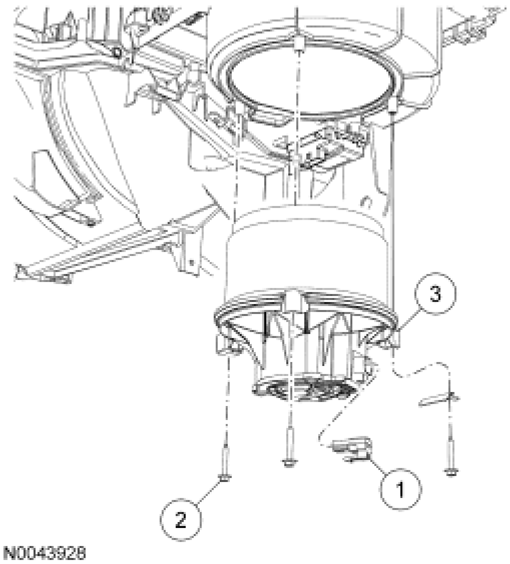

Fig. 9: Exploded View Of Blower Motor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Blower motor electrical connector (part of 19D887)
2	-	Blower motor screw (3 required)
3	19805	Blower motor

REMOVAL AND INSTALLATION

MKZ vehicles

1. Remove the RH lower instrument panel insulator.

   All vehicles

2. Disconnect the blower motor electrical connector.
3. Remove the 3 blower motor screws.
4. Remove the blower motor.
5. To install, reverse the removal procedure.

BLOWER MOTOR RESISTOR

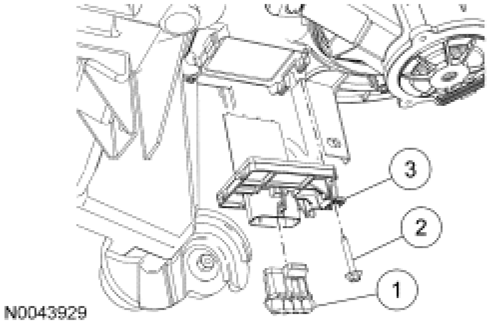

Fig. 10: Exploded View Of Blower Motor Resistor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Blower motor resistor electrical connector (part of 19D887)
2	-	Blower motor resistor screw
3	18591	Blower motor resistor

REMOVAL AND INSTALLATION

1. Disconnect the blower motor resistor electrical connector.
2. Remove the blower motor resistor screw.
3. Remove the blower motor resistor.
4. To install, reverse the removal procedure.

BLOWER MOTOR SPEED CONTROL

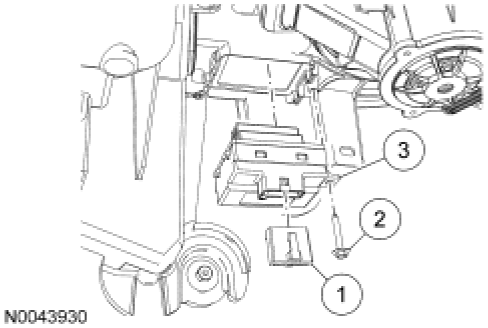

Fig. 11: Exploded View Of Blower Motor Speed Control
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Blower motor speed control electrical connector (part of 19D887)
2	-	Blower motor speed control screw

3	19E624	Blower motor speed control

REMOVAL AND INSTALLATION

MKZ vehicles

1. Remove the RH lower instrument panel insulator.

   All vehicles

2. Disconnect the blower motor speed control electrical connector.
3. Remove the blower motor speed control screw.
4. Remove the blower motor speed control.
5. To install, reverse the removal procedure.

BLOWER MOTOR SWITCH

REMOVAL AND INSTALLATION

1. Remove the climate control assembly. For additional information, refer to **Heating Ventilation Air Conditioning (HVAC) Module** in this article.
2. Pull and remove the blower motor switch knob.
3. Depress the tab and rotate the blower counterclockwise to remove.

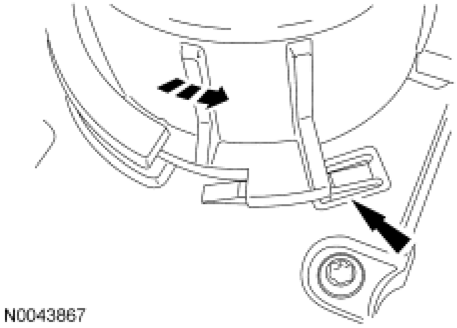

Fig. 12: Identifying Blower Motor Switch Components
Courtesy of FORD MOTOR CO.

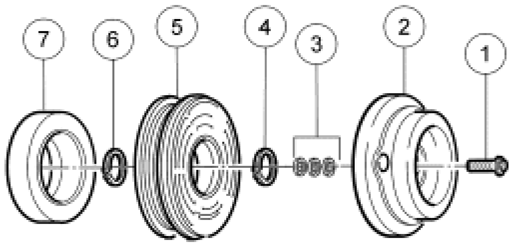
4. To install, reverse the removal procedure.

CLUTCH AND CLUTCH FIELD COIL

Special Tools

Illustration	Tool Name	Tool Number
	Holding Fixture, Compressor	

 ST2946-A	Clutch Disc and Hub	412-134



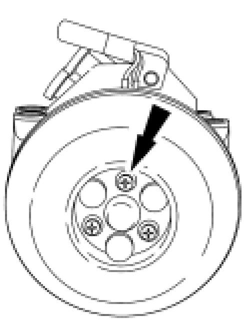
N0043868

Fig. 13: A/C Compressor Clutch Assembly
Courtesy of FORD MOTOR CO.

Item	**Part Number**	**Description**
1	W712303	A/C clutch disc and hub bolt
2	19D786	A/C clutch disc and hub
3	19D648	A/C clutch disc and hub spacers
4	W712302	A/C compressor pulley snap ring
5	19D784	A/C compressor pulley
6	W712301	A/C clutch field coil snap ring
7	19D798	A/C clutch field coil

REMOVAL

1. Remove the A/C compressor. For additional information, refer to **Air Conditioning (A/C) Compressor - 2.3L** or **Air Conditioning (A/C) Compressor - 3.0L, 3.5L** in this article.
2. Remove the 3 screws and the A/C clutch shield (if equipped).



N0045760

Fig. 14: Locating A/C Clutch Shield Screw

Courtesy of FORD MOTOR CO.

3. Remove the A/C clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the special tool.
    2. Remove the A/C clutch disc and hub bolt.

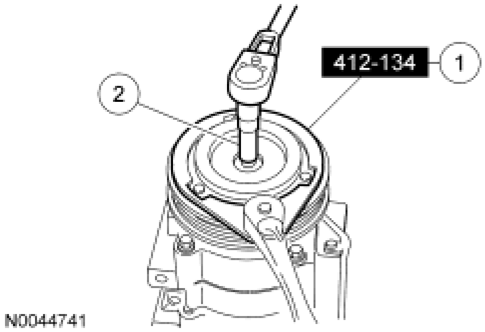


Fig. 15: A/C Clutch Disc & Hub Bolt
Courtesy of FORD MOTOR CO.

4. Remove the A/C clutch disc and hub.
5. Remove the A/C compressor pulley snap ring.
6. Remove the A/C compressor pulley.
7. Remove the A/C clutch field coil electrical connector clip screw.

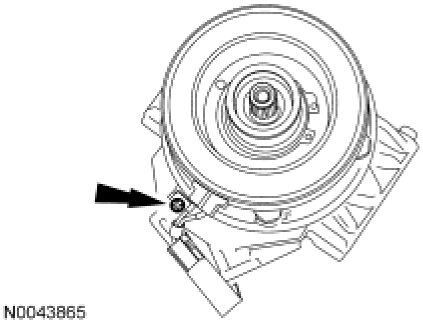

Fig. 16: Locating A/C Clutch Field Coil Electrical Connector Clip Screw
Courtesy of FORD MOTOR CO.

8. Remove the A/C clutch field coil snap ring.
9. Remove the A/C clutch field coil.

INSTALLATION

NOTE:	**If installing a new A/C compressor, the A/C clutch components should be reused unless obvious signs of damage are found. If excessive grooving is found, a new A/C clutch disc and hub and A/C compressor pulley must be installed together. Otherwise, each component can be installed individually**

where needed.

1. Visually inspect the A/C clutch disc and hub, A/C compressor pulley and A/C clutch field coil for damage.
   - Inspect for physical damage, including cracked or melted components or discoloration due to excessive heat.
   - Inspect for excessive wear, including grooving in the A/C clutch disc and hub or A/C compressor pulley that is more than fingernail depth.
   - Inspect for roughness in the A/C compressor pulley bearing.
2. Clean the A/C clutch field coil and pulley mounting surfaces.
3. Install the A/C clutch field coil.
4. Install the A/C clutch field coil snap ring.
5. Install the A/C clutch field coil electrical connector clip screw.

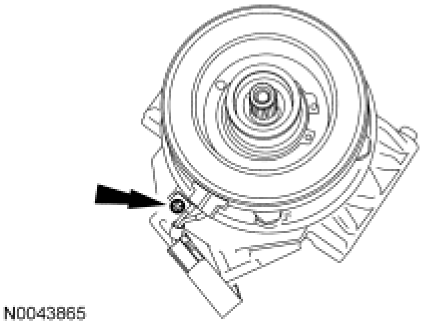

Fig. 17: Locating A/C Clutch Field Coil Electrical Connector Clip Screw
Courtesy of FORD MOTOR CO.

NOTE: The A/C clutch pulley is a tight fit on the A/C compressor head. It must be correctly aligned during installation.

6. Install the A/C clutch pulley.
7. Install the A/C clutch pulley snap ring.
8. Place one nominal thickness A/C clutch disc and hub spacer inside the clutch hub spline opening.
9. Install the A/C clutch disc and hub assembly.
10. Install the A/C clutch disc and hub bolt.
    1. Hold the A/C clutch disc and hub with the special tool.
    2. Install the A/C clutch disc and hub bolt.
    3. Tighten to 14 Nm (10 lb-ft).

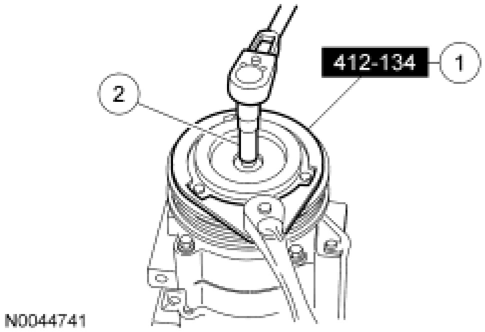

Fig. 18: A/C Clutch Disc & Hub Bolt
Courtesy of FORD MOTOR CO.

11. Install the A/C clutch shield and the 3 screws.

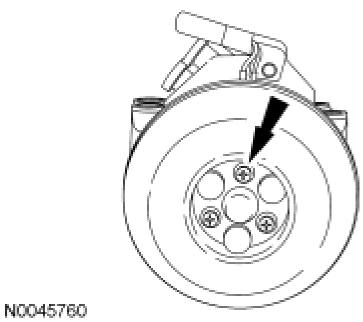

Fig. 19: Locating A/C Clutch Shield Screw
Courtesy of FORD MOTOR CO.

12. Measure and adjust the clutch air gap by removing or adding A/C clutch hub spacers.

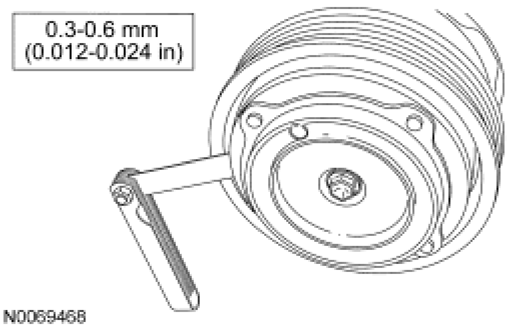

Fig. 20: Checking A/C Compressor Clutch Air Gap
Courtesy of FORD MOTOR CO.

13. Install the A/C compressor. For additional information, refer to **Air Conditioning (A/C) Compressor - 2.3L** or **Air Conditioning (A/C) Compressor - 3.0L, 3.5L** in this article.

COMPRESSOR MANIFOLD AND TUBE ASSEMBLY - 2.3L

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

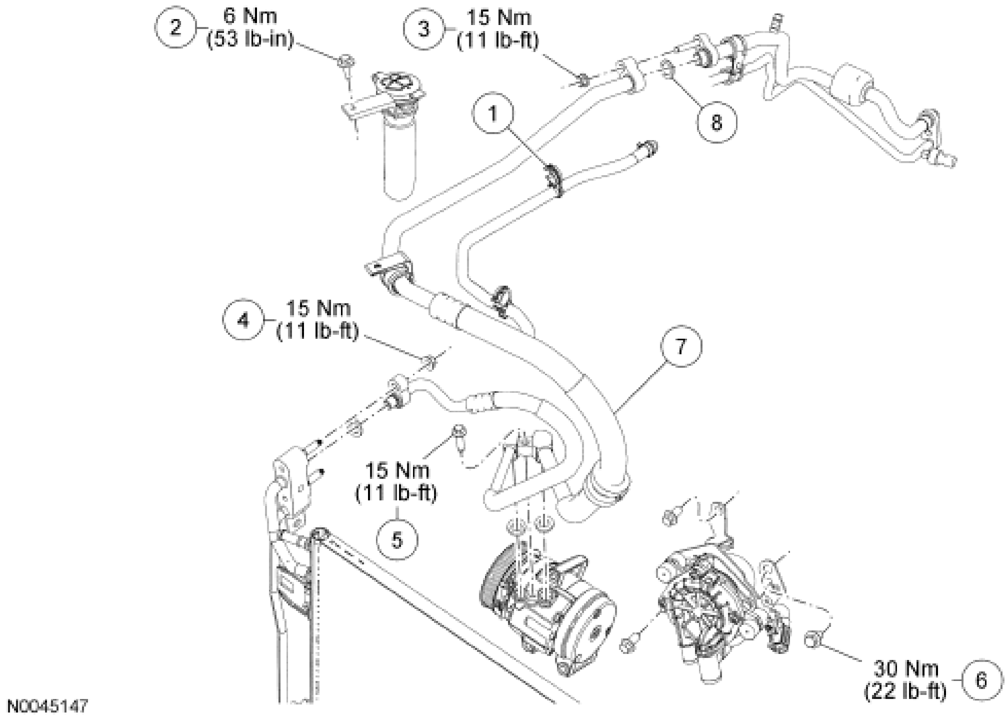

Fig. 21: Exploded View Of Compressor Manifold & Tube Assembly With Torque Specifications - 2.3L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Coolant reservoir hose retainer (2 required)
2	W505422	Washer reservoir filler neck bolt
3	W520413	Compressor manifold and tube suction fitting nut
4	W520413	Condenser inlet fitting nut
5	W701625	Compressor manifold bolt
6	W500032	Secondary air injection pump bolt (3 required)
7	19D734	Compressor manifold and tube assembly
8	19B596	Gasket seal (4 required)

REMOVAL AND INSTALLATION

1. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
3. Detach the 2 coolant reservoir hose retainers from the compressor manifold and tube assembly.
4. Remove the washer reservoir filler neck bolt.
   - To install, tighten to 6 Nm (53 lb-in).
5. Remove the compressor manifold and tube suction fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).
6. Remove the condenser inlet fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).
7. Remove the lower engine splash shield.
8. Remove the compressor manifold bolt and detach the manifold from the A/C compressor.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
9. Remove the 3 secondary air injection pump bolts and position the secondary air injection pump aside (if equipped).
   - To install, tighten to 30 Nm (22 lb-ft).
10. Remove the compressor manifold and tube assembly.
11. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

COMPRESSOR MANIFOLD AND TUBE ASSEMBLY - 3.0L, 3.5L

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

NOTE: **3.0L shown, 3.5L similar.**

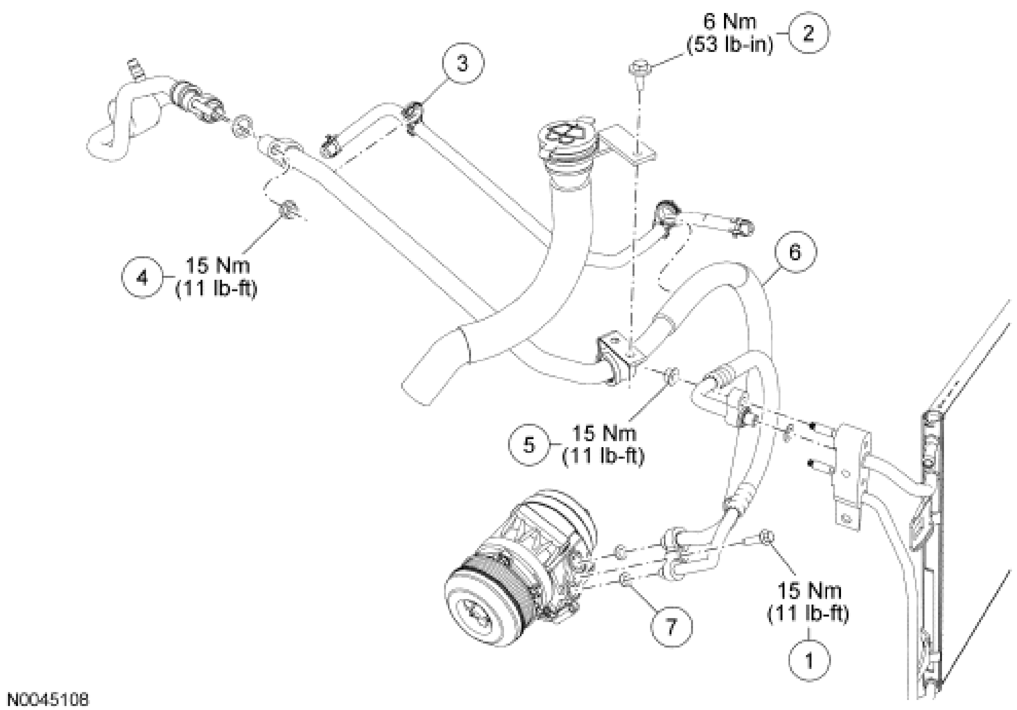

Fig. 22: Exploded View Of Compressor Manifold & Tube Assembly With Torque Specifications - 3.0L, 3.5L
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701625	Compressor manifold bolt
2	W505422	Washer reservoir filler neck bolt
3	-	Coolant reservoir hose retainer (2 required)
4	W520413	Compressor manifold and tube suction fitting nut
5	W520413	Condenser inlet fitting nut
6	19D734	Compressor manifold and tube assembly
7	19B596	Gasket seal (4 required)

REMOVAL AND INSTALLATION

CAUTION: Do not stress or bend the aluminum lines on the compressor manifold and tube assembly to facilitate removal. Bending or squeezing the lines together may damage the welds and lead to premature failure of the line.

All vehicles

1. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
3. Remove the lower engine splash shield (if equipped).
4. Remove the compressor manifold bolt and detach the manifold from the A/C compressor.
    - Discard the gasket seals.
    - To install, tighten to 15 Nm (11 lb-ft).
5. Detach the 2 coolant reservoir hose retainers from the compressor manifold and tube assembly.
6. Remove the washer reservoir filler neck bolt.
    - To install, tighten to 6 Nm (53 lb-in).
7. Remove the compressor manifold and tube suction fitting nut and disconnect the fitting.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (11 lb-ft).
8. Remove the condenser inlet fitting nut and disconnect the fitting.
    - Discard the gasket seal.
    - To install, tighten to 15 Nm (11 lb-ft).

3.5L vehicles

NOTE: **Be sure not to strike the A/C lines against any hard object such as the exhaust manifold when removing the compressor manifold and tube assembly.**

9. Remove the compressor manifold and tube assembly.
    1. Rotate the compressor manifold and tube counterclockwise enough to allow it to be lifted between the exhaust manifold shield and alternator.
    2. Remove the compressor manifold and tube assembly.

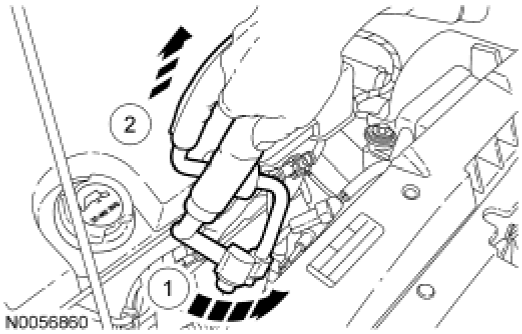

Fig. 23: Rotating Compressor Manifold & Tube Counterclockwise
Courtesy of FORD MOTOR CO.

3.0L vehicles

NOTE: **Be sure not to strike the A/C lines against any hard object such as the**

exhaust manifold when removing the compressor manifold and tube assembly.

10. Remove the compressor manifold and tube assembly.

    All vehicles

11. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

CONDENSER CORE

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

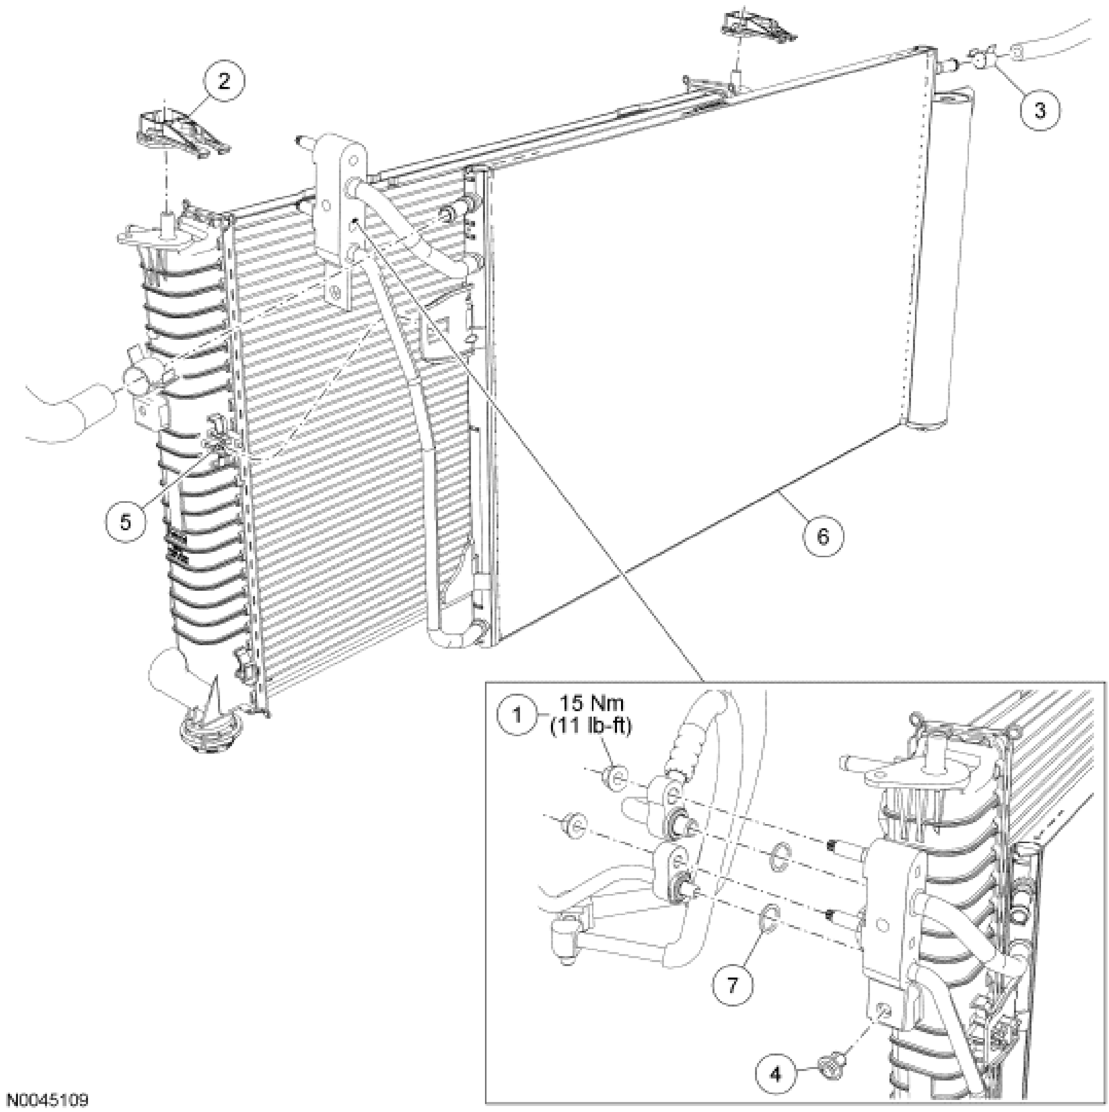

Fig. 24: Exploded View Of Condenser Core With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W520413	Condenser fitting nut (2 required)
2	8A193	Radiator bracket (2 required)
3	W525884	Power steering hose clamp (2 required)
4	W711622	Condenser manifold rivet
5	-	Condenser clip (2 required) (part of 8005)
6	19712	Condenser core
7	19B596	Gasket seal (2 required)

REMOVAL AND INSTALLATION

NOTE: New A/C condenser service parts are shipped with a new receiver/drier cartridge installed in the integral receiver/drier.

1. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
2. With the vehicle in NEUTRAL position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
3. Remove the cooling fan. For additional information, refer to **ENGINE COOLING** article.
4. Remove the washer reservoir filler neck bolt.
5. Remove the 2 condenser fitting nuts and disconnect the fittings.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
6. Unclip the 2 radiator brackets from the radiator core support and position the cooling module rearward.
7. Remove the 2 radiator brackets.

   NOTE: Position a drain pan underneath each power steering hose connection.

8. Release the 2 power steering hose clamps at the condenser and disconnect the hoses.
9. Remove the condenser manifold rivet.
10. Release the 2 condenser clips at the radiator and detach the condenser from the radiator.
11. Remove the condenser core.
12. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
13. Fill the power steering system. For additional information, refer to **STEERING SYSTEM - GENERAL INFORMATION** article.
14. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

EVAPORATOR CORE

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

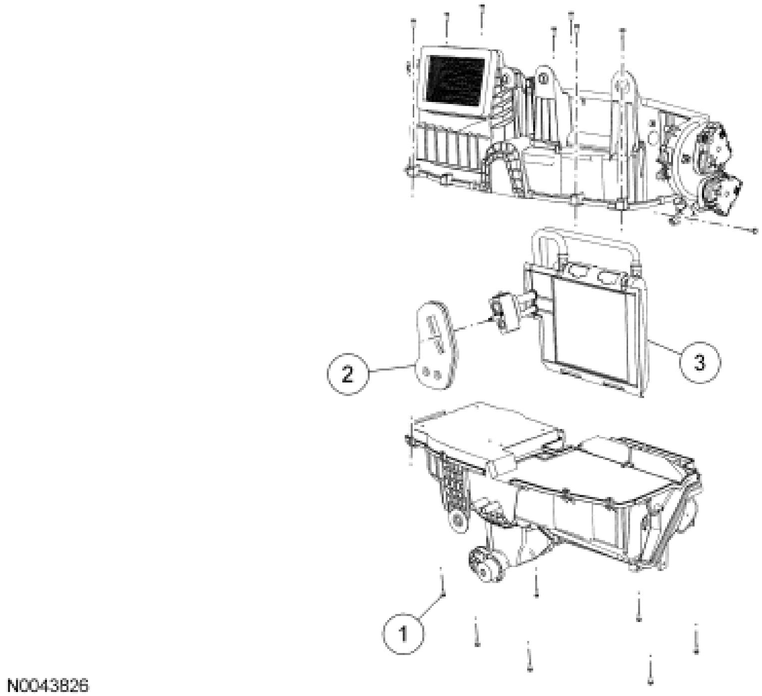

Fig. 25: Exploded View Of Evaporator Core
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712320	Evaporator core cover screw (15 required)
2	19W700	Dash panel seal
3	19860	Evaporator core

REMOVAL AND INSTALLATION

NOTE: If an evaporator core leak is suspected, the evaporator core must be leak tested before it is removed from the vehicle.

1. Remove the heater core and evaporator core housing. For additional information, refer to **Heater Core And Evaporator Core Housing** in this article.
2. Detach the wire harness from the heater core and evaporator core housing.
3. Remove the 15 evaporator core cover screws.
4. Separate the 2 halves of the heater core and evaporator core housing.
5. Remove the dash panel seal.
6. Remove the evaporator core.
7. To install, reverse the removal procedure.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND**

DIAGNOSTICS article.

HEATER CORE

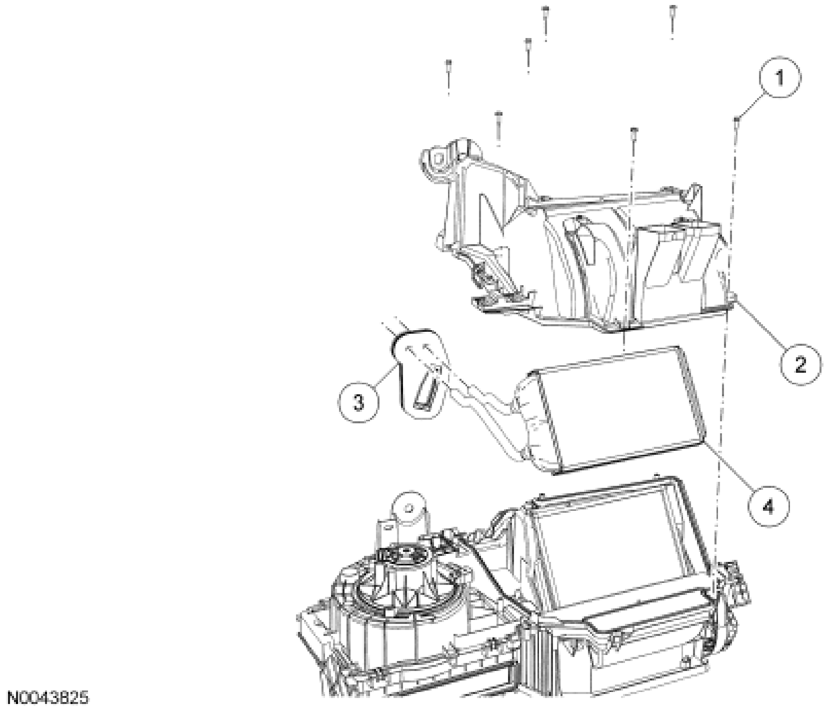

Fig. 26: Exploded View Of Heater Core
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712320	Heater core cover screw (8 required)
2	18B300	Heater core cover
3	19C593	Dash panel seal
4	18476	Heater core

REMOVAL AND INSTALLATION

NOTE: **If a heater core leak is suspected, the heater core must be pressure leak tested before it is removed from the vehicle. For additional information, refer to CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS article.**

1. Remove the heater core and evaporator core housing. For additional information, refer to **Heater Core And Evaporator Core Housing** in this article.
2. Detach the wire harness from the heater core cover.
3. Remove the 8 heater core cover screws.
4. Remove the heater core cover.

5. Remove the dash panel seal from the heater core tubes.
6. Remove the heater core.
7. To install, reverse the removal procedure.

HEATING VENTILATION AIR CONDITIONING (HVAC) MODULE

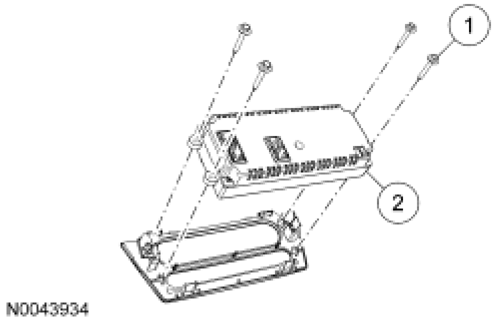

Fig. 27: Exploded View Of Climate Control Assembly
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W505823	HVAC module screw (4 required)
2	19980	HVAC module

REMOVAL AND INSTALLATION

1. Remove the instrument panel lower center finish panel. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Remove the 4 HVAC module screws.
3. Remove the HVAC module.
4. To install, reverse the removal procedure.

HEATER CORE AND EVAPORATOR CORE HOUSING

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

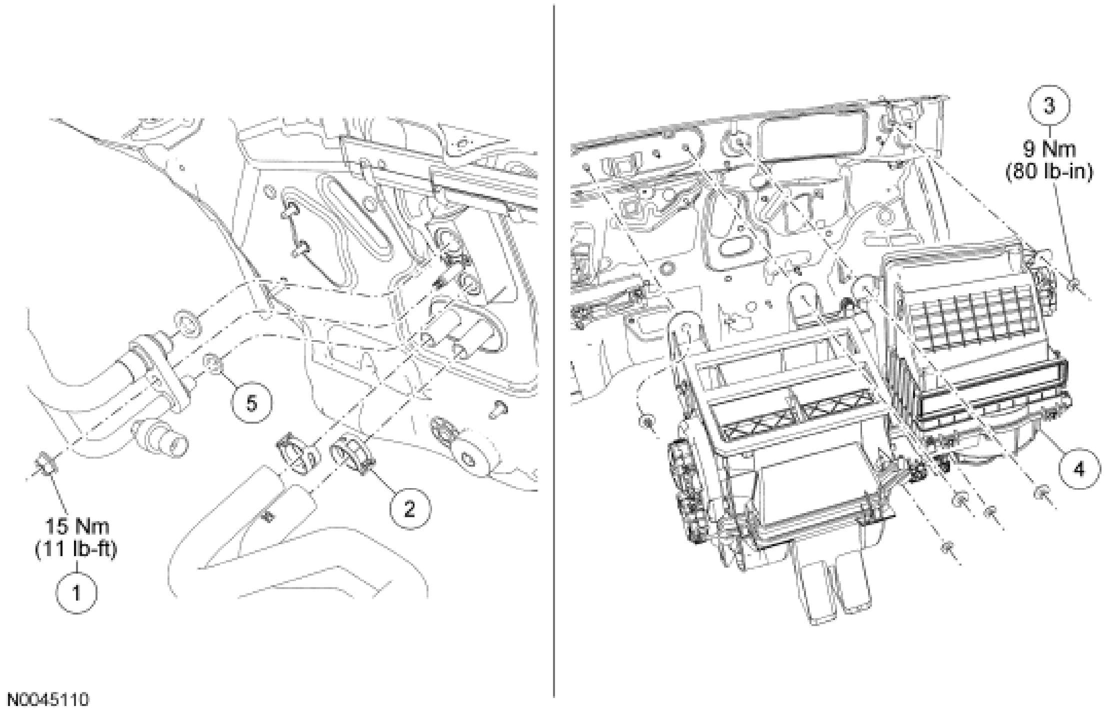

Fig. 28: Exploded View Of Heater Core & Evaporator Core Housing With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W520413	Thermostatic expansion valve (TXV) fitting nut
2	8287	Heater hose clamp (2 required)
3	N621907	Heater core and evaporator core housing nut (6 required)
4	-	Heater core and evaporator core housing
5	19B596	Gasket seal (2 required)

REMOVAL AND INSTALLATION

3.0L or 3.5L vehicles

1. Remove the lower cowl panel grille. For additional information, refer to **FRONT END BODY PANELS** article.

   All vehicles

2. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
3. Drain the engine coolant. For additional information, refer to **ENGINE COOLING** article.
4. Remove the instrument panel. For additional information, refer to **INSTRUMENT PANEL AND**

CONSOLE article.

5. Disconnect the A/C pressure transducer electrical connector and detach the wire harness from the thermostatic expansion valve (TXV) stud.

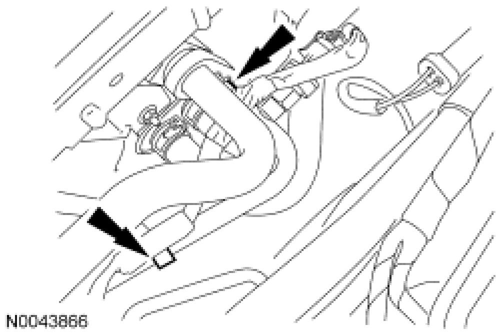

Fig. 29: Locating A/C Pressure Transducer Electrical Connector
Courtesy of FORD MOTOR CO.

6. Remove the TXV fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
7. Release the heater hoses clamps and disconnect the hoses from the heater core
8. Remove the 6 heater core and evaporator core housing nuts.
   - To install, tighten to 9 Nm (80 lb-in).
9. Remove the heater core and evaporator core housing.
10. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
11. Fill the engine coolant level. For additional information, refer to **ENGINE COOLING** article.
12. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

IN-VEHICLE TEMPERATURE SENSOR

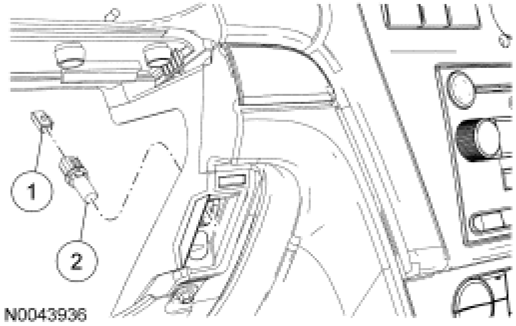

Fig. 30: Exploded View Of In-Vehicle Temperature Sensor
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	In-vehicle temperature sensor electrical connector (part of 14401)
2	19C734	In-vehicle temperature sensor

REMOVAL AND INSTALLATION

1. Remove the lower steering column shroud screws.
2. Remove the lower steering column shroud.
3. Disconnect the in-vehicle temperature sensor electrical connector.
4. Remove the in-vehicle temperature sensor.
5. To install, reverse the removal procedure.

MODE DOOR ACTUATOR - AIR INLET DOOR

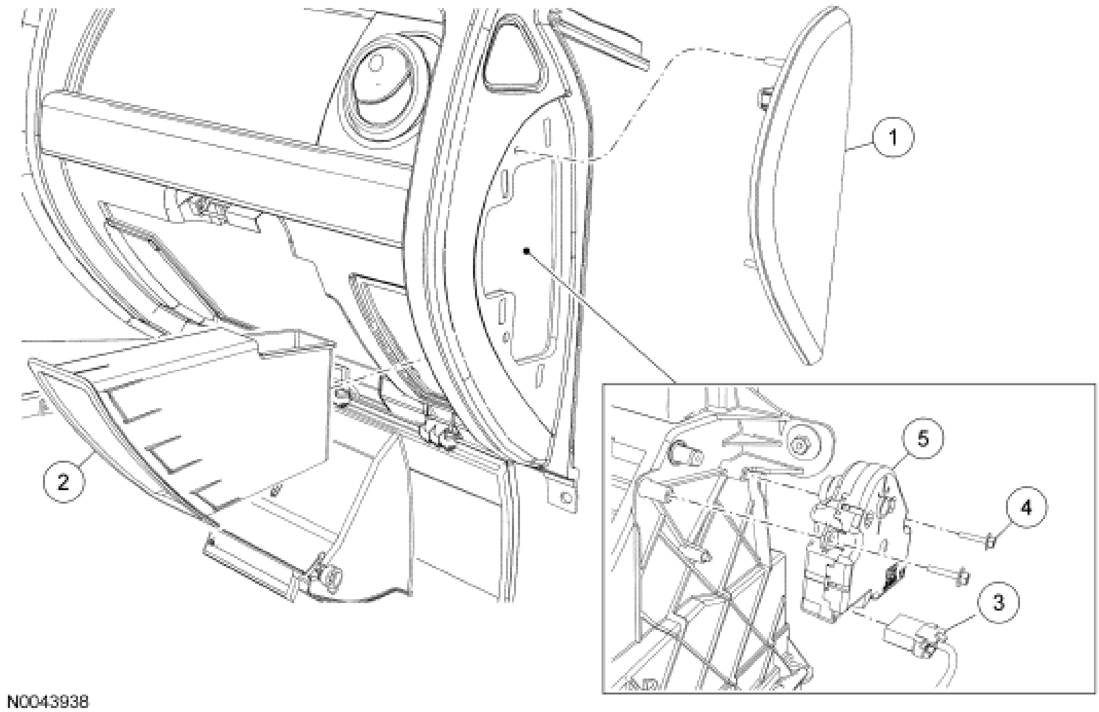

Fig. 31: Exploded View Of Mode Door Actuator - Air Inlet Door
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5404480	RH instrument panel end panel
2	5406010	Glove compartment storage bin

3	-	Air inlet mode door actuator electrical connector (part of 19D887)
4	W712320	Air inlet mode door actuator screw (2 required)
5	19E616	Air inlet mode door actuator

REMOVAL AND INSTALLATION

1. Lower the glove compartment.
2. Remove the RH instrument panel end panel.
3. Remove the glove compartment storage bin.
4. Disconnect the air inlet mode door actuator electrical connector.
5. Remove the air inlet mode door actuator.
6. To install, reverse the removal procedure.

MODE DOOR ACTUATOR - DEFROST/PANEL/FLOOR DOOR

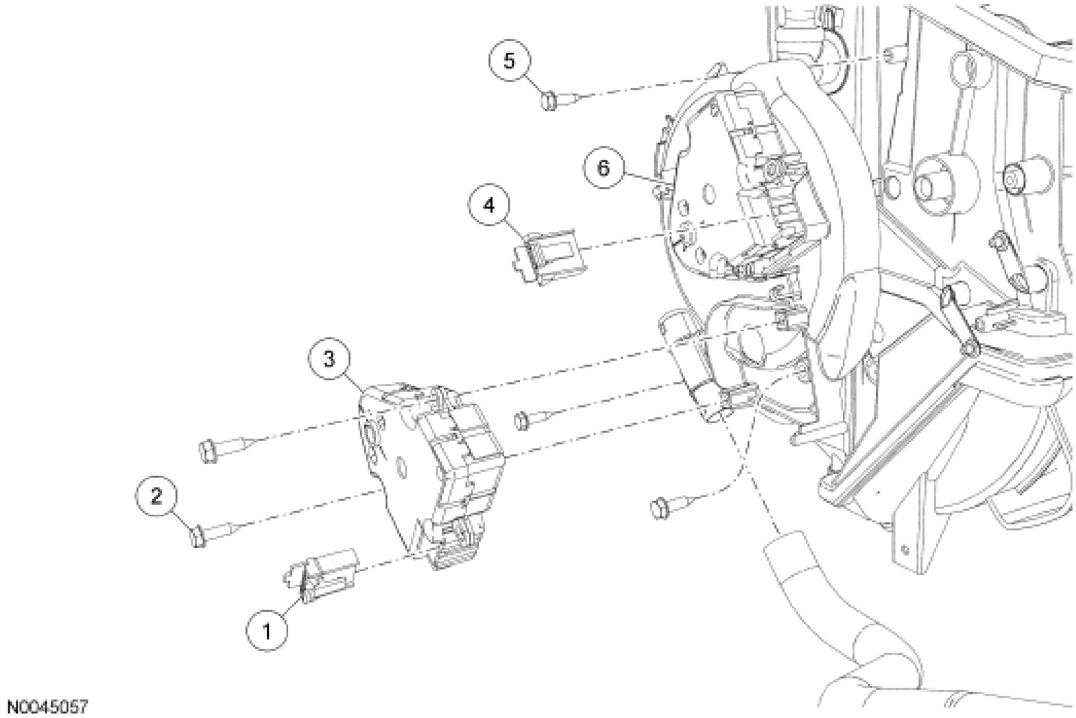

Fig. 32: Exploded View Of Mode Door Actuator - Defrost/Panel/Floor Door
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	LH temperature blend door actuator electrical connector (part of 19D887)
2	W712320	LH temperature blend door actuator screw (2 required)

3	19E616	LH temperature blend door actuator
4	-	DEFROST/PANEL/FLOOR mode door actuator electrical connector (part of 19D887)
5	W712320	DEFROST/PANEL/FLOOR mode door actuator and cam assembly screw
6	19C772	DEFROST/PANEL/FLOOR mode door actuator and cam assembly

REMOVAL AND INSTALLATION

1. Remove the instrument panel. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.
2. Disconnect the LH temperature blend door actuator electrical connector.
3. Remove the 2 LH temperature blend door actuator screws.
4. Remove the LH temperature blend door actuator.
5. Disconnect the DEFROST/PANEL/FLOOR mode door actuator electrical connector.
6. Remove the 3 DEFROST/PANEL/FLOOR mode door actuator and cam assembly screws.
7. Remove the DEFROST/PANEL/FLOOR mode door actuator and cam assembly.
8. To install, reverse the removal procedure.

RECEIVER DRIER CARTRIDGE

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

REMOVAL AND INSTALLATION

NOTE: **Care must be taken to minimize exposure of the receiver/drier cartridge to outside air. If multiple air conditioning (A/C) system components are being removed and installed, the receiver/drier cartridge should be installed last. The new receiver/drier cartridge should not be removed from its packaging until it is ready to be installed. Evacuation of the A/C system must be started as soon as the receiver/drier cartridge is installed. Excessive exposure of the receiver/drier cartridge to outside air will result in moisture contamination of the receiver/drier cartridge desiccant.**

NOTE: **Installation of a new receiver/drier cartridge is not required when repairing the A/C system, except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver/drier cartridge. Damage to the receiver/drier cartridge includes physical damage or moisture contamination. Moisture contamination results only from a complete loss of refrigerant, and equalization of the refrigerant system pressure with atmospheric pressure for a**

period longer than one hour. If even a slight amount of positive refrigerant pressure is present in the refrigerant system before repairs are carried out, the receiver/drier cartridge does not need to be replaced.

1. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer **JACKING AND LIFTING** article.
3. Remove the lower radiator air deflector.
4. Unscrew and remove the plastic receiver/drier cap.

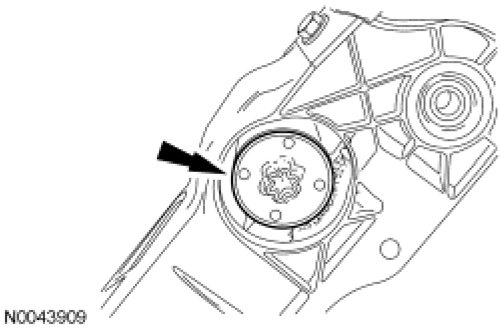

Fig. 33: Locating Plastic Receiver/Drier Cap
Courtesy of FORD MOTOR CO.

NOTE:	**If the receiver/drier plug is difficult to remove, open a refrigerant system fitting to relieve any vacuum created during refrigerant recovery, and attempt to remove the plug again.**

5. Remove the receiver/drier plug.
    1. Push the receiver/drier plug upwards and remove the snap ring.
    2. Install the bolt included with the A/C desiccant cartridge service kit in the center of the receiver drier plug and remove the plug.

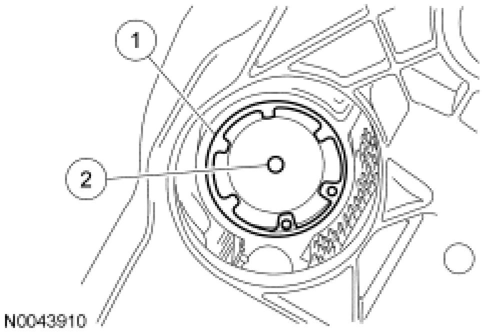

Fig. 34: Identifying Snap Ring And Receiver Drier Plug
Courtesy of FORD MOTOR CO.

6. Using a suitable tool, grasp the receiver/drier cartridge grab handle and remove the receiver/drier cartridge.

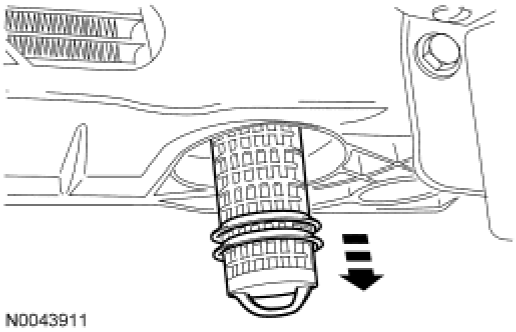

Fig. 35: Removing A/C Desiccant Cartridge
Courtesy of FORD MOTOR CO.

7. To install, reverse the removal procedure.
   - Lubricate the receiver/drier plug O-ring seals using residual refrigerant oil from inside the receiver/drier.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
8. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

REGISTER - CENTER, FUSION/MILAN

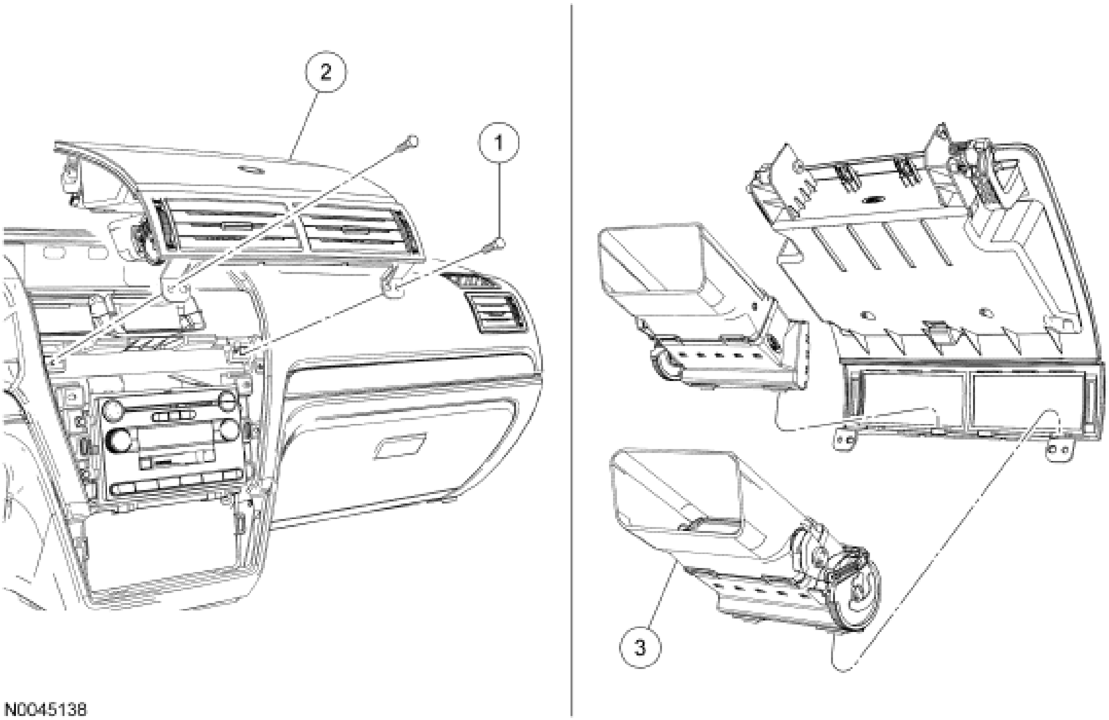

Fig. 36: Exploded View Of Register - Center, Fusion/Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Upper instrument panel storage bin screw (2 required)
2	5413594	Upper instrument panel storage bin
3	19893	Center instrument panel register (2 required)

REMOVAL AND INSTALLATION

1. Remove the audio unit bezel.
2. Remove the 2 upper instrument panel storage bin screws.
3. Remove the upper instrument panel storage bin.
4. Release the 3 upper clips on each register and remove the 2 center instrument panel registers.
5. To install, reverse the removal procedure.

REGISTER - DRIVER AND PASSENGER SIDE, FUSION/MILAN

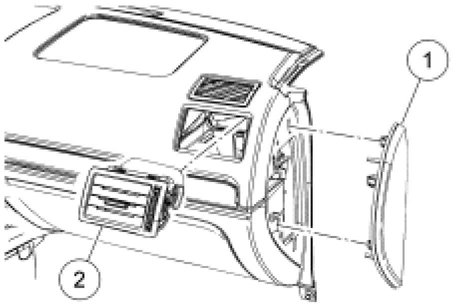

Fig. 37: Exploded View Of Register - Driver and Passenger Side, Fusion/Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5404480	Instrument panel end panel
2	19893	Register

REMOVAL AND INSTALLATION

NOTE: Passenger side register shown, driver side similar.

1. Remove the instrument panel end panel.
2. Working through the instrument panel end panel opening, release the 2 lower register clips and remove the driver or passenger side instrument panel register.
3. To install, reverse the removal procedure.

REGISTER - MKZ

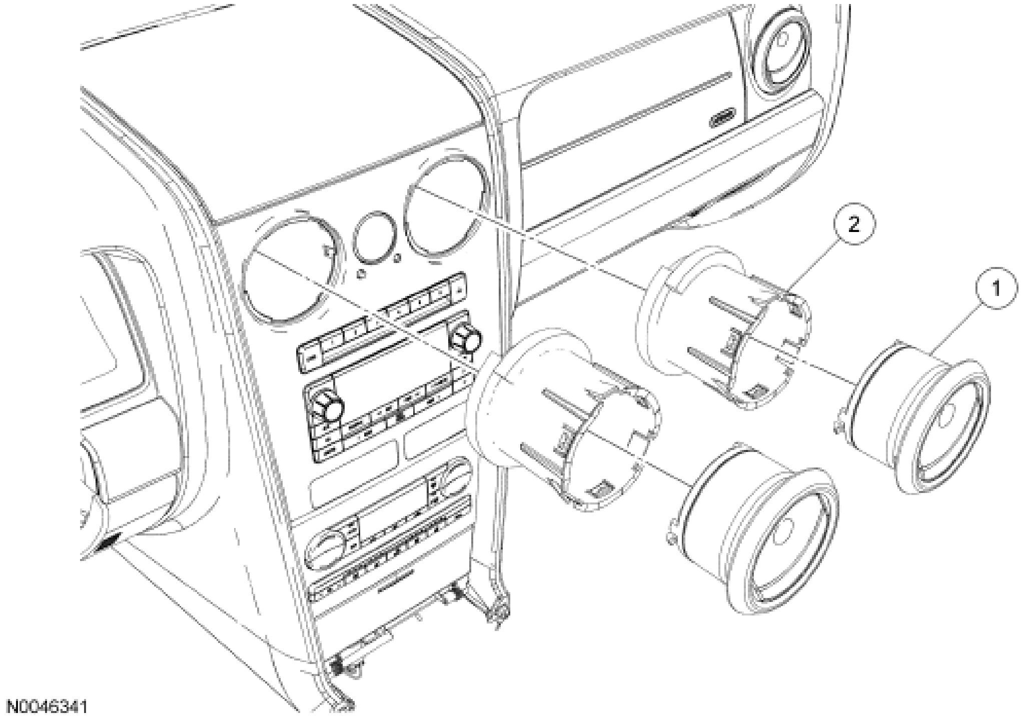

Fig. 38: Exploded View Of Register - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	Register barrel (part of 19893)
2	-	Register housing (part of 19893)

REMOVAL AND INSTALLATION

NOTE: Center registers shown, outer registers similar.

NOTE: To avoid damage to the instrument panel registers, rotate either left or right and pull straight out. Do not wiggle the register from side to side to free it.

1. Open the register barrel vanes, grasp the inside of the register barrel and pull the register barrel straight out.
2. Release the 3 tabs and remove the register housing.

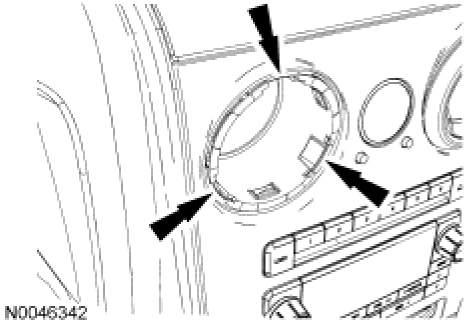

Fig. 39: Locating Register Housing Tabs
Courtesy of FORD MOTOR CO.

3. To install, reverse the removal procedure.

TEMPERATURE BLEND DOOR ACTUATOR - LH

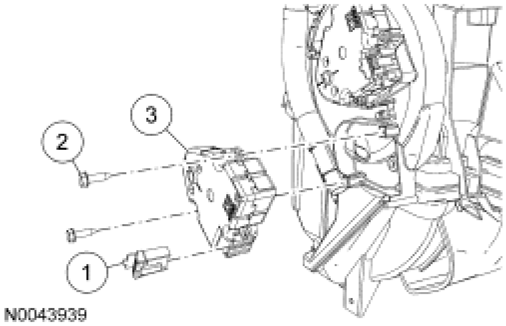

Fig. 40: Exploded View Of Temperature Blend Door Actuator - LH
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	LH temperature blend door actuator electrical connector (part of 19D887)
2	W712320	LH temperature blend door actuator screw (2 required)
3	19E616	LH temperature blend door actuator

REMOVAL AND INSTALLATION

NOTE: The LH temperature blend door actuator can be accessed from below the LH side of the instrument panel.

1. Disconnect the LH temperature blend door actuator.
2. Remove the 2 LH temperature blend door actuator screws.
3. Remove the LH temperature blend door actuator.
4. To install, reverse the removal procedure.

TEMPERATURE BLEND DOOR ACTUATOR - RH, DUAL-ZONE EATC

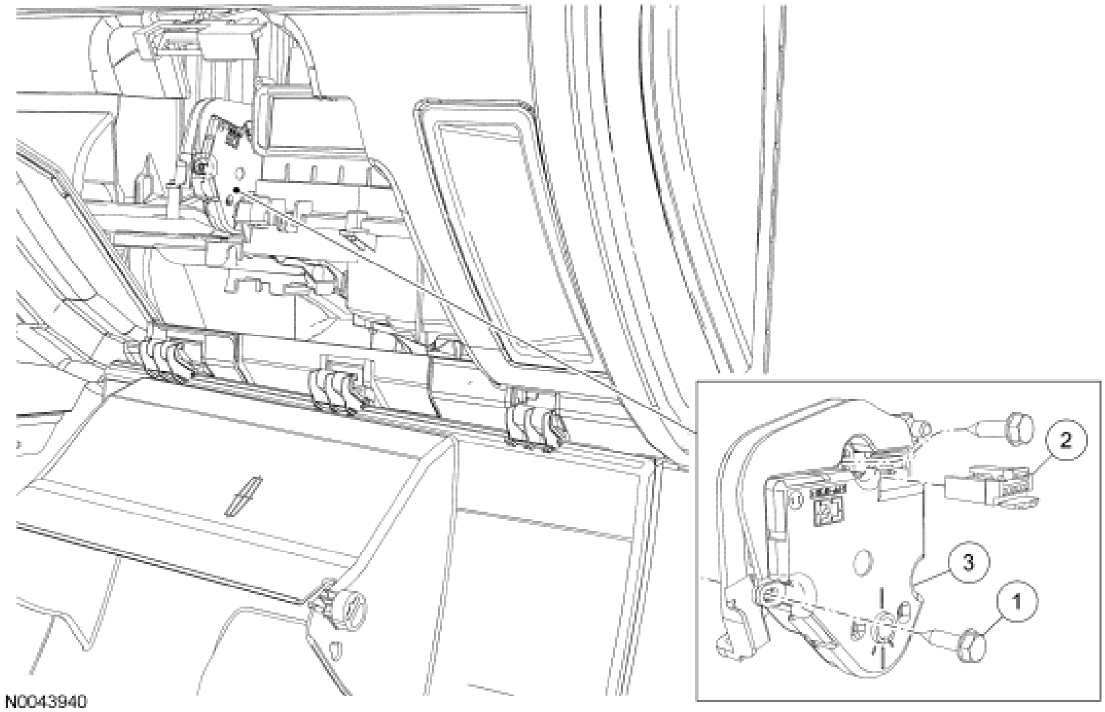

Fig. 41: Exploded View Of Temperature Blend Door Actuator - RH, Dual-Zone EATC
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W712320	RH temperature blend door actuator screw (2 required)
2	-	RH temperature blend door actuator electrical connector (part of 19D887)
3	19E616	RH temperature blend door actuator

REMOVAL AND INSTALLATION

1. Remove the passenger air bag module. For additional information, refer to **SUPPLEMENTAL RESTRAINT SYSTEM** article.
2. Disconnect the RH temperature blend door actuator electrical connector.
3. Remove the 2 RH temperature blend door actuator bracket screws.
4. Detach the wire harness from the RH temperature blend door actuator bracket.
5. Remove the RH temperature blend door actuator.
6. To install, reverse the removal procedure.

THERMOSTATIC EXPANSION VALVE

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

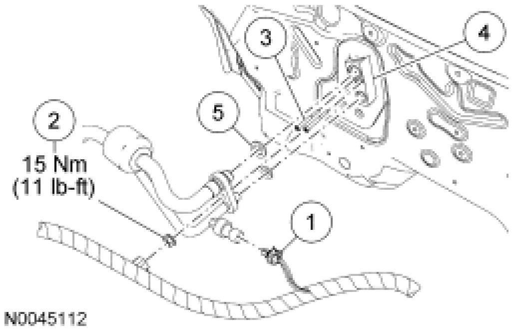

Fig. 42: Exploded View Of Thermostatic Expansion Valve With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	-	A/C pressure transducer electrical connector (part of 14290)
2	W520413	Thermostatic expansion valve (TXV) fitting nut
3	7A711	TXV bolt (2 required)
4	19849	TXV
5	19B596	Gasket seal (4 required)

REMOVAL AND INSTALLATION

1. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
2. Disconnect the A/C pressure transducer electrical connector and detach the wire harness from the thermostatic expansion valve (TXV) stud.
3. Remove the TXV fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
4. Remove the 2 TXV bolts.
5. Remove the TXV.
   - Discard the gasket seals.
6. To install, reverse the removal procedure.
   - Install new gasket seals.
   - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

THERMOSTATIC EXPANSION VALVE MANIFOLD AND TUBE ASSEMBLY

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

5	W520413	TXV fitting nut
6	19835	TXV manifold and tube
7	19B596	Gasket seal (4 required)

REMOVAL AND INSTALLATION

All vehicles

1. Recover the refrigerant. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

   3.5L vehicles

2. Detach the power steering reservoir from the bracket and position the power steering reservoir aside.

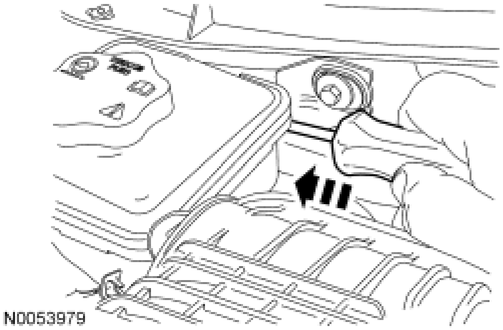

Fig. 44: Detaching Power Steering Reservoir From Bracket
Courtesy of FORD MOTOR CO.

All vehicles

3. Remove the TXV manifold and tube bracket bolt.
   - To install, tighten to 8 Nm (71 lb-in).
4. Detach the wire harness clip from the TXV manifold and tube assembly.

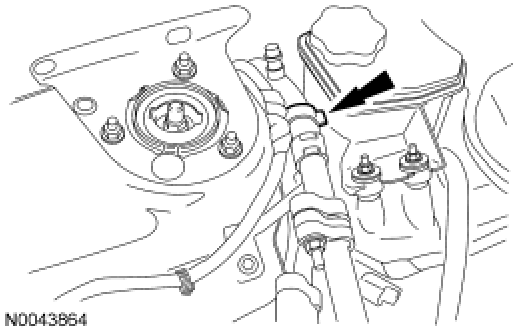

Fig. 45: Locating Wire Harness Clip
Courtesy of FORD MOTOR CO.

5. Remove the condenser-to-evaporator line fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).

6. Remove the compressor manifold and tube suction fitting nut and disconnect the fitting.
   - Discard the gasket seal.
   - To install, tighten to 15 Nm (11 lb-ft).
7. Disconnect the A/C pressure transducer electrical connector and detach the wire harness from the TXV manifold and tube.
8. Remove the TXV fitting nut and disconnect the fitting.
   - Discard the gasket seals.
   - To install, tighten to 15 Nm (11 lb-ft).
9. Remove the TXV manifold and tube assembly.
10. To install, reverse the removal procedure.
    - Install new gasket seals.
    - Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
11. Evacuate, leak test and charge the refrigerant system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.

2008 ACCESSORIES & BODY, CAB

Clock - Fusion, Milan & MKZ

DESCRIPTION AND OPERATION

CLOCK

The stand-alone analog clock is mounted in the center of the instrument panel finish panel and is set using the 2 buttons located to either side of the clock face or the single knob located to the side of the face.

DIAGNOSTIC TESTS

CLOCK

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	73III Automotive Meter	105-R0057 or equivalent
 ST2574-A	Flex Probe Kit	105-R025C or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

VISUAL INSPECTION CHART

Mechanical	Electrical
• Clock	• Smart junction box (SJB) fuse 13 (7.5A) • Wiring, terminals or connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the fault is not visually evident, verify the symptom. Go to **Symptom Chart**.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
• The clock illumination is inoperative/does not operate correctly	• Wiring, terminals or connectors • Clock • Smart junction box (SJB)	• **INSTRUMENT CLUSTER AND PANEL ILLUMINATION** article.
• The clock operation is erratic/inoperative	• Fuse • Wiring, terminals or connectors • Clock	• Go to **Pinpoint Test A**.

Pinpoint Tests

Pinpoint Tests A: The Clock Operation Is Erratic/Inoperative

Refer to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ, Horn/Cigar Lighter for schematic and connector information.

Normal Operation

The clock receives battery voltage from the smart junction box (SJB) through circuit SBP07 (WH/RD). Ground for the clock is supplied through circuit GD116 (BK/VT).

This pinpoint test is intended to diagnose the following:

- Fuse
- Wiring, terminals or connectors
- Clock

PINPOINT TEST A: THE CLOCK OPERATION IS ERRATIC/INOPERATIVE

CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.

A1 CHECK CIRCUIT SBP07 (WH/RD) FOR AN OPEN

- Key in OFF position.
- Disconnect: Clock C2016

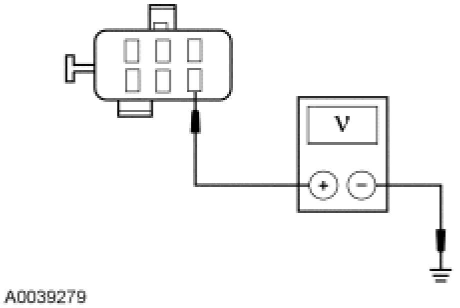

Fig. 1: Checking Circuit For Voltage
Courtesy of FORD MOTOR CO.

- Measure the voltage between the clock C2016-6, circuit SBP07 (WH/RD), harness side and ground.
- **Is the voltage greater than 10 volts?**

  YES : Go to A2.

  NO : VERIFY that the SJB fuse 13 (7.5A) is OK. If OK, REPAIR the circuit. If not OK, REFER to **SYSTEM WIRING DIAGRAMS** article for Fusion, **SYSTEM WIRING DIAGRAMS** article for Milan or **SYSTEM WIRING DIAGRAMS** article for MKZ to identify the possible causes of the circuit short. TEST the system for normal operation.

A2 CHECK CIRCUIT GD116 (BK/VT) FOR AN OPEN

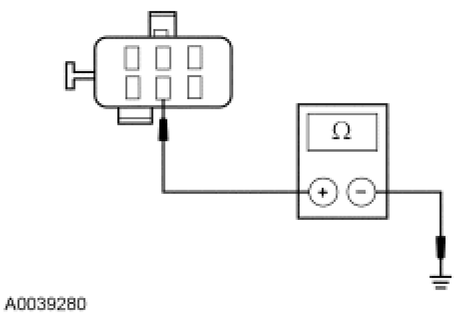

Fig. 2: Checking Circuit For Open
Courtesy of FORD MOTOR CO.

- Measure the resistance between the clock C2016-5, circuit GD116 (BK/VT), harness side and ground.
- **Is the resistance less than 5 ohms?**

  YES : INSTALL a new clock. REFER to **Clock - Fusion, Milan** or **Clock - MKZ**. TEST the system for normal operation.

  NO : REPAIR the circuit. TEST the system for normal operation.

REMOVAL AND INSTALLATION

CLOCK - FUSION, MILAN

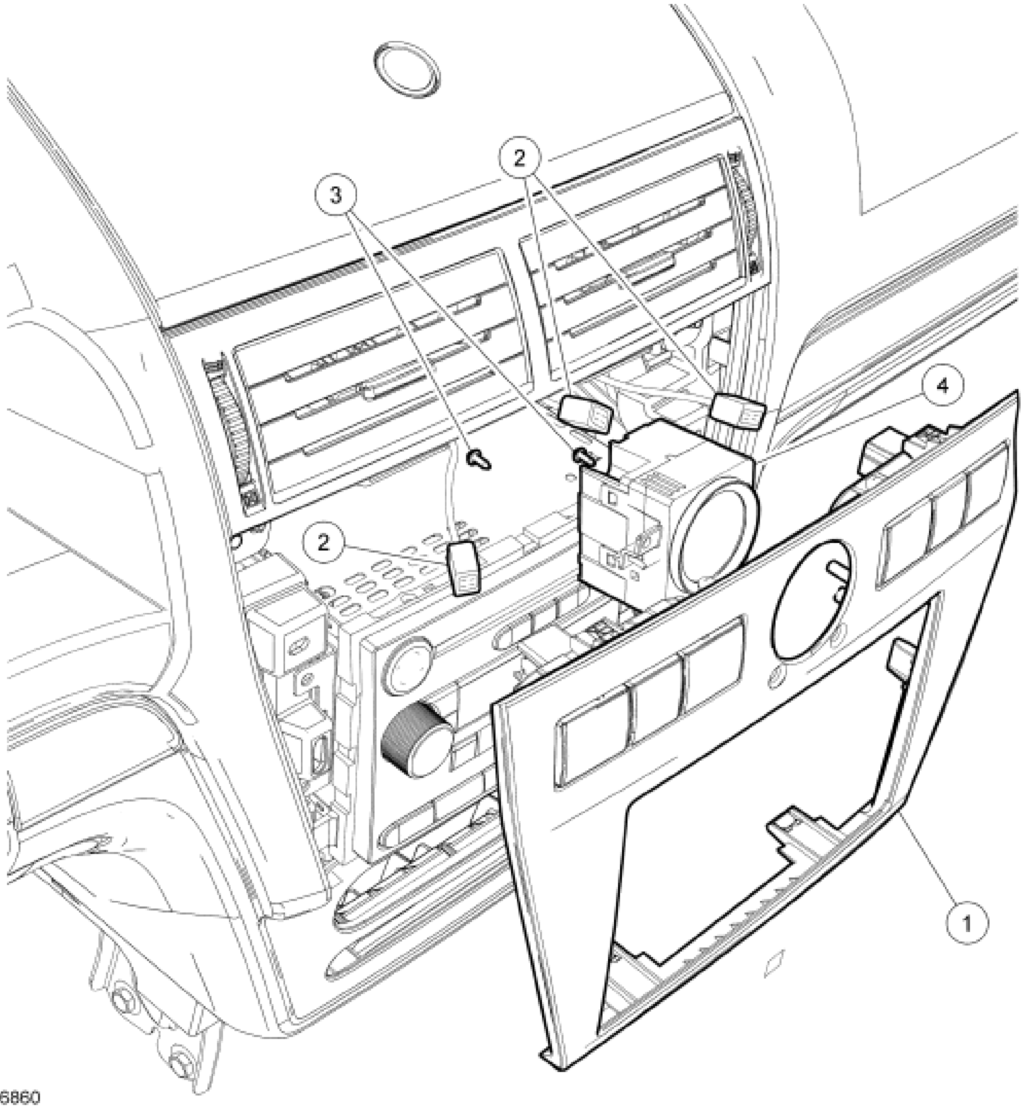

Fig. 3: Exploded View Of Clock - Fusion, Milan
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	5404302	Instrument panel center finish panel
2	-	Clock electrical wiring harness connector(s) (part of 14405)
3	W506921	Clock screws (2 required)
4	15000	Clock

REMOVAL AND INSTALLATION

1. Remove the instrument panel center finish panel by pulling rearward to release the spring clips.
    - Disconnect the electrical connectors as required.
2. Disconnect the electrical connectors as required.

3. Remove the 2 screws and the clock from the panel.
4. To install, reverse the removal procedure.

CLOCK - MKZ

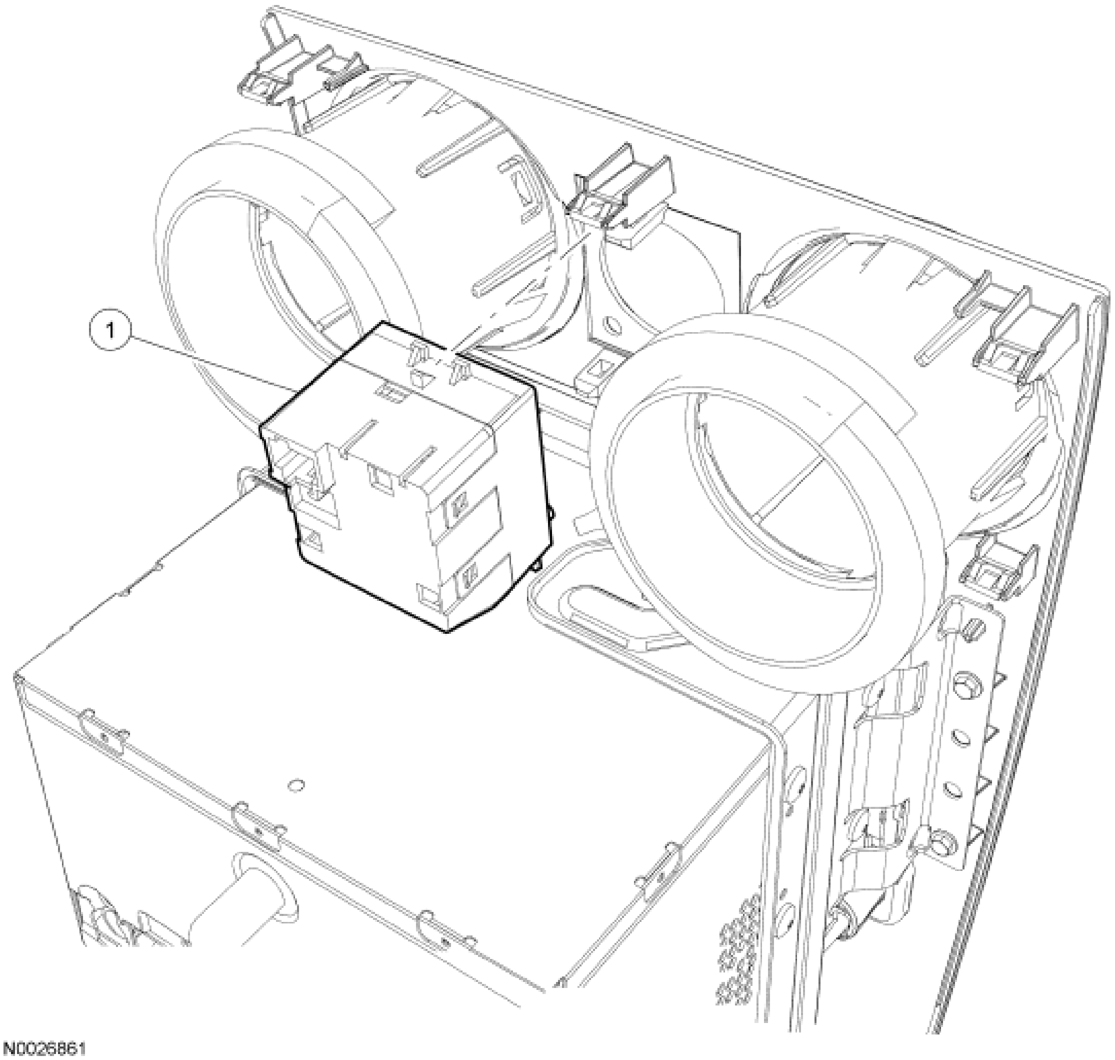

Fig. 4: Exploded View Of Clock - MKZ
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	15000	Clock

REMOVAL AND INSTALLATION

1. Remove the instrument panel center finish panel. For additional information, refer to **INSTRUMENT PANEL AND CONSOLE** article.

2. Release the locator tabs and remove the clock from the panel.
3. To install, reverse the removal procedure.

PCM bracket nuts	10	-	89

DESCRIPTION AND OPERATION

CLUTCH CONTROLS

The clutch controls system consists of the following components:

- Clutch pedal
- Clutch master cylinder
- Clutch slave cylinder
- Clutch hydraulic fluid tube

When the clutch pedal is depressed, the clutch master cylinder transmits fluid pressure to the clutch slave cylinder. The clutch slave cylinder and the clutch release fork transfer the clutch pedal motion to the clutch release bearing. The release bearing presses against the pressure plate diaphragm spring, releasing the clutch disc.

The clutch master cylinder uses brake fluid and shares a common reservoir with the brake master cylinder.

DIAGNOSTIC TESTS

CLUTCH CONTROLS

For diagnosis and testing of the clutch controls, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

CLUTCH PEDAL

Material

13	-	Retaining clip

REMOVAL AND INSTALLATION

1. Remove the battery and the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
2. Remove the PCM.
    1. Disconnect the electrical connectors.
    2. Remove the PCM bolts.

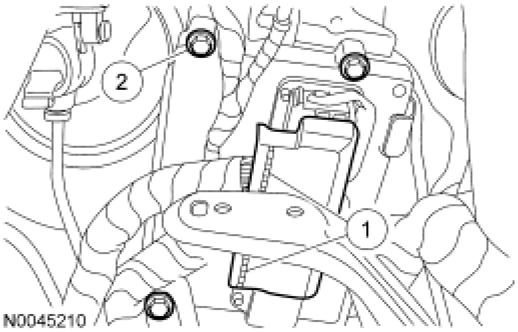

Fig. 2: Identifying PCM Bolts
Courtesy of FORD MOTOR CO.

3. Remove the PCM bracket.

Fig. 3: Locating PCM Bracket
Courtesy of FORD MOTOR CO.

4. Remove the clutch master cylinder nut.

- To install, tighten to 21 Nm (15 lb-ft).

5. Working under the instrument panel, disconnect the clutch switch electrical connector.
6. Disconnect the clutch pedal position (CPP) electrical connector.
7. Remove the clutch master cylinder nut and the clutch pedal bracket nut.
    - To install, tighten to 21 Nm (15 lb-ft).
8. Remove the clutch pedal and bracket assembly.

NOTE: Make sure to align the push rod into the clutch master cylinder piston as the pedal assembly is installed.

9. To install, reverse the removal procedure.
    - Apply a small amount of grease to the:
        - clevis bushing.
        - end of the clutch switch.
        - end of the master cylinder push rod.
10. Check the clutch pedal height and the clutch pedal free play. Adjust as necessary. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.

CLUTCH MASTER CYLINDER

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1-C (US); CPM-1-C (Canada)	WSS-M6C62-A

REMOVAL AND INSTALLATION

WARNING: Carefully read cautionary information on product label. For EMERGENCY MEDICAL INFORMATION seek medical advice. In the USA or Canada on Ford/Motorcraft products call: 1-800-959-3673. For additional information, consult the product Material Safety Data Sheet (MSDS) if available. Failure to follow these instructions may result in serious personal injury.

WARNING: Do not use any fluid other than clean brake fluid meeting manufacturer's specification. Additionally, do not use brake fluid that has been previously drained. Following these instructions will help prevent system contamination, brake component damage and the risk of serious personal injury.

WARNING: Do not allow the brake master cylinder to run dry during the bleeding operation. Master cylinder may be damaged if operated without fluid, resulting in degraded braking performance. Failure to follow this instruction may result in serious personal injury.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, wash it immediately with water.

NOTE: When any part of the hydraulic system has been disconnected for repair or new installation, air may get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Working under the instrument panel, remove the clutch master cylinder nut.
    - To install, tighten to 21 Nm (15 lb-ft).
2. Using a suitable suction tool, remove the brake fluid to just below the clutch reservoir hose.

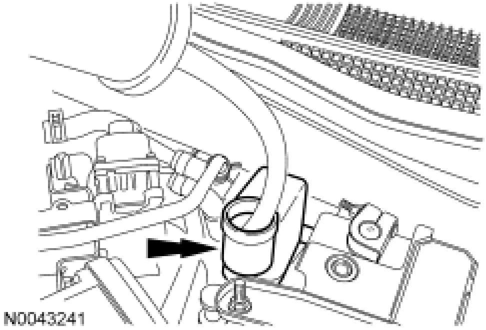

Fig. 5: Locating Brake Fluid To Clutch Reservoir Hose

Courtesy of FORD MOTOR CO.

3. Remove the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
4. Remove PCM.
    1. Disconnect the electrical connectors.
    2. Remove the 3 PCM bolts.
    3. To install, tighten to 10 Nm (89 lb-in).

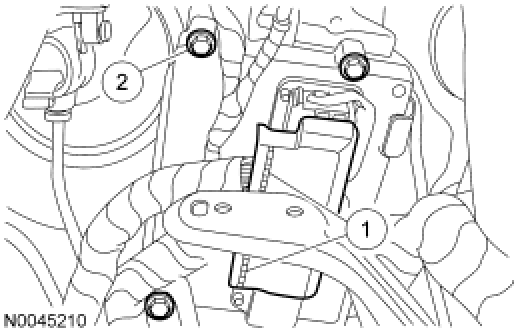

Fig. 6: Identifying PCM Bolts
Courtesy of FORD MOTOR CO.

5. Remove 3 PCM bracket nuts and the PCM bracket.
    - To install, tighten to 10 Nm (89 lb-in).

Fig. 7: Locating PCM Bracket
Courtesy of FORD MOTOR CO.

6. Disconnect the clutch master cylinder-to-clutch slave cylinder hydraulic tube.
    - To install, tighten to 17 Nm (13 lb-ft).

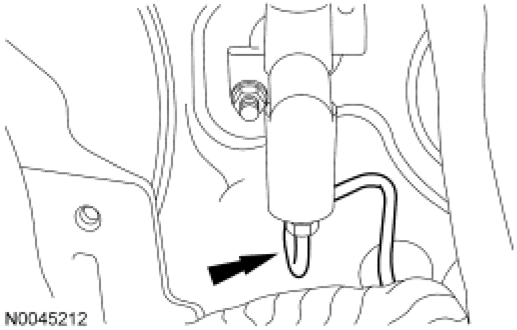

Fig. 8: Locating Clutch Master Cylinder-To-Clutch Slave Cylinder Hydraulic Line
Courtesy of FORD MOTOR CO.

7. Disconnect the clutch master cylinder-to-clutch reservoir hose.
8. Remove the clutch master cylinder nut.
   - To install, tighten to 21 Nm (15 lb-ft).
9. Remove the clutch master cylinder assembly.
10. To install, reverse the removal procedure.
11. Bleed the clutch hydraulic system. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.

[a] Refer to **FLYWHEEL** for the specification.

DESCRIPTION AND OPERATION

CLUTCH

The clutch system includes the following components:

- Flywheel
- Clutch disc
- Clutch pressure plate
- Clutch release fork
- Clutch release bearing

The clutch is a single plate, dry-friction disc with a diaphragm-style spring clutch pressure plate. The clutch disc has a hub which is splined to the transmission input shaft. The clutch disc has friction material where it contacts the flywheel and the clutch pressure plate. The clutch pressure plate applies pressure to the clutch disc, holding

it tightly against the surface of the flywheel. In the engaged position, the diaphragm spring holds the clutch pressure plate against the clutch disc, so that engine torque is transmitted to the input shaft.

When the clutch pedal is depressed, the release bearing pushes the diaphragm spring center of the clutch pressure plate toward the flywheel. The diaphragm spring pivots at the fulcrum, relieving the load on the clutch pressure plate. Steel spring straps riveted to the clutch pressure plate cover pull the clutch pressure plate from the clutch disc, disengaging the engine torque from the transaxle.

Courtesy of FORD MOTOR CO.

NOTE: **Loosen each bolt, one turn at a time in a star pattern, until spring tension is released.**

4. Using a suitable clutch disc aligner, remove the bolts, the clutch pressure plate and the clutch disc.

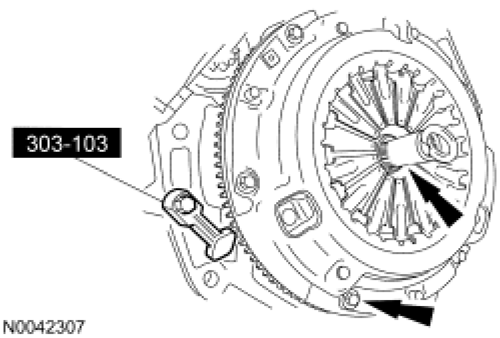

Fig. 4: Locating Bolts And Clutch Disc Aligner
Courtesy of FORD MOTOR CO.

NOTE: **Do not use cleaners with a petroleum base and do not immerse the clutch pressure plate in solvent.**

5. Using a suitable commercial alcohol-based solvent, clean the clutch pressure plate.
6. Inspect the clutch pressure plate surface for burn marks, scores, flatness, ridges or cracks. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.
    - Maximum clearance for flatness check is 0.3 mm (0.012 in).

CAUTION: **If the clutch disc is saturated with oil, inspect the rear engine crankshaft seal or transmission input shaft seal for leakage. If leakage is found, install a new seal prior to clutch disc installation. For additional information, refer to ENGINE - 2.3L article or MANUAL TRANSAXLE/TRANSMISSION article.**

NOTE: **Use an emery cloth to remove minor imperfections in the clutch disc lining surface.**

7. Inspect the clutch disc for the following:
   - Oil or grease saturation
   - Worn or loose facings
   - Warpage or loose rivets at the hub
   - Wear or rust on the splines
   - Install a new clutch disc if any of the these conditions are present.
8. Check the clutch disc runout. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.
9. If necessary, conduct a flywheel runout check. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION AND CLUTCH - GENERAL INFORMATION** article.
10. Remove the clutch release bearing.

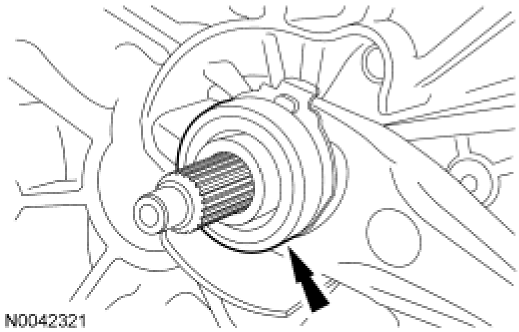

Fig. 5: Locating Clutch Release Bearing
Courtesy of FORD MOTOR CO.

11. Inspect the clutch release bearing for wear or damage.
    - Rotate the bearing while applying pressure in the axial direction. If the bearing feels rough, sticks or has excessive resistance, install a new bearing.

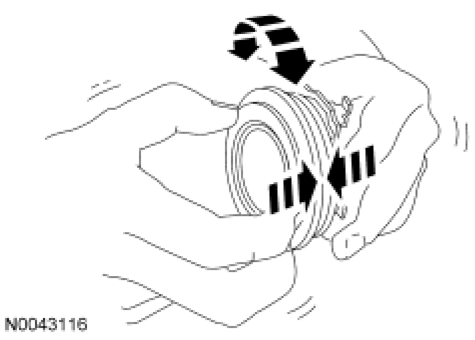

Fig. 6: Inspecting Clutch Release Bearing For Wear Or Damage
Courtesy of FORD MOTOR CO.

12. Inspect the release bearing guide tube for wear or damage.
    - Slide the release bearing on the guide tube. Check for roughness or sticking.
13. Remove the clutch release fork. Inspect the fork for wear or damage.

INSTALLATION

1. Apply a very small amount of grease in the clutch disc hub. Wipe off excess grease to avoid contaminating the clutch disc and affecting clutch function.
2. Using a suitable clutch disc aligner, position the clutch disc on the flywheel.

Item	Part Number	Description
1	-	Transaxle side
2	-	Engine side

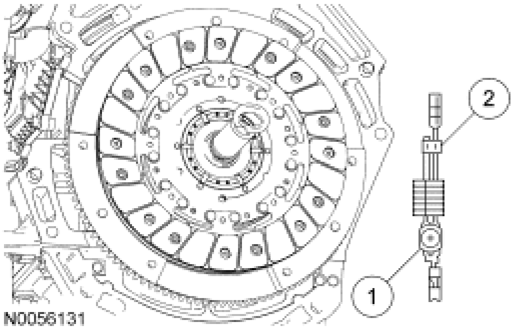

Fig. 7: Identifying Transaxle Side & Engine Side
Courtesy of FORD MOTOR CO.

3. Position the clutch pressure plate on the flywheel and to the dowels. Install the 6 clutch pressure plate bolts.
    - Tighten the bolts one turn at a time in a star pattern. Tighten to 29 Nm (21 lb-ft).

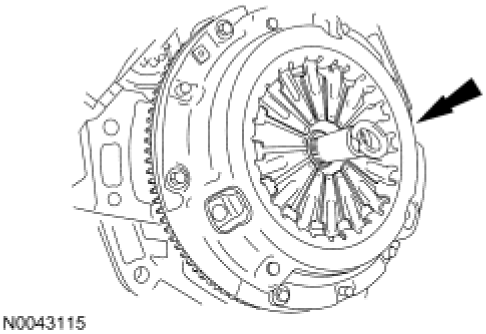

Fig. 8: Locating Clutch Pressure Plate On Flywheel
Courtesy of FORD MOTOR CO.

4. Apply a small amount of grease to:
    - the clutch release fork fingers.

- the clutch release fork spring.
- the guide tube.
- the clutch slave cylinder end that contacts the release fork.

5. Install the clutch release bearing and the clutch release fork.

NOTE: Apply a very small amount of grease to the transmission input shaft end and on the splines.

6. Install the transaxle. For additional information, refer to **MANUAL TRANSAXLE/TRANSMISSION** article.

Component Testing - Fusion, Milan & MKZ

INTRODUCTION

Component testing procedures are provided to determine whether a component is good or bad.

Testing information for each component includes a schematic, a view of the terminal locations and step-by-step test procedures. Terminal locations are identified by numbers or letters that may be on the component or next to it. See **Fig. 1**.

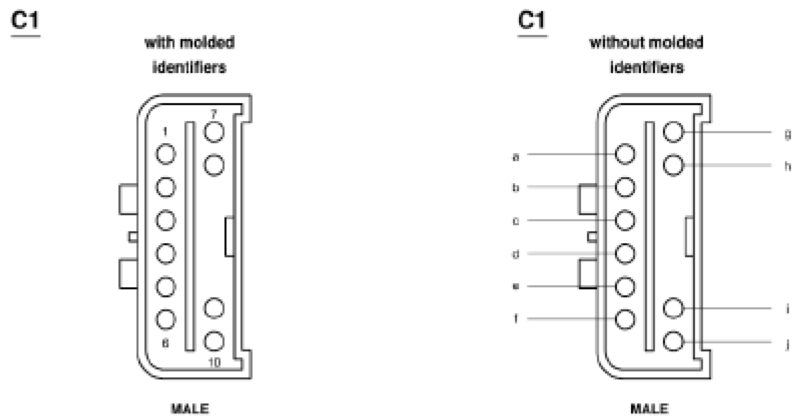

Fig. 1: Connector Terminals
Courtesy of FORD MOTOR CO.

The component connector MUST BE REMOVED before testing. To test a single circuit within the component, select that circuit under the column "Circuit to test". If you wish to test the complete component, perform all tests.

Connect the tester to the terminals shown in the second column and operate the component as shown in the third column.

COMPONENT TESTING

MULTIFUNCTION SWITCH, WIPER/WASHER PORTION

Schematic

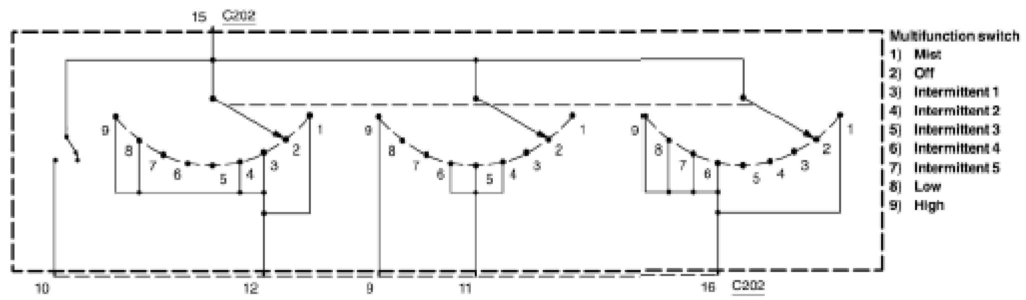

Fig. 2: Multifunction Switch, Wiper/Washer Portion - Schematic
Courtesy of FORD MOTOR CO.

Terminals

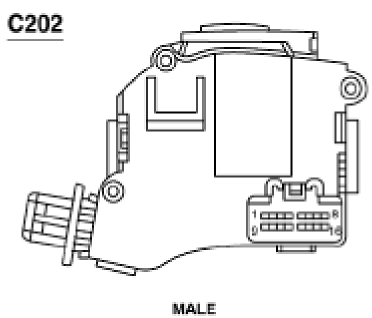

Fig. 3: Multifunction Switch, Wiper/Washer Portion - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

MULTIFUNCTION SWITCH, WIPER/WASHER PORTION - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Washer switch circuit	10 and 15	On	Closed circuit
		Rest	Open circuit
Wiper switch circuit	9 and 15	Off	Open circuit
		High	Closed circuit
		Low	Open circuit
	11 and 15	Off	Open circuit
		High	Open circuit
		Low	Open circuit
	12 and 15	Off	Open circuit
		High	Closed circuit
		Low	Closed circuit
	15 and 16	Off	Open circuit
		High	Closed circuit
		Low	Closed circuit

Intermittent wiper circuit	15 and 16	Interval 1	Open circuit
		Interval 2	Open circuit
		Interval 3	Open circuit
		Interval 4	Closed circuit
		Interval 5	Closed circuit
	11 and 15	Interval 1	Open circuit
		Interval 2	Closed circuit
		Interval 3	Closed circuit
		Interval 4	Closed circuit
		Interval 5	Open circuit
	12 and 15	Interval 1	Closed circuit
		Interval 2	Closed circuit
		Interval 3	Open circuit
		Interval 4	Open circuit
		Interval 5	Open circuit

MULTIFUNCTION SWITCH

Schematic

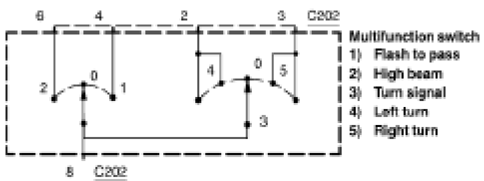

Fig. 4: Multifunction Switch - Schematic
Courtesy of FORD MOTOR CO.

Terminals

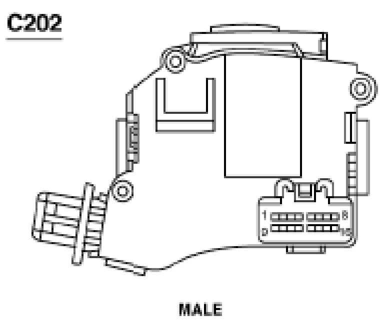

Fig. 5: Multifunction Switch - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

MULTIFUNCTION SWITCH - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Turn signal	2 and 8	Left turn	Closed circuit
	3 and 8	Right turn	Closed circuit
Flash-to-pass	6 and 8	Pull and hold lever stalk toward steering wheel	Open circuit
	4 and 8		Closed circuit
High beam/Low beam	6 and 8	Lever stalk in detent toward steering wheel	Closed circuit
	4 and 8		

MAIN LIGHT SWITCH

Schematic

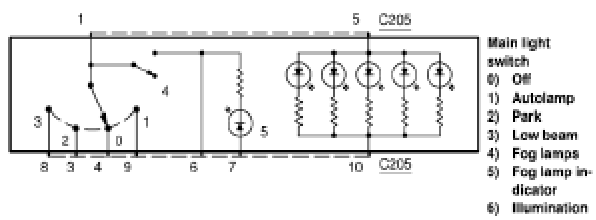

Fig. 6: Main Light Switch - Schematic
Courtesy of FORD MOTOR CO.

Terminals

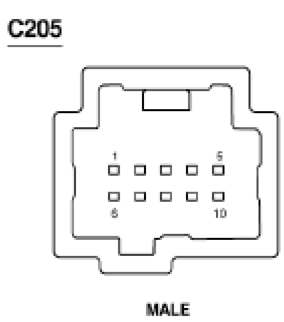

Fig. 7: Main Light Switch - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

MAIN LIGHT SWITCH - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Headlamp circuit	1 and 8	Off	Open circuit
		Park	Open circuit
		Head	Closed circuit

		Auto	Open circuit
Autolamp Circuit	1 and 9	Off	Open circuit
		Park	Open circuit
		Head	Open circuit
		Auto	Closed circuit
Parking Lamps	1 and 3	Off	Open circuit
		Park	Closed circuit
		Head	Open circuit
		Auto	Open circuit
Fog lamps	1 and 6	Off	Open circuit
		Fog lamps	Closed circuit

ILLUMINATION DIMMER SWITCH

Schematic

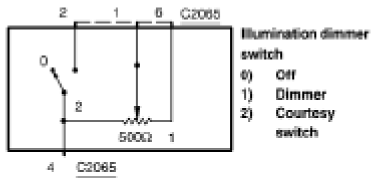

Fig. 8: Illumination Dimmer Switch - Schematic
Courtesy of FORD MOTOR CO.

Terminals

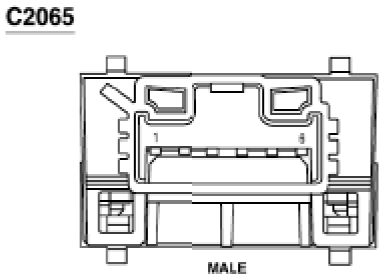

Fig. 9: Illumination Dimmer Switch - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

ILLUMINATION DIMMER SWITCH - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Interior lamps Circuit	4 and 2	Interior lamps	Closed circuit
		Off	Open circuit

Illumination dimmer resistor	4 and 1	Rotate knob clockwise	Ohmmeter will show smoothly increasing resistance

IGNITION SWITCH

Schematic

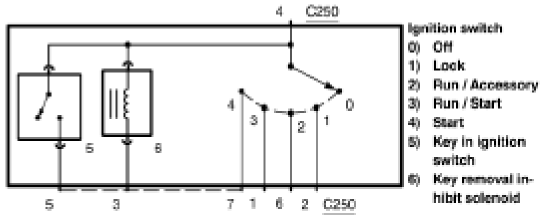

Fig. 10: Ignition Switch - Schematic
Courtesy of FORD MOTOR CO.

Terminal locations

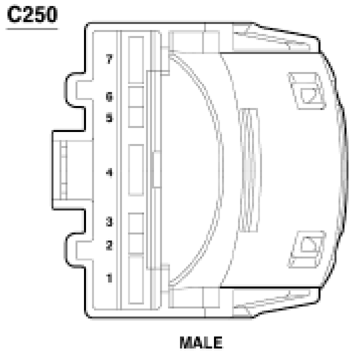

Fig. 11: Ignition Switch - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

IGNITION SWITCH - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Starter relay circuit	4 and 7	Off	Open circuit
		Acc	Open circuit
		Run	Open circuit
		Start	Closed circuit
Run/Start power circuit	4 and 1	Off	Open circuit
		Acc	Open circuit
		Run	Closed circuit

		Start	Closed circuit
Run/Acc power circuit	4 and 6	Off	Open circuit
		Acc	Closed circuit
		Run	Closed circuit
		Start	Open circuit
Key reminder circuit	4 and 5	Key In	Closed circuit
		Key Out	Open circuit
Key removal inhibit circuit	4 and 3		65-75ohms

POWER SEAT SWITCH, 8-WAY POWER SEAT

Schematic

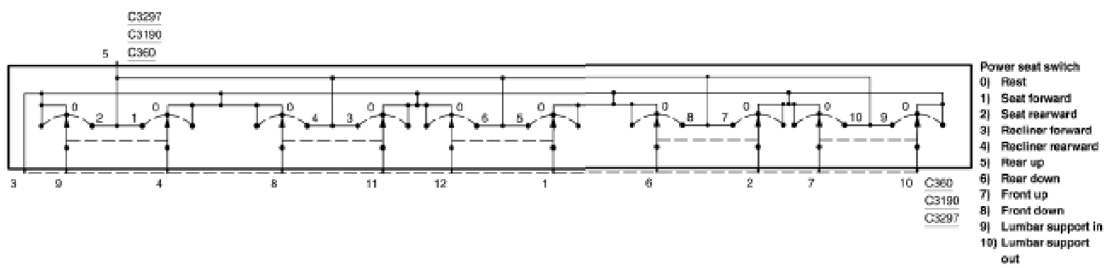

Fig. 12: Power Seat Switch, 8-Way Power Seat - Schematic
Courtesy of FORD MOTOR CO.

Terminals

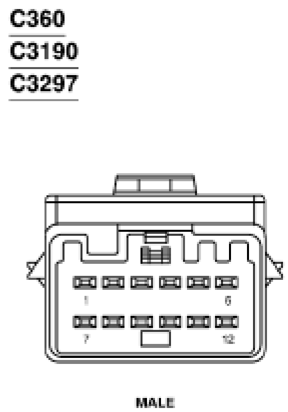

Fig. 13: Power Seat Switch, 8-Way Power Seat - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

POWER SEAT SWITCH, 8-WAY POWER SEAT - COMPONENT TESTING

	Connect self-powered test light	Move switch to these	A good switch

Circuit to test	or ohmmeter to terminals	positions	will indicate
Forward/Rearward circuit	5 and 4	Forward	Closed circuit
		Rest/Rearward	Open circuit
	5 and 9	Rest/Forward	Open circuit
		Rearward	Closed circuit
Front up/down circuit	5 and 2	Up	Closed circuit
		Rest/Down	Open circuit
	5 and 6	Rest/Up	Open circuit
		Down	Closed circuit
Rear up/down circuit	5 and 1	Up	Closed circuit
		Rest/Down	Open circuit
	5 and 12	Rest/Up	Open circuit
		Down	Closed circuit
Forward/Rearward recliner Circuit	5 and 8	Rest/Forward	Open circuit
		Rearward	Closed circuit
	5 and 3	Forward	Closed circuit
		Rest/Rearward	Open circuit

POWER SEAT SWITCH, 6-WAY POWER SEAT

Schematic

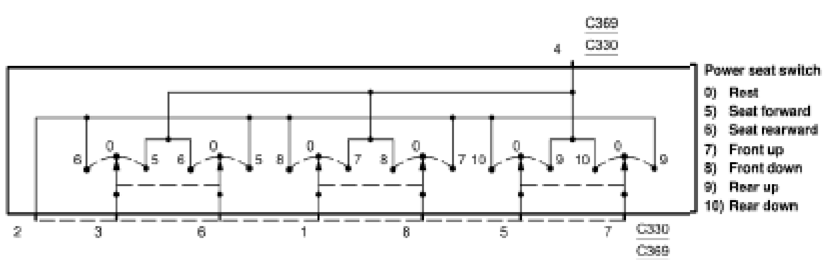

Fig. 14: Power Seat Switch, 6-Way Power Seat - Schematic
Courtesy of FORD MOTOR CO.

Terminals

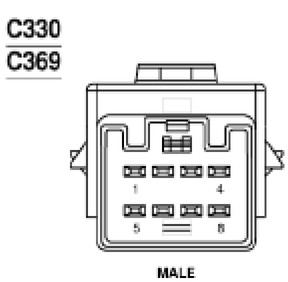

Fig. 15: Power Seat Switch, 6-Way Power Seat - Terminals

Courtesy of FORD MOTOR CO.

Component testing procedure

POWER SEAT SWITCH, 6-WAY POWER SEAT - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Forward/Rearward circuit	4 and 3	Forward	Closed circuit
	6 and 2		Closed circuit
	4 and 6	Rearward	Closed circuit
	3 and 2		Closed circuit
Front up/down circuit	4 and 1	Up	Closed circuit
	8 and 2		Closed circuit
	4 and 8	Down	Closed circuit
	1 and 2		Closed circuit
Rear up/down circuit	4 and 5	Up	Closed circuit
	7 and 2		Closed circuit
	7 and 4	Down	Closed circuit
	5 and 2		Closed circuit

MASTER WINDOW CONTROL SWITCH - FUSION / MILAN

Schematic

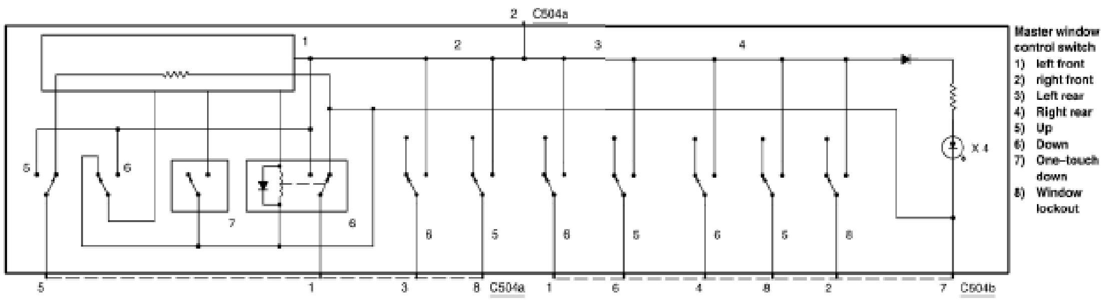

Fig. 16: Master Window Control Switch - Fusion / Milan - Schematic
Courtesy of FORD MOTOR CO.

Terminals

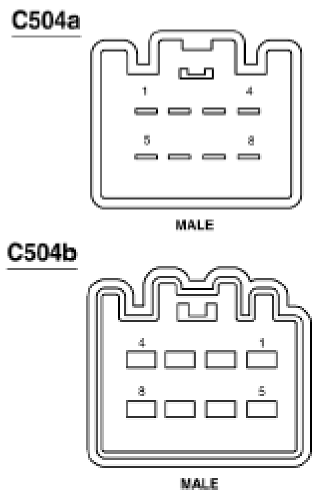

Fig. 17: Master Window Control Switch - Fusion / Milan - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

MASTER WINDOW CONTROL SWITCH - FUSION / MILAN - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Switch lock	2, C504a and 2, C504b	Unlock	Closed circuit
		Lock	Open circuit
Left front window circuit	2, C504a and 5, C504a	Up	Closed circuit
Right front window circuit	2, C504a and 3, C504a	Down	Closed circuit
	2, C504a and 8, C504a	Up	Closed circuit
	7, C504b and 8, C504a 7, C504b and 3, C504a	Rest	Closed circuit
Left rear window circuit	2, C504a and 1, C504b	Up	Closed circuit
	2, C504a and 6, C504b	Down	Closed circuit
	7, C504b and 1, C504b 7, C504b and 6, C504b	Rest	Closed circuit
Right rear window Circuit	2, C504a and 8, C504b	Up	Closed circuit
	2, C504a and 4, C504b	Down	Closed circuit
	7, C504b and 8, C504b 7, C504b and 4, C504b	Rest	Closed circuit

MASTER WINDOW CONTROL SWITCH [] MKZ

Schematic

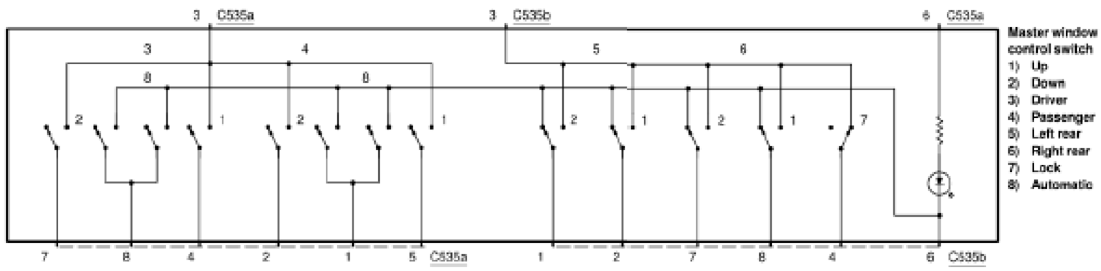

Fig. 18: Master Window Control Switch - MKZ - Schematic
Courtesy of FORD MOTOR CO.

Terminals

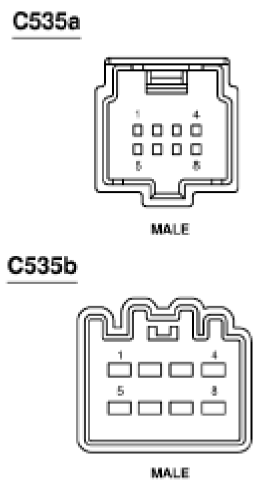

Fig. 19: Master Window Control Switch - MKZ - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

MASTER WINDOW CONTROL SWITCH - MKZ - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Switch lock	3, C535b and 4, C535b	Lock On	Closed circuit
		Lock Off	Open circuit
Left front window circuit	3, C535a and 4, C535a	Up	Closed circuit
	3, C535a and 7, C535a	Down	Closed circuit
	3, C535a and 8, C535a	One-Touch Up/Down	Closed circuit
Right front window circuit	3, C535a and 5, C535a	Up	Closed circuit
	3, C535a and 2, C535a	Down	Closed circuit
	3, C535a and 1, C535a	One-Touch Up/Down	Closed circuit
Left rear window circuit	3, C535b and 2, C535b	Up	Closed circuit
	3, C535b and 1, C535b	Down	Closed circuit

Right rear window circuit	3, C535b and 8, C535b	Up	Closed circuit
	3, C535a and 7, C535b	Down	Closed circuit

WINDOW CONTROL SWITCH, PASSENGER SIDE - MKZ

Window switch - Schematic

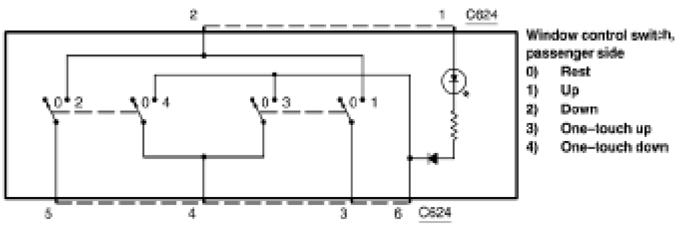

Fig. 20: Window Control Switch, Passenger Side - MKZ - Schematic
Courtesy of FORD MOTOR CO.

Terminals

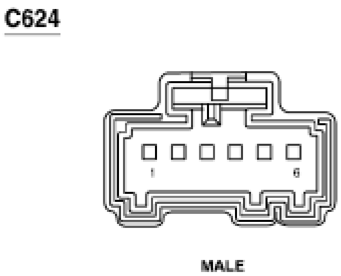

Fig. 21: Window Control Switch, Passenger Side - MKZ - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

WINDOW CONTROL SWITCH, PASSENGER SIDE - MKZ - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
One-Touch Up/Down	4 and 6	One-Touch Up/Down	Closed circuit
		Neutral	Open circuit
Right front window circuit	2 and 3	Up	Closed circuit
	5 and 2	Down	Closed circuit

WINDOW CONTROL SWITCHES

Schematic

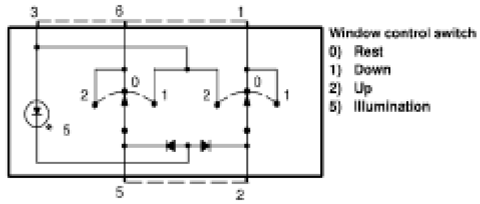

Fig. 22: Window Control Switches - Schematic
Courtesy of FORD MOTOR CO.

Terminals

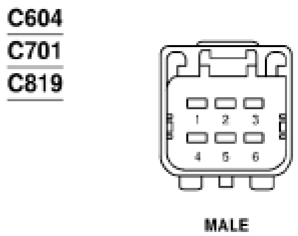

Fig. 23: Window Control Switches - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

WINDOW CONTROL SWITCHES - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Window control switches	2 and 3, 5 and 6	Up	Closed circuit
	1 and 2, 3 and 5	Down	Closed circuit
	6 and 5	Rest	Closed circuit
	1 and 2		

EXTERIOR REAR VIEW MIRROR SWITCH

Schematic

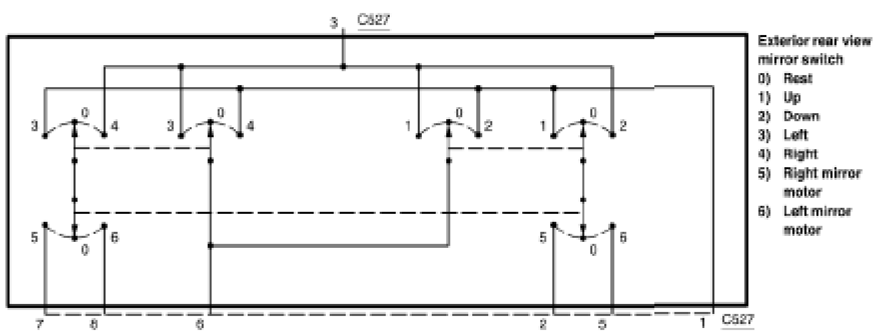

Fig. 24: Exterior Rear View Mirror Switch - Schematic

Courtesy of FORD MOTOR CO.

Terminal locations

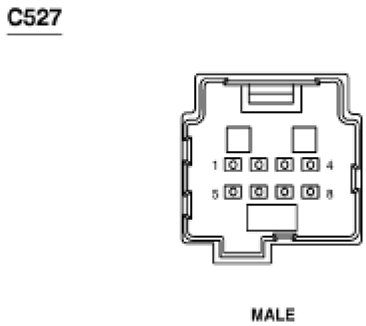

Fig. 25: Exterior Rear View Mirror Switch - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

EXTERIOR REAR VIEW MIRROR SWITCH - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Left mirror		Selector switch Left	
Up	6 and 3 1 and 5	Up	Closed circuit
Down	3 and 5 6 and 1	Down	Closed circuit
Left	6 and 3 5 and 4	Left	Closed circuit
Right	6 and 1 3 and 8	Right	Closed circuit
Right mirror		Selector switch Right	
Up	6 and 3 2 and 1	Up	Closed circuit
Down	3 and 2 6 and 1	Down	Closed circuit
Left	6 and 3 7 and 1	Left	Closed circuit
Right	3 and 7 6 and 1	Right	Closed circuit

POWER DOOR LOCK SWITCH

Schematic

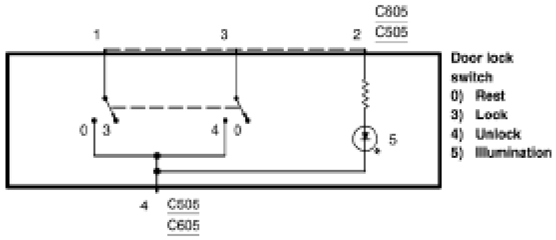

Fig. 26: Power Door Lock Switch - Schematic
Courtesy of FORD MOTOR CO.

Terminal locations

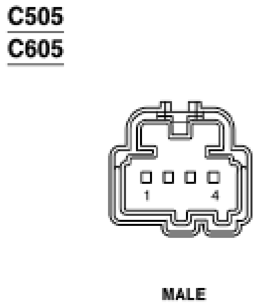

Fig. 27: Power Door Lock Switch - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

POWER DOOR LOCK SWITCH - COMPONENT TESTING

Circuit to test	Connect self-powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Lock/unlock circuit	3 and 4	Rest	Open circuit
		Lock	Open circuit
		Unlock	Closed circuit
	1 and 4	Rest	Open circuit
		Lock	Closed circuit
		Unlock	Open circuit

ROOF OPENING PANEL SWITCH

Schematic

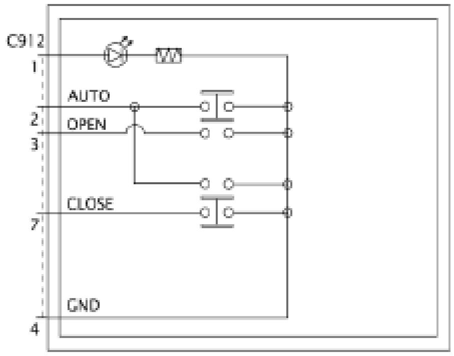

Fig. 28: Roof Opening Panel Switch - Schematic
Courtesy of FORD MOTOR CO.

Terminals

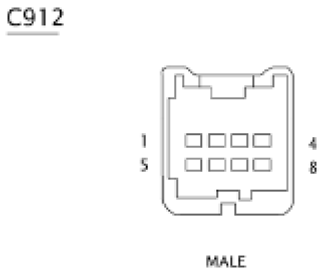

Fig. 29: Roof Opening Panel Switch - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure

ROOF OPENING PANEL SWITCH - COMPONENT TESTING

Circuit to test	Connect self powered test light or ohmmeter to terminals	Move switch to these positions	A good switch will indicate
Tilt	4 and 2	Tilt	Closed circuit
Slide	4 and 7	Close	Closed circuit
	4 and 3	Open	Closed circuit
	4 and 2	Auto open	Closed circuit

RELAY-MINI ISO

Schematic

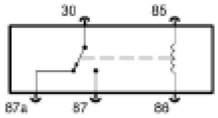

Fig. 30: Relay-Mini ISO - Schematic

Courtesy of FORD MOTOR CO.

Terminals

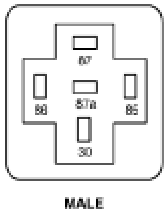

Fig. 31: Relay-Mini ISO - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure (no voltage applied)

RELAY-MINI ISO (NO VOLTAGE APPLIED) - COMPONENT TESTING

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	85 and 86	50-100ohms
Contact	30 and 87a	Closed circuit
	30 and 87	Open circuit
Coil - Contact	86 and 30	Open circuit
	86 and 87a	Open circuit
	86 and 87	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 30 and 85 to 12V DC power and pin 86 to ground. Measure voltage between pin 87 and pin 86. If the voltage is 12V, continue with the test. If not, replace the relay. Disconnect power from pin 85 and measure voltage between pin 87a and pin 86. If the voltage is 12V, the relay is okay. If not, replace the relay.

RELAY - MICRO ISO

Schematic

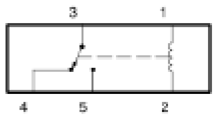

Fig. 32: Relay - Micro ISO - Schematic
Courtesy of FORD MOTOR CO.

Terminals

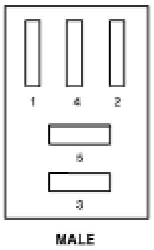

Fig. 33: Relay - Micro ISO - Terminals
Courtesy of FORD MOTOR CO.

Component testing procedure (no voltage applied)

RELAY - MICRO ISO (NO VOLTAGE APPLIED) - COMPONENT TESTING

Circuit to test	Connect ohmmeter to terminals	A good relay will indicate
Coil	1 and 2	100-150ohms
Contact	3 and 4	Closed circuit
	3 and 5	Open circuit
Coil - Contact	1 and 3	Open circuit
	1 and 4	Open circuit
	1 and 5	Open circuit

Component testing procedure (voltage applied)

Disconnect the ohmmeter; connect pins 2 and 3 to 12V DC power and pin 1 to ground. Measure voltage between pin 5 and pin 1. If the voltage is 12V, the relay is okay. If not, replace the relay.

GENERAL INFORMATION

Diagnostic Connector (DLC) Locations

DOMESTIC CARS

CHRYSLER GROUP LLC

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

CHRYSLER GROUP LLC - DOMESTIC CARS

Application	Connector Location
Acclaim	
1989-90	Under Left Side Of Dash
1991-92	On Left Front Fender Panel, Near Shock Tower
1993-94	Near Battery
1995	Behind Left Side Of Dash, Near Fuse Block
Aries, Caravelle, Dynasty, E Class, Executive Sedan, LeBaron Sedan, New Yorker, Reliant, Town & Country, 400 & 600	
1984-85	On Left Fender Apron, Behind Battery (2.2L Only)
1986-87	On Front Of Right Shock Tower (2.2L & 2.5L Only)
1988-89	On Left Fenderwell
1990	Under Left Side Of Dash
1991-92	On Left Front Fender Panel, Near Shock Tower
1993 (Except New Yorker)	Near Battery
1993 (New Yorker)	On Left Fender Panel Near PCM
Avenger (1995-00)	Under Center Of Dash, Near Center Console
Breeze, Cirrus & Stratus (1995)	Left Of Steering Column, On BCM
Charger, Horizon, Omni, Rampage, Scamp & Turismo	
1985-89	
2.2L Carbureted	On Left Fender Apron
2.2L Turbo	On Front Of Right Shock Tower
Concorde, Intrepid, LHS, New Yorker, Vision & 300M	
1993-95	Behind Left Side Of Dash
1996-97	Under Left Side Of Dash, Near Center

	Console
Daytona	
1984-87	On Front Of Right Shock Tower
1988-89	On Left Fenderwell
1990-92	On Left Front Fender Panel, Near Shock Tower
1993	On Left Front Inner Fender Or Under Steering Column
Dynasty	
1990	Under Left Side Of Dash
1991-93	On Left Fender Panel, Near SBEC/PCM
Fifth Avenue	
1990	Under Left Side Of Dash
1991-93	On Left Fender Panel Near SBEC/PCM
Horizon & Omni (1989-90)	Under Left Side Of Dash
Imperial	
1981-83	CCC Connector Left Of Air Cleaner
1990	Under Left Side Of Dash
1991-93	On Left Fender Panel Near SBEC/PCM
LeBaron Coupe & Convertible	
1985-87	On Right Front Shock Tower
1988-89	On Left Fenderwell
1990-92	On Left Front Fender Panel, Near Shock Tower
1993	On Left Front Inner Fender Or Under Steering Column
1994	Near Battery
1995	Behind Left Side Of Dash, Near Fuse Block
Lancer	
1985-87	On Right Front Shock Tower
1988-89	On Left Fenderwell
Laser	
1990-94	Above Left Kick Panel, Near Fuse Block
1995	Under Left Side Of Dash, Near Center Console
Monaco & Premier	
1990	On Right Front Fender Panel
1991-92	On Left Fender Panel, Next To SBEC
	Under Headlight Switch, Under Left Side

Neon (1995)	Of Dash
Shadow	
1985-87	On Right Front Shock Tower
1988	On Left Fenderwell
1989	Under Dash, To Right Of Steering Column
1990	On Left Fender Front Panel, Near SBEC
1991-92	On Left Front Fender Panel, Near Shock Tower
1993-94	Near Battery
Spirit & Sundance	
1985-87	On Right Front Shock Tower
1989-90	Under Left Side Of Dash
1991-92	On Left Front Fender Panel, Near Shock Tower
1993-94	Near Battery
1995	Behind Left Side Of Dash, Near Fuse Block
Talon	
1990-94	Above Left Kick Panel, Near Fuse Block
1995-98	Under Left Side Of Dash, Near Center Console

FORD MOTOR CO.

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

FORD MOTOR CO. - DOMESTIC CARS

Application	**Connector Location**
Bobcat & Pinto	On Center Of Right Fender Apron
Capri	
1980-85	On Center Of Left Front Fender Apron
1986	On Left Rear Corner Of Engine Compartment
Continental	
1984-89	On Right Rear Corner Of Engine Compartment
1990-91	On Right Rear Corner Of Firewall, On Electronic Assembly Cover

1992	On Right Fender Apron
1993-94	VIP Connectors (2) On Right Rear Of Engine Compartment, On PCM Cover
Contour & Mystique	
1995	On Left Rear Corner Of Engine Compartment
Cougar & Thunderbird	
1982-90	On Left Fender Apron
1991	On Rear Of Right Front Fender Panel
1992	Front Of Right Shock Tower
1993	2 Connectors In Right Rear Corner Of Engine Compartment
1994	On Right Side Of Engine Compartment & Below Glove Box
1995	
3.8L	On Right Side Of Engine Compartment & Below Glove Box
4.6L	Behind Right Side Of Dash, Below Glove Box
1996	Lower Right Side Of Dash, Below Glove Box
Crown Victoria, Grand Marquis & Lincoln Town Car	
1983 & 1987	On Right Fender Apron
1985-86 & 1988-90	On Left Fender Apron
1992	On Left Front Fender Panel
1993-94	On Top Of Left Front Wheelwell
Escort, EXP, Lynx & Tracer	
1985-90	On Right Fender Apron Near Firewall
1991	On Left Rear Of Engine Compartment
1992	On Right Rear Of Engine Compartment, Near Cowl
1993-95	On Left Side Of Firewall
LTD & Marquis	
1983	On Left Fender Apron
1984-86	On Left Rear Corner Of Engine Compartment
Mark VII	
1984-87	On Right Rear Corner Of Engine Compartment
1988-90	Front Of Right Fender Apron
1991	On Right Side Of Engine Compartment, Near Thermactor Solenoids

Mark VIII	
1993-96	On Top Of Left Wheelwell
Mustang	
1980-85	On Center Of Left Front Fender Apron
1986-91	On Left Rear Corner Of Engine Compartment
1992	On Left Shock Tower, Near Ignition Coil
1993	2 Connectors On Right Front Strut Tower
1994-95	Behind Right Front Strut Tower & Right Of Steering Column
Probe	
1991-92	On Left Rear Corner Of Engine Compartment
1993	DLC - Behind Left Side Of Dash; STI Connector - On Left Inner Fender Panel
1994-95	On Left Front Inner Fender Panel
Sable & Taurus	
1986-87 (3.0L Only)	Near Alternator
1988-90	
2.5L	On Engine Harness Near PCV Hose
3.0L	On Right Rear Corner Of Engine Compartment
1991	On Right Rear Corner Of Engine Compartment, On ECA Cover
1992	On Right Rear Corner Of Engine Compartment, Below MAP Sensor
1993-95	Right Rear Of Engine Compartment
Tempo & Topaz	
1984-92	On Right Rear Corner Of Engine Compartment
1993-94	In Engine Compartment, On Left Strut Tower

GENERAL MOTORS

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

GENERAL MOTORS - DOMESTIC CARS

Application	**Connector Location**

Allante	Enter Diagnostic Mode By Pressing OFF & WARM Buttons On Instrument Panel
Bonneville (1980-81)	ECU Connector On Upper Right Kick Panel
Brougham (1987-92)	Bottom Center Of Instrument Panel
Camaro & Firebird (1980)	Diagnostic Ground Lead Connector On Right Shroud Above ECM
Caprice Classic	
1980-81	ECU Connector On Upper Right Kick Panel
1982-88	Under Center Of Instrument Panel
Catalina	ECU Connector On Upper Right Kick Panel
Cavalier (1982-88)	On Side Of Fuse Block
Cimarron	On Side Of Fuse Block
Century	Under Left Of Dash Ashtray
Corvette (1980-83)	In Center Console, Under Ashtray
Custom Cruiser	
1980-81	ECU Connector On Upper Right Kick Panel
1982-88	Under Center Of Instrument Panel
DeVille (1981-88)	Enter Diagnostic Mode By Pressing OFF & WARMER Buttons On Instrument Panel
Delta 88	ECU Connector On Upper Right Kick Panel
Eldorado (1981-88)	Enter Diagnostic Mode By Pressing OFF & WARMER Buttons On Instrument Panel
Electra (1980-81)	ECU Connector On Upper Right Kick Panel
Estate Wagon	ECU Connector On Upper Right Kick Panel
Fiero	Under Ashtray Or Cigar Lighter Panel Within Center Console
Firenza	On Side Of Fuse Block
Fleetwood (1981-88)	Enter Diagnostic Mode By Pressing OFF & WARMER Buttons On Instrument Panel
Fleetwood Brougham	On Bottom Center Of Dash, Near Ashtray
Impala (1982-88)	Under Center Of Instrument Panel
LeMans	ECM Connector On Right Kick Panel

	Or Under Left Side Of Dash
LeSabre (1980-81)	ECU Connector On Upper Right Kick Panel
LeSabre Wagon (1982-88)	Under Center Of Instrument Panel
Monza	Under Right Side Of Dash
Ninety-Eight (1980-81)	ECU Connector On Upper Right Kick Pane
Nova	Behind Right Strut Tower
Parisienne	Under Center Of Instrument Panel
Reatta	
1988-92 (MFI)	Enter Diagnostic Mode By Pressing OFF & WARM Buttons On Instrument Panel
1991-93	Above Parking Brake Pedal
Riviera	
1980-85 (Carbureted)	Under Left Or Center Of Dash
1986-92 (MFI)	Enter Diagnostic Mode By Pressing OFF & WARM Buttons On Instrument Panel
Safari	Under Center Of Instrument Panel
Seville (1981-88)	Enter Diagnostic Mode By Pressing OFF & WARMER Buttons On Instrument Panel
Skyhawk	Under Right Side Of Dash
Starfire	Under Right Side Of Dash
Sunbird	On Side Of Fuse Block, Under Right Side Of Dash
Toronado	
1980-85 (Carbureted)	Under Left Or Center Of Dash
1986-92 (MFI)	Enter Diagnostic Mode By Pressing OFF & WARM Buttons On Instrument Panel
Trofeo	
1988-92 (MFI)	Enter Diagnostic Mode By Pressing OFF & WARM Buttons On Instrument Panel
1991-93	Above Parking Brake Pedal
2000	On Side Of Fuse Block

DOMESTIC LIGHT TRUCKS & VANS

CHRYSLER GROUP LLC - DOMESTIC LIGHT TRUCKS & VANS

Application	Connector Location
Caravan, Grand Caravan, Grand Voyager, Mini Ram Van, Town & Country, & Voyager	
1984-92	On Left Side Fender Apron
1993	On Left Fender Front Fender Panel, Near SBEC
1994-95	On Wiring Harness, On Center Of Firewall
Dakota	
1987-88	On Right Side Fender Apron
1989	On Left Side Of Firewall
1990-92	On Right Side Of Firewall
1993-95	On Right Rear Corner Of Engine Compartment
Jeep	
Cherokee (1992-95)	On Left Front Fender Apron, Behind Air Cleaner
Comanche	On Left Front Fender Apron, Behind Air Cleaner
Grand Cherokee & Wagoneer	
1993-95	
PCM	On Right Rear Of Engine Compartment, Near PCM
TCM	Behind Left Side Of Instrument Panel
Wrangler (1992-95)	On Left Side Of Firewall, Near PCM
Pickup & Ramcharger	
1985-90	On Left Side Of Firewall
1991-93	On Left Front Fender Panel, Next To SBEC/PCM
1995 Pickup	On Right Side Of Firewall
Ram Wagon & Van	
1985-90	On Left Side Of Firewall
1991-95	On Center Of Firewall, Near SBEC/PCM

FORD MOTOR CO.

of the dash, as mandated in 1996 by the Federal government.

FORD MOTOR CO. - DOMESTIC LIGHT TRUCKS & VANS

Application	**Connector Location**
Aerostar	
1986-90	On Left Front Fender
1991	Near Starter Relay
1992	On Left Front Inner Fender Panel
1993-95	On Left Side Of Firewall
Bronco	
1982-85	
6-Cylinder	On Left Front Fender
V8	On Right Inner Fender Panel
1986-87	On Right Front Fender, Near Starter Relay
1988-92	On Left Fender Apron
1993-95	2 Connectors In Left Rear Of Engine Compartment, On Bracket
1996-	Below Glove Box
Bronco II	
1983-85	On Right Front Inner Fender Panel (2.3L Only)
1986-90	On Right Front Fender Apron
Excursion	Behind Center Of Dash
Explorer & Mountaineer (1991-94)	On Right Rear Of Engine Compartment, Near A/C-Heater Blower
Pickup	
1982-85	
6-Cylinder	On Left Front Fender
V8	On Right Inner Fender Panel
1986-87	On Right Front Fender, Near Starter Relay
1988-92	On Left Fender Apron
1993-95	2 Connectors In Left Rear Of Engine Compartment, On Bracket
1996-	Below Center Of Instrument Panel
Pickup (F250 Heavy Duty & F350)	Under Right Side Of Dash
Ranger	
1983-85	On Right Front Inner Fender Panel (2.3L Only)
1986-90	On Right Front Fender Apron
1991	Behind Engine Compartment

	Fuse/Relay Block
1992	On Left Front Inner Fender Panel
1993-95	On Rear Of Engine Compartment Fuse/Relay Block
Van	
1986-92	On Right Fender Apron
1993-95	On Left Front Corner Of Engine Compartment
1996	
5.8L (49 State, Over 8600 GVW) & 7.5L (Except Calif.)	On Left Front Corner Of Engine Compartment
All Others	Under Left Side Of Dash
1997-98	
Diesel	Under Left Side Of Dash
All Others	Left Front Corner Of Engine Compartment
Villager (1993)	On Left Side Of Engine Compartment, Below Coolant Reservoir

GENERAL MOTORS

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

GENERAL MOTORS - DOMESTIC LIGHT TRUCKS & VANS

Application	**Connector Location**
Astro & Safari Van (1986-87)	Under Left Corner Of Cowl
"S" & "T" Series Blazer, Bravada, Envoy, Jimmy, Pickup & Sonoma	
1982-85	
1.9L	Under Left Side Of Dash, Behind ECM
2.0L & 2.8L	Under Ashtray
2.5L	Under Left Side Of Dash
1986-87	Under Ashtray
Van ("G" Series) (1982-87)	Under Driver's Seat

IMPORTED CARS & TRUCKS

ACURA

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side**

ACURA - IMPORTED CARS & TRUCKS

Application	Connector Location
Integra	
1991-93	Behind Right Kick Panel
1994-97	Behind Glove Compartment
1998-02	Behind Right Side Of Center Console
Legend	
1991-93	Under Right Side Of Dash, Above PGM-FI ECU/PCM
1994-95	Behind Glove Compartment
NSX (1997-01)	Under Glove Compartment
SLX	Behind Lower Left Corner Of Dash, Behind Cover
Vigor	
1992-93	Under Right Side Of Dash, Near Center Console
1994	Behind Glove Compartment
2.2CL & 2.3CL	In Front Of Shift Lever, Behind Ashtray
2.5TL	In Front Of Shift Lever, Behind Ashtray
3.0CL	In Front Of Shift Lever, Behind Ashtray
3.2TL & 3.5RL	In Front Of Shift Lever, Behind Ashtray

AUDI

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

AUDI - IMPORTED CARS & TRUCKS

Application	Connector Location
A4	
1996	Next To Rear Ashtray
1997-01 (1.8L Turbo)	Behind Cover, Under Left Side Of Steering Column
1997-99 (2.8L V6)	Under Cover, Next To Rear Ashtray
1997-	Under Left Side Of Dash, Behind Cover
A6	
1995	Under Ashtray, In Front Storage Compartment Of Center Console

1996-97	Under Cover, Next To Parking Brake Handle
Cabriolet	
1994-96	In Fuse/Relay Block, On Left Side Of Dash
1997-98	Under Ashtray, At Rear Of Center Console
Coupe GT, 4000S & 4000S Quattro	In Fuse Socket, On Fuel Pump Relay
80	In Fuse Socket, On Fuel Pump Relay
90	
1988-92	In Fuse Socket, On Fuel Pump Relay
1993	In Main Fuse/Relay Block, On Plenum Tray
1994-95	In Fuse/Relay Block, On Left Side Of Dash
100	
1989-91	Under Left Side Of Dash
1992-94	In Auxiliary Relay Station No. 1, On Left Rear Of Engine Compartment
5000CS Quattro, 5000CS Turbo & 5000S	In Fuse Socket, On Fuel Pump Relay

BENTLEY

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

BENTLEY - IMPORTED CARS & TRUCKS

Application	Connector Location
1996-00	
All Models	In Glove Compartment
2001-04	
Arnage	Below Left Side Of Dash
2001-	
Azure Convertible	In Glove Compartment
Continental	In Glove Compartment

BMW

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

BMW - IMPORTED CARS & TRUCKS

Application	Connector Location
Z3	Behind Cover, On Right Side Of Center Console
Z4 & Z8	Under Left Side Of Dash, Left Of Steering Column, Behind Cover
318 & 325	
1991	On Bracket, Above Thermostat Housing
1992-95	On Right Rear Of Engine Compartment
1996	Under Left Side Of Dash, Behind Panel Labeled OBD
330	Behind Cover, Under Left Side of Dash Above Hood & Trunk Releases
524t	On Top Rear Of Engine
525i & 535i	
1990-91 (Black 20-Pin Connector)	Left Rear Corner Of Engine Compartment
1992-95	Outside Of Engine Compartment Fuse/Relay Block
528e	On Intake Manifold Bracket, Behind Thermostat Housing
635CSi	On Bracket, Next To Fuse/Relay Block
735i	
1986-87	On Bracket, On Top Of Engine
1988-92	On Right Side Of Engine Compartment, On Shock Tower
740 & 750	Under Left Side Of Dash, Behind Panel Labeled OBD
740i & 740iL (1993-01)	Behind Cover On Lower Left Corner Of A/C Control Panel
745Li	In Left Side Kickpanel, Behind Cover Labeled OBD
750iL	Behind Cover On Lower Left Corner Of A/C Control Panel

DAIHATSU

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

DAIHATSU - IMPORTED CARS & TRUCKS

Application	Connector Location
Charade	At Upper Section Of Transmission

Rocky	On Right Front Fender Panel

CHRYSLER GROUP LLC

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

CHRYSLER GROUP LLC - IMPORTED CARS & TRUCKS

Application	**Connector Location**
Colt & Summit	
1986-87	Above Inside Of Glove Compartment
1988	On Left Rear Corner Of Engine Compartment
1989-98	Under Left Side Of Dash, Near Fuse/Relay Block
Colt Vista	
1987	Behind Glove Compartment
1988-89	Under Left Side Of Dash, Near Hood Release Handle
1990-96	Under Right Side Of Dash
Conquest & Starion	Behind Glove Compartment
Expo	Under Left Side Of Dash, Near Fuse/Relay Block
Medallion	On Left Side Of Firewall
Pickup	Under Left Side Of Dash, Near Fuse/Relay Block
Ram-50	Under Left Side Of Dash, Near Fuse/Relay Block
Sigma	In Glove Compartment
Stealth	
1991-98	Under Left Side Of Dash, On Fuse/Relay Block
1999	Under Left Side Of Dash, Left Of Center Console
Summit Wagon	Under Right Side Of Dash
Vista Wagon	Under Right Side Of Dash

FERRARI

FERRARI - IMPORTED CARS & TRUCKS

Application	**Connector Location**

All Models	
1996-	Behind Left Side Of Dash

FORD MOTOR CO.

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

FORD MOTOR CO. - IMPORTED CARS & TRUCKS

Application	**Connector Location**
Aspire	
1994-95	On Left Rear Corner Of Engine Compartment
1996-97	Under Left Side Of Dash
Capri	
1991	Behind Right Side Of Dash, Behind Glove Compartment
1992	
1.3L	On Left Rear Corner Of Engine Compartment
1.6L	On Right Rear Corner Of Engine Compartment
1993-94	On Right Rear Corner Of Engine Compartment
Festiva	
1992-93	
1.3L	On Left Rear Corner Of Engine Compartment
1.6L	On Right Rear Corner Of Engine Compartment
Merkur XR4Ti	On Right Front Fender Apron, Near Battery
Scorpio	On Right Rear Corner Of Engine Compartment
Tracer	On Left Rear Corner Of Engine Compartment

GENERAL MOTORS

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

GENERAL MOTORS & GEO - IMPORTED CARS & TRUCKS

Application	Connector Location
LeMans	Behind Right Kick Panel, Above ECM
Metro	
1989-95	Under Left Side Of Dash, Near Fuse Block
1996	Under Right Side Of Dash, Near Center Console
1997-01	Under Left Side Of Dash
Prizm & Prizm LSi	
1989-95	On Left Front Strut Tower
1996-02	Under Left Side Of Dash
Spectrum	Under Right Side Of Dash, Above A/C-Heater Blower Motor
Sprint	On Left Front Shock Tower, Near Battery
Storm	
1990-91	Behind Right Side Of Dash, Above A/C-Heater Blower Motor
1992-93	Behind Right Kick Panel
Tracker	
1989-95	Under Left Side Of Dash, Near Fuse Block
1996	In Engine Compartment, Near MAP Sensor
1997-	Under Left Side Of Dash

HONDA

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

HONDA - IMPORTED CARS & TRUCKS

Application	Connector Location
Accord	
1990-95	Behind Right Side Of Dash, Above Kick Panel
1996-97	Behind Ashtray In Center Console
Civic (1992-95)	Behind Right Side Of Dash, Near PGM-FI ECM
Civic Del Sol	
1992-95	Behind Right Side Of Dash, Near

	PGM-FI ECM
1996-97	Under Removable Cover On Right Side Of Center Console
CR-V	Behind Passenger Side Of Center Console
Element	
2003-11	Above Gas Pedal, Below Fuse Block
Insight (2010-11)	Below Left-of-Center Of Dash
Odyssey	
1995	Behind Right Side Of Dash, Above Kick Panel
1996-98	Behind Passenger Side Of Center Console
Passport (1995)	Behind Left Kick Panel
Prelude	
1992-95	Behind Center Console
1996	Under Beverage Holder In Center Console
1997-02	Under Removable Cover On Right Side Of Center Console
S2000	Behind Right Side Of Center Console

HYUNDAI

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

HYUNDAI - IMPORTED CARS & TRUCKS

Application	**Connector Location**
Accent (1995)	In Coin Box
Sonata	
1989	Under Left Side Of Dash, In Fuse Block
1990	
W/Passive Seat Belt Restraints	In Fuse Block
W/O Passive Seat Belt Restraints	On Lower Left Of Steering Column

INFINITI

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side

of the dash, as mandated in 1996 by the Federal government.

INFINITI - IMPORTED CARS & TRUCKS

Application	**Connector Location**
G20 (1993-95)	In ECCS Control Unit, Behind Center Console
I30 (1995)	Beside Fuse Box
J30	
1993	Under Left Side Of Dash
1994-95	In ECM, Behind Right Kick Panel
1996-98	Under Left Side Of Dash
M30	Under Left Side Of Dash, Near Fuse Block
Q45	
1990-93	Under Left Side Of Dash, Near Fuse Block
1994-95	In ECM, Behind Right Kick Panel

ISUZU

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

ISUZU - IMPORTED CARS & TRUCKS

Application	**Connector Location**
Amigo & Pickup	
1986-89	Under Left Side Of Dash
1990-95	Behind Left Kick Panel, Near ECM
1998-00	Lower Left Corner Of Dash, Behind Small Cover
Hombre	Under Lower Left Side Of Dash, Behind Cover
Impulse	
1986-89	Under Left Side Of Dash, Above ECU
1990-92	Behind Right Kick Panel
1993-95	Behind Left Kick Panel, Near ECM
I-Mark	Behind Right Side Of Dash, Above A/C-Heater Blower Motor
Oasis	Behind Right Side Of Center Console
Rodeo	
1991-95	Behind Left Kick Panel
1996-	Lower Left Side Of Dash, Behind

	Small Cover
Stylus	Behind Right Kick Panel
Trooper & Trooper II	
1986	Under Left Side Of Dash
1987-91	Under Center Console
1992	
DOHC	Behind Center Of Dash, Right Of Steering Column
SOHC	Under Left Side Of Dash
1993-95	Under Left Side Of Dash, Right Of Steering Column
1996-02	Lower Left Side Of Dash, Behind Small Cover
VehiCROSS	Under Left Side Of Dash

JAGUAR

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

JAGUAR - IMPORTED CARS & TRUCKS

Application	**Connector Location**
XJR (1995-97)	Near Center Console
XJS	
1992	On Left Rear Trunk Wheel Arch, Behind Trim Panel
1993-94	Under Battery Tray, On Right Front Of Luggage Compartment
1995-96	Near Center Console
XJ6	
1992	On Left Rear Of Engine Compartment
1993-94	Under Battery Tray, On Right Front Of Luggage Compartment
1995-97	Under Left Side Of Dash, Near Center Console
XJ12	Near Center Console

KIA

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side

of the dash, as mandated in 1996 by the Federal government.

KIA - IMPORTED CARS & TRUCKS

Application	Connector Location
Sephia	
1994	On Center Of Firewall
1995 & 1996	
1.6L	Under Center Of Dash, Mounted On Floorboard
2.0L	Under Right Side Of Dash, Near Kick Panel
Sportage	
1994	On Center Of Firewall
1995 & 1996	
1.6L	Under Center Of Dash, Mounted On Floorboard
2.0L	Under Right Side Of Dash, Near Kick Panel

LAND ROVER

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

LAND ROVER - IMPORTED CARS & TRUCKS

Application	Connector Location
Defender 90	Behind Fuse Cover, In Center Of Console
Range Rover	Under Right Side Of Dash, In Footwell

LEXUS

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

LEXUS - IMPORTED CARS & TRUCKS

Application	Connector Location
ES Series	
1990-91	
DLC	Near Left Shock Tower
Total Diagnostic Communication Link Connector	Under Left Side Of Dash
1992-94	

DLC No. 1	On Bracket, Behind Right Front Strut Tower
DLC No. 2 & 3	Under Left Side Of Dash
1995-97	In Fuse Box At Lower Left Of Dash
GS Series	
1990-95	
DLC No. 1	On Bracket, On Top Of Engine
DLC No. 2	Under Left Side Of Dash
1996-00	In Fuse Box At Lower Left Of Dash
LS Series	
1990-94	
DLC No. 1	On Bracket, On Top Of Engine
DLC No. 2	Under Left Side Of Dash
1995-00	In Fuse Box At Lower Left Of Dash
SC Series	
1992-95	
DLC No. 1	On Bracket, Behind Right Front Strut Tower
DLC No. 2 & 3	Under Left Side Of Dash
1996-00	In Fuse Box At Lower Left Of Dash

MAZDA

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

MAZDA - IMPORTED CARS & TRUCKS

Application	Connector Location
B-Series	
1987-88	On Right Front Fender Apron
1989-93	
Engine Control Check Connector (Black 6-Pin)	Near Windshield Washer Motor
Trouble Codes Connector (Green 1-Pin)	Near Black 6-Pin Connector (Engine Control)
1994-95	On Right Front Fender Panel
Miata (1990-95)	On Left Rear Of Engine Compartment, Near Master Cylinder
MPV (1989-95)	
Engine Control Unit (Green 6-Pin & 1-Pin Connectors)	On Left Side Of Engine Compartment, Near Inner Fender Panel
MX-3	Mounted On Bracket, On Left Front Strut Tower

MX-6 & 626	
1988	Behind Left Front Shock Tower
1989	On Left Front Corner Of Engine Compartment
1990-91	At ECU Connector Terminal
1992	On Left Rear Corner Of Engine Compartment
1993	On Side Of Fuse/Relay Block, Near Battery
1994-95	On Left Front Fender Apron
Navajo	
1991-93	On Right Rear Corner Of Engine Compartment
1994-95	On Right Front Fender Panel
Protege	
1987-89	On Passenger's Footwell (Left Foot Area)
1990-95	On Left Side Of Firewall, Near Wiper Motor
RX7	
1986-88 (3 Check Connectors)	At Left & Right Corners Of Engine Compartment
1989-91 (Green 6-Pin Connector)	Behind Ignition Coil
1993-95	On Bracket, On Left Front Strut Tower
323	
1986-88	Front Left Of Engine Compartment, Near Ignition Coil
1989 (Green 6-Pin & Green 1-Pin Connectors)	On Left Side Of Firewall
1990-95	On Left Side Of Firewall, Near Wiper Motor
929	
1989	Near Air Cleaner
1990-91 (Green 6-Pin Connector)	In Left Front Corner Of Engine Compartment
1992-93	Mounted On Air Cleaner Housing
1994-95	On Left Front Strut Tower

MERCEDES-BENZ

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

MERCEDES-BENZ - IMPORTED CARS & TRUCKS

Application	Connector Location
C-Class (1994)	On Right Rear Of Engine Compartment
E-Class	
1994-97	On Right Rear Of Engine Compartment
G-Class	Under Left Side Of Dash, Behind Cover
ML-Class	Under Left Side Of Dash, Behind Cover
S-Class	
140 Platform (1994-99)	On Right Rear Of Engine Compartment
190 Series	
1986-87	On Left Rear Of Engine Compartment
1988-93	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
1994	On Right Rear Of Engine Compartment
260E	
1987	On Left Front Fender Apron, Next To Ignition Control Module
1988-89	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
300 Series	
1986-87	On Left Front Fender Apron, Next To Ignition Control Module
1988-92	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
1993	
Except 300E	Left Fender Apron
300E	Right Rear Corner Of Engine Compartment
1994-95 (All Models)	On Right Rear Of Engine Compartment
400 & 500 Series	

1993	
12-Pin Connector	On Rear Of Left Front Inner Fender Panel
38-Pin (Impulse Readout)	In Module Box, On Right Rear Of Engine Compartment
1994-95	On Right Rear Of Engine Compartment
420SEL & 560 Series (Except 2.2L)	
1986-89	
All Models	In Engine Compartment, On Left Front Fender
California (OBD)	On Right Side Of Firewall, Near Battery
1990-91	In Engine Compartment, On Left Front Fender
560 Series (2.2L)	On Lower Left Side Of Engine Connector

MITSUBISHI

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

MITSUBISHI - IMPORTED CARS & TRUCKS

Application	Connector Location
Diamante (1992-98)	Under Left Side Of Dash, Near Fuse/Relay Block
Expo	Under Left Side Of Dash, Near Fuse/Relay Block
Montero	
1986-88	Left Rear Corner Of Engine Compartment
1989-91	Behind Glove Compartment
Pickup	Under Left Side Of Dash, Near Fuse/Relay Block
Raider	
1987-88	Left Rear Corner Of Engine Compartment
1989	Behind Glove Compartment
3000GT	
1991-98	Under Left Side Of Dash, On Fuse/Relay Block
1999	Under Left Side Of Dash, Left Of Center Console

NISSAN

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

NISSAN - IMPORTED CARS & TRUCKS

Application	Connector Location
Altima	
1993-94	On Driver-Side Of Center Console, Above Accelerator Pedal
1995-96	Below Fuse Box
Maxima	
1989-94	Under Left Side Of Dash
1995-96	Below Fuse Box
NX & Sentra	Under Left Side Of Dash, Near Fuse Block
Pulsar NX	
1986	Above Right Side Of Dash, Below Wiper Motor
1987	Above Steering Column
Quest (1993-95)	
CONSULT Tester Connector	On Driver-Side Of Center Console, Above Accelerator Pedal
Self-Test Connector	Located Near Starter
Stanza	Below Center Of Dash, Near Center Console
Van	On Right Side Of Engine Compartment, Behind Fuel Filter
200SX (1995-96)	Below Fuse Box
240SX	
1991-94	Under Left Side Of Dash, Below Fuse Block
1995-96	In Glove Box
300ZX (1990)	Near Parking Brake

PEUGEOT

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

PEUGEOT - IMPORTED CARS & TRUCKS

Application	Connector Location
505 Series	On Lower Left Side Of Engine Connector

PORSCHE

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

PORSCHE - IMPORTED CARS & TRUCKS

Application	Connector Location
911 Series	
1992-95	In Passenger's Footwell
1996	Left Side Of Center Console
928S	Top Front Of Engine
944 Series	On Left Side Of Engine Compartment

RENAULT

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

RENAULT - IMPORTED CARS & TRUCKS

Application	Connector Location
Sportwagon	
Engine Diagnostic	On Center Of Firewall
Fuel Injection Diagnostic	Right Rear Of Engine Compartment, Behind Airflow Meter

ROLLS-ROYCE

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

ROLLS-ROYCE - IMPORTED CARS & TRUCKS

Application	Connector Location
All Models	
1996-00	In Glove Compartment
2001-	Under Left Side Of Dash

SAAB

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

SAAB - IMPORTED CARS & TRUCKS

Application	Connector Location
900 Series	
1986-90	In Front Of Fuse/Relay Panel
1991-93	Under Back Seat, On Right Side
1994	
Convertible	Under Rear Seat
Hatchback	Under Steering Column
All Others	Under Right Front Seat
9000 Series	
1990	On Left Side Of Engine Compartment
1991-92	Under Passenger's Seat
1993	On Left Of Firewall
1994-95	Under Right Front Seat

SUBARU

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

SUBARU - IMPORTED CARS & TRUCKS

Application	Connector Location
Brat, Coupe, Hatchback, Sedan & Wagon	
1987	
Read Memory Connector	Under Left Side Of Dash, Next To MFI/SMFI Control Unit
Test Mode Connector	
MFI	On Left Side Of Dash, Next To MFI Control Unit
Sequential MFI	On Left Side Of Firewall
1988-89	On Left Side Of Dash, Next To ECU
Forester	Under Left Side of Dash, Behind Cover
Justy	
1987-88	
Read Memory Connector (Factory)	On Right Front Fender, Near Strut Tower
Test Mode Connector	On Driver-Side Kick Panel Or ECU

1989-95	
Read Memory Connector (Factory)	Under Left Side Of Dash
Test Mode Connector	On Driver-Side Kick Panel Or ECU
Legacy	
1990-94	
Check Connector (Black Connector)	Behind Right Side Of Steering Column, Near Heater Case
Diagnostic Connector (Black 4-Pin Connector)	Behind Right Side Of Steering Column, Near Heater Case
Read Memory Connector (Black Connector)	Behind Knee Panel, Right Of Steering Column
Select Monitor Connector (Yellow Connector)	Behind Right Side Of Steering Column, Near Heater Case
Test Mode Connector (Green Connector)	Behind Knee Panel, Right Of Steering Column
1995-	Under Left Side Of Dash, Behind Cover
Loyale	
1990-91	
MFI (5-Pin Connector)	In Front Of ECU
SMFI (Yellow 9-Pin & Black 13-Pin Connectors)	Near Brake Booster
1992-95	
Diagnostic Check Connector (Yellow 9-Pin & Black 13-Pin Connectors)	Behind Brake Booster
Diagnostic Read-Memory Connector (2-Single Wire Connectors)	Behind Left Front Strut Tower
Outback & Outback Sport	Under Center Of Dash
SVX	
1992-96	Under Left Side Of Dash
1997	Right Of Steering Column, On Center Console

SUZUKI

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

SUZUKI - IMPORTED CARS & TRUCKS

Application	**Connector Location**
Esteem (1995)	Near Battery
Samurai	
1986-90	Under Right Side Of Dash, Behind Glove Compartment

1991-92	On Right Side Of Firewall
1993-95	Under Left Side Of Dash, In Fuse Block
Sidekick & X90	
1989-91	Under Left Side Of Dash, In Fuse Block
1992-93	
ALDL Connector	Under Left Side Of Dash
Engine Connector	Under Left Side Of Dash, Near Fuse Block
1994-96	In Engine Compartment, Near Battery
Swift	
1989-91	Under Left Side Of Dash, In Fuse Block
1992	
ALDL Connector	Under Left Side Of Dash
Diagnostic Test Terminal	In Fuse Block
1993-95	Under Left Side Of Dash, In Fuse Block

TOYOTA

NOTE: This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.

TOYOTA - IMPORTED CARS & TRUCKS

Application	**Connector Location**
Camry	
1983-90	Next To Brake Master Cylinder
1991	Near Left Front Shock Tower
1992-95	
4-Cylinder	Near Wiper Motor
V6	Under Left Side Of Dash
Celica	
1983-84	Next To Battery
1985-95	Behind Left Front Shock Tower
Celica Supra	Rear Of Battery, Near Relay Panel (2-Pin Connector)
Corolla	
Front Wheel Drive	
1987	Side Of Left Front Shock Tower (2-

	Pin Connector)
1988-94	Behind Left Front Shock Tower
Rear Wheel Drive	
1985-86	Side Of Right Front Shock Tower (2-Pin Connector)
1987	Right Rear Corner Of Engine Compartment
Cressida	
1988-93	
Check Connector	On Left Front Shock Tower
Total Diagnostic Communication Link Connector	Under Left Side Of Dash
Land Cruiser (1988-94)	Near Wiper Motor
MR2	
1986-90	Near Airflow Meter
1992-95	On Right Rear Of Engine Compartment, Near MAP Sensor
Paseo (1992-95)	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
Pickup	
1984-86	Near Ignition Coil, Near Master Cylinder (2-Pin Connector)
1987-90	Right Front Inner Fender Panel, Near Relay Block
1992-94	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
Previa	
1992-93	Under Front Of Driver's Seat
1994	
Except Supercharged	Under Center Console, Near Parking Brake Lever
Supercharged	Under Cover, On Top Center Of Instrument Panel
1995-97	On Top Center Of Instrument Panel
RAV4	Under Dash, Near Center Console
Starlet	
1981-82	On Instrument Panel Fuse Block, On Top Of Dash
1983-84	Right Rear Of Engine Compartment
Supra	
1986-90	Rear Of Battery, Near Relay Panel
1991-92	On Left Front Shock Tower
1993-94	
DLC No. 1	On Right Side Of Firewall

DLC No. 2	Under Left Side Of Dash, Near Kick Panel
Tacoma & T100	
1993	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
1994-95	
Except OBD-II DLC	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
OBD-II DLC	Under Left Side Of Dash
Tercel	
1987-90	In Engine Compartment, Next To Master Cylinder
1991-94	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery
1995-98	Near Steering Column
Van	Near Airflow Meter
4Runner	
1985-86	Near Ignition Coil, Next To Master Cylinder (2-Pin Connector)
1987-95	On Side Of Engine Compartment Fuse/Relay Block No. 2, Near Battery

VOLKSWAGEN

NOTE: **This table provides a quick reference for self-diagnostic connector locations, when available from manufacturer, that ARE NOT located at the lower left side of the dash, as mandated in 1996 by the Federal government.**

VOLKSWAGEN - IMPORTED CARS & TRUCKS

Application	**Connector Location**
Cabrio	
1996	In Center Console, Below Tachometer
1997-02	On Center Dash, Behind Panel Near Ashtray
Corrado	Under Center Console Trim Plate
Fox	Under Center Console, Near Shift Lever
Golf	
1993	On Center Of Dash, Below A/C-Heater Control Knobs
1994	Under Center Console
1998-03	In Center Console

Golf III 2.0L	
1995-96	Below A/C-Heater Control Panel
1997-98	On Center Dash, Behind Panel Adjacent To Ashtray
GTI	
1993	On Center Of Dash, Below A/C-Heater Control Knobs
1994	Under Center Console
GTI 2.8L	On Center Dash, Behind Panel Adjacent To Ashtray
Jetta

DESCRIPTION AND OPERATION

DRIVELINE SYSTEM

Driveline System

The driveline system consists of the following components:

- Center support bearing
- Driveshaft assembly
- Front halfshafts
- Rear halfshafts
- Active torque coupling/rear axle

On Front Wheel Drive (FWD) vehicles, the transaxle transmits power from the engine to the halfshafts.

On All-Wheel Drive (AWD) vehicles, power is transmitted from the engine through the transaxle to the Power

Transfer Unit (PTU). The PTU transfers engine power from the transaxle to the front halfshafts, and through the driveshaft to the active torque coupling/rear axle and halfshafts. For information on the PTU, refer to **FOUR WHEEL DRIVE (4WD) SYSTEMS** article or **TRANSFER CASE - POWER TRANSFER UNIT (PTU)** article.

The engine angle is built into the engine mounts. If the engine angle is out of specification, the engine mounts must be inspected for damage. Refer to **ENGINE - 2.3L** article, **ENGINE - 3.0L (4V)** article or **ENGINE - 3.5L** article.

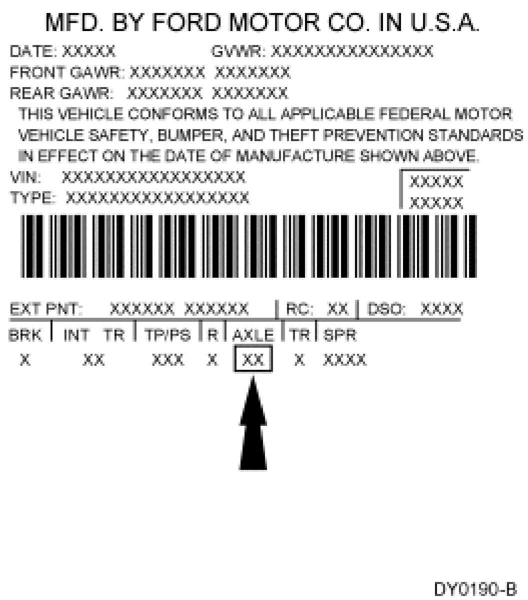

Fig. 1: Vehicle Certification (VC) Label Example
Courtesy of FORD MOTOR CO.

The Vehicle Certification (VC) label is located in the driver door jamb. The axle code is on the VC label. Refer to **IDENTIFICATION CODES** article.

The axle ratio is 2.93 and the ring gear has a diameter of 174 mm (6.85 in).

The wheel speed sensor rings for FWD vehicles are located on the front halfshafts and are mounted to the rear inner spindles.

The wheel speed sensor rings are located on the front and rear halfshafts for AWD vehicles.

Driveshaft

The driveshaft is a 3-piece shaft with rubber-isolated center bearings.

The driveshaft has traditional balance weights attached (spot-welded) by the manufacturer.

U-joints

The CV and U-joints are installed new with the driveshaft.

The front CV joint is:

- lubricated with a special lubricant and requires no additional lubrication.

The center U-joints are:

- a lubed-for-life design that requires no periodic lubrication.
- equipped with nylon thrust washers located at the base of each bearing cup which control end play, position the needle bearings and improve grease movement.

Rear Drive Unit

The active torque coupling/Rear Drive Unit (RDU) is serviced as an assembly.

The RDU housing cover uses a silicone sealant rather than a gasket.

Each halfshaft is held in the RDU case by a halfshaft circlip that is located on the inner CV joint stub shaft pilot bearing housing. When each halfshaft is installed, the halfshaft circlip engages a slot in the differential side gear.

The RDU operates as follows:

- The RDU pinion receives power from the engine through the transaxle, PTU, driveshaft and active torque coupling, and is always engaged.
- The pinion gear rotates the differential case, which is bolted to the differential case outer flange.
- Inside the differential case, 2 differential pinion gears are mounted on a differential pinion shaft that is pinned to the differential case.
- These differential pinion gears are engaged with the differential side gears, to which the halfshafts are splined.
- As the differential case turns, it rotates the halfshafts and rear wheels.
- When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the 2 halfshafts.

Halfshafts

The drive halfshafts consist of the following components:

- Inner CV joints
- Outer CV joints
- CV joint boot clamps

- CV joint boots
- Tripod joint housings
- Retainer circlips
- Front intermediate shaft bearing

The front intermediate shaft bearing is pressed on and is only serviced as an assembly with the intermediate shaft.

NOTE:	**An inspection of the outer and inner constant velocity (CV) joint boots is necessary so that if damage or grease leakage is evident, installation of a new halfshaft can take place immediately. Continued operation with damage or grease leakage will result in CV joint wear and noise due to contamination and loss of the CV joint grease.**

- The inner and outer CV joints connect to a splined shaft. A circlip holds the cross groove inner race assembly (inner CV joint) together.
- A circlip retains the splined inner CV joint. Install a new axle circlip each time the halfshaft is removed from the vehicle.
- A wheel hub nut secures the side shaft assembly (interconnecting shaft and outer CV joint) to the wheel hub. Install a new wheel hub nut each time the halfshaft is removed from the vehicle.

Halfshaft Handling

NOTE:	**Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the constant velocity (CV) joints. Damage will occur to an assembled inner CV joint if it is over-plunged outward from the joint housing or over angled.**

Handle all halfshaft components carefully during removal and installation procedures. Never use a hammer to remove or install the halfshafts. Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft. Do not allow the boots to contact sharp edges or hot exhaust components. Do not drop assembled halfshafts. The impact may cut the boots from the inside without evidence of external damage.

DIAGNOSTIC TESTS

DRIVELINE SYSTEM

Principals of Operation

Driveline System - General Information

The driveline system enables the power generated by the engine and transferred through the transmission in Front Wheel Drive (FWD), or the transmission and the Power Transfer Unit (PTU) in All-Wheel Drive (AWD) to place the vehicle in motion. Rotational torque received from the transmission or PTU is delivered to the front

wheels by halfshafts or the rear axle by way of the driveshaft(s). The U-joints or CV joints at the ends of the shafts allow the shafts to rotate smoothly in an allowable angle plane. The rotational torque is introduced into the axle drive pinion which drives the differential ring gear. The ring gear is bolted to the axle differential which divides the torque between the left and right axle shafts, while permitting the shafts to turn at different speeds when required, such as when cornering.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical damage.

VISUAL INSPECTION CHART

Mechanical
• U-joints • CV joints • Center bearings • Driveshaft tubes • Mounting brackets • Flanges • Housing and cover damage • Differential bearings • Differential gear sets • Pinion bearings

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and Go to **Symptom Chart - NVH**.

Driveshaft Center U-Joint and CV Joint Inspection

With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article. Rotate the driveshaft by hand. Check for rough operation or seizure of the U-joints or CV joints. Install a new driveshaft if it shows signs of seizure, excessive wear or incorrect seating. Refer to **DRIVESHAFT** article.

Driveshaft Center Bearing

With the vehicle in NEUTRAL, position it on a hoist. Refer to **JACKING AND LIFTING** article. Rotate the driveshaft by hand. If the bearing shows signs of roughness or is noisy, install a new driveshaft assembly. Refer to **DRIVESHAFT** article.

Symptom Charts - NVH

NOTE: NVH symptoms should be identified using the diagnostic tools that are available. For a list of these tools, an explanation of their uses and a glossary of common terms, refer to NOISE, VIBRATION AND HARSHNESS article. Since it is possible any one of multiple systems may be the cause of a symptom, it may be necessary to use a process of elimination type of diagnostic approach to pinpoint the responsible system. If this is not the causal system for the symptom, refer back to NOISE, VIBRATION AND HARSHNESS article for the next likely system and continue diagnosis.

Symptom Charts - NVH

Condition	Possible Sources	Action
• Axle howling or whine - front or rear axle	• Axle lubricant low	• CHECK the lubricant level. FILL the axle to specification.
	• Axle housing damage	• INSPECT the axle housing for damage. INSTALL a new axle as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• Damaged or worn wheel hub bearings	• CHECK for abnormal wheel hub bearing play or roughness. REFER to **FRONT SUSPENSION** article or **REAR SUSPENSION** article.
	• Damaged or worn differential ring and pinion	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• Damaged or worn differential side or pinion bearings	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Driveline clunk - loud clunk when shifting from reverse to drive	• Incorrect axle lubricant level	• CHECK the lubricant level. FILL the axle to specification.
	• Excessive backlash in the axle	• CHECK the axle backlash. INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• Damaged or worn pinion bearings	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• Damaged or worn U-joints	• INSPECT the U-joints for wear or damage. INSTALL a new driveshaft as necessary. REFER to

		DRIVESHAFT article.
• Driveline clunk - occurs as the vehicle starts to move forward following a stop • Driveline clunk (Front Wheel Drive (FWD) vehicles) - occurs during acceleration or from cruise to coast/deceleration	• Worn driveshaft CV joint or U-joints with excessive play • Loose rear axle mount • Damaged or worn inner CV joint	• INSPECT the CV joint and U-joints for a worn condition. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article. • CHECK the axle for loose bolts. TIGHTEN to specification. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. • INSPECT the inner CV joint and boot. INSTALL a new CV joint as necessary. REFER to **FRONT DRIVE HALFSHAFTS** article.
• Clicking, popping or grinding - occurs while the vehicle is turning	• Inadequate or contaminated lubrication in the CV joints • Loose wheel end nut • Another component contacting the halfshaft	• CHECK the CV boots and joints for wear or damage. INSTALL new components as necessary. REFER to **FRONT DRIVE HALFSHAFTS** article. • CHECK wheel hub nut torque. REPAIR as necessary. REFER to **FRONT DRIVE HALFSHAFTS** article. • CHECK the halfshafts and the area around the halfshafts. REPAIR as necessary.
• High pitched chattering - noise from the rear axle when the vehicle is turning • Buzz - buzzing noise is the same at cruise or coast/deceleration	• Incorrect or contaminated lubricant • Damaged or worn differential (differential side gears and pinion gears) • Incorrect driveline angles	• CHECK the vehicle by driving in tight circles (5 clockwise, 5 counterclockwise). DRAIN and REFILL with the specified rear axle lubricant and friction modifier as necessary. • INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article. • CHECK for correct driveline angles. REPAIR as necessary. REFER to **Driveline Angle Measurement**.
• Rumble or boom - noise occurs at coast/deceleration, usually	• Driveshaft is out-of-	• CHECK the driveshaft for damage, missing balance weights or undercoating. REFER to **DRIVESHAFT BALANCING -**

driveshaft speed-related and noticeable over a wide range of speeds	balance	**USING THE MASTER TECH® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)**.
	• U-joints are binding or seized	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
• Grunting - normally associated with a shudder experienced during acceleration from a complete stop	• Driveshaft CV joint binding	• INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
	• Loose rear axle mount bolts or suspension fasteners	• INSPECT the rear suspension and axle. TIGHTEN the fasteners to specification. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Howl - can occur at various speeds and driving conditions. Affected by acceleration and deceleration	• Incorrect ring and pinion contact, incorrect bearing preload or gear damage	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Chuckle - heard at coast/deceleration. Also described as a knock	• Incorrect ring and pinion contact or damaged teeth on the coast side of the ring and pinion	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Knock - noise occurs at various speeds. Not affected by acceleration or deceleration	• Gear tooth damage to the drive side of the ring and pinion	• INSPECT and INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Scraping noise - a continuous low pitched noise starting at low speeds	• Worn or damaged pinion bearings	• INSTALL a new axle assembly as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
• Driveline shudder - occurs during acceleration from a slow speed or stop	• Rear drive axle assembly mispositioned	• CHECK the axle mounts and the rear suspension for damage or wear. REPAIR as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• Loose rear axle bolts	• CHECK the rear axle for loose bolts. TIGHTEN the bolts to specification. REFER to **REAR DRIVE**

		AXLE/DIFFERENTIAL article.
	• Driveline angles out of specification	• CHECK for correct driveline angles. REFER to **Driveline Angle Measurement**.
	• U-joints binding or seized	• ROTATE the driveshaft and CHECK for rough operation or seized U-joints. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
	• Binding or damaged driveshaft CV joint	• INSPECT the driveshaft CV joint and coupling shaft for wear or damage. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
• Driveline vibration - occurs at cruising speeds	• Worn U-joints	• CHECK for wear or incorrect seating. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
	• Worn or damaged driveshaft center bearing support	• CHECK the insulator for damage or wear. ROTATE the driveshaft and CHECK for rough operation. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
	• Loose axle pinion flange bolts	• INSPECT the axle pinion flange. TIGHTEN the pinion flange bolts to specification. REFER to **DRIVESHAFT** article.
	• Excessive axle pinion flange runout	• CARRY OUT a runout check. REPAIR as necessary. REFER to **REAR DRIVE AXLE/DIFFERENTIAL** article.
	• Driveshaft is out-of-balance	• CHECK the driveshaft for damage, missing balance weights or undercoating. CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REFER to **Driveshaft Runout and Balancing**.
	• Binding or damaged driveshaft CV joint	• INSPECT the driveshaft CV joint for wear or damage. INSTALL a new driveshaft as necessary. REFER to **DRIVESHAFT** article.
	• Excessive driveshaft	• CARRY OUT a runout check. REFER to **Driveshaft Runout and**

	runout	**Balancing**.
	• Driveline angles out of specification	• CHECK for correct driveline angles. REPAIR as necessary. REFER to **Driveline Angle Measurement**.
	• Incorrectly seated CV joint in the wheel hub	• CHECK the outer CV joint for correct seating into the hub. REPAIR as necessary. REFER to **FRONT DRIVE HALFSHAFTS** article for the front CV joints or **REAR DRIVE HALFSHAFTS** article for the rear CV joints.

Analysis of Leakage

Clean up the leaking area enough to identify the exact source.

A plugged Rear Drive Unit (RDU) housing vent can cause excessive pinion seal lip wear due to internal pressure buildup.

Verify the RDU lubricant level is at least 3-5 mm (1/8-3/16 in) below the bottom of the fill hole.

Axle Vent

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. If the vent cannot be cleared, install a new vent.

Drive Pinion Seal

Leaks at the drive pinion seal originate from the following causes:

- Damaged seal
- Worn seal journal surface

Any damage to the seal bore (dings, dents, gouges or other imperfections) distorts the seal casing and allows leakage past the outer edge of the drive pinion seal.

The drive pinion seal can be torn, cut or gouged if it is not installed correctly. The spring that holds the drive pinion seal against the pinion flange may be knocked out and allow fluid to pass the lip.

Metal chips trapped at the sealing lip can cause oil leaks. These can cause a wear groove on the drive pinion flange and result in pinion seal wear.

When a seal leak occurs, install a new drive pinion seal and check the vent to make sure it is clean and free of foreign material.

A new drive pinion flange must be installed if any of these conditions exist.

Drive Pinion Nut

NOTE: **Install the drive pinion nut to the correct torque specifications or damage to the differential components may occur.**

On some high-mileage vehicles, oil may leak through the threads of the drive pinion nut. This condition can be corrected by installing a new nut.

Differential Seals

NOTE: **When installing shafts, do not allow splines to contact seals during installation or damage to the seals may occur.**

Halfshaft pilot bearing housing seals are susceptible to the same types of damage as drive pinion seals if incorrectly installed. The seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. The seal journal surface must be free of nicks, gouges and rough surface texture.

For information on differential seals, refer to **REAR DRIVE AXLE/DIFFERENTIAL** article.

GENERAL PROCEDURES

DRIVELINE ANGLE MEASUREMENT

Special Tools

Illustration	Tool Name	Tool Number
 ST2574-A	Angle master II Driveline Inclinometer/Protractor	164-R2402 or equivalent

NOTE: **This procedure does not apply to CV joints, flex couplers or double cardan joints that are used in some driveshaft. This check is for single-cross and roller-style joints found in the driveshaft.**

NOTE: **Prior to checking driveline angularity, inspect the U-joints for correct operation.**

NOTE: **An incorrect driveline angle can cause a vibration or shudder. For additional information, refer to NOISE, VIBRATION AND HARSHNESS article.**

NOTE: **Driveline angularity is the angular relationship between the engine crankshaft, the driveshaft and the rear axle pinion. Factors determining driveline angularity include ride height, rear spring and engine mounts.**

All vehicles

1. Carry out the following preliminary setup steps:
   - Inspect the U-joints for correct operation.
   - Park the vehicle on a level surface such as a drive-on hoist, or back onto a front end alignment rack.
   - Verify the curb position ride height is within specifications with the vehicle unloaded and all of the tires are inflated to their normal operating pressures.
   - Calibrate the Angle master II Driveline Inclinometer/Protractor by placing it on a clean, flat level section of the frame rail and press the ALT-ZERO button.

   Vehicles with flat-flanged, split-pin or slip-flanged U-joints

   NOTE: If equipped, remove the snap ring to allow access to the base of the U-joint cup. Make sure the Angle master II Driveline Inclinometer/Protractor is seated against the U-joint cup.

   NOTE: Rotate the driveshaft until the flange U-joint cup is parallel with the floor. This will simplify taking measurements.

2. To check the U-joint operating angle, install the Angle master II Driveline Inclinometer/Protractor. Check and record the flange angle as angle A.

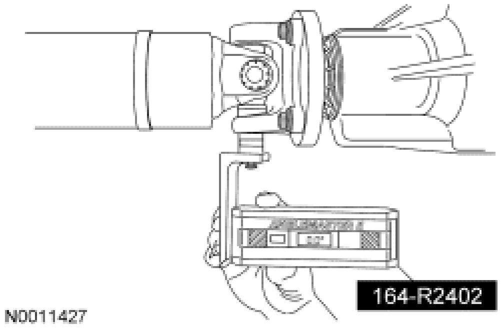

Fig. 2: Checking Flange Angle (1 Of 2)
Courtesy of FORD MOTOR CO.

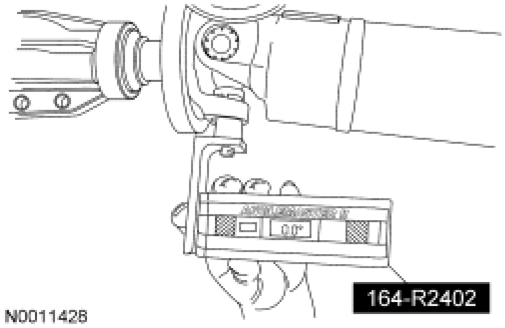

Fig. 3: Checking Flange Angle (2 Of 2)

Courtesy of FORD MOTOR CO.

3. Using the Angle master II Driveline Inclinometer/Protractor, measure the slope of the connecting component. Record the measurements of the component's angle as angle B.

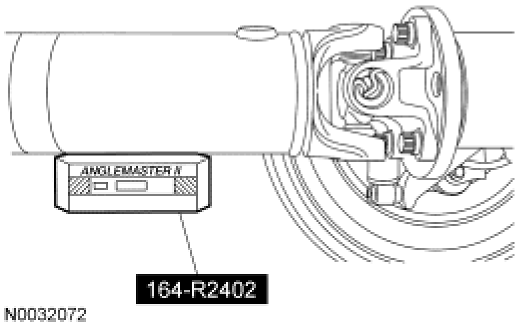

Fig. 4: Checking Driveshaft Angle
Courtesy of FORD MOTOR CO.

Multiple piece driveshaft

NOTE:	**Repeat this step for each center support bearing on the driveshaft.**

NOTE:	**It is not necessary to remove the U-joint snap ring, if equipped, for these measurements.**

4. Using the Angle master II Driveline Inclinometer/Protractor, measure the slope of the components in front and behind the center support bearing U-joint in the area indicated. Record the front component as angle A and the rear component as angle B.

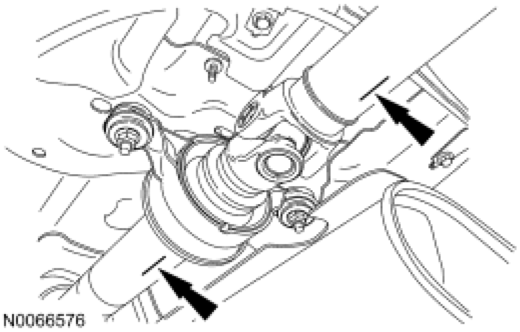

Fig. 5: Locating Index Mark On Driveshaft
Courtesy of FORD MOTOR CO.

All vehicles

NOTE:	**When 2 connected components slope in the same direction, subtract the smallest number from the larger number to find the U-joint operating angle. When 2 connected components slope in the opposite direction, add**

the measurements to find the U-joint operating angle.

5. Calculate the difference in the slope of the components to determine the U-joint operating angle.
   - The U-joint operating angle is the angle formed by 2 yokes connected by a cross and bearing kit. Ideally, the operating angles on each connection of the driveshaft must:
     - be equal or within one degree of each other.
     - have a 3 degree maximum operating angle.
     - have at least 1/2 of one degree continuous operating angle.
6. If the angle is not within specifications, repair or adjust to obtain the correct angle. Inspect the engine mounts, transmission mounts, center support bearing mounting, rear suspension, rear axle, rear axle mounting or the frame for wear or damage.

DRIVESHAFT RUNOUT AND BALANCING

Special Tools

Illustration	Tool Name	Tool Number
 ST1137-A	Dial Indicator Gauge with Holding Fixture 100-02 (TOOL-4201-C) or equivalent	
 ST2834-A	Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)	257-00018 or equivalent

Driveshaft Inspection

NOTE: **Driveline vibration exhibits a higher frequency and lower amplitude than high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is noticed at various speeds. Driveline vibration can be perceived as a tremor in the floorpan or heard as a rumble, hum or boom.**

NOTE: **Refer to <u>SPECIFICATIONS</u> for all runout specifications.**

NOTE: **Do not make any adjustments before carrying out a road test. Do not change the tire pressure or the vehicle load.**

1. Carry out a visual inspection of the vehicle. Operate the vehicle and verify the condition by reproducing it during the road test.
   - The concern should be directly related to vehicle road speed, not affected by acceleration or deceleration or could not be reduced by coasting in NEUTRAL.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
    - The driveshaft should be kept at an angle equal to or close to the curb-weighted position. Use a twin-post hoist or a frame hoist with jackstands.
3. Inspect the driveshaft for damage, undercoating or incorrectly seated U-joints. Rotate the driveshaft slowly by hand and feel for binding or end play in the U-joint trunnions. Remove the driveshaft. For additional information, refer to **DRIVESHAFT** article. Inspect the slip yoke splines for any galling, dirt, rust or incorrect lubrication. Clean the driveshaft or install new U-joints as necessary. Install a new driveshaft if damaged. After any corrections or new components are installed, recheck for the vibration at the road test speed.
    - If the vibration is gone, test drive the vehicle.
    - If the vibration persists or the driveshaft passes visual inspection, measure the driveshaft runout.

Driveshaft Runout

1. Install the suitable Dial Indicator Gauge with Holding Fixture. Rotate the driveshaft by turning the axle and measure the runout at the front, the center and the rear of the driveshaft.
    - If the runout exceeds 0.89 mm (0.035 in) at the front or center, install a new driveshaft.
    - If the front and center is within 1 mm (0.254 in), but the rear runout is not, index-mark the rear runout high point and proceed to Step 2.
    - If the runout is within 0.89 mm (0.035 in) at all points, recheck for vibration at road test speed. If the vibration persists, balance the driveshaft. For additional information, refer to **DRIVESHAFT BALANCING - USING THE MASTER TECH® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)**.

NOTE: Circular pinion flanges can be turned in 90 degree or 1/4 increments. Half-round pinion flanges are limited to 2 positions.

2. Index-mark the driveshaft to the pinion flange. Disconnect the driveshaft and rotate it 180 degrees. Reconnect the driveshaft. Recheck the runout at the rear of the driveshaft.
    - If the runout is still over specification, mark the high point and proceed to Step 3.
    - If the runout is within specification, check for the vibration at the road test speed. If the vibration is still present, balance the driveshaft. For additional information, refer to **DRIVESHAFT BALANCING - USING THE MASTER TECH® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)**.
3. Excessive driveshaft runout can originate in the driveshaft itself or from the pinion flange. To find the source, compare the 2 high points previously determined.
    - If the index marks are close together, within 25 mm (1 in), the driveshaft is eccentric. Install a new driveshaft.
    - If the marks are on opposite sides of the driveshaft, 180 degrees apart, the slip yoke or pinion flange is responsible. Check the pinion flange runout. If the pinion flange runout exceeds specifications, a bent pinion is indicated.
    - If the pinion flange and pinion run outs are within specifications, road test and check for the vibration at the road test speed. If the vibration persists, balance the driveshaft. For additional

information, refer to **DRIVESHAFT BALANCING - USING THE MASTER TECH® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)**.

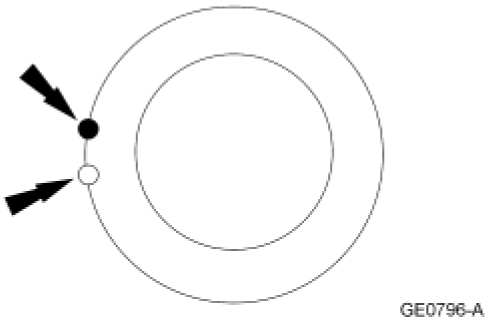

Fig. 6: Finding Excessive Driveshaft Runout (1 Of 2)
Courtesy of FORD MOTOR CO.

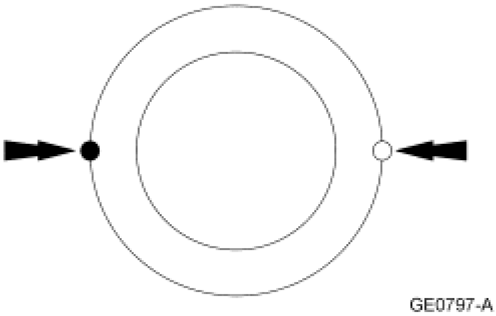

Fig. 7: Finding Excessive Driveshaft Runout (2 Of 2)
Courtesy of FORD MOTOR CO.

Driveshaft Balancing - Using the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix)

All vehicles

1. Install the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix) to the vehicle.
2. Working under the vehicle, install an accelerometer. The accelerometer can be attached and mounted near either the transmission or differential end of the driveshaft.
3. Clean an area of the driveshaft and install the reflective tape, then install the photo-tachometer sensor. The sensor should be placed at approximately a 20-degree angle from perpendicular to the surface of the reflective tape. Make sure the sensor does not get moved during the balance procedure.
    1. Reflective tape.
    2. Photo-tachometer sensor.

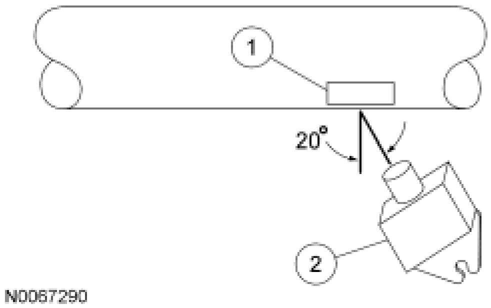

Fig. 8: Driveshaft Balancing - Using the MTS 4000
Courtesy of FORD MOTOR CO.

4. Using the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a driveshaft balance test with the driveshaft unmodified.

Vehicles with tapped pinion flanges

5. Label the tapped holes in the pinion flange numerically, starting at the top hole as 1. Mark the remaining holes 2, 3 and 4. Label in the direction of rotation.

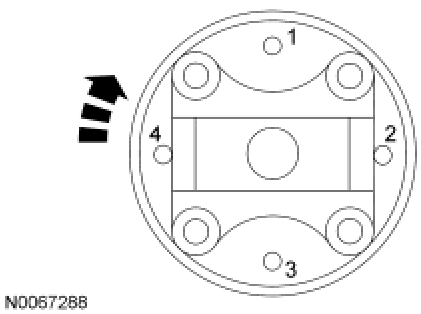

Fig. 9: Labeling Tapped Holes In The Pinion Flange
Courtesy of FORD MOTOR CO.

6. Using the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with the 12 mm (0.47 in) test weight set screw in the No. 1 hole, previously marked on the pinion flange.
7. Remove the test weight, then install the weight combination directed by the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix).

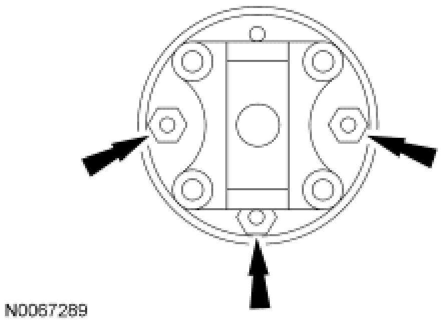

Fig. 10: Installing Weight Combination
Courtesy of FORD MOTOR CO.

Vehicles without tapped pinion flanges

8. Using the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a second test with a test weight. Using a metal band, secure the test weight to the end of the driveshaft. The weight should be placed at the end of the driveshaft tube, as close to the tube-to-yoke weld seam as possible. Mark the location of the test weight on the driveshaft, as shown in the figure below.
    1. Test weight.
    2. Tube-to-yoke weld seam.
    3. Driveshaft pinion flange.
    4. Select the test weight based on driveshaft size. Larger driveshaft use 10 g (0.353 oz). Smaller driveshaft use 5 g (0.176 oz).

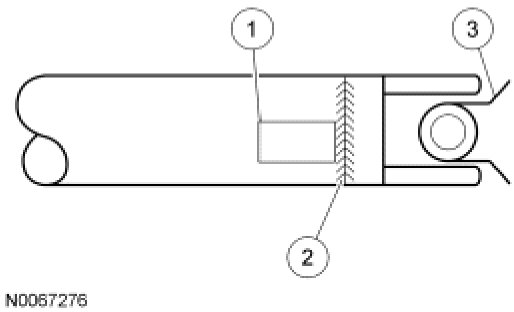

Fig. 11: Test Weight, Tube-To-Yoke Weld Seam, And Driveshaft Pinion Flange
Courtesy of FORD MOTOR CO.

9. Remove the test weight, then install the recommended weight at the position directed by the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix). Using a metal band and epoxy, secure the test weight to the driveshaft, as shown in the figure below.
    1. Test weight.
    2. Measure in this direction.
    3. Driveshaft diameter.
    4. Directional rotation.

5. Balance weight relative to test weight centerline.
6. The results are displayed with respect to the location to where the test weight was placed.

Courtesy of FORD MOTOR CO.

All vehicles

10. Using the Master tech® Series MTS 4000 Driveline Balance and NVH Analyzer (Vetronix), run a third test to verify the repair.

Driveshaft Balancing - Hose Clamp Method

1. Install 1 or 2 hose clamps on the driveshaft, near the rear. Position of the hose clamp head(s) can be determined through trial and error.
2. Mark the rear of the driveshaft into 4 approximately equal sectors and number the marks 1 through 4. Install a hose clamp on the driveshaft with its head at position No. 1, as shown in the figure below. Check for vibration at road speed. Recheck with the clamp at each of the other positions to find the position that shows minimum vibration. If 2 adjacent positions show equal improvement, position the clamp head between them.

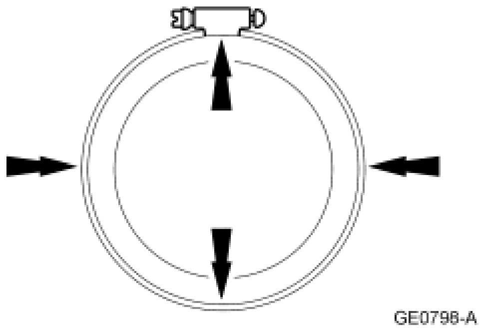

Fig. 13: Marking Rear Driveshaft Into Four Equal Sections
Courtesy of FORD MOTOR CO.

3. If the vibration persists, add a second clamp at the same position and recheck for vibration.

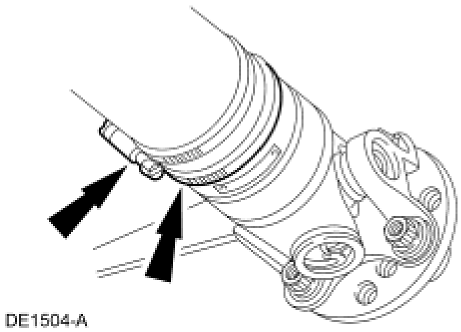

Fig. 14: Adding A Second Clamp
Courtesy of FORD MOTOR CO.

4. If no improvement is noted, rotate the clamps in opposite directions, equal distances from the best position determined in Step 2. Separate the clamp heads about 13 mm (1/2 in) and recheck for vibration at the road speed.

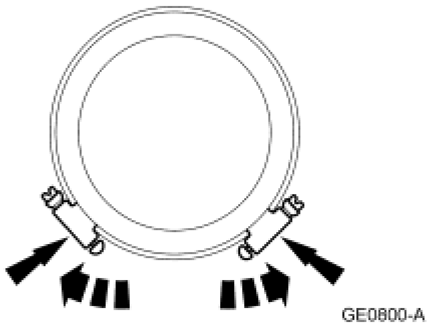

Fig. 15: Rotating Clamps In Opposite Directions
Courtesy of FORD MOTOR CO.

5. Repeat the process with increasing separation until the best combination is found or the vibration is reduced to an acceptable level.

DRIVESHAFT INDEXING

NOTE: If indexing the driveshaft does not eliminate the vibration, balance the driveshaft. For additional information, refer to Driveshaft Runout and Balancing.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.

 NOTE: Do not reuse constant velocity (CV) joint bolts or flange bolts. Install new bolts or damage to the vehicle may occur.

2. Remove and discard the driveshaft-to-transfer case bolts.

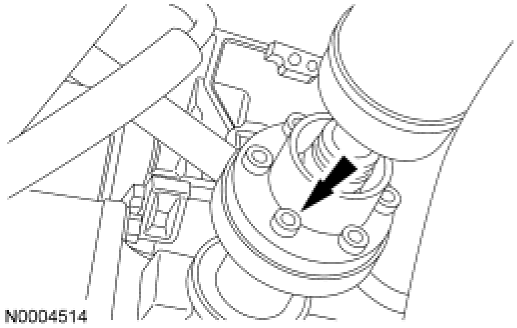

Fig. 16: Identifying Driveshaft Flange Bolts
Courtesy of FORD MOTOR CO.

3. Using a suitable pry bar as shown, separate the driveshaft from the Power Transfer Unit (PTU) flange.

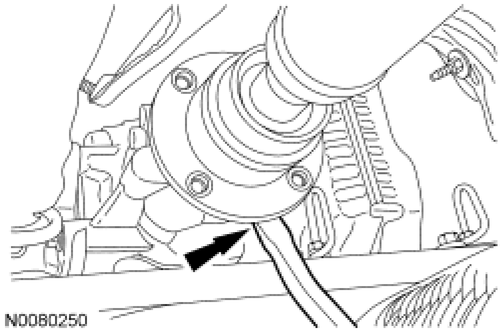

Fig. 17: Separating Driveshaft From Power Transfer Unit (PTU) Flange Using A Suitable Pry Bar
Courtesy of FORD MOTOR CO.

NOTE: Index-mark the shaft for reference.

4. Rotate the flange 90 degrees clockwise.

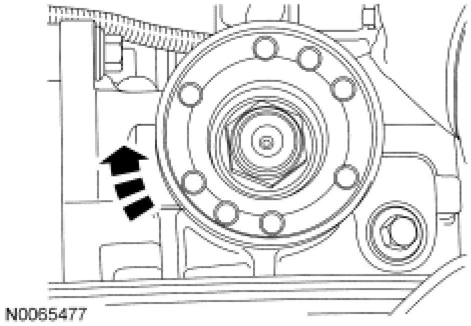

Fig. 18: Rotating Flange 90 Degrees Clockwise
Courtesy of FORD MOTOR CO.

5. Connect the front driveshaft and install the new bolts. For additional information, refer to **DRIVESHAFT** article.

NOTE: Do not reuse the bolts for the pinion yoke. Install new bolts or damage to the vehicle may occur.

6. Disconnect the rear driveshaft U-joint flange.
   - Discard the bolts.

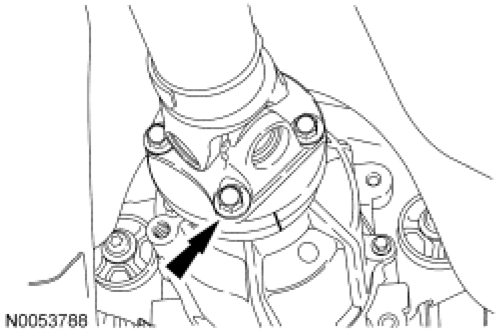

Fig. 19: Locating Rear Driveshaft Universal Joint Flange Bolts
Courtesy of FORD MOTOR CO.

7. Rotate the rear pinion 90 degrees clockwise.

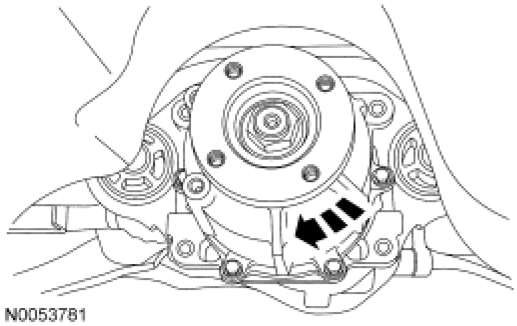

Fig. 20: Rotating Rear Pinion 90 Degrees Clockwise
Courtesy of FORD MOTOR CO.

8. Connect the rear driveshaft and install the new bolts. For additional information, refer to **DRIVESHAFT** article.
9. Test drive the vehicle.
10. Repeat the procedure if necessary.

2008 DRIVELINE/AXLES

Driveshaft - Fusion, Milan & MKZ

SPECIFICATIONS

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Description	Nm	lb-ft
Center bearing support nuts	55	41
Exhaust flex pipe nuts	40	30
Front driveshaft-to-power transfer unit (PTU) flange bolts	70	52
Rear driveshaft-to-pinion flange bolts	70	52

DESCRIPTION AND OPERATION

DRIVESHAFT

NOTE: All driveshaft assemblies are balanced. If undercoating the vehicle, protect the driveshaft to prevent overspray of any undercoating material.

The driveshaft assembly consists of the following:

- Rubber isolated center support bearings
- Constant velocity (CV) joint at the power transfer unit (PTU)
- U-joints at the center supports and pinion flange
- Assembly balanced with traditional balance weights
- Lubed-for-life joints requiring no periodic lubrication

The driveshaft transfers torque from the PTU to the rear axle. It is attached to the PTU flange with a CV joint. The 3-piece shaft is connected by a staked U-joint at each center bearing and attached to the rear pinion flange. The driveshaft joints allow the smooth continuous rotation of the driveshaft through the allowable angle planes and length variations required in normal vehicle operation. The driveshaft is always turning at front wheel speed. The driveshaft is not serviceable. A new driveshaft must be installed if worn or damaged.

UNIVERSAL JOINTS

The U-joints consist of the following:

- A single spider (cross)
- Lubed-for-life design and require no periodic lubrication
- Nylon thrust washers, located at each base of the bearing cup, which control end play, position the needle bearing and improve grease movement

- Grease seals located at the opening of each bearing cup to retain the grease for the bearing lubrication
- Bearing cups that retain the needle bearings and locate the spider on the centerline of the shaft bore to control shaft runout and balance

The U-joints are staked in place and are not serviced individually. If worn or damaged, install a new driveshaft assembly.

The 3 U-joints in this driveshaft assembly allow the driveshaft tubes to rotate smoothly through the varying angles of the power transfer unit (PTU), the center support bearings and the rear drive unit (RDU). The angles that cause the U-joints to accelerate and decelerate may cause vibration in the driveshaft assembly if the angles are either too great or too small. Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

DIAGNOSTIC TESTS

DRIVESHAFT

Refer to **DRIVELINE SYSTEM - GENERAL INFORMATION** article.

REMOVAL AND INSTALLATION

DRIVESHAFT

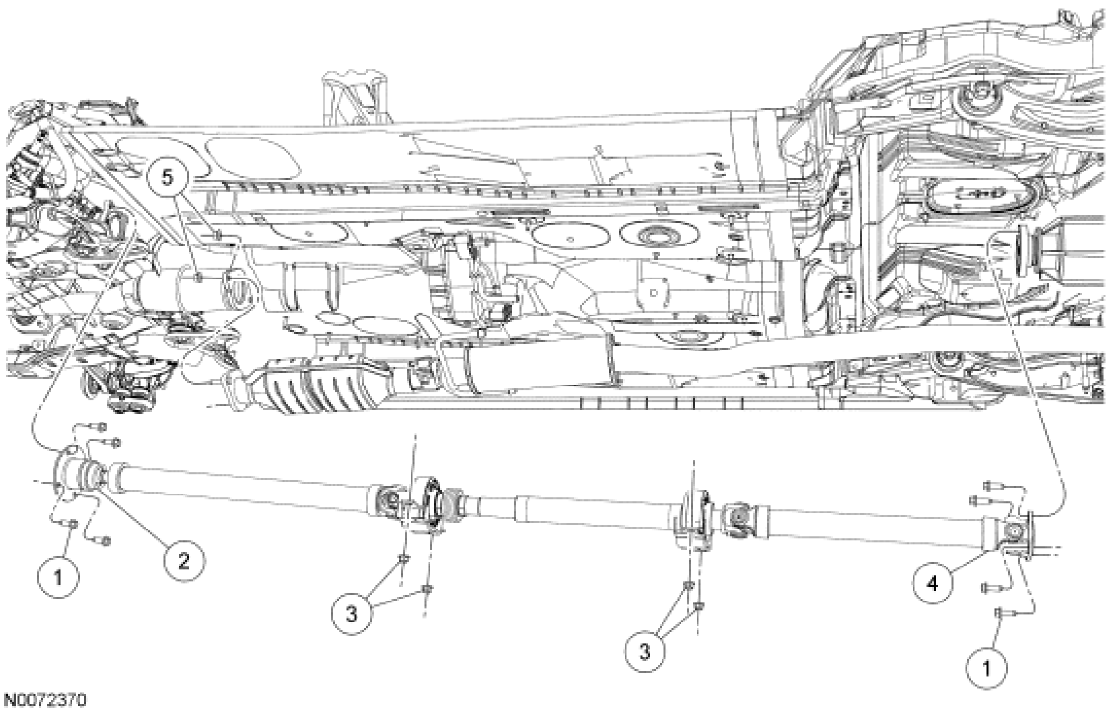

Fig. 1: Exploded View Of Driveshaft
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W711918-S	Driveshaft flange bolts (8 required)
2	-	Front driveshaft flange
3	W711960	Center bearing support nuts (4 required)
4	-	Rear driveshaft flange
5	W705443-S	Exhaust flex pipe flange nuts (2 required)

REMOVAL AND INSTALLATION

NOTE: Index-mark both the driveshaft flanges.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article
2. Remove and discard the 2 nuts and separate the exhaust system at the flex pipe.
    - Install new nuts and tighten to 40 Nm (30 lb-ft).

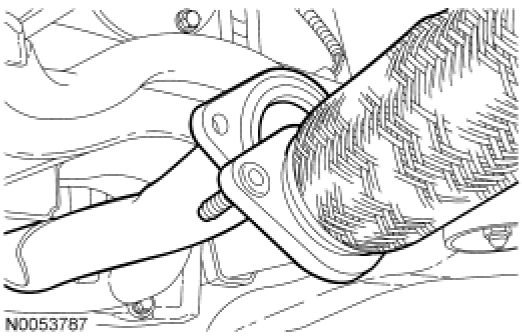

Fig. 2: Identifying Exhaust System At Flex Pipe
Courtesy of FORD MOTOR CO.

3. Support the exhaust system and remove the 2 front exhaust hangers.

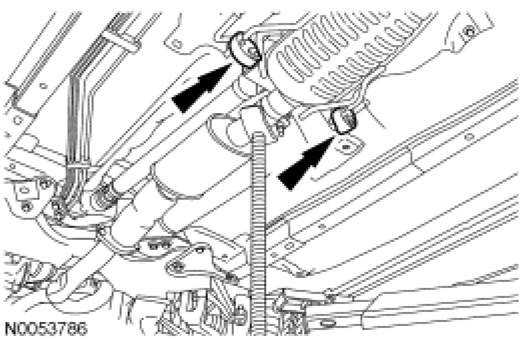

Fig. 3: Locating Front Exhaust Hangers
Courtesy of FORD MOTOR CO.

4. Carefully lower the exhaust system to allow clearance for removal of the driveshaft.

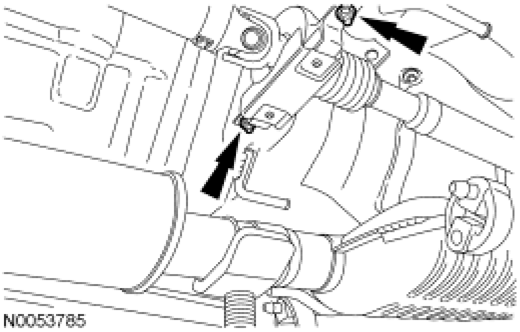

Fig. 4: Lowering Exhaust System To Allow Clearance For Removal Of Driveshaft
Courtesy of FORD MOTOR CO.

NOTE: Do not reuse the constant velocity (CV) joint bolts and washers.

5. Remove and discard the 4 front driveshaft-to-power transfer unit (PTU) flange bolts and washers.
   - Install new bolts and washers and tighten to 70 Nm (52 lb-ft).

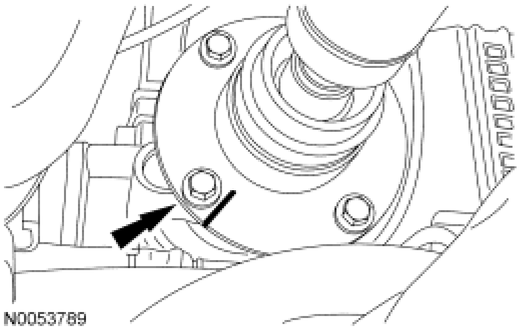

Fig. 5: Identifying Front Driveshaft-To-Transfer Case Bolts & Index Mark
Courtesy of FORD MOTOR CO.

6. Using a suitable pry bar as shown, separate the driveshaft flange from the PTU flange.

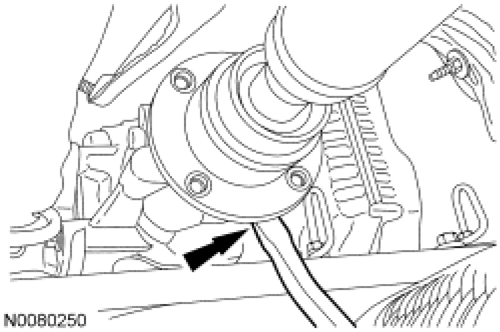

Fig. 6: Separating Driveshaft Flange From PTU Flange Using A Suitable Pry Bar
Courtesy of FORD MOTOR CO.

CAUTION: Do not reuse the bolts for the rear U-joint flange. Install new bolts.

7. Remove and discard the 4 rear driveshaft-to-pinion flange bolts.
    - Install new bolts and tighten to 70 Nm (52 lb-ft).

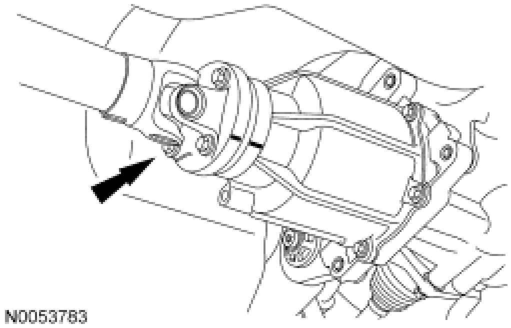

Fig. 7: Locating U-Joint Flange Bolts
Courtesy of FORD MOTOR CO.

8. With the help of an assistant, remove the 4 center bearing support nuts and the driveshaft.
    - To install, tighten to 55 Nm (41 lb-ft).

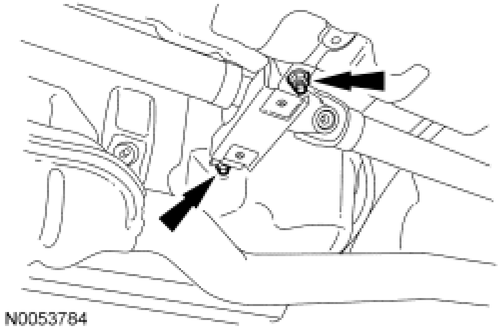

Fig. 8: Locating Center Bearing Support Nuts
Courtesy of FORD MOTOR CO.

NOTE: **If a driveshaft is installed and driveshaft vibration is encountered after installation, index the driveshaft. For additional information, refer to DRIVELINE SYSTEM - GENERAL INFORMATION article.**

9. To install, reverse the removal procedure.

2008 DTC INDEX

Fusion, Milan & MKZ

ANTI-THEFT - PASSIVE DTCS

INSTRUMENT CLUSTER (IC) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1600	PATS Ignition Key Transponder Signal is Not Received	No PATS key has been read by the IC. Go to **Pinpoint Test B** .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder	There is an unprogrammed PATS key. Go to **Pinpoint Test C** .
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder	Only a partial PATS key was read. Go to **Pinpoint Test D** .
B1681	PATS Transceiver Module Signal is Not Received	The IC did not receive the PATS transceiver signal. Go to **Pinpoint Test E** .
B2103	Antenna Not Connected	There has been a PATS transceiver antenna failure. Go to **Pinpoint Test A** .
U0100	Lost Communication With ECM/PCM	**NOTE:** **If DTCs U0100 and U2510 are both present, address DTC U2510 first.** Go to **Pinpoint Test G** .
U2511	CAN - Data Mis-Match (Receive Data Does Not Match Expected)	**NOTE:** **If DTCs U2510 and U2511 are both present, address DTC U2510 first.** Go to **Pinpoint Test G** .

AUTOMATIC TRANSAXLE/TRANSMISSION DTCS - AISIN AW21 DTCS

AUTOMATIC TRANSAXLE/TRANSMISSION DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Component	Description	Condition	Symptom	Perform Test
P0601	Transmission Control Module (TCM)	TCM Read-Only Memory (ROM) error.	TCM detected an internal software concern with ROM.	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM.
P0603	TCM	TCM Keep Alive Memory (KAM) error.	TCM detected an internal software concern with KAM.	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM.
P0604	TCM	TCM Random Access Memory (RAM) error.	TCM detected an internal software concern with RAM.	No engagements, no adaptive or self-learning strategy.	INSTALL a new TCM.
P0706	Transmission Range (TR)	TR sensor range or performance error.	TR sensor signal is out of normal range.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self learning strategy.	INSTALL a new TCM.
P0707	TR Sensor	TR sensor circuit low input.	TR sensor signal is below threshold of 0.127 volt, sensor/circuit electrical malfunction.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self learning strategy.	INSTALL a new TCM.
P0708	TR Sensor	TR sensor circuit high input.	TR sensor signal is above threshold of 4.87 volts, sensor/circuit electrical malfunction.	TR sensor indicates a stuck position (D-3rd gear), no adaptive or self learning strategy.	INSTALL a new TCM.
P0711	Transmission Fluid Temperature (TFT)	No change in TFT during operation.	PCM has detected no TFT change during operation. TFT	TFT indicates 80°C (176°F) at all times, no self learning strategy, no Torque	Go to **Pinpoint Test B** .

	Sensor		value stuck at some normal reading.	Converter Clutch (TCC) engagement.	
P0712	TFT Sensor	200°C (329°F) indicated, TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature -43°C (-45°F).	TFT indicates 80°C (176°F) at all times, no self learning strategy, no TCC engagement.	Go to **Pinpoint Test B** .
P0713	TFT Sensor	-43°C (-45°F) indicated, TFT sensor circuit grounded.	Voltage drop across TFT sensor exceeds scale set for temperature -43°C (-45°F).	TFT indicates 80°C (176°F) at all times, no self learning strategy, no TCC engagement.	Go to **Pinpoint Test B** .
P0716	Turbine Shaft Speed (TSS) Sensor	TSS range out of performance, insufficient input from TSS.	PCM has detected a loss or noisy TSS signal during operation.	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test D** .
P0717	TSS Sensor	No TSS signal.	PCM has not detected a TSS signal. No TSS signal when Output Shaft Speed (OSS) signal present.	No TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test D** .
P0721	OSS Sensor	OSS range out of performance, insufficient input from OSS.	PCM has detected a loss or noisy OSS signal during operation.	No adaptive or self learning strategy.	Go to **Pinpoint Test C** .
P0722	OSS Sensor	No OSS signal.	PCM has detected no OSS signal.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test C** .
P0729	Transaxle	6th gear ratio.	No 6th gear ratio detected by TCM.	No 6th gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0730	Clutch Control Solenoids or Internal Parts	Gear ratio error.	PCM has detected a gear ratio error.	No self learning strategy.	Go to **Pinpoint Test A** .
P0731	Solenoid or	1st gear ratio.	No 1st gear ratio	No 1st gear, no TCC	Go to **Pinpoint Test A** .

	Internal Parts		detected by TCM.	engagements, no adaptive or self learning strategy.	
P0732	Solenoid or Internal Parts	2nd gear ratio.	No 2nd gear ratio detected by TCM.	No 2nd gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0733	Solenoid or Internal Parts	3rd gear ratio.	No 3rd gear ratio detected by TCM.	No 3rd gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0734	Solenoid or Internal Parts	4th gear ratio.	No 4th gear ratio detected by TCM.	No 4th gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0735	Solenoid or Internal Parts	5th gear ratio.	No 5th gear ratio detected by TCM.	No 5th gear, no TCC engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0736	Transaxle	Reverse gear ratio.	No reverse gear ratio detected by TCM.	No reverse gear, no self learning strategy.	Go to **Pinpoint Test A** .
P0817	TCM/PCM Starter Circuit	Starter disable circuit open or shorted to power/ground.	TCM detected a failure in the starter lock circuit, failed ON or OFF Ignition switch is ON, TCM and PCM communication is normal. No voltage is detected on the start lock circuit for more than 0.1 second or a continuous 12-volt output is detected for more than 0.1 second. Conditions present 2 times to set DTC.	DTC is set. Warning lamp is illuminated.	Go to **Pinpoint Test E** .
P0961	Pressure Control	PCA circuit or solenoid	PCA circuit or solenoid (SLT)	No engagements, no adaptive or self	Go to **Pinpoint Test A** .

	Solenoid A (PCA)	failure.	failed during operation. Incorrect commanded current detected by TCM.	learning strategy.	
P0962	PCA	PCA solenoid signal or grounded circuits either short or open, solenoid circuit failure.	Voltage through PCA (SLT) is checked. An error will be noted if tolerance is exceeded.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0963	PCA	PCA solenoid short to power circuit failure.	Voltage through PCA (SLT) is checked. An error will be noted if tolerance is exceeded.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0973	Shift Solenoid A (SSA)	SSA solenoid or circuit shorted to ground.	Voltage through SSA (S1) circuit is checked. An error will be noted if tolerance is exceeded. Short to ground failure detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0974	SSA	SSA or circuit shorted to power or open.	Voltage through SSA (S1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0976	Shift Solenoid B (SSB)	SSB solenoid or circuit shorted to ground.	Voltage through SSB (S2) circuit is checked. An error will be noted if tolerance is exceeded. Short to ground failure	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .

			detected.		
P0977	SSB	SSB solenoid or circuit shorted to power or open.	Voltage through SSB solenoid (S2) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0978	Shift Solenoid C (SSC)	SSC circuit or solenoid failure.	SSC circuit or solenoid (SLC1) failed during operation. Incorrect commanded current detected by TCM.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0979	SSC	SSC solenoid signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSC (SLC1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0980	SSC	SSC solenoid or circuit shorted to power.	Voltage through SSC (SLC1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0981	Shift Solenoid D (SSD)	SSD circuit or solenoid failure.	SSD circuit or solenoid (SLC2) failed during operation. Incorrect	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .

			commanded current detected by TCM.		
P0982	SSD	SSD signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSD (SLC2) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0983	SSD	SSD or circuit shorted to power.	Voltage through SSD (SLC2) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0984	Shift Solenoid E (SSE)	SSE circuit or solenoid failure.	SSE circuit or solenoid (SLC3) failed during operation. Incorrect commanded current detected by TCM.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0985	SSE	SSE signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSE (SLC3) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0986	SSE	SSE or circuit shorted to power.	Voltage through SSE (SLC3) circuit is	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .

			checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.		
P0997	Shift Solenoid F (SSF)	SSF circuit or solenoid failure.	SSF circuit or solenoid (SLB1) failed during operation. Incorrect commanded current detected by TCM.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0998	SSF	SSF signal or grounded circuits either shorted or open, solenoid circuit failure.	Voltage through SSF (SLB1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P0999	SSF	SSF or circuit shorted to power.	Voltage through SSF (SLB1) circuit is checked. An error will be noted if tolerance is exceeded. Short to power failure or open circuit detected.	No engagements, no adaptive or self learning strategy.	Go to **Pinpoint Test A** .
P1657	TCM	TCM communication link error.	Controller Area Network (CAN) link error detected by PCM.	No engagements, no adaptive or self learning strategy. Limited fuel and spark.	INSTALL a new TCM.

P0734	SEA, SSB, SSC, SSD, SSE, SSF or Internal Parts	4th gear error.	No 4th gear.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged	REFER to Solenoid On/Off Charts. Go to **Pinpoint Test A** .

				friction material). Engine RPM could be higher or lower than expected.	
P0735	SEA, SSB, SSC, SSD, SSE, SSF or Internal Parts	5th gear error.	No 5th gear.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material). Engine RPM could be higher or lower than expected.	REFER to Solenoid On/Off Charts. Go to **Pinpoint Test A** .
P0745	Pressure Control Solenoid A (PCA) solenoid	PCA circuit failure.	Voltage through PCA solenoid is checked. Error is noted if tolerance is exceeded.	Open circuit causes maximum transmission line pressure, harsh engagement and shifts.	Go to **Pinpoint Test D** .
P0753	SEA	SEA solenoid circuit failure.	Shift Solenoid Pressure Control A (SSPCA) circuit failed to provide voltage drop across solenoid. Circuit open or shorted or TCM driver failure during On-Board Diagnostic (OBD).	No reverse gear (short) or no 4th gear (open). MIL off.	Go to **Pinpoint Test A** .
P0758	SSB	SSB solenoid circuit failure.	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or TCM driver failure during OBD.	Not all gears present. No converter clutch apply in 3rd and 4th gears. MIL off.	Go to **Pinpoint Test A** .
P0761	Shift Solenoid C (SSC)	SSC functional failure (stuck off).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present.	Go to **Pinpoint Test A** .
P0762	SSC	SSC functional failure (stuck on).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present.	Go to **Pinpoint Test A** .
P0763	SSC	SSC solenoid circuit	Shift Solenoid Pressure Control C (SSPCC) circuit	Not all gears present. MIL off.	Go to **Pinpoint Test**

		failure.	fails to provide voltage drop across solenoid. Circuit open or shorted or TCM driver failure during OBD.		**A** .
P0766	SSD	SSD functional failure (stuck off).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present.	Go to **Pinpoint Test A** .
P0767	SSD	SSD functional failure (stuck on).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present.	Go to **Pinpoint Test A** .
P0768	SSD	SSD solenoid circuit failure.	SSD circuit fails to provide voltage drop across solenoid. Circuit open, shorted or TCM driver circuit failure during OBD.	Not all gears present. MIL off.	Go to **Pinpoint Test A** .
P0771	SSE	SSE functional failure (stuck off).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present.	Go to **Pinpoint Test A** .
P0772	SSE	SSE functional failure (stuck on).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present.	Go to **Pinpoint Test A** .
P0773	SSE	SSE solenoid circuit failure.	SSE circuit failed to provide voltage drop across solenoid. Circuit open. Shorted or TCM driver circuit failed during OBD.	Not all gears present. MIL off.	Go to **Pinpoint Test A** .
P0777	Pressure Control Solenoid B (PCB) solenoid	PCB solenoid stuck on.	Mechanical or hydraulic failure of PCB.	Harsh engagement and shifts.	Go to **Pinpoint Test E** .
P0778	PCB	PCB solenoid circuit failure.	PCB circuit failed to provide voltage drop across solenoid. Circuit open or shorted or TCM driver failure during on-board diagnostic.	Harsh engagement and shifts.	Go to **Pinpoint Test E** .
P0791	Intermediate Shaft Speed	Insufficient input from	TCM detected a loss of intermediate shaft speed	Harsh shift, possible abnormal shift	Go to **Pinpoint Test**

	Sensor	intermediate shaft speed sensor.	signal during operation.	schedule.	**F** .
P0841	Transmission Fluid Pressure Switch	Transmission fluid pressure switch circuit failure open or shorted.	TCM has detected a loss of transaxle fluid pressure.	Harsh shifts, possible abnormal shift schedule.	Go to **Pinpoint Test H** .
P0882	TCM	TCM input power circuit voltage low.	TCM has detected a loss of voltage.	MIL on.	Go to **Pinpoint Test I** .
P1783	TFT	Transmission overtemp condition indicated.	Transmission fluid temperature exceeded 135°C (275°F).	Increase in control pressure.	Go to **Pinpoint Test B** .
P2707	SSF	SSF functional failure (stuck off).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present.	Go to **Pinpoint Test A** .
P2708	SSF	SSF functional failure (stuck on).	Mechanical or hydraulic failure of the shift solenoid.	Not all gears present, MIL off.	Go to **Pinpoint Test A** .
P2709	SSF	SSF solenoid circuit failure.	SSF circuit fails to provide voltage drop across solenoid. Circuit open. Shorted or TCM driver circuit failed during OBD.	Not all gears present, MIL off.	Go to **Pinpoint Test A** .
P0604	TCM	Internal TCM error.	TCM Random Access Memory (RAM) error.	MIL on.	INSTALL a new TCM.
P0605	TCM	Internal TCM error.	TCM Read-Only Memory (ROM) error.	MIL on.	INSTALL a new TCM.

CHARGING SYSTEM DTCS

CHARGING SYSTEM DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTCs	Description	Source	Perform Test
B1317	Battery Voltage High	Various Modules	Go to **Pinpoint Test B** .
B1318	Battery Voltage Low	Various Modules	Go to **Pinpoint Test F** .
B1676	Battery Voltage Out Of Range	Various Modules	Go to **Pinpoint Test F** .
P0563	System Voltage High	PCM	Go to **Pinpoint Test B** .

P0620	Generator Control Circuit	PCM	Go to **Pinpoint Test B** .
P0625	Generator Field Terminal Circuit - Low	PCM	Go to **Pinpoint Test B** .
P0626	Generator Field Terminal Circuit - High	PCM	Go to **Pinpoint Test B** .
P065B	Generator Control Circuit Range/Performance	PCM	Go to **Pinpoint Test B** .

CLIMATE CONTROL SYSTEM DTCS

HVAC MODULE DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1003	Mode Door Circuit Failure	Go to **Pinpoint Test F** .
B1251	Air Temperature Internal Sensor Circuit Open	Go to **Pinpoint Test D** .
B1253	Air Temperature Internal Sensor Circuit Short To Ground	Go to **Pinpoint Test D** .
B1255	Air Temperature External Sensor Circuit Open	Go to **Pinpoint Test E** .
B1257	Air Temperature External Sensor Circuit Short To Ground	Go to **Pinpoint Test E** .
B1676	Battery Voltage Out of Range	Go to **Pinpoint Test J** .
B2266	Left Side Blend Door Circuit Failure	Go to **Pinpoint Test Q** .
B2267	Right Side Blend Door Circuit Failure	Go to **Pinpoint Test Q** .
B2426	Passenger Solar Radiation Sensor Circuit Open	Go to **Pinpoint Test F** .
B2427	Passenger Solar Radiation Sensor Circuit Short to Ground	Go to **Pinpoint Test F** .
B2795	Driver Solar Radiation Sensor Circuit Short to Ground	Go to **Pinpoint Test F** .
B2796	Driver Solar Radiation Sensor Circuit Open	Go to **Pinpoint Test F** .
B2826	Front Evaporator Temp Sensor Circuit Failure	Go to **Pinpoint Test G** .
B2827	Front Evaporator Temp Sensor Short to Ground	Go to **Pinpoint Test G** .

ENGINE COOLING DTCS

PCM DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
P0217	Engine Coolant Overtemperature Condition	Go to **Pinpoint Test B** .
P1285	Cylinder Head Overtemperature Condition	Go to **Pinpoint Test B** .
P1299	Cylinder Head Overtemperature Protection Active	Go to **Pinpoint Test B** .
P0125	Insufficient Coolant Temp For Closed Loop Fuel Control	Go to **Pinpoint Test C** .
P0128	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	Go to **Pinpoint Test C** .

EXTERIOR LIGHTING DTCS

AUTOLAMPS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1472	Lamp Headlamp Input Circuit Short to Ground	Go to **Pinpoint Test H** .
B1578	Lamp Park Input Circuit Short to Ground	Go to **Pinpoint Test H** .
B1692	Autolamp Delay Circuit Short to Ground	Go to **Pinpoint Test H** .
B1791	Autolamp Sensor Input Circuit Open	Go to **Pinpoint Test H** .
B1793	Autolamp Sensor Input Circuit Short to Ground	Go to **Pinpoint Test G** .
B2498	Headlamp Switch Multiple Signals Input Active	Go to **Pinpoint Test H** .

FOG LAMPS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B2030	Front Fog Lamp Relay CKT Failure	Go to **Pinpoint Test R** .
B2254	Front Fog Lamp Switch Failure	Go to **Pinpoint Test T** .

HEADLAMPS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1472	Lamp Headlamp Input Circuit Short to Ground	Go to **Pinpoint Test E** .
B1510	Flash To Pass Switch Circuit Short to Ground	Go to **Pinpoint Test E** .
B1570	Lamp Headlamp High-Beam Circuit Short to Ground	Go to **Pinpoint Test E** .
B1578	Lamp Park Input Circuit Short to Ground	Go to **Pinpoint Test E** .
B1795	Lamp Headlamp Low-Beam Circuit Open	If a low beam is inoperative, go to **Pinpoint Test C** . If a low beam is always on, go to **Pinpoint Test E** .
B1797	Lamp Headlamp Low-Beam Circuit Short to Ground	Go to **Pinpoint Test C** .
B2498	Headlamp Switch Multiple Signals Input Active	Go to **Pinpoint Test E** .

TURN LAMPS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1799	Lamp Turn Signal Front Output Circuit Open	Go to **Pinpoint Test N** .
B1801	Lamp Turn Signal Front Output Circuit Short to Ground	Go to **Pinpoint Test N** .
B1875	Turn Signal/Hazard Switch Signal Circuit Failure	Go to **Pinpoint Test O** .
B2048	Left Rear Turn Lamp Circuit Short to Ground	For Milan or MKZ, go to **Pinpoint Test N** . For Fusion, REFER to **Stoplamp** to continue diagnosis of the turn lamp.
B2049	Left Rear Turn Lamp Circuit Open	For Milan or MKZ, go to **Pinpoint Test N** . For Fusion, REFER to **Stoplamp** to continue diagnosis of the turn lamp.
B2050	Right Rear Turn Lamp Circuit Short to Ground	For Milan or MKZ, go to **Pinpoint Test N** . For Fusion, REFER to **Stoplamp** to continue diagnosis of the turn lamp.
B2051	Right Rear Turn Lamp Circuit Open	For Milan or MKZ, go to **Pinpoint Test N** . For Fusion, REFER to **Stoplamp** to continue diagnosis of the turn lamp.
B2281	Right Turn Switch Short to Ground	Go to **Pinpoint Test M** .
B2282	Left Turn Switch Short to Ground	Go to **Pinpoint Test M** .

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1485	Brake Pedal Input Short to Battery	Go to **Pinpoint Test K** .
B2048	Left Rear Turn Lamp Circuit Short to Ground	For Fusion, go to **Pinpoint Test J** . For Milan or MKZ, REFER to **Turn Signal and Hazard Lamps** .
B2049	Left Rear Turn Lamp Circuit Open	For Fusion, if the lamp is inoperative, go to **Pinpoint Test J** . For Fusion, if the lamp is always on, go to **Pinpoint Test K** . For Milan or MKZ, REFER to **Turn Signal and Hazard Lamps** .
B2050	Right Rear Turn Lamp Circuit Short to Ground	For Fusion, go to **Pinpoint Test J** . For Milan or MKZ, REFER to **Turn Signal and Hazard Lamps** .
B2051	Right Rear Turn Lamp Circuit Open	For Fusion, if the lamp is inoperative, go to **Pinpoint Test J** . For Fusion, if the lamp is always on, go to **Pinpoint Test K** . For Milan or MKZ, REFER to **Turn Signal and Hazard Lamps** .

FOUR WHEEL DRIVE (4WD) SYSTEMS DTCS

4X4 CONTROL MODULE DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Possible Causes	Source	Perform Test
B1317	Battery Voltage High	• Generator	4X4 Control Module	Go to **Pinpoint Test B** .
B1318	Battery Voltage Low	• Open fuse (B+) • Intermittent open on power circuit • 4X4 control module connector	4X4 Control Module	Go to **Pinpoint Test B** .
P1635	Tire/Axle Out of Acceptable Range	• Incorrect size tire installed on vehicle • Wheel speed sensor failure • Flat or under-inflated tire	4X4 Control Module	Go to **Pinpoint Test F** .
P1824	Four-Wheel Drive (4WD) Clutch Relay Circuit Failure	• Short to ground on Active Torque Coupling (ATC) solenoid (part of rear axle) high circuit • 4X4 control module failure	4X4 Control Module	Go to **Pinpoint Test D** .
P1825	4WD Clutch Relay Open Circuit	• 4X4 control module harness connector • Open in ATC solenoid (part of rear axle) low circuit • Open in ATC solenoid high circuit • Short to ground on ATC solenoid low circuit • Short to ground on ATC solenoid high circuit • Open coil inside ATC solenoid • Short to voltage in ATC solenoid low circuit • 4X4 control module	4X4 Control Module	Go to **Pinpoint Test D** .

		failure		
U0415	Invalid Data Received From Anti-lock Brake System (ABS) Control Module	• Invalid data received from ABS module • Data out of range	4X4 Control Module	Go to **Pinpoint Test C** .

FUEL SYSTEM - GENERAL INFORMATION DTCS

EVAPORATIVE EMISSION SYSTEM DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
P0446	Evaporative Emission System Vent Control Circuit	Go to **Pinpoint Test A** .
P0451	Evaporative Emission System Pressure Sensor/Switch Range/Performance	Go to **Pinpoint Test A** .
P0452	Evaporative Emission System Pressure Sensor/Switch Low	Go to **Pinpoint Test A** .
P0453	Evaporative Emission System Pressure Sensor/Switch High	Go to **Pinpoint Test A** .
P0454	Evaporative Emission System Pressure Sensor/Switch Intermittent	Go to **Pinpoint Test A** .
P1443	Evaporative Emission System Control Valve (Low/No Flow)	Go to **Pinpoint Test A** .
P1450	Unable to Bleed up Fuel Tank Vacuum	Go to **Pinpoint Test A** .
P1451	Evaporative Emission System Vent Control Circuit	Go to **Pinpoint Test A** .
P260F	Emission System Monitoring Processor Performance	Go to **Pinpoint Test A** .

GLASS, FRAMES & MECHANISMS DTCS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1345	Heated Rear Window Input Circuit Short to Ground	Go to **Pinpoint Test J** .
B2947	Global Opening/Closing Circuit Open	Go to **Pinpoint Test I** .
B2949	Global Opening/Closing Circuit Short to Battery	Go to **Pinpoint Test I** .

HANDLES, LOCKS, LATCHES & ENTRY SYSTEMS DTCS

DRIVER DOOR MODULE (DDM)

DRIVER DOOR MODULE (DDM) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B2574	Drivers Door LOCK Switch Short to Ground	Go to **Pinpoint Test H** .
B2575	Drivers Door UNLOCK Switch Short to Ground	Go to **Pinpoint Test H** .

INSTRUMENT CLUSTER (IC)

INSTRUMENT CLUSTER (IC) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1137	Data Not Programmed	Go to **Pinpoint Test R** .
B1139	Invalid Transmitter Identification Code	Go to **Pinpoint Test L** .

SMART JUNCTION BOX (SJB)

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1139	Invalid Transmitter Identification Code	Go to **Pinpoint Test L** .
B1309	Power Door Lock Circuit Short to Ground	Go to **Pinpoint Test H** .
B1341	Power Door Unlock Circuit Short to Ground	Go to **Pinpoint Test H** .
B1554	Decklid Release Circuit Short to Ground	Go to **Pinpoint Test I** .
B1623	Lamp Keypad Output Circuit Failure	Go to **Pinpoint Test K** .
B2425	Remote Keyless Entry Out of Synchronization	Go to **Pinpoint Test L** .
B2695	Keypad_A Switch Circuit Failure	Go to **Pinpoint Test J** .
B2696	Keypad_B Switch Circuit Failure	Go to **Pinpoint Test J** .
B2697	Keypad_C Switch Circuit Failure	Go to **Pinpoint Test J** .

INFORMATION & ENTERTAINMENT SYSTEMS DTCS

ACCESSORY PROTOCOL INTERFACE MODULE (APIM)

ACCESSORY PROTOCOL INTERFACE MODULE (APIM) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1038	Microphone Input Circuit Failure	Go to **Pinpoint Test V** .
B1117	Audio Steering Wheel Button Stuck	Go to **Pinpoint Test G** .
B1136	Audio Steering Wheel Switch #2 Circuit Failure	Go to **Pinpoint Test G** .
U0184	Lost Communication With Radio (ACM)	Go to **Pinpoint Test R** .
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DISREGARD the DTC. CLEAR the DTCs.
U0249	Lost Communication With Entertainment Control Module -	DISREGARD the DTC. CLEAR the DTCs.

	Rear "B" (RCU)	
U0255	Lost Communication With Front Controls Interface Module	DISREGARD the DTC. CLEAR the DTCs.
U0256	Lost Communication With Front Display Interface Module	DISREGARD the DTC. CLEAR the DTCs.
U261C	USB #1 Device Error	Go to **Pinpoint Test T** .
U261D	USB #2 Device Error	DISREGARD the DTC. CLEAR the DTCs.

AUDIO CONTROL MODULE (ACM)

AUDIO CONTROL MODULE (ACM) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1117	Audio Steering Wheel Button Stuck	VERIFY that no steering wheel control switches are stuck and that no steering wheel control button was pressed during the self-test. If no concern is found, go to **Pinpoint Test G** .
B1119 (Navigation only)	Audio Disc DVD Player Thermal Shutdown	**NOTE:** **This DTC refers to the navigation DVD mechanism, not the DVD entertainment system.** The audio control module (ACM) was over-temperature. Navigation operation will resume after the ACM cools. This is normal operation. CLEAR the DTCs.
B1136 (Navigation only)	Audio Steering Wheel Switch #2 Circuit Failure	Go to **Pinpoint Test G** .
B2103	Antenna Not Connected	Go to **Pinpoint Test A** .
B2204 (Navigation only)	GPS Antenna Connection Open or Short	Go to **Pinpoint Test K** .
B2274	Phone Transceiver Active Circuit Failure	DISREGARD the DTC. CLEAR the DTCs.
B2384	Audio Reverse Aid Mute Input CKT Failure	DISREGARD the DTC. CLEAR the DTCs.
B2404	Audio Steering Wheel Switch Circuit Fault	Go to **Pinpoint Test G** .
B2405	Audio Disc CD Player Thermal Shutdown Fault	The ACM was over-temperature. Audio operation will resume after the ACM cools. This is normal operation. CLEAR the DTCs.
B2633 (Navigation only)	Driver-Front Microphone Circuit Failure	Go to **Pinpoint Test P** .
B2965	Audio System Speaker Circuit Fault	For the THX® audio system, go to **Pinpoint Test C** . For all others, go to **Pinpoint Test B** .

C1992	Vehicle Speed Circuit Failure	DISREGARD the DTC. CLEAR the DTCs.
P0812	Reverse Input Circuit	DISREGARD the DTC. CLEAR the DTCs.
U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	If the speed sensitive volume does not operate correctly, go to **Pinpoint Test Q** . If the navigation is inaccurate, go to **Pinpoint Test O** .
U0159	Lost Communication With Parking Assist Control Module (PAM)	Go to **Pinpoint Test N** .
U0193	Lost Communication With Digital Audio Control Module (SDARS)	Go to **Pinpoint Test H** .
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DISREGARD the DTC. CLEAR the DTCs.
U0197	Lost Communication With Telephone Control Module	Go to **Pinpoint Test R** .
U0238	Lost Communication With Digital Audio Control Module "D" (DSP)	Go to **Pinpoint Test D** .
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	DISREGARD the DTC. CLEAR the DTCs.
U2473	Unexpected Vehicle Speed (VSS)	Go to **Pinpoint Test O** .

AUDIO DIGITAL SIGNAL PROCESSING (DSP)

AUDIO DIGITAL SIGNAL PROCESSING (DSP) MODULE DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1158	Subwoofer #2 Open	Go to **Pinpoint Test C** .
B2913	Audio Subwoofer Not Connected	Go to **Pinpoint Test C** .
B2925	Subwoofer Speaker Short Circuit	Go to **Pinpoint Test C** .
B292A	Subwoofer #2 Speaker Short Circuit	**NOTE:** **Despite the DTC description, this DTC applies to the DSP module clip/enable circuit, not the subwoofer.** Go to **Pinpoint Test C** .
B2965	Audio System Speaker Circuit Fault	If the symptom is no audio from all speakers, go to **Pinpoint Test D** . If the symptom is no audio from one or more (but not all) speakers, go to **Pinpoint Test C** .
C1992	Vehicle Speed Circuit Failure	DISREGARD the DTC. CLEAR the DTCs.

U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DISREGARD the DTC. CLEAR the DTCs.

SATELLITE DIGITAL AUDIO RECEIVER SYSTEM (SDARS)

SATELLITE DIGITAL AUDIO RECEIVER SYSTEM (SDARS) MODULE DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1031	SDARS Satellite Antenna Open	Go to **Pinpoint Test I** .
B1032	SDARS Satellite Antenna Short	Go to **Pinpoint Test I** .
U0184	Lost Communication With Radio (ACM)	Go to **Pinpoint Test H** .
U0196	Lost Communication With Entertainment Control Module - Rear (AUX)	DISREGARD the DTC. CLEAR the DTCs.
U0197	Lost Communication With Telephone Control Module	Go to **Pinpoint Test H** .
U0249	Lost Communication With Entertainment Control Module - Rear "B" (RCU)	DISREGARD the DTC. CLEAR the DTCs.

INSTRUMENT CLUSTER (IC), MESSAGE CENTER & WARNING CHIMES DTCS

INSTRUMENT CLUSTER (IC)

INSTRUMENT CLUSTER (IC) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1202	Fuel Sender Circuit Open (fuel pump module)	If equipped with front wheel drive (FWD), go to **Pinpoint Test B** . If equipped with all wheel drive (AWD), go to **Pinpoint Test C** .
B1204	Fuel Sender Circuit Short to Ground (fuel pump module)	If equipped with front wheel drive (FWD), go to **Pinpoint Test B** . If equipped with all wheel drive (AWD), go to **Pinpoint Test C** .
B1318	Battery Voltage Low	Go to **Pinpoint Test AA** .
B1352	Ignition Key-In Circuit Failure	Go to **Pinpoint Test AI** .
B1360	Ignition Run/Acc Circuit Open	Go to **Pinpoint Test A** .
B2627	Fuel Sender Circuit Open	Go to **Pinpoint Test C** .

	#2 (secondary fuel sender)	
B2628	Fuel Sender Circuit Short to Ground #2 (secondary fuel sender)	Go to **Pinpoint Test C** .
B2844	Ignition Fault	Go to **Pinpoint Test AB** .
B2879	Fuel Tank Jet Pump Fault	Go to **Pinpoint Test C** .
U2013	Compass Module is Not Responding	Go to **Pinpoint Test AE** .

PCM

PCM DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
P0457	Evaporative Emission System Leak Detected (fuel cap loose/off)	Go to **Pinpoint Test V** .
P0460	Fuel Level Sensor A Circuit	If sent here from the PC/ED manual, go to **Pinpoint Test B** for front wheel drive (FWD). If sent here from the PC/ED manual, go to **Pinpoint Test C** for wagon or all wheel drive (AWD).
P0461	Fuel Level Sensor A Circuit Range/Performance	If sent here from the PC/ED manual, go to **Pinpoint Test B** for front wheel drive (FWD). If sent here from the PC/ED manual, go to **Pinpoint Test C** for wagon or all wheel drive (AWD).

SMART JUNCTION BOX (SJB)

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B2479	Brake Park Switch Circuit Short to Ground	Go to **Pinpoint Test J** .
C1125	Brake Fluid Level Sensor Input Circuit Failure	Go to **Pinpoint Test J** .
C1284	Oil Pressure Switch Failure	Go to **Pinpoint Test S** .

INSTRUMENT CLUSTER & PANEL ILLUMINATION DTCS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1247	Panel Dim Switch Circuit Open	Go to **Pinpoint Test E** .
B2026	Incandescent Backlighting Output Circuit Failure	Go to **Pinpoint Test C** .
B2027	LED Backlighting Output Circuit Failure	Go to **Pinpoint Test C** .

INTERIOR LIGHTING DTCS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1320	Driver Door Ajar Circuit Open	Go to **Pinpoint Test C** .
B1328	Passenger Door Ajar Circuit Open	Go to **Pinpoint Test C** .
B1331	Decklid Ajar Rear Door Circuit Failure	Go to **Pinpoint Test C** .
B1336	Door Ajar RR Circuit Open	Go to **Pinpoint Test C** .
B1572	Door Ajar LR Circuit Open	Go to **Pinpoint Test C** .
B1688	Lamp Dome Input Circuit Short to Ground	Go to **Pinpoint Test C** .
B2499	Courtesy Lamp Output Failure	Go to **Pinpoint Test A** .

PARKING AID DTCS

PARKING AID MODULE (PAM) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1299	Power Supply Sensor Circuit Short to Ground	Go to **Pinpoint Test E** .
C1699	Left Rear Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .
C1700	Left Rear Sensor Circuit Failure or Blockage	Go to **Pinpoint Test B** .
C1701	Left Rear Sensor Circuit Fault	Go to **Pinpoint Test D** .
C1702	Right Rear Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .
C1703	Right Rear Sensor Circuit Failure or Blockage	Go to **Pinpoint Test B** .
C1704	Right Rear Sensor Circuit Fault	Go to **Pinpoint Test D** .
C1705	Left Rear Center Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .
C1706	Left Rear Center Sensor Circuit Failure	Go to **Pinpoint Test B** .
C1707	Left Rear Center Sensor Circuit Fault	Go to **Pinpoint Test D** .
C1708	Right Rear Center Sensor Circuit Short to Vbat	Go to **Pinpoint Test C** .
C1709	Right Rear Center Sensor Circuit Failure	Go to **Pinpoint Test B** .
C1710	Right Rear Center Sensor Circuit Fault	Go to **Pinpoint Test D** .
C1742	Rear Sounder Circuit Failure	Go to **Pinpoint Test F** .
C1743	Rear Sounder Circuit Short to Vbat	Go to **Pinpoint Test F** .
U0140	Lost Communication With Body Control Module (GEM)	Go to **Pinpoint Test G** .

U0155	Lost Communication With Instrument Panel Cluster (IC) Control Module	Go to **Pinpoint Test H** .

POWERTRAIN DTC CHARTS AND DESCRIPTIONS - GASOLINE ENGINES DTCS

DIAGNOSTIC TROUBLE CODES (DTC) LIST

DTC	Description
DTC P0010	INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 1)
DTC P0011	INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 1)
DTC P0012	INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 1)
DTC P0016	CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 1 SENSOR A
DTC P0018	CRANKSHAFT POSITION - CAMSHAFT POSITION CORRELATION - BANK 2 SENSOR A
DTC P0020	INTAKE CAMSHAFT POSITION ACTUATOR CIRCUIT/OPEN (BANK 2)
DTC P0021	INTAKE CAMSHAFT POSITION TIMING - OVER-ADVANCED (BANK 2)
DTC P0022	INTAKE CAMSHAFT POSITION TIMING - OVER-RETARDED (BANK 2)
DTC P0030	HO2S HEATER CONTROL CIRCUIT (BANK 1, SENSOR 1)
DTC P0040	OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 1/BANK 2 SENSOR 1
DTC P0041	OXYGEN SENSOR SIGNALS SWAPPED BANK 1 SENSOR 2/BANK 2 SENSOR 2
DTC P0050	HO2S HEATER CONTROL CIRCUIT (BANK 2, SENSOR 1)
DTC P0053	HO2S HEATER RESISTANCE (BANK 1, SENSOR 1)
DTC P0054	HO2S HEATER RESISTANCE (BANK 1, SENSOR 2)
DTC P0055	HO2S HEATER RESISTANCE (BANK 1, SENSOR 3)
DTC P0059	HO2S HEATER RESISTANCE (BANK 2, SENSOR 1)
DTC P0060	HO2S HEATER RESISTANCE (BANK 2, SENSOR 2)
DTC P0068	MANIFOLD ABSOLUTE PRESSURE (MAP)/MASS AIR FLOW (MAF) - THROTTLE POSITION CORRELATION
DTC P0097	INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT LOW
DTC P0098	INTAKE AIR TEMPERATURE SENSOR 2 CIRCUIT HIGH
DTC P0102	MASS OR VOLUME AIR FLOW A CIRCUIT LOW
DTC P0103	MASS OR VOLUME AIR FLOW A CIRCUIT HIGH
DTC P0104	MASS OR VOLUME AIR FLOW A CIRCUIT INTERMITTENT/ERRATIC
DTC P0106	MANIFOLD ABSOLUTE PRESSURE (MAP/BARO) SENSOR RANGE/PERFORMANCE
DTC P0107	MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR LOW
DTC P0108	MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR HIGH
DTC P0109	MANIFOLD ABSOLUTE PRESSURE (MAP)/BAROMETRIC PRESSURE (BARO) SENSOR INTERMITTENT

DTC P0111	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE
DTC P0112	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT LOW
DTC P0113	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 CIRCUIT HIGH
DTC P0114	INTAKE AIR TEMPERATURE (IAT) SENSOR 1 INTERMITTENT/ERRATIC
DTC P0116	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT RANGE/PERFORMANCE
DTC P0117	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT LOW
DTC P0118	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT HIGH
DTC P0119	ENGINE COOLANT TEMPERATURE (ECT) SENSOR 1 CIRCUIT INTERMITTENT/ERRATIC
DTC P0121	THROTTLE/PEDAL POSITION SENSOR A CIRCUIT RANGE/PERFORMANCE
DTC P0122	THROTTLE/PEDAL POSITION SENSOR A CIRCUIT LOW
DTC P0123	THROTTLE/PEDAL POSITION SENSOR A CIRCUIT HIGH
DTC P0125	INSUFFICIENT COOLANT TEMPERATURE FOR CLOSED LOOP FUEL CONTROL
DTC P0127	INTAKE AIR TEMPERATURE (IAT) TOO HIGH
DTC P0128	COOLANT THERMOSTAT (COOLANT TEMPERATURE BELOW THERMOSTAT REGULATING TEMPERATURE)
DTC P012B	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT RANGE/PERFORMANCE
DTC P012C	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT LOW
DTC P012D	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT HIGH
DTC P012E	TURBOCHARGER/SUPERCHARGER INLET PRESSURE SENSOR CIRCUIT INTERMITTENT/ERRATIC
DTC P0130	O2 CIRCUIT (BANK 1, SENSOR 1)
DTC P0132	O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 1)
DTC P0133	O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 1)
DTC P0134	O2 CIRCUIT NO ACTIVITY DETECTED (BANK 1, SENSOR 1)
DTC P0135	O2 HEATER CIRCUIT (BANK 1, SENSOR 1)
DTC P0138	O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 2)
DTC P0139	O2 CIRCUIT SLOW RESPONSE (BANK 1, SENSOR 2)
DTC P0141	O2 HEATER CIRCUIT (BANK 1, SENSOR 2)
DTC P0144	O2 CIRCUIT HIGH VOLTAGE (BANK 1, SENSOR 3)
DTC P0147	O2 HEATER CIRCUIT (BANK 1, SENSOR 3)
DTC P0148	FUEL DELIVERY ERROR
DTC P0150	O2 CIRCUIT (BANK 2, SENSOR 1)
DTC P0152	O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 1)
DTC P0153	O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 1)
DTC P0154	O2 CIRCUIT NO ACTIVITY DETECTED (BANK 2, SENSOR 1)
DTC P0155	O2 HEATER CIRCUIT (BANK 2, SENSOR 1)

DTC P0158	O2 CIRCUIT HIGH VOLTAGE (BANK 2, SENSOR 2)
DTC P0159	O2 CIRCUIT SLOW RESPONSE (BANK 2, SENSOR 2)
DTC P0161	O2 HEATER CIRCUIT (BANK 2, SENSOR 2)
DTC P0171	SYSTEM TOO LEAN (BANK 1)
DTC P0172	SYSTEM TOO RICH (BANK 1)
DTC P0174	SYSTEM TOO LEAN (BANK 2)
DTC P0175	SYSTEM TOO RICH (BANK 2)
DTC P0180	FUEL TEMPERATURE SENSOR A CIRCUIT
DTC P0181	FUEL TEMPERATURE SENSOR A CIRCUIT RANGE/PERFORMANCE
DTC P0182	FUEL TEMPERATURE SENSOR A CIRCUIT LOW
DTC P0183	FUEL TEMPERATURE SENSOR A CIRCUIT HIGH
DTC P0190	FUEL RAIL PRESSURE SENSOR A CIRCUIT
DTC P0191	FUEL RAIL PRESSURE SENSOR A CIRCUIT RANGE/PERFORMANCE
DTC P0192	FUEL RAIL PRESSURE SENSOR A CIRCUIT LOW
DTC P0193	FUEL RAIL PRESSURE SENSOR A CIRCUIT HIGH
DTC P0196	ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT RANGE/PERFORMANCE
DTC P0197	ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT LOW
DTC P0198	ENGINE OIL TEMPERATURE (EOT) SENSOR CIRCUIT HIGH
DTC P020X	INJECTOR CIRCUIT/OPEN - CYLINDER X

B272E	Driver Ignition Run/Blower Circuit Short to Ground (this DTC sets for an open or short to voltage)	On-Demand and Continuous	Go to **Pinpoint Test AD** .
B272F	Passenger Ignition Run/Blower Circuit Short to Ground (this DTC sets for an open or short to voltage)	On-Demand and Continuous	Go to **Pinpoint Test AE** .
B2730	Back Over-Temp Detected (Driver)	On-Demand and Continuous	Go to **Pinpoint Test AF** .

SPEED CONTROL DTCS

PCM DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
P0579	Cruise Control Multifunction Input A Circuit Range/Performance	Go to **Pinpoint Test C** .
P0581	Cruise Control Multifunction Circuit High	Go to **Pinpoint Test C** .
P0833	Clutch Pedal Switch B Circuit	Go to **Pinpoint Test D** .
P1572	Brake Pedal Switch Circuit	Go to **Pinpoint Test B** .
P1703	Brake Switch Out of Self-Test Range	Go to **Pinpoint Test B** .

SUPPLEMENTAL RESTRAINT SYSTEM DTCS

SUPPLEMENTAL RESTRAINT SYSTEM (SRS) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC[a]	Description	Retrieved From	Perform Test
Continuous Lamp	The Air Bag Warning Indicator is Illuminated Continuously	Restraints control module (RCM)	Go to **Pinpoint Test A** .
B1884	PAD Warning Lamp Circuit Failure	RCM	Go to **Pinpoint Test B** .
B1890	PAD Warning Lamp Circuit Short to Battery	RCM	Go to **Pinpoint Test C** .
B2290 (Rail Type System)	Occupant Classification System Fault	OCSM	**NOTE:** **If no on-demand or continuous DTC is present in the RCM and DTC B2290 is**

			only present in the OCSM continuous, CLEAR all OCSM DTCs and PROVE OUT the SRS. Go to **Pinpoint Test D** .
B2292	Restraint System - Safety Belt Pretensioner Fault	RCM	Go to **Pinpoint Test E** .
B2293	Restraint System - Air Bag Fault	RCM	Go to **Pinpoint Test F** .
B2294	Restraint System - Curtain Fault	RCM	Go to **Pinpoint Test G** .
B2295	Restraint System - Side Air Bag Fault	RCM	Go to **Pinpoint Test H** .
B2296	Restraint System - Impact Sensor Fault	RCM	Go to **Pinpoint Test I** .
B2434	Drivers Seat Belt Buckle Switch Circuit Short to Ground	RCM	Go to **Pinpoint Test J** .
B2435	Drivers Seat Belt Buckle Switch Resistance Out of Range	RCM	Go to **Pinpoint Test K** .
B2438	Passengers Seat Belt Buckle Switch Short to Ground	RCM	Go to **Pinpoint Test L** .
B2439	Passengers Seat Belt Buckle Switch Resistance Out of Range	RCM	Go to **Pinpoint Test M** .
B2691	Seat Belt Buckle Switch Circuit Fault, Front Driver's Side	RCM	Go to **Pinpoint Test N** .
B2692	Front Passenger's Seat Belt Buckle Switch Circuit Fault	RCM	Go to **Pinpoint Test O** .
B2792	Cross Link Between Firing Loops	RCM	Go to **Pinpoint Test P** .
C1946	Front Driver's Seat Track Position Switch Circuit Open	RCM	Go to **Pinpoint Test S** .
C1947	Front Driver's Seat Track Position Switch Circuit Short to Ground	RCM	Go to **Pinpoint Test T** .
C1948	Front Driver's Seat Track Position Switch Circuit Resistance Out of Range	RCM	Go to **Pinpoint Test U** .
C1981	Front Driver's Seat Track Position Switch Circuit Fault	RCM	Go to **Pinpoint Test V** .

VEHICLE DYNAMIC SYSTEMS DTCS

ABS MODULE

ABS MODULE DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTCs	Description	Source	Perform Test
B1483	Brake Pedal Input Open Circuit	ABS Module	Go to **Pinpoint Test A** .
B1676	Battery Pack Voltage Out of Range	ABS Module	Go to **Pinpoint Test B** .
C1095	ABS Hydraulic Pump Motor Circuit Failure	ABS Module	Go to **Pinpoint Test E** .
C1145	Wheel Speed Sensor RF Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1155	Wheel Speed Sensor LF Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1165	Wheel Speed Sensor RR Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1175	Wheel Speed Sensor LR Input Circuit Failure	ABS Module	Go to **Pinpoint Test C** .
C1233	Wheel Speed LF Signal Fault	ABS Module	Go to **Pinpoint Test D** .
C1234	Wheel Speed RF Signal Fault	ABS Module	Go to **Pinpoint Test D** .
C1235	Wheel Speed RR Signal Fault	ABS Module	Go to **Pinpoint Test D** .
C1236	Wheel Speed LR Signal Fault	ABS Module	Go to **Pinpoint Test D** .

INSTRUMENT CLUSTER (IC)

INSTRUMENT CLUSTER DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Source	Perform Test
C1093	Traction Control Disable Switch Circuit Failure	Instrument Cluster	Go to **Pinpoint Test G** .

WHEELS & TIRES DTCS

TIRE PRESSURE MONITORING SYSTEM (TPMS) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Source	Perform Test
B106A	Pressure Sensor Range Bit Incorrect State	Smart Junction Box (SJB)	Go to **Pinpoint Test G** .
B106B	Tire Pressure Sensor Low Battery	SJB	DTC B106B can be set during SJB configuration. Go to **Pinpoint Test H** .
B287A	Tire Pressure System Fault	SJB	Go to **Pinpoint Test F** .

WIPERS & WASHERS DTCS

SMART JUNCTION BOX (SJB) DIAGNOSTIC TROUBLE CODE (DTC) LIST

DTC	Description	Perform Test
B1432	Wiper Brake/Run Relay Circuit Short to Battery	Go to **Pinpoint Test A** .
B1433	Wiper Brake/Run Relay Circuit Short to Ground	Go to **Pinpoint Test B** .
B1447	Wiper Park Sense Circuit Open	Go to **Pinpoint Test F** .
B2179	Front Wiper Select Switch "A" Short to Ground	Go to **Pinpoint Test B** .
B2180	Front Wiper Select Switch "B" Short to Ground	Go to **Pinpoint Test B** .
B2181	Front Wiper Select Switch "C" Short to Ground	Go to **Pinpoint Test B** .
B2183	Front Wiper Select Switch "H" Short to Ground	Go to **Pinpoint Test C** .
B2184	Front Wiper Select Switch "W" Short to Ground	Go to **Pinpoint Test E** .

2008 FORD MOTOR CO.

Fusion, Milan & MKZ

BUZZERS, RELAYS & TIMERS

BUZZERS, RELAYS & TIMERS LOCATION

Component	Location
A/C Clutch Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
A/C Clutch Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
Blower Motor Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
Blower Motor Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
FNR5 Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
FNR5 Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
Fog Lamp Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
Fog Lamp Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
Fuel Pump Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
Fuel Pump Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
High Current PETA Pump Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
High Current PETA Pump Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
High Intensity Discharge Headlamp Relay (Left) (Early Production)	In battery junction box (BJB). See **Fig. 2**.
High Intensity Discharge Headlamp Relay (Left) (Late Production)	In battery junction box (BJB). See **Fig. 36**.
High Intensity Discharge Headlamp Relay (Right) (Early Production)	In battery junction box (BJB). See **Fig. 2**.
High Intensity Discharge Headlamp Relay (Right) (Late Production)	In battery junction box (BJB). See **Fig. 36**.
PCM Power Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
PCM Power Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
Wiper Park Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
Wiper Park Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.
Wiper Run/Park Relay (Early Production)	In battery junction box (BJB). See **Fig. 2**.
Wiper Run/Park Relay (Late Production)	In battery junction box (BJB). See **Fig. 36**.

CIRCUIT PROTECTION DEVICES

CIRCUIT PROTECTION DEVICES LOCATION

Component	Location
A/C Evaporative Thermistor	Right side of dash. See **Fig. 20**.
Battery Junction Box (BJB) (2.3L)	Left side of engine compartment. See **Fig. 31**.
Battery Junction Box (BJB) (3.0L)	Left front of engine compartment. See **Fig. 29**.

Circuit Breaker	In smart junction box (SJB). See **Fig. 1**.
Fusible Link A (2.3L)	Right side of engine. See **Fig. 30**.
Fusible Link A (3.0L)	Center front of engine compartment. See **Fig. 28**.
Fusible Link A (3.5L)	Top of engine. See **Fig. 35**.
Fusible Link B (2.3L)	Right side of engine. See **Fig. 30**.
Fusible Link B (3.0L)	Center front of engine compartment. See **Fig. 28**.
Fusible Link B (3.5L)	Top of engine. See **Fig. 35**.
PCM Power Diode	In battery junction box (BJB). See **Fig. 2**.
Smart Junction Box (SJB)	Base of left "A" pillar. See **Fig. 16**.

CONTROL UNITS

CONTROL UNITS LOCATION

Component	Location
ABS Control Module (2.3L)	Right front of engine compartment. See **Fig. 31**.
ABS Control Module (3.0L)	Right front of engine compartment. See **Fig. 29**.
ABS Control Module (3.5L)	Right front of engine compartment. See **Fig. 34**.
All Wheel Drive Control Module	Left kick panel. See **Fig. 16**.
Antenna Module (MKZ)	Right rear of trunk. See **Fig. 5**.
Blower Motor Speed Controller (Front)	Right side of dash. See **Fig. 20**.
Compass Module	Front center of roof. See **Fig. 3**.
Compass Module (W/ Moonroof)	In roof harness. See **Fig. 4**.
Digital Signal Processing (DSP) Module	Right rear of trunk compartment. See **Fig. 5**.
Driver's Door Module	Front of driver's door. See **Fig. 12**.
Dual Automatic Temperature Control (DATC) Module	Center of dash. See **Fig. 19**.
Electronic Automatic Temperature Control (EATC) Module	Center of dash. See **Fig. 19**.
Electronic Throttle Control (EATC) Module (3.5L)	Right side of engine. See **Fig. 32**.
Heated/Cooled Seat Module	Under seat bottom. See **Fig. 13**.
Heated Seat Module	Under seat bottom. See **Fig. 13**.
Intake Manifold Runner Control (IMRC) Module	Top of intake manifold. See **Fig. 27**.
Manual Climate Control Module	Center of dash. See **Fig. 19**.
Memory Module	Under driver's seat. See **Fig. 14**.
Passive Anti-Theft Transceiver Module	Left side of dash. See **Fig. 19**.
Powertrain Control Module (PCM) (2.3L)	Left rear of engine compartment. See **Fig. 30**.
Powertrain Control Module (PCM) (3.0L)	Left rear of engine compartment. See **Fig. 28**.
Powertrain Control Module (PCM) (3.5L)	Left rear of engine compartment. See **Fig. 34**.
Restraints Control Module (RCM)	Under center console. See **Fig. 17**.
Roof Opening Panel Module	In roof harness. See **Fig. 4**.
Side Air Curtain Module (Driver's) (Fusion)	Base of left "C" pillar. See **Fig. 7**.

Side Air Curtain Module (Driver's) (Milan)	Base of left "C" pillar. See **Fig. 6**.
Side Air Curtain Module (Driver's) (MKZ)	Base of left "C" pillar. See **Fig. 5**.
Side Air Curtain Module (Passenger's) (Fusion)	Base of right "C" pillar. See **Fig. 7**.
Side Air Curtain Module (Passenger's) (Milan)	Base of right "C" pillar. See **Fig. 6**.
Side Air Curtain Module (Passenger's) (MKZ)	Base of right "C" pillar. See **Fig. 5**.
Transaxle Control Module (AW21)	On transaxle. See **Fig. 46**.
Transmission Control Module (FNR5)	Under instrument panel, LH side. See **Fig. 47**.

MOTORS

MOTORS LOCATION

Component	Location
Blower Motor	Right side of dash. See **Fig. 20**.
Door Lock Actuator (Driver's)	In driver's door. See **Fig. 12**.
Door Lock Actuator (Left Rear)	In left rear door. See **Fig. 10**.
Door Lock Actuator (Right Front)	In right front door. See **Fig. 11**.
Door Lock Actuator (Right Rear)	In right rear door. See **Fig. 9**.
Electronic Throttle Control (ETC) Motor	Left rear of engine. See **Fig. 27**.
Engine Cooling Fan Motor (2.3L)	Left front of engine compartment. See **Fig. 30**.
Engine Cooling Fan Motor (3.0L)	Left front of engine compartment. See **Fig. 28**.
Engine Cooling Fan Motor (3.5L)	Front of engine compartment. See **Fig. 34**.
Fresh/Recirculation Door Actuator	Right side of dash. See **Fig. 20**.
Lumbar Motor (Driver Seat)	In driver's seat back. See **Fig. 14**.
Lumbar Motor (Front Passenger's Seat)	Right side of seat. See **Fig. 13**.
Mode Door Actuator	Center of dash. See **Fig. 20**.
PETA Pump Motor	Lower left side of engine block. See **Fig. 27**.
Power Seat Motor Assembly (Left)	Under seat bottom. See **Fig. 14**.
Power Seat Motor Assembly (Right)	Under seat bottom. See **Fig. 13**.
Power Window Motor (Left Front)	In driver's door. See **Fig. 12**.
Power Window Motor (Left Rear)	In left rear door. See **Fig. 10**.
Power Window Motor (Right Front)	In right front door. See **Fig. 11**.
Power Window Motor (Right Rear)	In right rear door. See **Fig. 9**.
Recliner Motor (Driver's Seat)	In seat back. See **Fig. 14**.
Recliner Motor (Front Passenger's Seat)	Right side of seat. See **Fig. 13**.
Starter Motor (2.3L)	Lower left side of engine block. See **Fig. 27**.
Starter Motor (3.0L)	Right rear of engine. See **Fig. 28**.
Starter Motor (3.5L)	Left side of engine compartment, near battery. See **Fig. 35**.
Temperature Blend Door Actuator (Driver)	Center of dash. See **Fig. 20**.
Temperature Blend Door Actuator (Passenger)	Right side of dash. See **Fig. 20**.
Windshield Washer Pump Motor (2.3L)	Behind right front headlight. See **Fig. 31**.

Windshield Washer Pump Motor (3.0L)	Right front of engine compartment. See **Fig. 29**.
Windshield Washer Pump Motor (3.5L)	Right front of engine compartment. See **Fig. 34**.
Windshield Wiper Motor (2.3L)	Left rear of engine compartment. See **Fig. 30**.
Windshield Wiper Motor (3.0L)	Left rear of engine compartment. See **Fig. 28**.
Windshield Wiper Motor (3.5L)	Left rear of engine compartment. See **Fig. 34**.

SENDING UNITS & SENSORS

SENDING UNITS & SENSORS LOCATION

Component	Location
Accelerator Pedal Position Sensor	Left side of dash. See **Fig. 16**.
A/C Pressure Transducer Sensor	Right front of engine. See **Fig. 31**.
A/C Pressure Transducer Sensor (3.0L)	Center rear of engine compartment. See **Fig. 29**.
A/C Pressure Transducer Sensor (3.5L)	Center rear of engine compartment. See **Fig. 34**.
Ambient Air Temperature Sensor (2.3L)	Right side of radiator support. See **Fig. 31**.
Ambient Air Temperature Sensor (3.0L)	Behind front grille. See **Fig. 29**.
Camshaft Position Sensor 1 (3.0L)	Right front of engine. See **Fig. 25**.
Camshaft Position Sensor 1 (3.5L)	Right front of engine. See **Fig. 32**.
Camshaft Position Sensor (2.3L)	Top of engine. See **Fig. 38**.
Camshaft Position Sensor 2 (3.0L)	Left front of engine. See **Fig. 25**.
Camshaft Position Sensor 2 (3.5L)	Rear of left cylinder head. See **Fig. 25**.
Crankshaft Position Sensor (2.3L)	Lower right front of engine block. See **Fig. 26**.
Crankshaft Position Sensor (3.0L)	Lower right front of engine block. See **Fig. 25**.
Crankshaft Position Sensor (3.5L)	Lower left rear of engine block. See **Fig. 32**.
Cylinder Head Temp Sensor	Front of left cyl. head. See **Fig. 40**.
Cylinder Identification Sensor (2.3L)	Top rear of engine. See **Fig. 27**.
Dual Knock Sensor (3.5L)	Top rear of engine.
Engine Coolant Temperature (ECT) Sensor (2.3L)	Right rear of engine. See **Fig. 26**.
Engine Coolant Temperature (ECT) Sensor (3.0L)	Left rear of engine. See **Fig. 24**.
Engine Coolant Temperature (ECT) Sensor (3.5L)	Front of engine. See **Fig. 33**.
Front Impact Severity Sensor (2.3L)	At front radiator support. See **Fig. 30**.
Front Impact Severity Sensor (3.0L)	At front radiator support. See **Fig. 28**.
Fuel Injector 1 (3.0L)	Top right of intake manifold. See **Fig. 25**.
Fuel Injector 2 (3.0L)	Top right of intake manifold. See **Fig. 25**.
Fuel Tank Pressure Transducer Sensor (Fusion)	In fuel tank assembly. See **Fig. 7**.
Fuel Tank Pressure Transducer Sensor (Milan)	In fuel tank assembly. See **Fig. 6**.
Fuel Tank Pressure Transducer Sensor (MKZ)	In fuel tank assembly. See **Fig. 5**.
Heated Oxygen Sensor (HO2S) #11 (2.3L)	In exhaust manifold. See **Fig. 27**.
Heated Oxygen Sensor (HO2S) #11 (3.0L)	In right exhaust manifold. See **Fig. 25**.
Heated Oxygen Sensor (HO2S) #11 (3.5L)	Right side exhaust manifold. See **Fig. 33**.
Heated Oxygen Sensor (HO2S) #12 (2.3L)	In exhaust manifold. See **Fig. 27**.

Heated Oxygen Sensor (HO2S) #12 (3.0L)	In right exhaust manifold. See **Fig. 25**.
Heated Oxygen Sensor (HO2S) #12 (3.5L)	In right exhaust manifold. See **Fig. 33**.
Heated Oxygen Sensor (HO2S) #13 (2.3L)	In exhaust system. See **Fig. 23**.
Heated Oxygen Sensor (HO2S) #21 (3.0L)	In left exhaust manifold. See **Fig. 24**.
Heated Oxygen Sensor (HO2S) #21 (3.5L)	In left exhaust manifold. See **Fig. 32**.
Heated Oxygen Sensor (HO2S) #22 (3.0L)	In exhaust system. See **Fig. 22**.
Heated Oxygen Sensor (HO2S) #22 (3.5L)	In exhaust system. See **Fig. 32**.
In-Vehicle Temperature Sensor	Left side of dash. See **Fig. 19**.
Knock Sensor (2.3L)	Front of engine. See **Fig. 26**.
Knock Sensor (3.0L)	Right side of engine. See **Fig. 25**.
Manifold Absolute Pressure (MAP) Sensor	Top rear of engine. See **Fig. 25**.
Mass Air Flow/Intake Air Temperature (MAF/IAT) Sensor (2.3L)	Left front of engine compartment. See **Fig. 31**.
Mass Air Flow/Intake Air Temperature (MAF/IAT) Sensor (3.0L)	Left front of engine compartment. See **Fig. 29**.
Mass Air Flow/Intake Air Temperature (MAF/IAT) Sensor (3.5L)	Left side of engine compartment, on air intake. See **Fig. 34**.
Occupant Classification Sensor (OCS)	In seat cushion. See **Fig. 13**.
Output Shaft Speed (OSS) Sensor	Rear of transmission. See **Fig. 23**.
Output Shaft Speed (OSS) Sensor	Top of transmission. See **Fig. 21**.
Rail Sensor (Left)	Lower left side of seat. See **Fig. 13**.
Rail Sensor (Right)	Right side of seat track. See **Fig. 13**.
Seat Track Position Sensor (Left)	Front of seat track. See **Fig. 14**.
Secondary Fuel Sender	Top of fuel tank. See **Fig. 15**.
Side Air Curtain Sensor (Left 2) (Fusion)	Base of left "C" pillar. See **Fig. 7**.
Side Air Curtain Sensor (Left 2) (Milan)	Base of left "C" pillar. See **Fig. 6**.
Side Air Curtain Sensor (Left 2) (MKZ)	Base of left "C" pillar. See **Fig. 5**.
Side Air Curtain Sensor (Right 2) (Fusion)	Base of right "C" pillar. See **Fig. 7**.
Side Air Curtain Sensor (Right 2) (Milan)	Base of right "C" pillar. See **Fig. 6**.
Side Air Curtain Sensor (Right 2) (MKZ)	Base of right "C" pillar. See **Fig. 5**.
Sunload Sensor	Right side of dash. See **Fig. 20**.
Temperature Manifold Absolute Pressure (TMAP) Sensor	Lower left side of engine block. See **Fig. 27**.
Transmission Range Sensor	Left side of dash. See **Fig. 23**.
Turbine Shaft Speed (TSS) Sensor	Left side of transmission. See **Fig. 23**.
Vehicle Speed Sensor (VSS)	Right side of transmission. See **Fig. 23**.
Wheel Speed Sensor (Left Front) (3.5L)	At left front hub assembly. See **Fig. 34**.
Wheel Speed Sensor (Left Rear) (Milan)	On left rear hub assembly. See **Fig. 6**.
Wheel Speed Sensor (Left Rear) (MKZ)	On left rear hub assembly. See **Fig. 5**.
Wheel Speed Sensor (Right Front) (3.5L)	At right front hub assembly. See **Fig. 34**.
Wheel Speed Sensor (Right Rear) (Fusion)	On right rear hub assembly. See **Fig. 7**.
Wheel Speed Sensor (Right Rear) (Milan)	Base of right "C" pillar. See **Fig. 6**.

Wheel Speed Sensor (Right Rear) (MKZ)	On right rear hub assembly. See **Fig. 5**.

SOLENOIDS & SOLENOID VALVES

SOLENOIDS & SOLENOID VALVES LOCATION

Component	**Location**
A/C Clutch Field Coil (2.3L)	Front of A/C compressor. See **Fig. 26**.
A/C Clutch Field Coil (3.0L)	Front of A/C compressor. See **Fig. 24**.
Active Torque Control Coupling Solenoid (Fusion)	Vehicle underbody, near fuel tank. See **Fig. 7**.
Active Torque Control Coupling Solenoid (Milan)	Vehicle underbody, near fuel tank. See **Fig. 6**.
Active Torque Control Coupling Solenoid (MKZ)	Vehicle underbody, near fuel tank. See **Fig. 5**.
EVAP Canister Vent Control Solenoid (Fusion)	Rear of vehicle chassis. See **Fig. 7**.
EVAP Canister Vent Control Solenoid (Milan)	Rear of vehicle chassis. See **Fig. 6**.
EVAP Canister Vent Control Solenoid (MKZ)	Rear of vehicle chassis. See **Fig. 5**.
Evaporative Emission (EVAP) Canister Purge Valve (2.3L)	Lower right strut tower. See **Fig. 30**.
Evaporative Emission (EVAP) Canister Purge Valve (3.0L)	Lower right strut tower. See **Fig. 28**.
Evaporative Emission EVAP Canister Purge Valve (3.5L)	Right rear of engine compartment. See **Fig. 34**.
Fuel Injector 1 (2.3L)	Top of intake manifold. See **Fig. 26**.
Fuel Injector 1 (3.0L)	Top right of intake manifold. See **Fig. 25**.
Fuel Injector 1 (3.5L)	Top right of intake manifold. See **Fig. 32**.
Fuel Injector 2 (2.3L)	Top of intake manifold. See **Fig. 26**.
Fuel Injector 2 (3.0L)	Top right of intake manifold. See **Fig. 25**.
Fuel Injector 2 (3.5L)	Top right of intake manifold. See **Fig. 32**.
Fuel Injector 3 (2.3L)	Top of intake manifold. See **Fig. 26**.
Fuel Injector 3 (3.0L)	Top right of intake manifold. See **Fig. 25**.
Fuel Injector 3 (3.5L)	Top right of intake manifold. See **Fig. 32**.
Fuel Injector 4 (2.3L)	Top of intake manifold. See **Fig. 26**.
Fuel Injector 4 (3.0L)	Top left of intake manifold. See **Fig. 24**.
Fuel Injector 4 (3.5L)	Top left of intake manifold. See **Fig. 32**.
Fuel Injector 5 (3.0L)	Left side of intake manifold. See **Fig. 24**.
Fuel Injector 5 (3.5L)	Left side of intake manifold. See **Fig. 32**.
Fuel Injector 6 (3.0L)	Left side of intake manifold. See **Fig. 24**.
Fuel Injector 6 (3.5L)	Left side of intake manifold. See **Fig. 32**.
Heated Positive Crankcase Ventilation (PCV) Fitting (3.5L)	Top right rear of engine. See **Fig. 33**.
Heated Positive Crankcase Ventilation (PCV) Valve (3.0L)	Top rear of right cylinder head. See **Fig. 25**.
PETA Solenoid	Top rear of engine. See **Fig. 27**.
Stepper Motor EGR Valve (2.3L)	Right rear of engine. See **Fig. 27**.

Stepper Motor EGR Valve (3.0L)	Top rear of engine. See **Fig. 25**.
Swirl Control Valve Solenoid (2.3L)	Top left of engine. See **Fig. 27**.
Variable Camshaft Timing (VCT) Valve	Top rear of engine. See **Fig. 27**.
Variable Camshaft Timing (VCT) Valve 1 (3.0L)	Top front of right valve cover. See **Fig. 25**.
Variable Camshaft Timing (VCT) Valve 1 (3.5L)	Top front of right valve cover. See **Fig. 32**.
Variable Camshaft Timing (VCT) Valve 2 (3.0L)	Top front of left valve cover. See **Fig. 25**.
Variable Camshaft Timing (VCT) Valve 2 (3.5L)	Top front of left valve cover. See **Fig. 32**.

SWITCHES

SWITCHES LOCATION

Component	Location
Anti-Theft Hood Switch	Left front radiator support. See **Fig. 31**.
Anti-Theft Hood Switch (3.0L)	Left front radiator support. See **Fig. 29**.
Anti-Theft Hood Switch (3.5L)	Left front of engine compartment. See **Fig. 34**.
Brake Fluid Level Switch (2.3L)	Left rear of engine compartment. See **Fig. 31**.
Brake Fluid Level Switch (3.0L)	Left rear of engine compartment. See **Fig. 29**.
Brake Fluid Level Switch (3.5L)	Left rear of engine compartment. See **Fig. 34**.
Brake Pedal Position Switch	Left side of dash. See **Fig. 16**.
Clutch Pedal Position (CPP) Switch	Left side of dash. See **Fig. 16**.
Clutch Pedal Speed Control Deactivator Switch	Left side of dash. See **Fig. 16**.
Decklid Release Solenoid/Ajar Switch (Fusion)	Center rear of trunk. See **Fig. 8**.
Decklid Release Solenoid/Ajar Switch (Milan)	Center rear of trunk. See **Fig. 6**.
Ignition Switch	Base of steering column. See **Fig. 19**.
Inertia Fuel Shutoff (IFS) Switch	Base of right "A" pillar. See **Fig. 15**.
Luggage Compartment Disarm Switch (Fusion)	Center rear of luggage compartment. See **Fig. 7**.
Luggage Compartment Disarm Switch (Milan)	Center rear of luggage compartment. See **Fig. 6**.
Multifunction Switch	Left side of dash. See **Fig. 19**.
Oil Pressure Switch (2.3L)	On oil filter housing. See **Fig. 27**.
Oil Pressure Switch (3.0L)	Left side of engine block. See **Fig. 24**.
Oil Pressure Switch (3.5L)	Left side of engine block. See **Fig. 32**.
Park Brake Switch	Under center console. See **Fig. 17**.
Power Steering Pressure Switch (2.3L)	Front of engine. See **Fig. 27**.
Power Steering Pressure Switch (3.0L)	Lower right front of engine. See **Fig. 25**.
Power Steering Pressure Switch (3.5L)	Right rear of engine compartment. See **Fig. 35**.
Reversing Lamps Switch	Top of transmission. See **Fig. 21**.
Safety Belt Buckle Switch (Driver)	Under right side of seat. See **Fig. 14**.
Safety Belt Buckle Switch (Passenger)	Lower left side of seat track. See **Fig. 13**.
Transmission Fluid Pressure Switch	Left side of transmission. See **Fig. 23**.

MISCELLANEOUS

MISCELLANEOUS LOCATION

Component	**Location**
A/C Clutch Field Coil (3.5L)	Left front of engine, on front of A/C compressor. See **Fig. 32**.
Air Bag Sliding Contact	Behind steering wheel assembly. See **Fig. 18**.
Amplifier (Left Side)	Base of left "C" pillar. See **Fig. 5**.
Amplifier (Right Side)	Base of right "C" pillar. See **Fig. 5**.
Antenna (Fusion)	Base of right "C" pillar. See **Fig. 7**.
Antenna (Milan)	Base of right "C" pillar. See **Fig. 6**.
Antenna (MKZ)	Base of right "C" pillar. See **Fig. 5**.
Audio Jack	In center console. See **Fig. 17**.
Audio Unit	Center of dash. See **Fig. 19**.
Blower Motor Resistor Assembly (Front)	Right side of dash. See **Fig. 20**.
Coil On Plug (COP) 1 (2.3L)	Top rear of left valve cover. See **Fig. 26**.
Coil On Plug (COP) 1 (3.0L)	Top front of right valve cover. See **Fig. 25**.
Coil On Plug (COP) 1 (3.5L)	Top front of right valve cover. See **Fig. 33**.
Coil On Plug (COP) 2 (2.3L)	Top rear of left valve cover. See **Fig. 26**.
Coil On Plug (COP) 2 (3.0L)	Top of right valve cover. See **Fig. 25**.
Coil On Plug (COP) 2 (3.5L)	Top rear of right cylinder head. See **Fig. 33**.
Coil On Plug (COP) 3 (2.3L)	Top rear of left valve cover. See **Fig. 26**.
Coil On Plug (COP) 3 (3.0L)	Top rear of right valve cover. See **Fig. 25**.
Coil On Plug (COP) 3 (3.5L)	Top rear of right valve cover. See **Fig. 33**.
Coil On Plug (COP) 4 (2.3L)	Top rear of left valve cover. See **Fig. 26**.
Coil On Plug (COP) 4 (3.0L)	Top of left valve cover. See **Fig. 24**.
Coil On Plug (COP) 4 (3.5L)	Top of left valve cover. See **Fig. 32**.
Coil On Plug (COP) 5 (3.0L)	Top of left valve cover. See **Fig. 24**.
Coil On Plug (COP) 5 (3.5L)	Top of left valve cover. See **Fig. 32**.
Coil On Plug (COP) 6 (3.0L)	Top rear of left valve cover. See **Fig. 24**.
Coil On Plug (COP) 6 (3.5L)	Top rear of left valve cover. See **Fig. 32**.
Data Link Connector (DLC)	Left side of dash. See **Fig. 19**.
Driver Safety Belt Retractor Pretensioner	Base of "B" pillar. See **Fig. 16**.
Electrochromatic Inside Mirror Unit	In roof harness. See **Fig. 3**.
Generator (2.3L)	Right front of engine. See **Fig. 26**.
Generator (3.0L)	Left front of engine. See **Fig. 24**.
Generator (3.5L)	Left front of engine. See **Fig. 32**.
Horn (2.3L)	Behind right front of headlight. See **Fig. 31**.
Horn (3.0L)	Right front of engine compartment. See **Fig. 29**.
Horn (3.5L)	Right side of engine compartment. See **Fig. 34**.
Ignition Transformer Capacitor 1 (3.5L)	Top rear of right cylinder head. See **Fig. 32**.
Ignition Transformer Capacitor (2.3L)	Top front of intake manifold. See **Fig. 26**.
Ignition Transformer Capacitor 2 (3.5L)	Top rear of left cylinder head. See **Fig. 32**.

Ignition Transformer Capacitor (3.0L)	Top front of intake manifold. See **Fig. 25**.
Passenger Safety Belt Retractor Pretensioner	Base of right "B" pillar. See **Fig. 15**.
Power Point	Under center console. See **Fig. 17**.
RKE Antenna	Left "A" pillar. See **Fig. 16**.
Satellite Radio Receiver	Right rear of trunk. See **Fig. 7**.
Satellite Radio Receiver (MKZ)	Right rear of trunk. See **Fig. 5**.
Seat Back Heater (Left Front)	In driver's seat back. See **Fig. 14**.
Seat Back Heater (Right Front)	Right side of front passenger's seat back. See **Fig. 13**.
Seat Cushion Heater (Right Front)	Right side of front passenger's seat bottom. See **Fig. 13**.
Seat Cushion Heater (Left Front)	In seat cushion. See **Fig. 14**.
Subwoofer Amplifier (Fusion)	Right side of luggage compartment. See **Fig. 7**.
Subwoofer Amplifier (Milan)	Right side of luggage compartment. See **Fig. 6**.
Switch Control Monitor (2.3L)	Left rear of engine block. See **Fig. 27**.
THX Amplifier (MKZ)	Right rear of trunk. See **Fig. 5**.

CONNECTORS

CONNECTORS LOCATION

Component	Location
C110 (3.5L) (Neutral, 2 Pin)	Rear of engine, near thermostat housing. See **Fig. 40**.
C133 (2.3L) (Black, 16 Pin)	Left front of engine compartment. See **Fig. 45**.
C133 (3.0L) (Black, 16 Pin)	Left front of engine compartment. See **Fig. 41**.
C133 (3.5L) (Black, 16 Pin)	Left front of engine compartment. See **Fig. 41**.
C134 (2.3L) (Black, 34 Pin)	Left front of engine compartment. See **Fig. 30**.
C134 (3.0L) (Black, 34 Pin)	Left front of engine compartment. See **Fig. 28**.
C139 (3.0L) (Neutral, 4 Pin)	Left side of engine compartment. See **Fig. 24**.
C140 (3.5L) (Neutral, 2 Pin)	Left front of engine compartment. See **Fig. 35**.
C144 (3.5L) (Neutral, 16 Pin)	Top of engine. See **Fig. 39**.
C145 (3.5L) (Neutral, 70 Pin)	Top of engine. See **Fig. 39**.
C210 (Gray, 4 Pin)	Right side of dash. See **Fig. 20**.
C211 (Blue, 16 Pin)	Right side of dash. See **Fig. 20**.
C212 (Gray, 2 Pin)	Right side of dash. See **Fig. 19**.
C213 (Blue, 16 Pin)	Right side of dash. See **Fig. 19**.
C214 (2.3L) (Gray, 2 Pin)	Left rear of engine compartment. See **Fig. 31**.
C214 (3.0L) (Gray, 2 Pin)	Left rear of engine compartment. See **Fig. 29**.
C214 (3.0L) (Gray, 2 Pin)	Left rear of engine compartment. See **Fig. 34**.
C219 (2.3L) (White, 57 Pin)	Left rear of engine compartment. See **Fig. 31**.
C219 (3.0L) (White, 57 Pin)	Left rear of engine compartment. See **Fig. 29**.
C219 (3.5L) (White, 57 Pin)	Left rear of engine compartment. See **Fig. 35**.

C237 (White, 57 Pin)	Base of right "A" pillar. See **Fig. 15**.
C238 (16 Pin)	Below dash panel.
C240 (Gray, 24 Pin)	Center of dash. See **Fig. 19**.
C311 (34 Pin)	Lower front of seat assembly. See **Fig. 13**.
C312 (White, 57 Pin)	Lower front of seat assembly. See **Fig. 13**.
C313 (Yellow, 2 Pin)	Under seat bottom. See **Fig. 13**.
C314 (Yellow, 2 Pin)	Under rear of seat bottom. See **Fig. 13**.
C315 (34 Pin)	In seat bottom. See **Fig. 14**.
C316 (White, 57 Pin)	Under seat bottom. See **Fig. 14**.
C327 (2 Pin)	Under drivers seat.
C328 (Yellow, 2 Pin)	Under seat bottom. See **Fig. 14**.
C339 (Gray, 4 Pin)	Behind lower seat back. See **Fig. 13**.
C340 (Gray, 10 Pin)	Under seat bottom. See **Fig. 14**.
C406 (40 Pin)	Right side of cargo area. See **Fig. 44**.
C408 (8 Pin)	Center of rear bumper. See **Fig. 42**.
C510 (White, 34 Pin)	Base of left "A" pillar. See **Fig. 16**.
C510 (White, 34 Pin)	Front of driver's door. See **Fig. 12**.
C610 (White, 34 Pin)	In right front door jamb. See **Fig. 11**.
C710 (Gray, 14 Pin)	Center of left "B" pillar. See **Fig. 10**.
C810 (Gray, 14 Pin)	At right rear door jamb. See **Fig. 9**.
C913 (W/ Moonroof) (Gray, 12 Pin)	Front of roof. See **Fig. 4**.
C913 (W/O Moonroof) (Gray, 12 Pin)	Right "A" pillar. See **Fig. 3**.
C919 (W/Moonroof) (Gray, 10 Pin)	Front of roof. See **Fig. 4**.
C919 (W/O Moonroof) (Gray, 10 Pin)	Right "A" pillar. See **Fig. 3**.
C3007 (Gray, 10 Pin)	Under rear of seat bottom. See **Fig. 13**.
C3047 (Black, 16 Pin)	Under center console. See **Fig. 37**.
C3049 (Gray, 4 Pin)	Under seat bottom. See **Fig. 14**.
C3050 (Fusion) (Neutral, 12 Pin)	Left side of vehicle rear end. See **Fig. 44**.
C3050 (Milan) (Neutral, 12 Pin)	Left side of vehicle rear end. See **Fig. 44**.
C3051	Bottom of left rear passenger compartment. See **Fig. 42**.
C3052	Under center console. See **Fig. 37**.
C3133	In rear of center console. See **Fig. 37**.
C3134	Under center console. See **Fig. 37**.

GROUNDS

GROUNDS LOCATION

Component	Location
G100 (2.3L)	Left front strut tower. See **Fig. 31**.
G100 (3.0L)	Left front strut tower. See **Fig. 29**.

G100 (3.5L)	Left side of engine compartment, near battery junction box (BJB). See **Fig. 35**.
G101 (2.3L)	Rear of engine. See **Fig. 31**.
G101 (3.0L)	In front of battery. See **Fig. 29**.
G101 (3.5L)	Under battery. See **Fig. 35**.
G102 (2.3L)	Left rear of engine compartment. See **Fig. 45**.
G102 (3.0L)	Left rear of engine compartment. See **Fig. 45**.
G102 (3.5L)	Left rear of engine compartment. See **Fig. 45**.
G103 (2.3L)	Left front of engine compartment. See **Fig. 31**.
G103 (3.0L)	Left front of engine compartment. See **Fig. 29**.
G103 (3.5L)	Left side of engine compartment. See **Fig. 35**.
G104 (2.3L)	In front of right strut tower. See **Fig. 31**.
G104 (3.0L)	Right front of engine compartment. See **Fig. 29**.
G104 (3.5L)	Right side of engine compartment. See **Fig. 34**.
G200	Center of dash. See **Fig. 19**.
G201	Center of dash. See **Fig. 19**.
G202	Left side of dash. See **Fig. 19**.
G203	Base of right "A" pillar. See **Fig. 15**.
G204	Behind air bag, in steering wheel. See **Fig. 18**.
G300	Center of left floor pan. See **Fig. 16**.
G301	On right floor support pillar. See **Fig. 15**.
G400 (Fusion)	Center rear of trunk compartment. See **Fig. 42**.
G400 (MKZ)	Center rear of trunk compartment. See **Fig. 42**.
G401	Center of rear floor pan. See **Fig. 15**.
G402 (Fusion)	Base of right "C" pillar. See **Fig. 41**.
G402 (Milan)	Base of right "C" pillar. See **Fig. 41**.
G402 (MKZ)	Base of right "C" pillar. See **Fig. 41**.
G405	Left side of rear window. See **Fig. 43**.

SPLICES

SPLICES LOCATION

Component	Location
S100 (2.3L)	In starter motor relay and battery ground harness, near breakout to generator. See **Fig. 44**.
S100 (3.0L)	In starter motor relay and battery ground harness, near breakout to generator. See **Fig. 44**.
S101 (2.3L)	In starter motor relay and battery ground harness, near breakout to generator. See **Fig. 30**.
S101 (3.0L)	In starter motor relay and battery ground harness, near breakout to generator. See **Fig. 28**.
	In engine control sensor and fuel charge harness,

S102 (2.3L)	near breakout to powertrain control module. See **Fig. 26**.
S102 (3.0L)	In engine control sensor and fuel charge harness, near breakout to stepper motor EGR valve. See **Fig. 25**.
S102 (3.5L)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 35**.
S103 (3.0L)	In engine control sensor and fuel charge harness, near breakout to powertrain control module. See **Fig. 25**.
S103 (3.5L)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 35**.
S104 (3.5L)	In dash panel to headlamp junction harness, near breakout to C145. See **Fig. 35**.
S105	In engine control sensor and fuel charge harness, near breakout to heated oxygen sensor (HO2S) #22. See **Fig. 24**.
S106	In engine control sensor and fuel charge harness, near breakout to heated oxygen sensor (HO2S) #22. See **Fig. 24**.
S107 (2.3L)	In engine control sensor and fuel charge harness, near breakout to IMRC module. See **Fig. 38**.
S108 (2.3L)	In engine control sensor and fuel charge harness, near breakout to ETC module. See **Fig. 26**.
S108 (3.0L)	In engine control sensor and fuel charge harness, near breakout to fuel injector 1. See **Fig. 24**.
S109 (2.3L)	In engine control sensor and fuel charge harness, near breakout to IMTV. See **Fig. 38**.
S109 (3.0L)	In engine control sensor and fuel charge harness, near breakout to ETC module. See **Fig. 24**.
S110	In engine control sensor and fuel charge harness, near breakout to OSS sensor. See **Fig. 21**.
S111	In engine control sensor and fuel charge harness, near breakout to PETA solenoid. See **Fig. 38**.
S112	In engine control sensor and fuel charge harness, near breakout to transmission fluid pressure switch. See **Fig. 38**.
S113	In engine control sensor and fuel charge harness, near breakout to cylinder identification sensor. See **Fig. 38**.
S114	In engine control sensor and fuel charge harness, near breakout to C134. See **Fig. 23**.
S115 (2.3L)	In engine control sensor and fuel charge harness, near breakout to crankshaft position sensor. See **Fig. 26**.

S115 (3.0L)	In engine control sensor and fuel charge harness, near breakout to crankshaft position sensor. See **Fig. 40**.
S115 (3.5L)	In engine control sensor and fuel charge harness, near breakout to C145. See **Fig. 33**.
S116 (3.5L)	In dash panel to headlamp junction harness, near breakout to C145. See **Fig. 35**.
S117 (3.5L)	In dash panel to headlamp junction harness, near breakout to C145. See **Fig. 35**.
S118	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 35**.
S119 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box. See **Fig. 31**.
S119 (3.5L)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 35**.
S120 (2.3L)	In dash panel to headlamp junction harness, near engine bulkhead grommet. See **Fig. 31**.
S120 (3.0L)	In dash panel to headlamp junction harness, near engine bulkhead grommet. See **Fig. 29**.
S121 (2.3L)	In dash panel to headlamp junction harness, near engine bulkhead grommet. See **Fig. 31**.
S121 (3.0L)	In dash panel to headlamp junction harness, near engine bulkhead grommet. See **Fig. 29**.
S121 (3.5)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 35**.
S122 (2.3L)	In dash panel to headlamp junction harness, near engine bulkhead grommet. See **Fig. 31**.
S122 (3.0L)	In dash panel to headlamp junction harness, near engine bulkhead grommet. See **Fig. 29**.
S123 (2.3L)	In dash panel to headlamp junction harness, near breakout to powertrain control module (PCM). See **Fig. 31**.
S123 (3.0L)	In dash panel to headlamp junction harness, near breakout to powertrain control module (PCM). See **Fig. 29**.
S124 (2.3L)	In dash panel to headlamp junction harness, near breakout to powertrain control module (PCM). See **Fig. 31**.
S124 (3.0L)	In dash panel to headlamp junction harness, near breakout to powertrain control module (PCM). See **Fig. 29**.
S124 (3.5L)	In dash panel to headlamp junction harness, near breakout to anti-theft hood switch. See **Fig. 35**.
S125 (2.3L)	In dash panel to headlamp junction harness, near breakout to G102. See **Fig. 31**.

S125 (3.0L)	In dash panel to headlamp junction harness, near breakout to G102.
S125 (3.5L)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 35**.
S126 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 31**.
S126 (3.0L)	In dash panel to headlamp junction harness, near breakout to powertrain control module (PCM). See **Fig. 29**.
S126 (3.5L)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 35**.
S127 (3.0L)	In dash panel to headlamp junction harness, near breakout to powertrain control module (PCM). See **Fig. 29**.
S128 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 31**.
S128 (3.0L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 29**.
S128 (3.5L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 35**.
S129 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 30**.
S129 (3.0L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S130 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S130 (3.0L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S130 (3.5L)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 45**.
S131 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S131 (3.0L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S131 (3.5L)	In dash panel to headlamp junction harness, near breakout to engine cooling fan motor. See **Fig. 45**.
S132 (2.3L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.
S132 (3.0L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.
S133 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box. See **Fig. 45**.
S133 (3.0L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.

S133 (3.5L)	In dash panel to headlamp junction harness, near breakout to powertrain control module. See **Fig. 45**.
S134 (2.3L)	In dash panel to headlamp junction harness, near breakout to anti-theft hood switch. See **Fig. 45**.
S134 (3.0L)	In dash panel to headlamp junction harness, near breakout to anti-theft hood switch. See **Fig. 45**.
S134 (3.5L)	In dash panel to headlamp junction harness, near breakout to anti-theft hood switch. See **Fig. 45**.
S135 (2.3L)	In dash panel to headlamp junction harness, near breakout to anti-theft hood switch. See **Fig. 45**.
S135 (3.0L)	In dash panel to headlamp junction harness, near breakout to anti-theft hood switch. See **Fig. 45**.
S135 (3.5L)	In dash panel to headlamp junction harness, near breakout to engine cooling fan motor. See **Fig. 45**.
S136 (2.3L)	In dash panel to headlamp junction harness, near breakout to front impact severity sensor. See **Fig. 31**.
S136 (3.0L)	In dash panel to headlamp junction harness, near breakout to front impact severity sensor. See **Fig. 29**.
S136 (3.5L)	In dash panel to headlamp junction harness, near breakout to left headlight. See **Fig. 35**.
S137 (2.3L)	In dash panel to headlamp junction harness, near breakout to front impact severity sensor. See **Fig. 45**.
S137 (3.0L)	In dash panel to headlamp junction harness, near breakout to front impact severity sensor. See **Fig. 45**.
S137 (3.5L)	In dash panel to headlamp junction harness, near breakout to ABS control module. See **Fig. 45**.
S138 (2.3L)	In dash panel to headlamp junction harness, near breakout to front impact severity sensor. See **Fig. 45**.
S138 (3.0L)	In dash panel to headlamp junction harness, near breakout to front impact severity sensor. See **Fig. 45**.
S138 (3.5L)	In dash panel to headlamp junction harness, near breakout to ambient air temperature sensor. See **Fig. 45**.
S139 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S139 (3.0L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S140 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.

S140 (3.0L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S141 (2.3L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.
S141 (3.0L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.
S142 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box. See **Fig. 45**.
S142 (3.5L)	In dash panel to headlamp junction harness, near breakout to engine cooling fan motor. See **Fig. 45**.
S143 (2.3L)	In dash panel to headlamp junction harness, near breakout to battery junction box. See **Fig. 45**.
S143 (3.0L)	In dash panel to headlamp junction harness, near breakout to battery junction box. See **Fig. 45**.
S143 (3.5L)	In dash panel to headlamp junction harness, near breakout to battery junction box (BJB). See **Fig. 45**.
S144 (2.3L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.
S144 (3.0L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.
S144 (3.5L)	In dash panel to headlamp junction harness, near breakout to G103. See **Fig. 45**.
S145 (3.5L)	In dash panel to headlamp junction harness, near breakout to C144. See **Fig. 35**.
S149 (3.0L)	In engine control sensor and fuel sensor harness, near breakout to heated oxygen sensor (HO2S) #22. See **Fig. 24**.
S153 (3.5L)	In engine control sensor and fuel charge harness, near breakout to C144. See **Fig. 40**.
S154 (3.5L)	In engine control sensor and fuel charge harness, near breakout to camshaft position sensor 1. See **Fig. 32**.
S155 (3.5L)	In engine control sensor and fuel charge harness, near breakout to C144. See **Fig. 40**.
S156 (3.5L)	In engine control sensor and fuel charge harness, near breakout to camshaft position sensor 1. See **Fig. 32**.
S157 (3.5L)	In engine control sensor and fuel charge harness, near breakout to ignition transformer capacitor 2. See **Fig. 39**.
S158 (3.5L)	In engine control sensor and fuel charge harness, near breakout to fuel injector 3. See **Fig. 39**.
S159 (3.5L)	In engine control sensor and fuel charge harness, near breakout to C144. See **Fig. 40**.
	In engine control sensor and fuel charge harness,

S160 (3.5L)	near breakout to fuel injector 3. See **Fig. 39**.
S200	In steering wheel jumper harness, near breakout to right steering wheel switch.
S201	In steering wheel jumper harness, near breakout to right steering wheel switch.
S202	In steering wheel jumper harness, near breakout to left steering wheel switch. See **Fig. 18**.
S203	In steering wheel jumper harness, near breakout to left steering wheel switch. See **Fig. 18**.
S204	In A/C jumper, near breakout to air conditioner evaporative thermistor. See **Fig. 20**.
S205	In A/C jumper, near breakout to C298. See **Fig. 20**.
S206	In A/C jumper, near breakout to air conditioner evaporative thermistor. See **Fig. 20**.
S210 (2.3L)	In dash panel to headlamp junction harness, near breakout to smart junction box (SJB). See **Fig. 31**.
S210 (3.0L)	In dash panel to headlamp junction harness, near breakout to smart junction box (SJB). See **Fig. 29**.
S220	In main harness, near breakout to C212. See **Fig. 19**.
S221	In main harness, near breakout to C212. See **Fig. 19**.
S222	In main harness, near breakout to clock. See **Fig. 20**.
S223	In main harness, near breakout to clock. See **Fig. 20**.
S224	In main harness, near breakout to G200. See **Fig. 19**.
S225	In main harness, near breakout to clock. See **Fig. 20**.
S226	In main harness, near breakout to data link connector. See **Fig. 20**.
S227	In main harness, near breakout to data link connector. See **Fig. 20**.
S228	In main harness, near breakout to data link connector. See **Fig. 19**.
S229	In main harness, near breakout to G201. See **Fig. 19**.
S230	In main harness, near breakout to smart junction box (SJB). See **Fig. 20**.
S231	In main harness, near breakout to main light switch. See **Fig. 19**.
S232	In main harness, near breakout to smart junction box (SJB). See **Fig. 19**.
S233	In main harness, near breakout to G201. See **Fig. 19**.

Variable camshaft timing (VCT) oil control solenoid bolts	10	-	89

DESCRIPTION AND OPERATION

ELECTRONIC ENGINE CONTROLS

The electronic engine controls consist of the:

- PCM.

- cylinder head temperature (CHT) sensor.
- camshaft position (CMP) sensor.
- crankshaft position (CKP) sensor.
- mass air flow (MAF) sensor.
- heated oxygen sensor (HO2S).
- catalyst monitor sensor.
- variable camshaft timing (VCT) oil control solenoid.
- knock sensor (KS).

The PCM carries out the following functions:

- accepts input from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio throughout the entire engine operational range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The CHT sensor:

- sends the PCM a signal indicating cylinder head temperature.
- resistance decreases as cylinder head temperature increases.

The CMP sensor:

- sends the PCM a signal indicating camshaft position used for fuel synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool.

The HO2S:

- creates a voltage signal dependent on exhaust oxygen content.
- provides feedback information to the PCM used to calculate fuel delivery.

The catalyst monitor sensor:

- monitors oxygen content after it flows through the catalytic converter.
- provides a voltage to the PCM used to calculate catalytic converter integrity.

The KS:

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, as necessary.

The VCT oil control solenoid:

- is an electrically controlled hydraulic valve that directs engine oil to the camshaft phaser. Once the PCM transmits a signal, the solenoid moves a valve spool, directing oil into the camshaft phaser cavity. This action changes valve timing by either inducing an advance or retard condition. The camshaft is, thereby repositioned in relation to crankshaft timing and allows for optimum engine performance and lower emissions.

DIAGNOSTIC TESTS

ELECTRONIC ENGINE CONTROLS

Refer to the **Introduction - Gasoline Engines** article.

REMOVAL AND INSTALLATION

CAMSHAFT POSITION (CMP) SENSOR

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

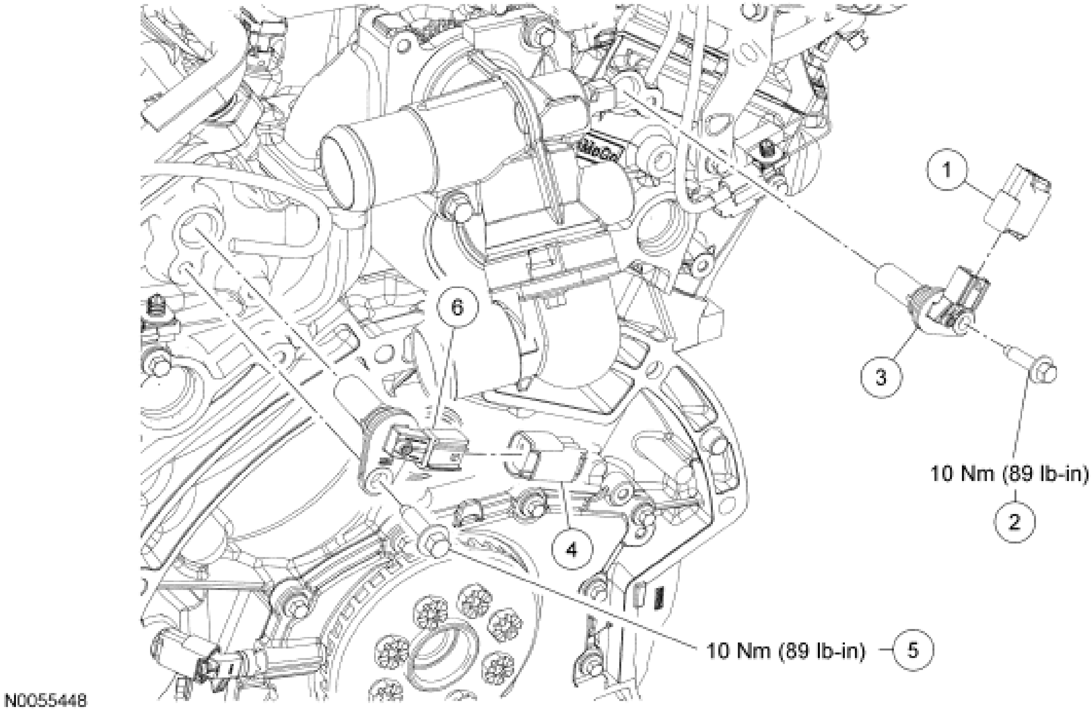

Fig. 1: Exploded View Of Camshaft Position (CMP) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	RH camshaft position (CMP) sensor electrical connector
2	W503279	RH CMP sensor bolt
3	6B288	RH CMP sensor
4	14A464	LH CMP sensor electrical connector
5	W503279	LH CMP sensor bolt
6	6B288	LH CMP sensor

REMOVAL AND INSTALLATION

1. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
2. Disconnect the camshaft position (CMP) sensor electrical connector.
3. Remove the bolt and the CMP sensor.
   - To install, tighten to 10 Nm (89 lb-in).

NOTE: Lubricate the CMP sensor O-ring seal with clean engine oil.

4. To install, reverse the removal procedure.

CRANKSHAFT POSITION (CKP) SENSOR

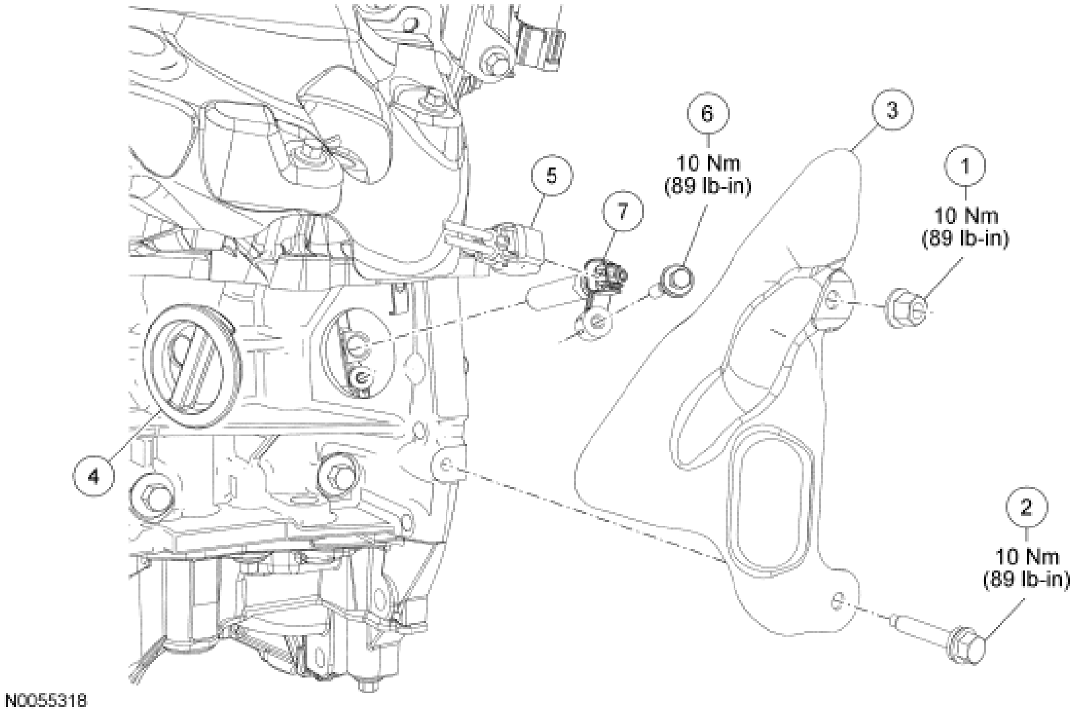

Fig. 2: Exploded View Of Crankshaft Position (CKP) Sensor With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701542	Heat shield nut
2	W701669	Heat shield bolt
3	6K342	Heat shield
4	6C070	Rubber grommet cover
5	14A464	Crankshaft position (CKP) sensor electrical connector
6	6D327	CKP sensor bolt
7	6C315	CKP sensor

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the LH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
3. Remove the bolt, nut and the heat shield.
   - To install, tighten to 10 Nm (89 lb-in).
4. Remove the rubber grommet cover.
5. Disconnect the crankshaft position (CKP) sensor electrical connector.
6. Remove the bolt and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).

7. To install, reverse the removal procedure.

POWERTRAIN CONTROL MODULE (PCM)

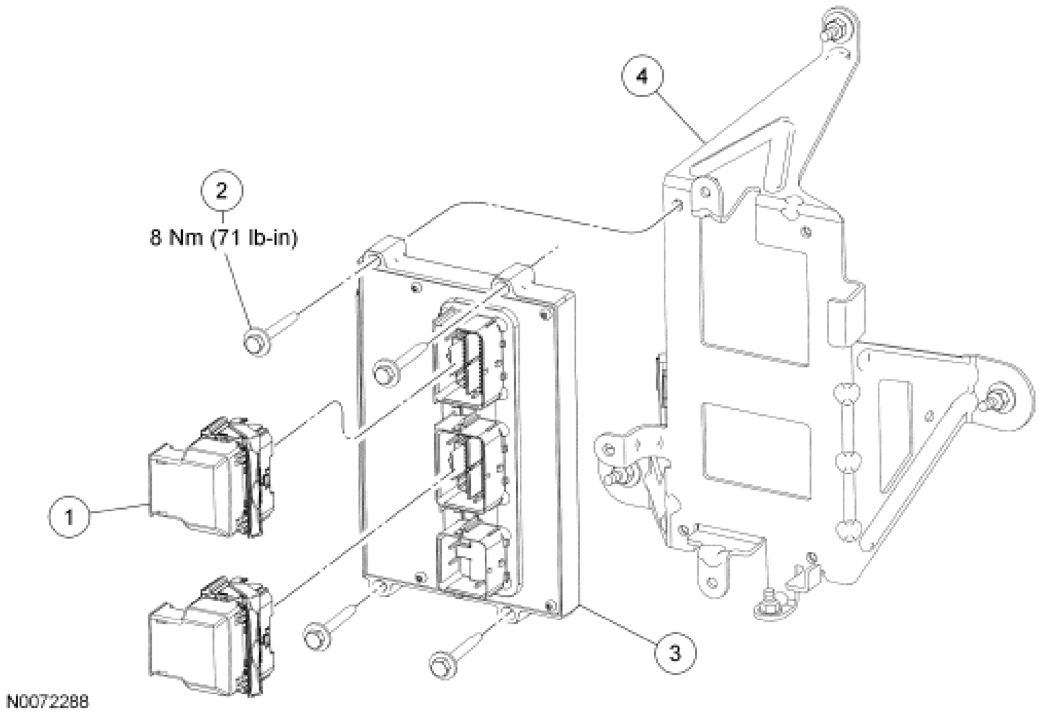

Fig. 3: Exploded View Of Powertrain Control Module (PCM) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	PCM electrical connector (part of 12B637) (2 required)
2	W505428	PCM bolt (4 required)
3	12A650	PCM
4	12A659	PCM bracket

REMOVAL

NOTE: PCM replacement DOES NOT require new keys or programming of keys.

1. Retrieve the module configuration. Carry out the module configuration retrieval steps of the Programmable Module Installation procedure. For additional information, refer to **MODULE CONFIGURATION** article.
2. Remove the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
3. Disconnect the 2 PCM electrical connectors.
4. Remove the 4 bolts and the PCM.

INSTALLATION

1. Install the PCM and the bolts.
    - Tighten to 8 Nm (71 lb-in).
2. Connect the 2 PCM electrical connectors.
3. Install the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
4. Restore the module configuration. Carry out the module configuration restore steps of the Programmable Module Installation procedure. For additional information, refer to **MODULE CONFIGURATION** article.
5. Reprogram the passive anti-theft system (PATS). Carry out the Parameter Reset procedure. For additional information, refer to **ANTI-THEFT - PASSIVE ANTI-THEFT SYSTEM (PATS)** article.

MASS AIR FLOW (MAF) SENSOR

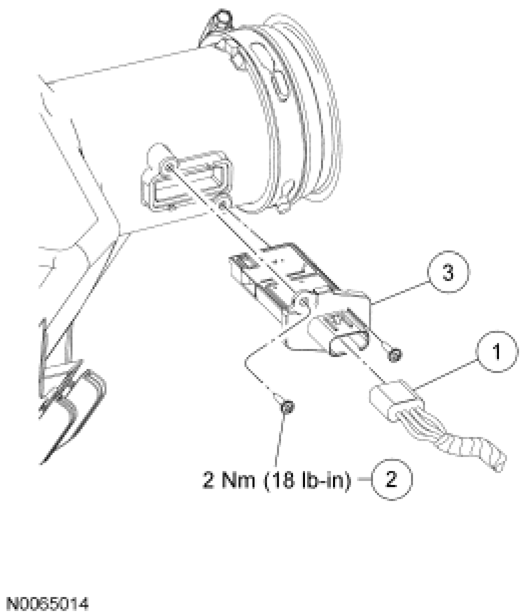

Fig. 4: Exploded View Of Mass Air Flow (MAF) Sensor With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector
2	W709287	MAF sensor screw (2 required)
3	12B579	MAF sensor

REMOVAL AND INSTALLATION

1. Disconnect the mass air flow (MAF) sensor electrical connector.
2. Remove the 2 screws and the MAF sensor.
    - To install, tighten to 2 Nm (18 lb-in).
3. To install, reverse the removal procedure.

CYLINDER HEAD TEMPERATURE (CHT) SENSOR

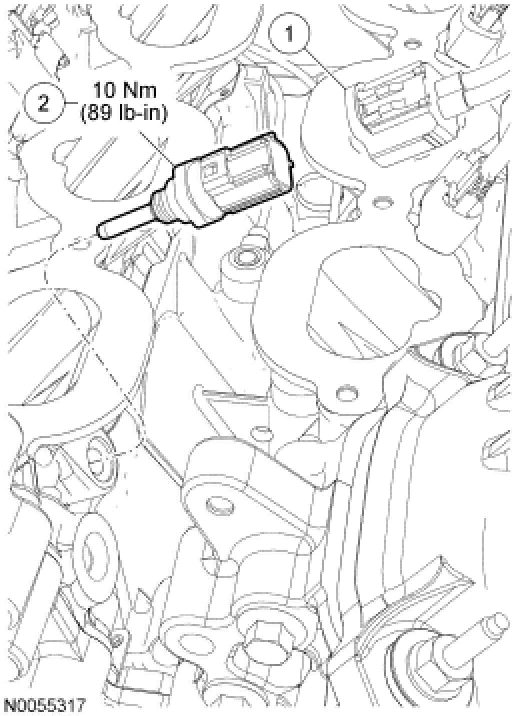

Fig. 5: Exploded View Of Cylinder Head Temperature (CHT) Sensor With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Cylinder head temperature (CHT) sensor electrical connector
2	6G004	CHT sensor

1. Remove the lower intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
2. Disconnect the cylinder head temperature (CHT) sensor electrical connector.
3. Remove and discard the CHT sensor.
    - To install, tighten to 10 Nm (89 lb-in).
4. To install, reverse the removal procedure.
    - Do not reuse the CHT sensor, install a new sensor.

HEATED OXYGEN SENSOR (HO2S) AND CATALYST MONITOR SENSOR - EXPLODED VIEW

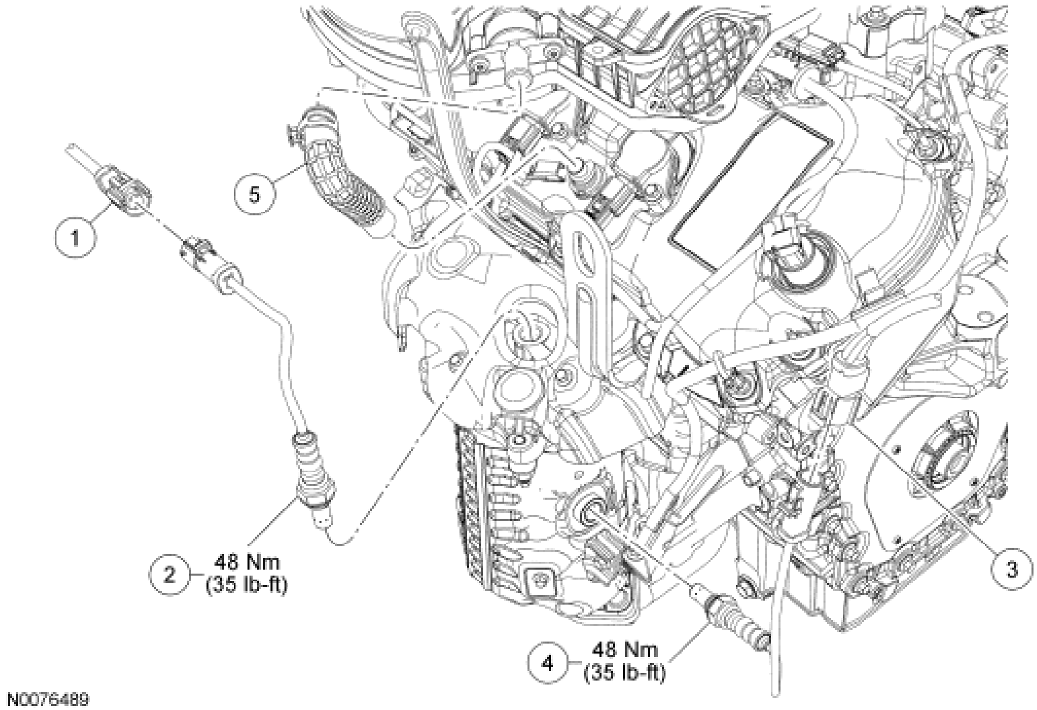

Fig. 6: Exploded View Of Heated Oxygen Sensor (HO2S) & Catalyst Monitor Sensor With Torque Specifications - RH Sensors
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Heated oxygen sensor (HO2S) electrical connector
2	9F472	HO2S
3	14A464	Catalyst monitor sensor electrical connector
4	9G444	Catalyst monitor sensor
5	6A664	PCV hose

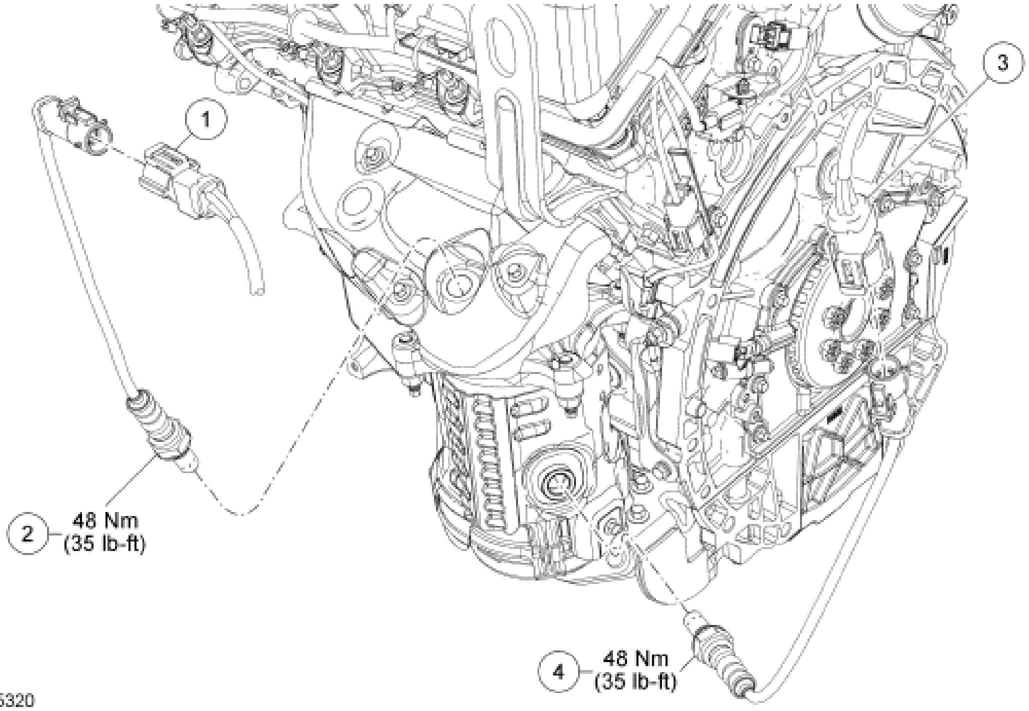

Fig. 7: Exploded View Of Heated Oxygen Sensor (HO2S) & Catalyst Monitor Sensor With Torque Specifications - LH Sensors
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Heated oxygen sensor (HO2S) electrical connector
2	9F472	HO2S
3	14A464	Catalyst monitor sensor electrical connector
4	9G444	Catalyst monitor sensor

1. For additional information, refer to the procedures.

HEATED OXYGEN SENSOR (HO2S)

Special Tools

Illustration	Tool Name	Tool Number
 ST1185-A	Socket, Exhaust Gas Oxygen Sensor	303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-

REMOVAL AND INSTALLATION

RH sensor

1. Remove the PCV hose.

   Both sensors

2. Disconnect the heated oxygen sensor (HO2S) electrical connector.

   NOTE: If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

3. Using the special tool, remove the HO2S.
   - To install, tighten to 48 Nm (35 lb-ft).

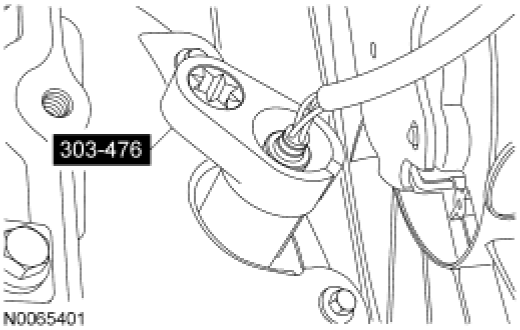

Fig. 8: Removing Heated Oxygen Sensor (HO2S) Using Special Tool (303-476)
Courtesy of FORD MOTOR CO.

NOTE: Apply a light coat of anti-seize lubricant to the threads of the HO2S.

4. To install, reverse the removal procedure.

CATALYST MONITOR SENSOR

Special Tools

Illustration	Tool Name	Tool Number
	Socket, Exhaust Gas Oxygen	

 ST1185-A	Sensor	303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (US); CXG-2-B (Canada)	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 (US); CXC-51-A (Canada)	-

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Disconnect the catalyst monitor sensor electrical connector.

NOTE: If necessary, lubricate the sensor threads with penetrating and lock lubricant to assist in removal.

3. Using the special tool, remove the catalyst monitor sensor.
   - To install, tighten to 48 Nm (35 lb-ft).

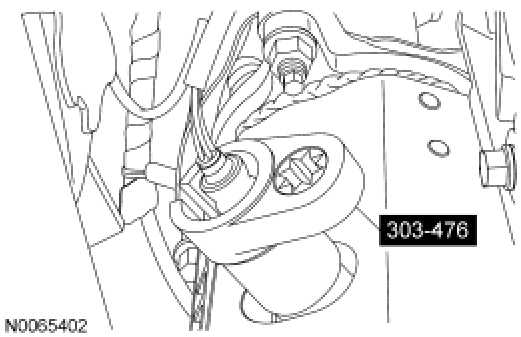

Fig. 9: Removing Catalyst Monitor Sensor Using Special Tool (303-476)
Courtesy of FORD MOTOR CO.

NOTE: Apply a light coat of anti-seize lubricant to the threads of the catalyst monitor sensor.

4. To install, reverse the removal procedure.

VARIABLE CAMSHAFT TIMING (VCT) OIL CONTROL SOLENOID

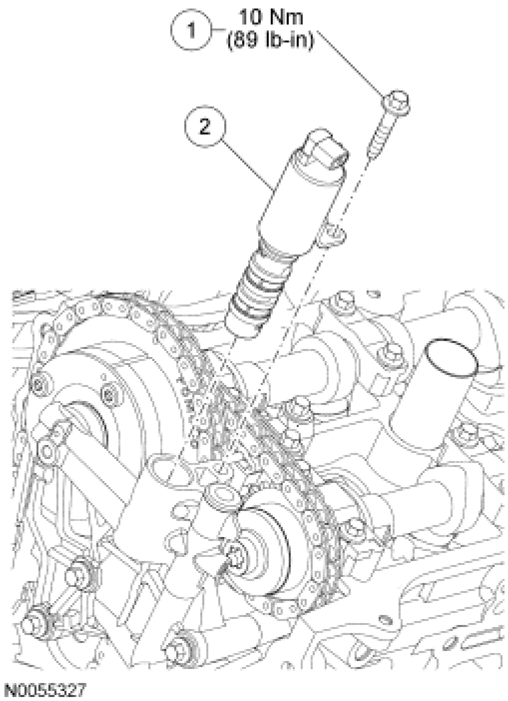

Fig. 10: Exploded View Of Variable Camshaft Timing (VCT) Oil Control Solenoid With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W500215	Variable camshaft timing (VCT) oil control solenoid bolt
2	6B297	VCT oil control solenoid

REMOVAL AND INSTALLATION

1. Remove the LH or RH valve cover. For additional information, refer to **ENGINE - 3.5L** article.
2. Remove the bolt and the variable camshaft timing (VCT) oil control solenoid.
   - To install, tighten to 10 Nm (89 lb-in).
3. To install, reverse the removal procedure.

KNOCK SENSOR (KS)

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant with Bittering Agent (US only) VC-7-B (US); CVC-7-A (Canada); or equivalent (yellow color)	WSS-M97B51-A1

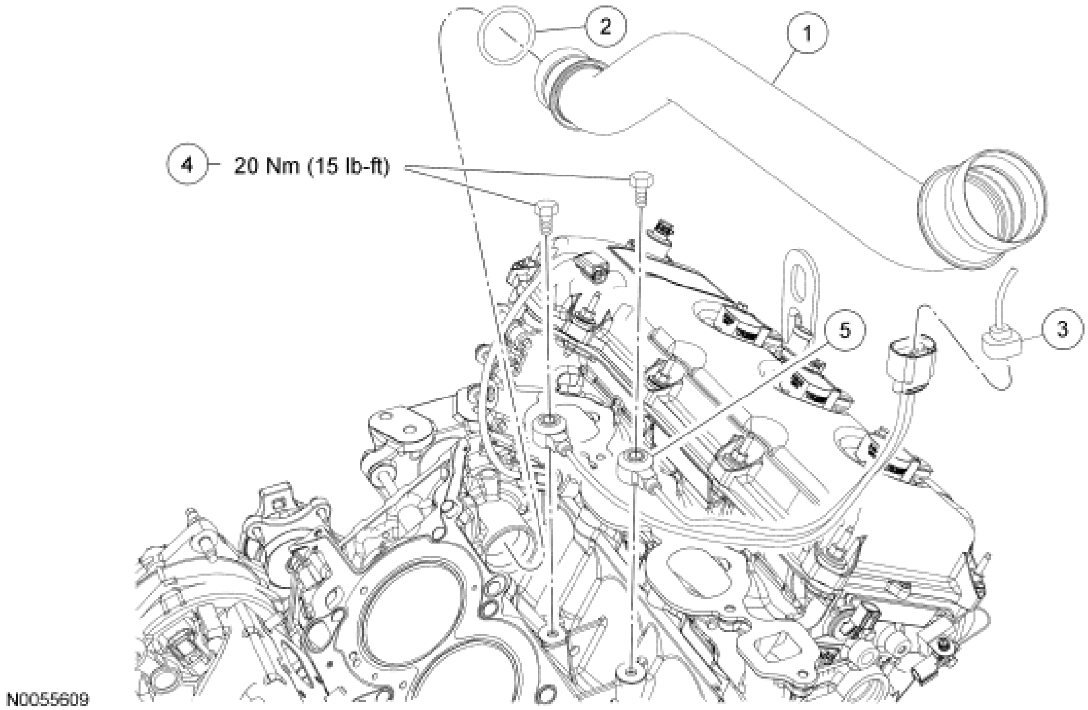

Fig. 11: Exploded View Of Knock Sensor (KS) With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	9N271	Coolant tube
2	8565	O-ring seal
3	14A464	Knock sensor (KS) electrical connector
4	W704749	KS bolts (2 required)
5	12A699	KS

REMOVAL AND INSTALLATION

1. Remove the thermostat housing. For additional information, refer to **ENGINE COOLING** article.
2. Remove the lower intake manifold. For additional information, refer to **ENGINE - 3.5L** article.
3. Remove the coolant tube.
   - Discard the O-ring seal.
4. Disconnect the knock sensor (KS) electrical connector.
5. Remove the 2 bolts and the KS.
   - To install, tighten to 20 Nm (15 lb-ft).
6. To install, reverse the removal procedure.
   - Lubricate the new O-ring seal with clean engine coolant.

EMISSION APPLICATIONS

2008 Ford - Lincoln MKZ

EMISSION APPLICATIONS

2008 MKZ

Engine & Fuel System	(1) Emission Control Systems & Devices	EGR Test No.

GENERAL SPECIFICATIONS

GENERAL SPECIFICATIONS

Item	Specification
Engine	
Displacement	3.5L (4V) (214 CID)
No. cylinders	6
Bore/stroke	92.5/86.7 mm (3.641/3.413 in)
Fire order	1-4-2-5-3-6
Oil pressure	Minimum 30 psi @ 1,500 RPM with engine at normal operating temperature
Spark plug	AYSF-22FM Gap = 1.29-1.45 mm (0.051-0.057 in)
Compression ratio	10.3:1
Engine weight (without accessory drive components)	161 kg (355 lb)
Engine and transaxle weight (without accessory	260.8 kg (575 lb)

drive components)	
Cylinder Head and Valve Train	
Cylinder head gasket surface flatness[a]	-
Combustion chamber volume	55.84 cc (3.41 CI)
Valve tappet clearance intake	0.15-0.25 mm (0.006-0.01 in)
Valve tappet clearance - exhaust	0.300-0.400 mm (0.0118-0.0157 in)
Valve guide bore inner diameter	5.519-5.549 mm (0.217-0.218 in)
Valve stem diameter - intake	5.479-5.497 mm (0.2157-0.2164 in)
Valve stem diameter - exhaust	5.466-5.484 mm (0.2151-0.2159 in)
Valve stem-to-guide clearance - intake	0.022-0.070 mm (0.0008-0.0027 in)
Valve stem-to-guide clearance - exhaust	0.035-0.083 mm (0.0013-0.032 in)
Valve head diameter - intake	36.82-37.18 mm (1.44-1.46 in)
Valve head diameter - exhaust	30.82-31.18 mm (1.21-1.22 in)
Valve face runout	0.05 mm (0.0001 in)
Valve face angle	90.50-91.50 degrees
Valve seat width - intake	1.3-1.5 mm (0.051-0.059 in)
Valve seat width - exhaust	1.4-1.6 mm (0.055-0.062 in)
Valve seat runout	0.04 mm (0.0001 in) MAX
Valve seat angle	89.0-91.0 degrees
Valve spring free length (approx.)	48.4 mm (1.90 in)
Valve spring compression pressure (N @ spec. length)	510 N @ 27.32 mm (115 lbs @ 1.08 in)
Valve spring installed height	37.0 mm (1.45 in)
Valve spring installed height pressure (N @ spec. length)	235 N @ 37.0 mm (53 lbs @ 1.45 in)
Valve spring installed pressure - service limit	10% force loss @ specified height
Camshaft	
Theoretical valve lift @ 0 lash	9.6798 mm (0.38 in)
Lobe lift - intake	9.6798 mm (0.38 in)
Lobe lift - exhaust	9.6798 mm (0.38 in)
Allowable lobe lift loss	0.062 mm (0.0024 in)

Camshaft journal bore inside diameter - 1st journal	31.0375-31.0625 mm (1.221-1.222 in)
Camshaft journal bore inside diameter - intermediate journals	25.9875-26.0125 mm (1.023-1.024 in)
Camshaft bearing outside diameter - 1st journal	30.993-31.013 mm (1.2202-1.2209 in)
Camshaft bearing outside diameter - intermediate journals	25.937-25.963 mm (1.021-1.022 in)
Camshaft journal-to-bearing clearance, 1st journal - service limit	0.070 mm (0.0027 in) MAX
Camshaft journal-to-bearing clearance, intermediate journals - service limit	0.0755 mm (0.0029 in) MAX
Runout	0.040 mm (0.0015 in) MAX
End play - standard	0.032-0.170 mm (0.0012-0.0066 in)
End play - service limit	0.190 mm (0.00748 in) MAX
Cylinder Block	
Cylinder bore diameter - grade 1	-
Cylinder bore diameter - grade 2	-
Cylinder bore diameter - grade 3	-
Cylinder bore maximum taper	-
Cylinder bore maximum out-of-round - limit	-
Cylinder bore maximum out-of-round - service limit	-
Main bearing bore inside diameter	72.400-72.424 mm (2.8503-2.8513 in)
Head gasket surface flatness	-
Head gasket surface finish	-
Crankshaft	
Main bearing journal diameter	67.5 mm (2.657 in)
Main bearing journal maximum taper	0.004 mm (0.00015 in)
Main bearing journal maximum out-of-round	0.006 mm (0.00023 in)
Main bearing journal-to-cylinder block clearance	-
Connecting rod journal diameter	55.983-56.003 mm (2.204-2.205 in)
Connecting rod journal maximum taper	0.004 mm (0.00015 in)
Connecting rod journal maximum out-of-round	0.006 mm (0.00023 in)
Crankshaft maximum end play	0.101-0.291 mm (0.0039-0.0114 in)
Piston and Connecting Rod	
Piston diameter - single grade	92.476-92.490 mm (3.6407-3.6413 in)
Piston-to-cylinder bore clearance	0.010 to 0.044 mm (0.0003-0.0017 in)
Piston ring end gap - compression (top, gauge diameter)	0.15-0.25 mm (0.0059-0.0098 in)
Piston ring end gap - compression (bottom, gauge	0.30-0.55 mm (0.0118-0.0216 in)

diameter)	
Piston ring end gap - oil ring (steel rail, gauge diameter)	0.15-0.45 mm (0.0059-0.0177 in)
Piston ring groove width - compression (top)	1.230-1.25 mm (0.0484-0.0492 in)
Piston ring groove width - compression (bottom)	1.530-1.55 mm (0.0602-0.0610 in)
Piston ring groove width - oil ring	2.53-2.55 mm (0.0996-0.1003 in)
Piston ring width - upper comp ring	1.17-1.19 mm (0.0460-0.0468 in)
Piston ring width - lower comp ring	1.47-1.49 mm (0.0578-0.0586 in)
Piston ring-to-groove clearance (upper and lower compression rings)	0.040-0.080 mm (0.0015-0.0031 in)
Piston pin bore diameter	23.002-23.006 mm (0.9055-0.9057 in)
Piston pin diameter	22.998-23.000 mm (0.9054-0.9055 in)
Piston pin length	55.975 mm (2.203 in)
Piston pin-to-piston fit	0.002 to 0.008 mm (0.00007-0.0003 in)
Piston-to-connecting rod clearance	2.7 mm (0.1 in)
Connecting rod-to-pin clearance - standard	0.007-0.021 mm (0.0002-0.0008 in)
Connecting rod-to-pin clearance - service limit	-
Connecting rod pin bore diameter	23.007-23.019 mm (0.905-0.906 in)
Connecting rod length (center-to-center)	152.68 mm (6.01 in)
Connecting rod maximum allowed bend	0.038 mm (0.0014 in)
Connecting rod maximum allowed twist	0.050 mm (0.0019 in)
Connecting rod bearing bore diameter - grade 1	59.866-59.872 mm (2.3569-2.3571 in)
Connecting rod bearing bore diameter - grade 2	59.873-59.879 mm (2.3572-2.3574 in)
Connecting rod bearing bore diameter - grade 3	59.880-59.886 mm (2.3574-2.3577 in)
Connecting rod bearing-to-crankshaft clearance	-
Connecting rod side clearance (assembled to crank) - standard	0.175-0.425 mm (0.0068-0.0167 in)
Connecting rod side clearance (assembled to crank) - service limit	-

[a] Refer to the procedure.

[a] Tighten to 20 Nm (15 lb-ft) plus an additional 180 degrees.

[b] Refer to the procedure.

[c] Tighten to 5 Nm (44 lb-in) plus an additional 180 degrees.

DESCRIPTION AND OPERATION

ENGINE

The 3.5L (4V) is a V-6 engine with the following features:

- Dual overhead camshafts
- Four valves per cylinder
- Sequential multi-port fuel injection Sequential Multi-Port Fuel Injection (SFI)
- An aluminum lower intake manifold and a composite upper intake manifold
- Aluminum cylinder heads
- An aluminum, 60-degree V-cylinder block
- Timing chain driven coolant pump
- Variable Camshaft Timing (VCT) system
- The electronic ignition system with 6 ignition coils

Identification

For quick identification, refer to the safety certification decal.

- The decal is located on the LH front door lock face panel.
- An engine identification label is also attached to the engine.
- The symbol code on the identification tag identifies each engine for determining parts usage; for instance, engine displacement in liters or cubic inch displacement and model year.

Exhaust Emission Control System

Operation and required maintenance of the exhaust emission control devices used on this engine is covered in the **Introduction - Gasoline Engines** article.

Induction System

The SFI provides the fuel/air mixture needed for combustion in the cylinders. The 6 solenoid-operated fuel injectors:

- are mounted between the fuel rail and the intake manifold.
- meter fuel into the air intake stream in accordance with engine demand.
- are positioned so that their tips direct fuel just ahead of the engine intake valves.

Valve Train

The valve train uses direct acting mechanical buckets (DAMB). The camshaft lobes are positioned directly above mechanical buckets which are positioned on top of the valves.

Variable Camshaft Timing (VCT) System

The VCT system changes intake camshaft timing dependent on engine speed, load and oil temperature. Oil pressure advances and retards camshaft timing to improve low-speed and high-speed engine performance, engine idle quality and exhaust emissions.

PCV System

All engines are equipped with a closed-type PCV system recycling the crankcase vapors to the upper intake manifold.

Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings, timing chain tensioners and VCT solenoids. The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the head gaskets.

Oil Pump

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.

The heart of the system is a positive displacement internal gear oil pump.

Generically, this design is known as a gerotor pump, which operates as follows:

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through flats on the crankshaft.
- System pressure is limited by an integral, internally-vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.
- Oil pump displacement has been selected to provide adequate volume to make sure of correct oil pressure both at hot idle and maximum speed.
- The relief valve calibration protects the system from excessive pressure during high-viscosity conditions.
- The relief valve is designed to provide adequate connecting rod bearing lubrication under high-temperature and high-speed conditions.

Cooling System

The engine cooling system includes the following:

- Radiator
- Timing chain driven coolant pump
- Electric fan assembly(s)
- Degas bottle (aids in maintaining the correct volume of engine coolant)
- Coolant thermostat
- Coolant hoses

Engine Cylinder Identification

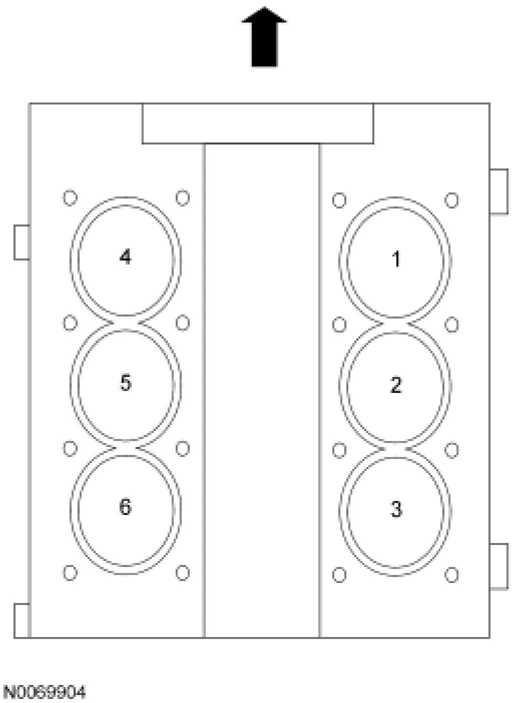

Fig. 1: Engine Cylinder Identification
Courtesy of FORD MOTOR CO.

DIAGNOSTIC TESTS

ENGINE

For basic engine mechanical concerns, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article. For driveability concerns, refer to the **Introduction - Gasoline Engines** article.

GENERAL PROCEDURES

VALVE CLEARANCE CHECK

1. Remove the valve covers. For additional information, refer to **Valve Cover - LH** and **Valve Cover - RH**.

   NOTE: The valve clearance must be measured with the camshaft at base circle. The engine will have to be rotated with the crankshaft pulley bolt to bring each valve to base circle.

2. Use a feeler gauge to measure the clearance of each valve and record its location. A mid-range clearance is the most desirable:
   - Intake: 0.15-0.25 mm (0.006-0.01 in)
   - Exhaust: 0.300-0.400 mm (0.0118-0.0157 in)

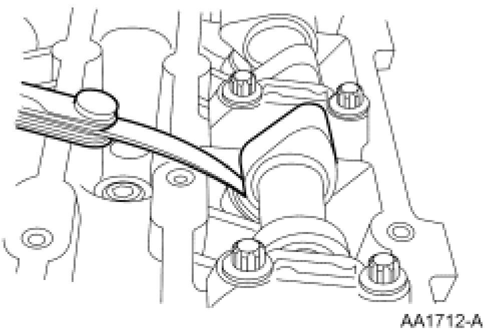

Fig. 2: Measuring Each Valve's Clearance Using A Feeler Gauge
Courtesy of FORD MOTOR CO.

NOTE: The number on the valve tappet reflects the thickness of the valve tappet. For example, a tappet with the number 3.310 has the thickness of 3.31 mm (0.13 in).

3. If any of the valve clearances are out of specification, select new tappets using this formula: tappet thickness = measured clearance + the base tappet thickness - most desirable thickness.

   Select the tappets and mark the installation location.

4. If required, install the new selected valve tappets in the marked locations. For additional information, refer to **Valve Tappets**.

IN-VEHICLE SERVICING

UPPER INTAKE MANIFOLD

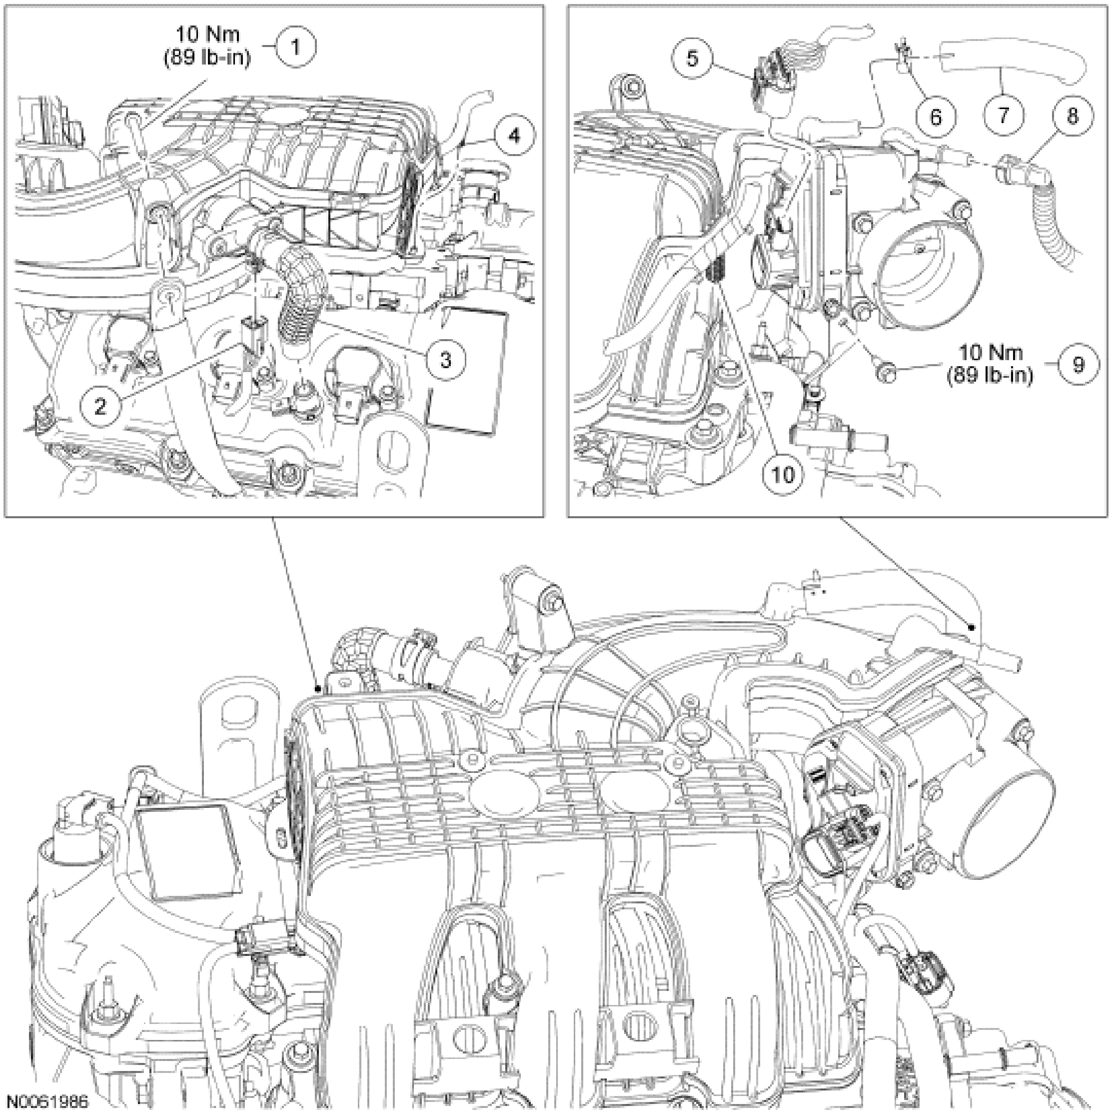

Fig. 3: Exploded View Of Upper Intake Manifold With Torque Specifications (1 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W503274	Upper intake manifold long support bracket bolt (early build engines)
2	14A464	Heated PCV electrical connector (part of 12C508) (early build engines)
3	6K817	PCV hose
4	13A506	Block heater wiring harness retainer (part of 6B018)
5	14A464	Throttle body (TB) electrical connector (part of 12C508)
6	CS16140	Brake booster-to-intake manifold vacuum hose clamp
7	6K817	Brake booster-to-intake manifold vacuum hose
8	9D661	Evaporative emissions (EVAP)-to-intake manifold tube

9	W503274	Upper intake manifold short support bracket bolt
10	-	Engine control wiring harness retainer (part of 12C508)

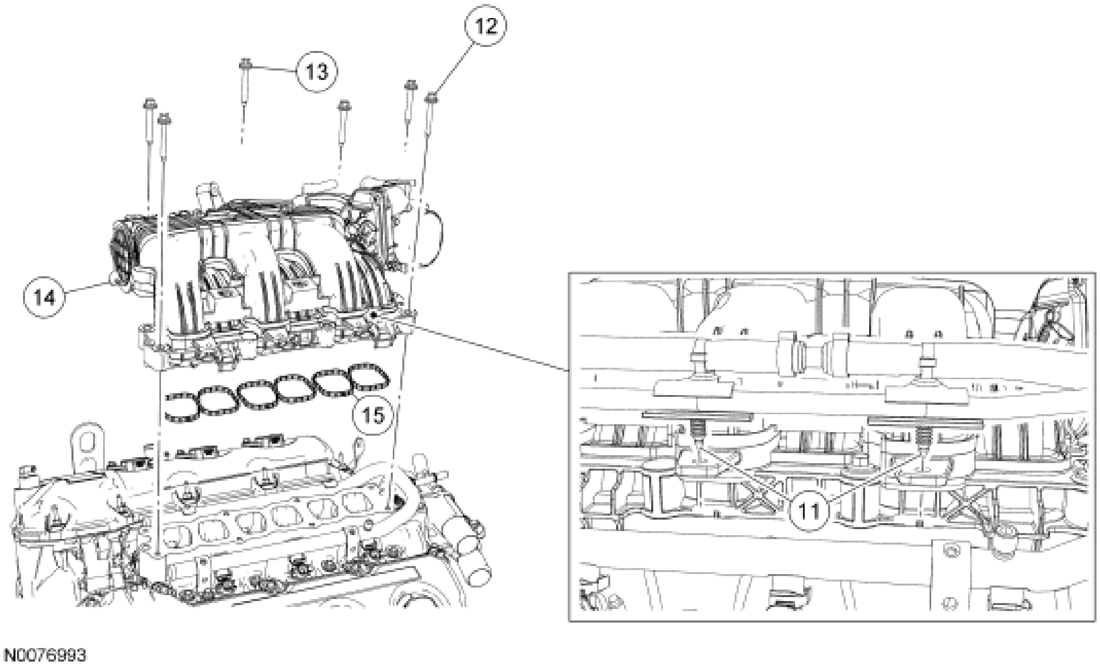

Fig. 4: Exploded View Of Upper Intake Manifold With Torque Specifications (2 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
11	13A506	Wire harness pin-type retainers (part of 14B060)
12	W503282	Upper intake manifold bolt (5 required)
13	W707083	Upper intake manifold bolt
14	9S455	Upper intake manifold
15	9H486	Upper intake manifold gasket (3 required)

REMOVAL

All engines

1. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
2. Disconnect the throttle body (TB) electrical connector.
3. Disconnect the evaporative emissions (EVAP) tube from the intake manifold. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
4. Disconnect the brake booster vacuum hose from the intake manifold.

5. Disconnect the PCV tube from the PCV valve.

Early build engines

6. Remove the upper intake manifold long support bracket bolt.
7. Disconnect the heated PCV electrical connector.

All engines

8. Detach all the wiring harness retainers from the upper intake manifold.
9. If equipped, detach the cylinder block heater wiring harness retainer from the upper intake manifold.
10. Remove the upper intake manifold short support bracket bolt.
11. Remove the 6 bolts and the upper intake manifold.
    - Remove and discard the gaskets.
    - Clean and inspect all of the sealing surfaces of the upper and lower intake manifold.

INSTALLATION

All engines

1. Using new gaskets, install the upper intake manifold and the 6 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

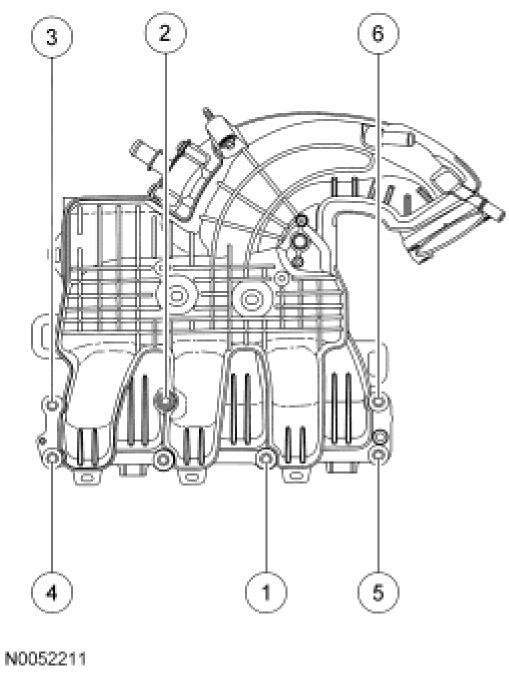

Fig. 5: Installing Upper Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

2. Install the upper intake manifold short support bracket bolt.
   - Tighten to 10 Nm (89 lb-in).
3. If equipped, attach the cylinder block heater wiring harness retainer to the upper intake manifold.
4. Attach all the wiring harness retainers to the upper intake manifold.
5. Connect the PCV tube to the PCV valve.

   Early build engines

6. Connect the heated PCV electrical connector.
7. Install the upper intake manifold long support bracket bolt.
   - Tighten to 10 Nm (89 lb-in).

   All engines

8. Connect the brake booster vacuum hose to the intake manifold.
9. Connect the EVAP tube to the intake manifold. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
10. Connect the TB electrical connector.
11. Install the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.

LOWER INTAKE MANIFOLD

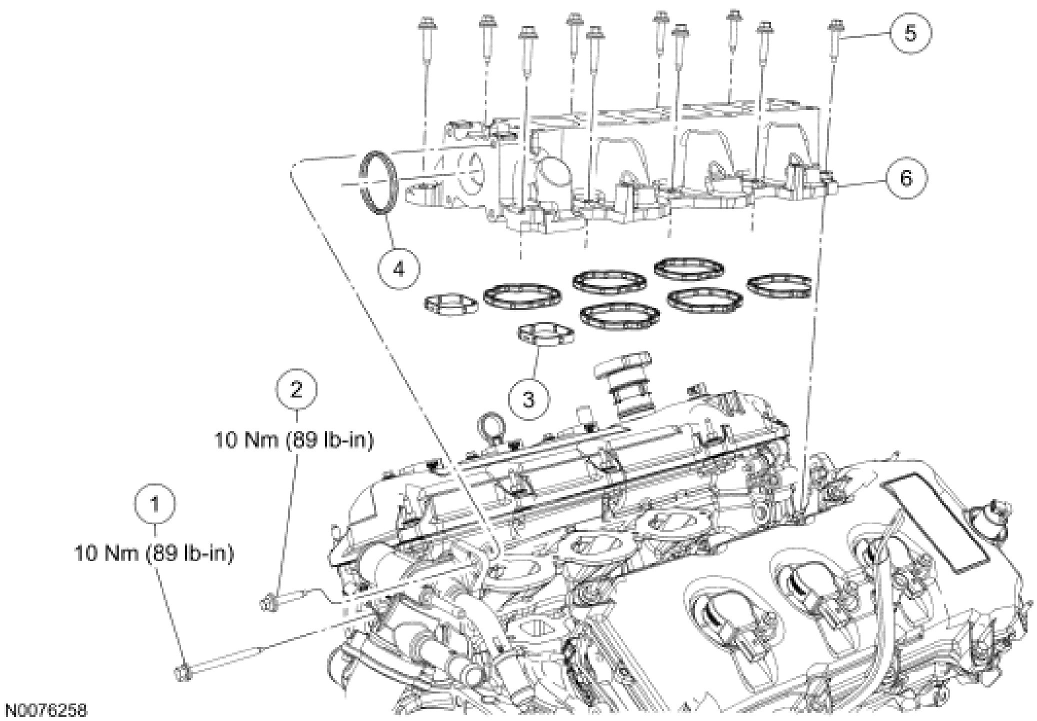

Fig. 6: Exploded View Of Lower Intake Manifold With Torque Specifications

Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W708607	Thermostat housing-to-lower intake manifold bolt
2	W503279	Thermostat housing-to-lower intake manifold bolt
3	9439	Lower intake manifold gasket (8 required)
4	8A571	Thermostat housing gasket
5	W503279	Lower intake manifold bolt (10 required)
6	9K461	Lower intake manifold

REMOVAL

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Drain the cooling system. For additional information, refer to **ENGINE COOLING** article.
3. Remove the fuel rail. For additional information, refer to **FUEL CHARGING AND CONTROLS - 3.5L** article.
4. Remove the 2 thermostat housing-to-lower intake manifold bolts.
5. Remove the 10 bolts and the lower intake manifold.
    - Remove and discard the intake manifold and thermostat housing gaskets.
    - Clean and inspect all sealing surfaces.

INSTALLATION

1. Using new intake manifold and thermostat housing gaskets, install the lower intake manifold and the 10 bolts.
    - Tighten in the sequence shown to 10 Nm (89 lb-in).

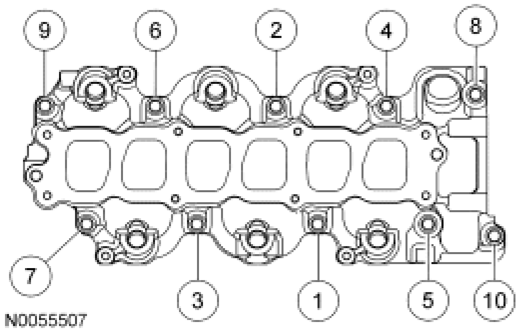

Fig. 7: Installing Lower Intake Manifold Bolts In Sequence
Courtesy of FORD MOTOR CO.

2. Install the 2 thermostat housing-to-lower intake manifold bolts.
    - Tighten to 10 Nm (89 lb-in).
3. Install the fuel rail. For additional information, refer to **FUEL CHARGING AND CONTROLS - 3.5L** article.
4. Fill and bleed the cooling system. For additional information, refer to **ENGINE COOLING** article.

14	6A559	LH valve cover gasket

REMOVAL

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

1. Remove the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
2. Remove the LH ignition coils. For additional information, refer to **ENGINE IGNITION - 3.5L** article.
3. Remove the oil level indicator.
4. Disconnect the LH variable camshaft timing (VCT) solenoid electrical connector.
5. Detach the 2 wiring harness retainers.

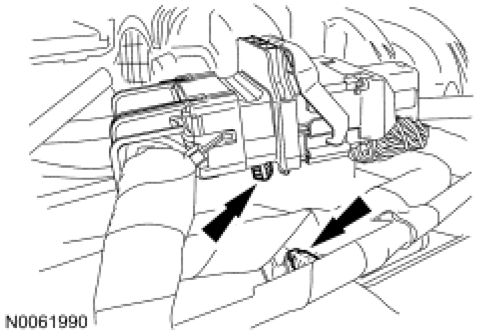

Fig. 10: Identifying Wiring Harness Retainers
Courtesy of FORD MOTOR CO.

6. Disconnect the 2 engine control wiring harness electrical connectors.

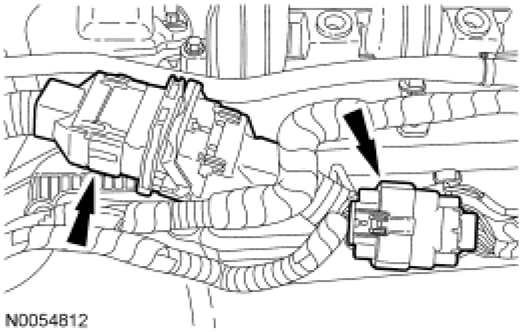

Fig. 11: Identifying Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

7. Remove the 2 nuts and the wiring harness retaining bracket.

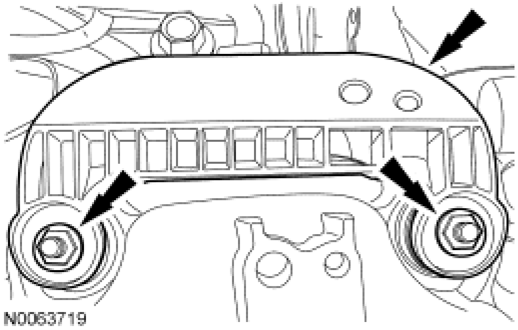

Fig. 12: Identifying Wiring Harness Retaining Bracket & Nuts
Courtesy of FORD MOTOR CO.

8. Detach all of the wiring harness retainers from the valve cover and the stud bolts.
9. Disconnect the 3 LH fuel injector electrical connectors.
10. Remove the 11 stud bolts and the LH valve cover.
    - Discard the gasket.

NOTE: VCT solenoid seal removal shown, spark plug tube seal removal similar.

11. Inspect the VCT solenoid seals and the spark plug tube seals. Remove any damaged seals.
    - Using the special tools, remove the seal(s).

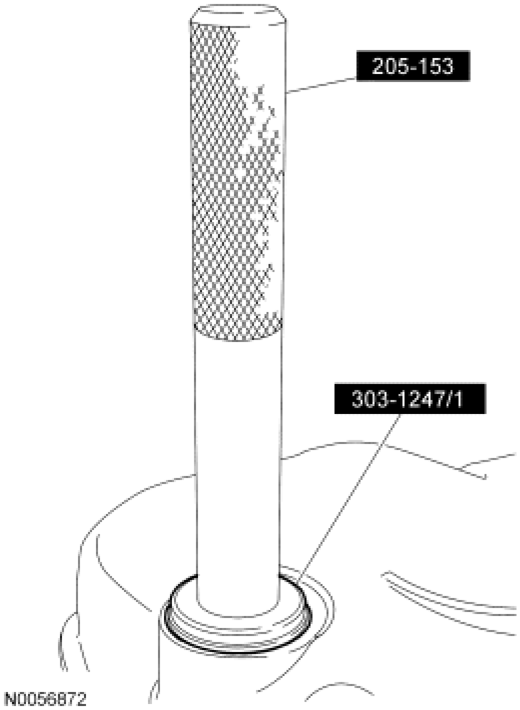

Fig. 13: Removing Seals Using Special Tools (205-153) & (303-1247/1)

12. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

INSTALLATION

NOTE: **Installation of new seals is only required if damaged seals were removed during disassembly of the engine.**

NOTE: **Spark plug tube seal installation shown, VCT seal installation similar.**

1. Using the special tools, install new VCT solenoid and/or spark plug tube seals.

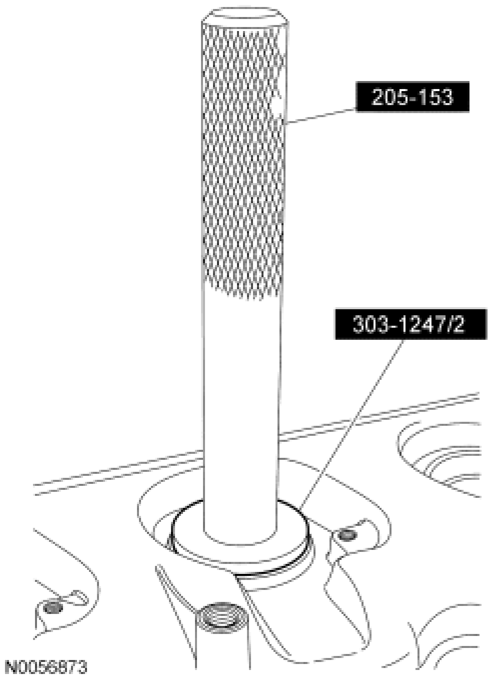

Fig. 14: Installing VCT Solenoid And/Or Spark Plug Tube Seals Using Special Tools (205-153) & (303-1247/2)
Courtesy of FORD MOTOR CO.

CAUTION: **Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.**

NOTE: **If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.**

2. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front

cover-to-LH cylinder head joints.

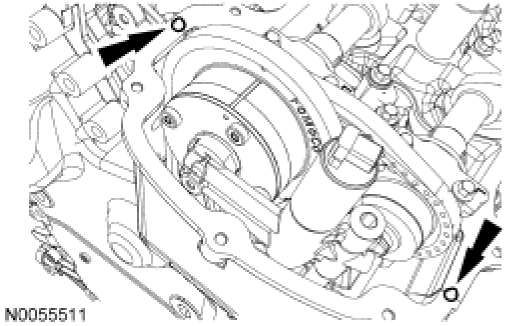

Fig. 15: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-LH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

3. Using a new gasket, install the LH valve cover and 11 stud bolts.
   - Tighten in the sequence shown to 10 Nm (89 lb-in).

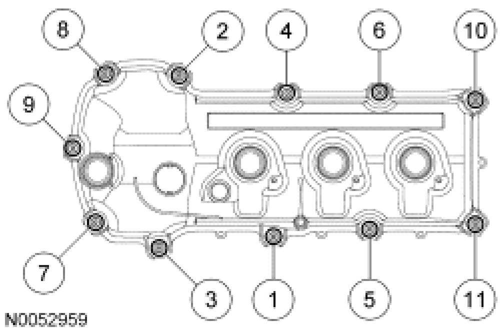

Fig. 16: Installing LH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

4. Connect the 3 LH fuel injector electrical connectors.
5. Attach all of the wiring harness retainers to the valve cover and the stud bolts.
6. Install the wiring harness retaining bracket and the 2 nuts.
   - Tighten to 9 Nm (80 lb-in).
7. Connect the 2 engine control wiring harness electrical connectors.
8. Attach the 2 wiring harness retainers.
9. Connect the LH VCT solenoid electrical connector.
10. Install the oil level indicator.
11. Install the LH ignition coils. For additional information, refer to **ENGINE IGNITION - 3.5L** article.
12. Install the air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.

VALVE COVER - RH

15	6C535	Spark plug tube seal (3 required)
16	6582	RH valve cover
17	6584	RH valve cover gasket

REMOVAL

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

All engines

1. Remove the RH ignition coils. For additional information, refer to **ENGINE IGNITION - 3.5L** article.
2. Remove the power steering fluid reservoir. For additional information, refer to **POWER STEERING** article.
3. Disconnect the power steering pressure (PSP) switch electrical connector.
4. Disconnect the RH catalyst monitor sensor electrical connector and retainer.
5. Remove the PSP hose bracket nut from the valve cover stud bolt and position the bracket aside.

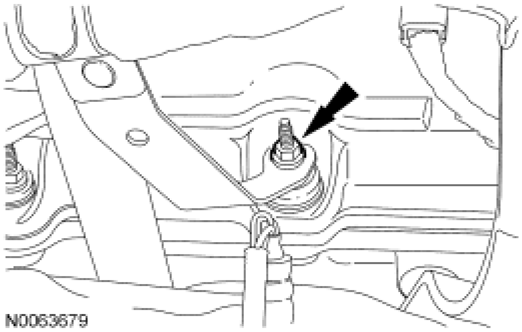

Fig. 20: Identifying PSP Hose Bracket Nut
Courtesy of FORD MOTOR CO.

6. Disconnect the RH heated oxygen sensor (HO2S) electrical connector.
7. Disconnect the RH variable camshaft timing (VCT) electrical connector.
8. Disconnect the 3 RH fuel injector electrical connectors.

Early build engines

9. Disconnect the heated PCV valve electrical connector.

All engines

10. Detach all of the wiring harness retainers from the valve cover and the stud bolts.
11. Remove the A/C tube retaining clamp bolt.
12. Remove the 2 A/C tube retaining clamp bolts.

NOTE: It is necessary to reposition the A/C tubes to remove the valve cover.

13. Remove the bolt, the 10 stud bolts and the RH valve cover.

- Discard the gasket.

NOTE: VCT solenoid seal removal shown, spark plug tube seal removal similar.

14. Inspect the VCT solenoid seals and the spark plug tube seals. Remove any damaged seals.
    - Using the special tools, remove the seal(s).

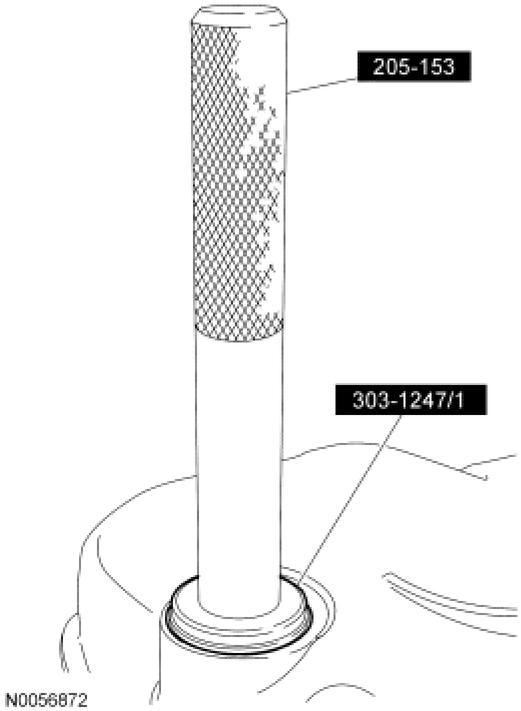

Fig. 21: Removing Seals Using Special Tools (205-153) & (303-1247/1)
Courtesy of FORD MOTOR CO.

15. Clean the valve cover, cylinder head and engine front cover sealing surfaces with metal surface prep.

INSTALLATION

All engines

NOTE: Installation of new seals is only required if damaged seals were removed during disassembly of the engine.

NOTE: Spark plug tube seal installation shown, VCT seal installation similar.

1. Using the special tools, install new VCT solenoid and/or spark plug tube seals.

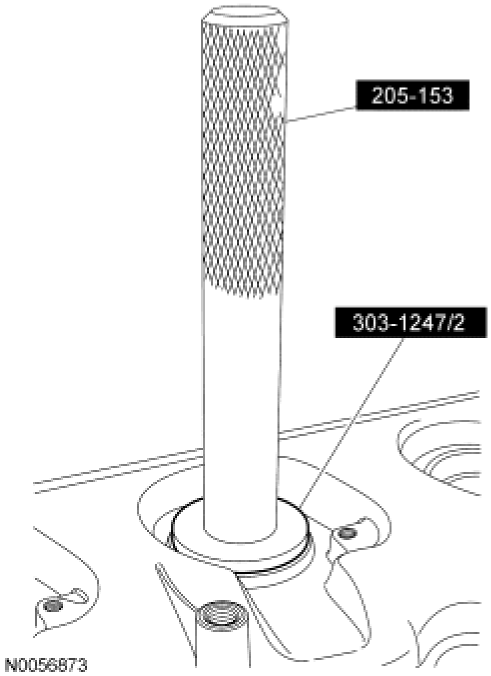

Fig. 22: Installing VCT Solenoid And/Or Spark Plug Tube Seals Using Special Tools (205-153) & (303-1247/2)
Courtesy of FORD MOTOR CO.

CAUTION: Failure to use Motorcraft High Performance Engine RTV Silicone may cause the engine oil to foam excessively and result in serious engine damage.

NOTE: If the valve cover is not installed and the fasteners tightened within 4 minutes, the sealant must be removed and the sealing area cleaned. To clean the sealing area, use silicone gasket remover and metal surface prep. Failure to follow this procedure can cause future oil leakage.

2. Apply an 8 mm (0.31 in) bead of Motorcraft High Performance Engine RTV Silicone to the engine front cover-to-RH cylinder head joints.

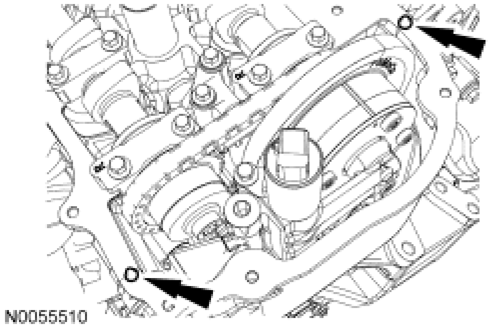

Fig. 23: Applying Bead Of Motorcraft High Performance Engine RTV Silicone To Engine Front Cover-To-RH Cylinder Head Joints
Courtesy of FORD MOTOR CO.

3. Using a new gasket, install the RH valve cover, bolt and the 10 stud bolts.
   - Tighten in the sequence shown to 10 Nm (89 lb-in).

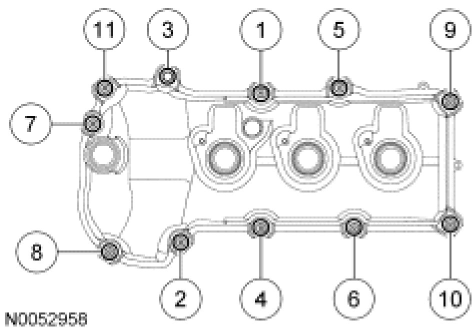

Fig. 24: Installing RH Valve Cover Stud Bolts In Sequence
Courtesy of FORD MOTOR CO.

4. Position the A/C tubes and install the 2 retaining clamp bolts.
   - Tighten to 10 Nm (89 lb-in).
5. Install the A/C tube retaining clamp bolt.
   - Tighten to 8 Nm (71 lb-in).
6. Attach all of the wiring harness retainers to the valve cover and the stud bolts.

Early build engines

7. Connect the heated PCV valve electrical connector.

All engines

8. Connect the 3 LH fuel injector electrical connectors.
9. Connect the LH VCT electrical connector.
10. Connect the RH HO2S electrical connector.
11. Install the PSP hose bracket and nut.
    - Tighten to 9 Nm (80 lb-in).
12. Connect the RH catalyst monitor sensor electrical connector and retainer.
13. Connect the PSP switch electrical connector.
14. Install the power steering fluid reservoir. For additional information, refer to **POWER STEERING** article.
15. Install the RH ignition coils. For additional information, refer to **ENGINE IGNITION - 3.5L** article.

LOWER END COMPONENTS - EXPLODED VIEW, CRANKSHAFT PULLEY AND CRANKSHAFT

FRONT SEAL

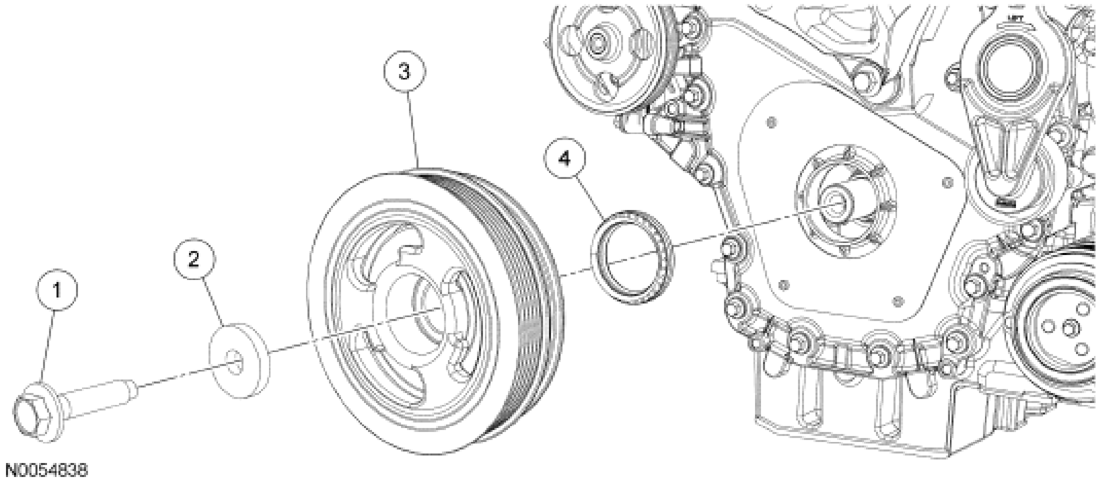

Fig. 25: Exploded View Of Crankshaft Pulley & Crankshaft Front Seal
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701512	Crankshaft pulley bolt
2	N806165	Washer
3	6316	Crankshaft pulley
4	6700	Crankshaft front seal

1. For additional information, refer to the procedures.

CRANKSHAFT PULLEY

Special Tools

Illustration	Tool Name	Tool Number
	3-Jaw Puller	303-D121

 ST1184-A		
 ST1287-A	Installer, Crankshaft Vibration Damper	303-102 (T74P-6316-B)
 ST2296-A	Installer, Front Cover Oil Seal	303-335
	Strap Wrench	303-D055 (D85L-6000-A)

		

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the accessory drive belt and the power steering belt. For additional information, refer to **ACCESSORY DRIVE - 3.5L** article.
3. Using the Strap Wrench, remove the crankshaft bolt and washer.
   - Discard the bolt.

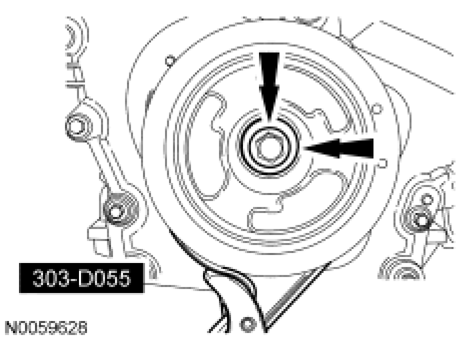

Fig. 26: Removing Crankshaft Bolt & Washer Using Special Tool (303-D055)
Courtesy of FORD MOTOR CO.

4. Using the 3-Jaw Puller, remove the crankshaft pulley.

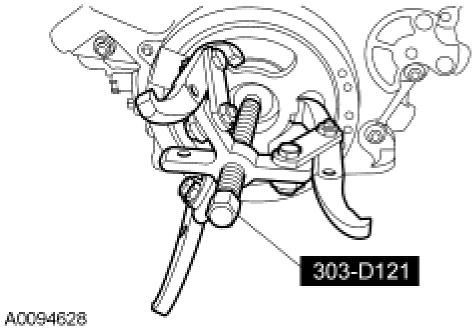

Fig. 27: Identifying Special Tools (303-D121) And Crankshaft Pulley
Courtesy of FORD MOTOR CO.

INSTALLATION

1. Lubricate the crankshaft front seal inner lip with clean engine oil.

NOTE: Lubricate the outside diameter sealing surfaces with clean engine oil.

2. Using the Front Cover Oil Seal Installer and Crankshaft Vibration Damper Installer, install the crankshaft pulley.

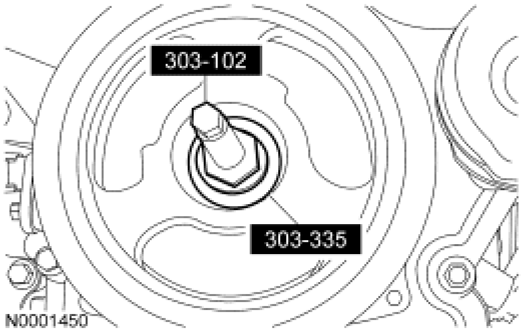

Fig. 28: Installing Crankshaft Pulley
Courtesy of FORD MOTOR CO.

3. Using the Strap Wrench, install the crankshaft pulley washer and new bolt and tighten in 4 stages.
   - Stage 1: Tighten to 120 Nm (89 lb-ft).
   - Stage 2: Loosen one full turn.
   - Stage 3: Tighten to 50 Nm (37 lb-ft).
   - Stage 4: Tighten an additional 90 degrees.

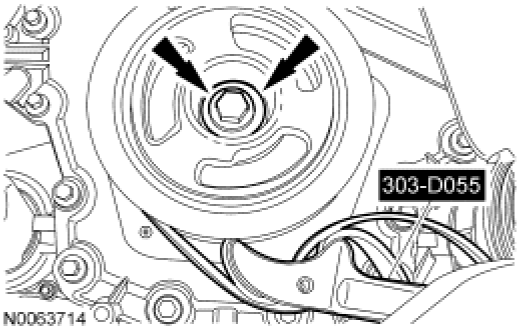

Fig. 29: Installing Crankshaft Pulley Washer & Bolt Using Special Tools (303-D055)
Courtesy of FORD MOTOR CO.

4. Install the accessory drive belt and the power steering belt. For additional information, refer to **ACCESSORY DRIVE - 3.5L** article.

CRANKSHAFT FRONT SEAL

Special Tools

Illustration	Tool Name	Tool Number
	Installer, Crankshaft Vibration Damper	303-102 (T74P-6316-B)
	Installer, Front Crankshaft Seal	303-1251

 ST2981-A		
 ST1385-A	Remover, Oil Seal	303-409 (T92C-6700CH)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the crankshaft pulley. For additional information, refer to **Crankshaft Pulley**.

3. Using the Oil Seal Remover, remove and discard the crankshaft front seal.
    - Clean all sealing surfaces with metal surface prep.

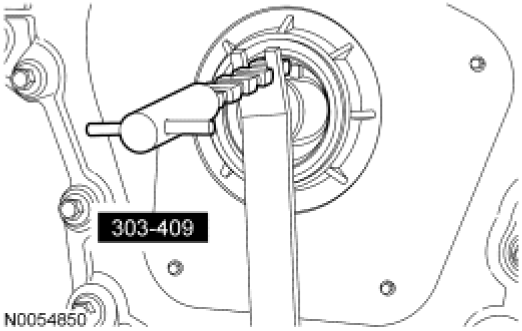

Fig. 30: Removing Crankshaft Front Seal Using Special Tool (303-409)
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: **Apply clean engine oil to the crankshaft front seal bore in the engine front cover.**

1. Using the Front Crankshaft Seal Installer and Crankshaft Vibration Damper Installer, install a new crankshaft front seal.

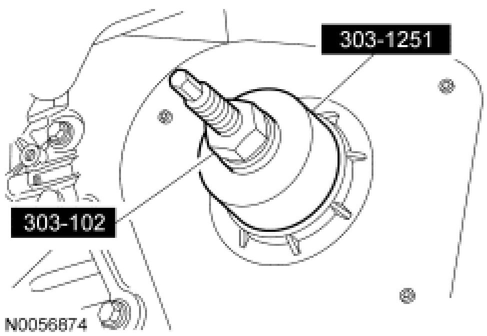

Fig. 31: Installing Crankshaft Front Seal Using Special Tools (303-102) & (303-1251)
Courtesy of FORD MOTOR CO.

2. Install the crankshaft pulley. For additional information, refer to **Crankshaft Pulley**.

LOWER END COMPONENTS - EXPLODED VIEW, FLEXPLATE AND CRANKSHAFT REAR SEAL

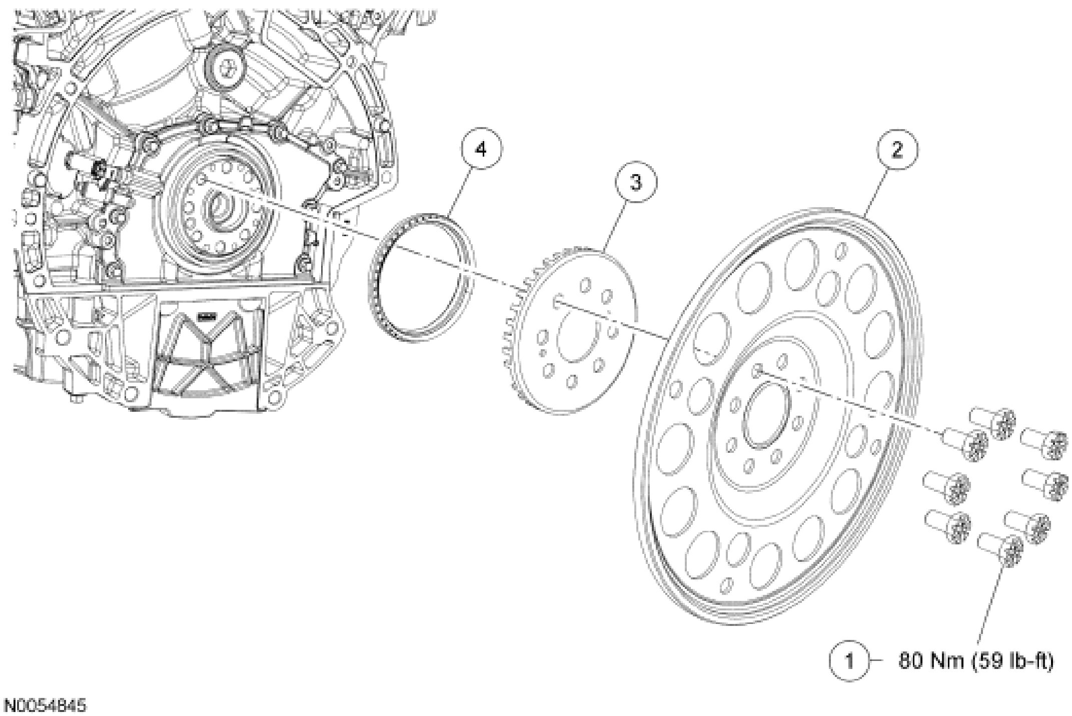

Fig. 32: Exploded View Of Flexplate & Crankshaft Rear Seal With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701559	Flexplate bolt (8 required)
2	6375	Flexplate
3	12A227	Crankshaft sensor ring
4	6701	Crankshaft rear seal

1. For additional information, refer to the procedures.

FLEXPLATE

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the transaxle. For additional information, refer to **AUTOMATIC TRANSAXLE/TRANSMISSION - AISIN AW21** article.

NOTE: One of the 8 flexplate holes are offset so the flexplate can only be installed in one position.

3. Remove the bolts and the flexplate.
   - To install, tighten to 80 Nm (59 lb-ft).

4. To install, reverse the removal procedure.

CRANKSHAFT REAR SEAL

Special Tools

Illustration	**Tool Name**	**Tool Number**
 ST1326-A	Handle	205-153 (T80T-4000-W)
 ST2980-A	Installer, Rear Main Seal	303-1250
	Remover, Crankshaft Rear Oil Seal	303-519 (T95P-6701-EH)

		
	Slide Hammer	307-005 (T59L-100-B)

Material

Item	**Specification**
Motorcraft Metal Surface Prep ZC-31-A	-
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Remove the flexplate. For additional information, refer to **Flexplate**.

3. Remove the crankshaft sensor ring.
4. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove and discard the crankshaft rear seal.
   - Clean all sealing surfaces with metal surface prep.

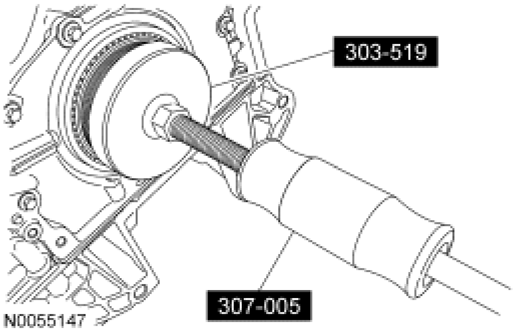

Fig. 33: Removing Crankshaft Rear Seal Using Special Tools (303-519) & (307-005)
Courtesy of FORD MOTOR CO.

INSTALLATION

NOTE: Lubricate the seal lips and bore with clean engine oil prior to installation.

1. Position the Rear Main Seal Installer onto the end of the crankshaft and slide a new crankshaft rear seal onto the tool.

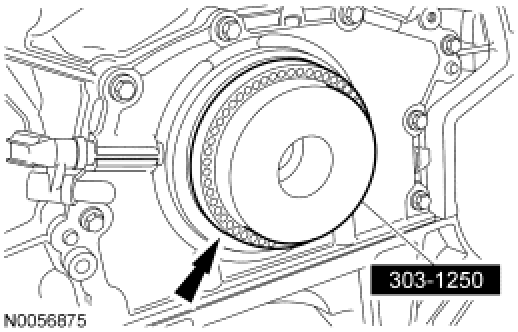

Fig. 34: Positioning Special Tool (303-1250) Onto End Of Crankshaft
Courtesy of FORD MOTOR CO.

2. Using the Rear Main Seal Installer and Handle, install the new crankshaft rear seal.

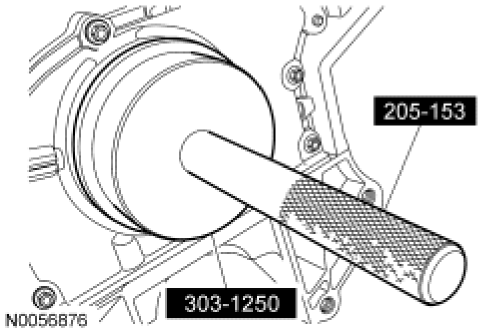

Fig. 35: Installing New Crankshaft Rear Seal Using Special Tools (303-1250) & (205-153)
Courtesy of FORD MOTOR CO.

3. Install the crankshaft sensor ring.
4. Install the flexplate. For additional information, refer to **Flexplate**.

OIL FILTER ADAPTER

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (US); Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12 (Canada); or equivalent	WSS-M2C930-A

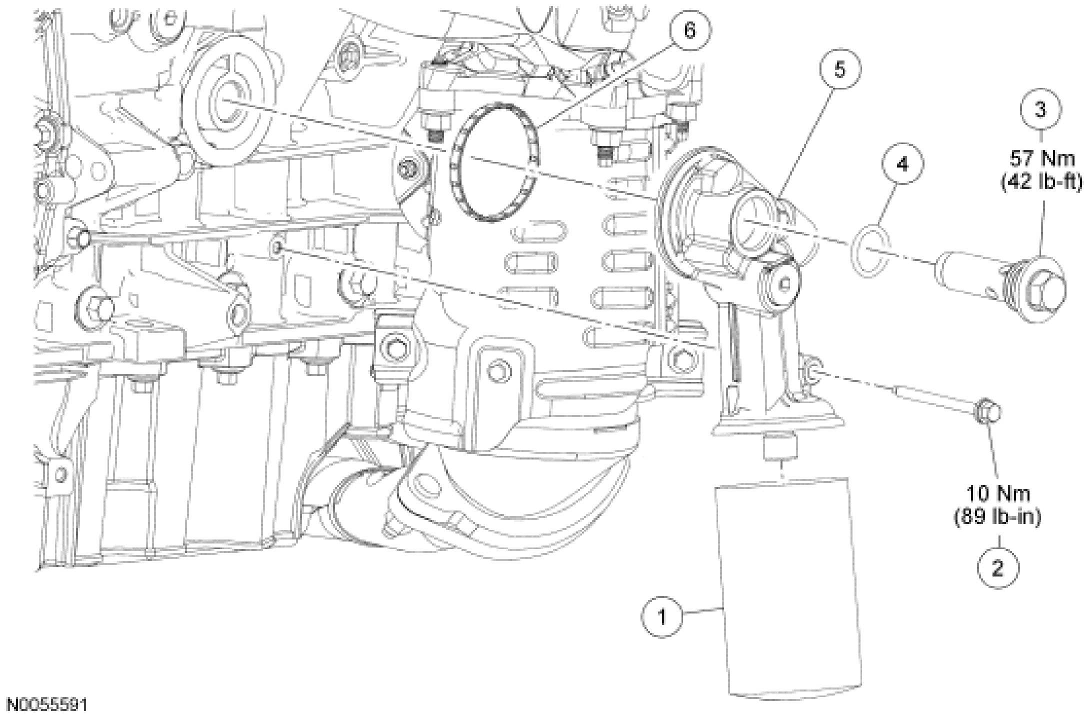

Fig. 36: Exploded View Of Oil Filter Adapter With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	6714	Engine oil filter
2	W708607	Oil filter adapter bolt
3	6895	Oil filter adapter bolt
4	6K649	O-ring seal
5	6831	Oil filter adapter
6	6A636	Oil filter adapter gasket

REMOVAL

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. If equipped, remove the 6 screws and the underbody shield.

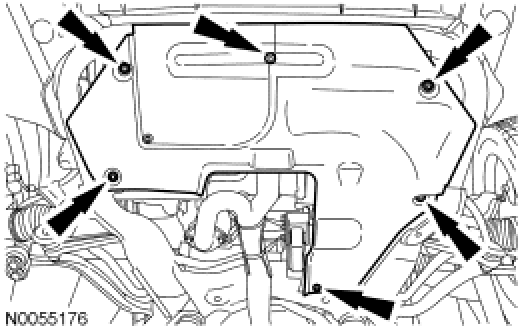

Fig. 37: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

3. Remove and discard the engine oil filter.
4. Remove the 2 bolts and the oil filter adapter.
    - Discard the gasket and O-ring seal.
    - Clean and inspect all sealing surfaces.

INSTALLATION

1. Using a new gasket and O-ring seal, install the oil filter adapter.
    - Tighten the large bolt to 57 Nm (42 lb-ft).
    - Tighten the small bolt to 10 Nm (89 lb-in).

NOTE: Lubricate the engine oil filter gasket with clean engine oil prior to installing the oil filter.

2. Install a new engine oil filter.

- Tighten to 5 Nm (44 lb-in) and then rotate an additional 180 degrees.

3. If equipped, install the 6 screws and the underbody shield.

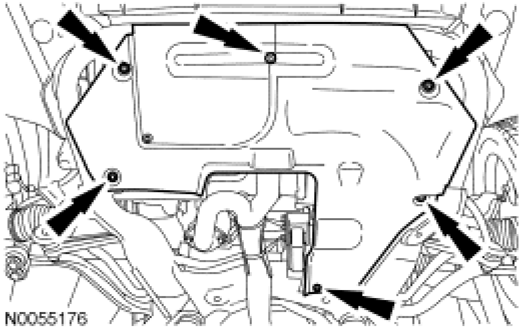

Fig. 38: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

ENGINE OIL PRESSURE (EOP) SWITCH

Material

Item	Specification
Thread Sealant with PTFE TA-24	WSK-M2G350-A2

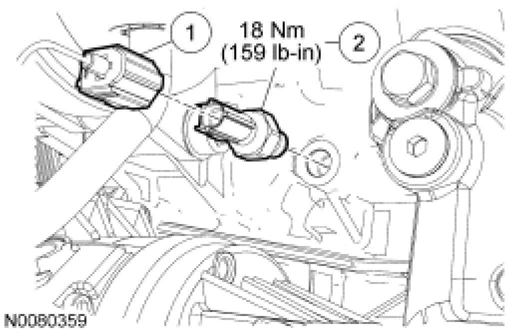

Fig. 39: Exploded View Of Engine Oil Pressure (EOP) Switch With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	14A464	Engine Oil Pressure (EOP) switch electrical connector (part of 12C508)
2	9278	EOP switch

REMOVAL AND INSTALLATION

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. If equipped, remove the 6 screws and the underbody shield.

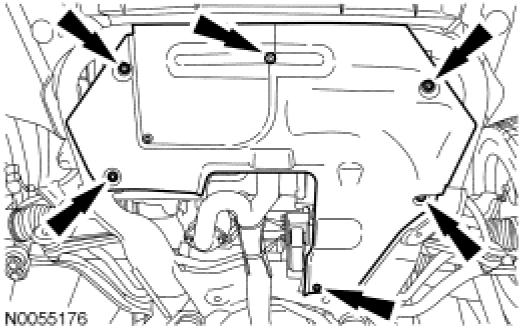

Fig. 40: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

3. Disconnect the Engine Oil Pressure (EOP) switch electrical connector.
4. Remove the EOP switch.
   - To install, tighten to 18 Nm (159 lb-in).
5. To install, reverse the removal procedure.
   - Apply thread sealant with PTFE to the EOP switch threads prior to installation.

EXHAUST MANIFOLD - LH

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-

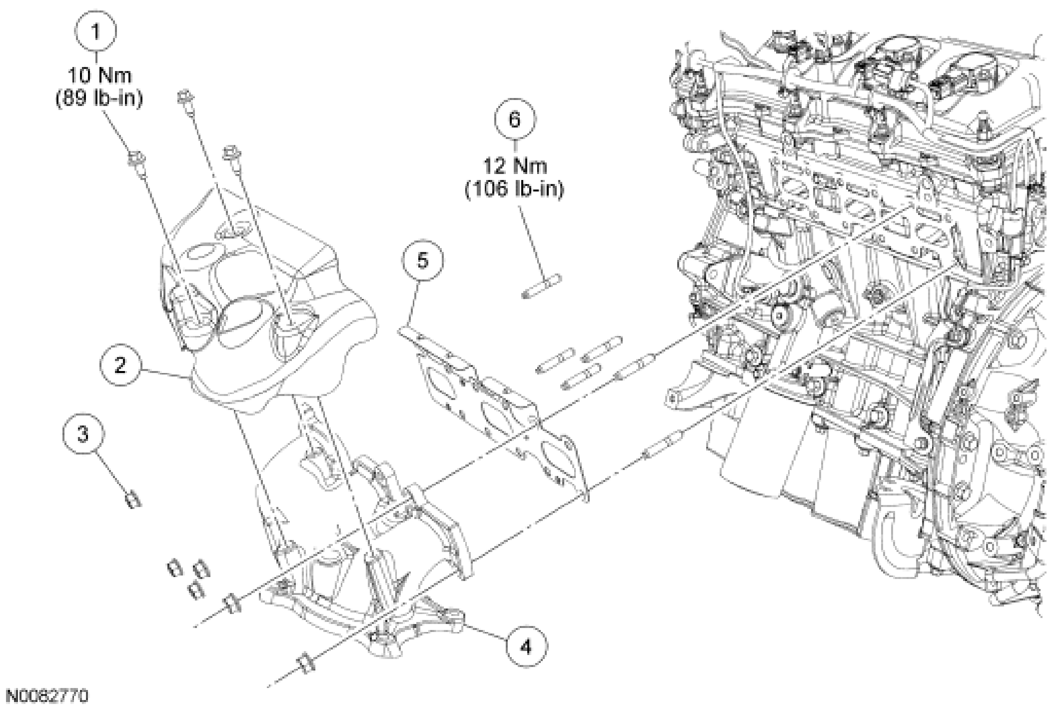

Fig. 41: Exploded View Of LH Exhaust Manifold With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W713299	LH exhaust manifold heat shield bolt (3 required)
2	9Y427	LH exhaust manifold heat shield
3	W701706	LH exhaust manifold nut (6 required)
4	9431	LH exhaust manifold
5	9448	LH exhaust manifold gasket
6	W701732	LH exhaust manifold stud (6 required)

REMOVAL

1. Remove the LH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
2. Remove the LH Heated Oxygen Sensor (HO2S). For additional information, refer to **ELECTRONIC ENGINE CONTROLS - 3.5L** article.
3. Remove the 3 bolts and the LH exhaust manifold heat shield.
4. Remove the 6 nuts and the LH exhaust manifold.
   - Discard the nuts and gasket.
5. Clean and inspect the LH exhaust manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
6. Remove and discard the 6 LH exhaust manifold studs.

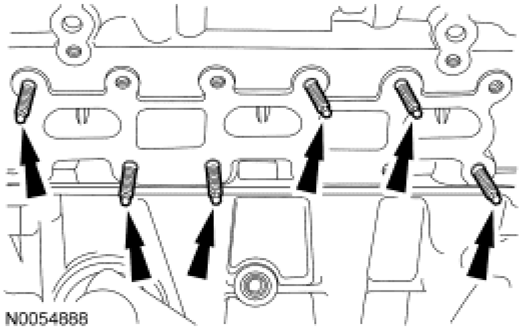

Fig. 42: Locating LH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

NOTE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.**

7. Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

INSTALLATION

1. Install 6 new LH exhaust manifold studs.
   - Tighten to 12 Nm (106 lb-in).

NOTE: Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.

2. Using a new gasket, install the LH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
   - Stage 1: Tighten to 20 Nm (177 lb-in).
   - Stage 2: Tighten to 25 Nm (18 lb-ft).

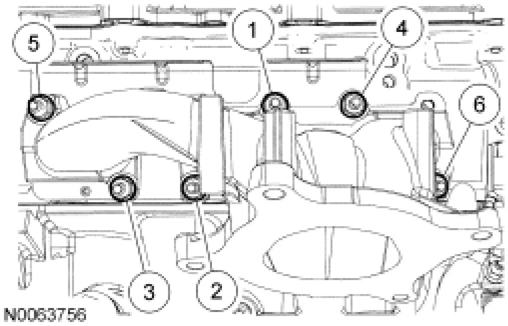

Fig. 43: Installing LH Exhaust Manifold Nuts In Sequence
Courtesy of FORD MOTOR CO.

3. Install the LH exhaust manifold heat shield and the 3 bolts.
   - Tighten to 10 Nm (89 lb-in).
4. Install the LH HO2S. For additional information, refer to **ELECTRONIC ENGINE CONTROLS - 3.5L** article.
5. Install the LH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.

EXHAUST MANIFOLD - RH

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31	-

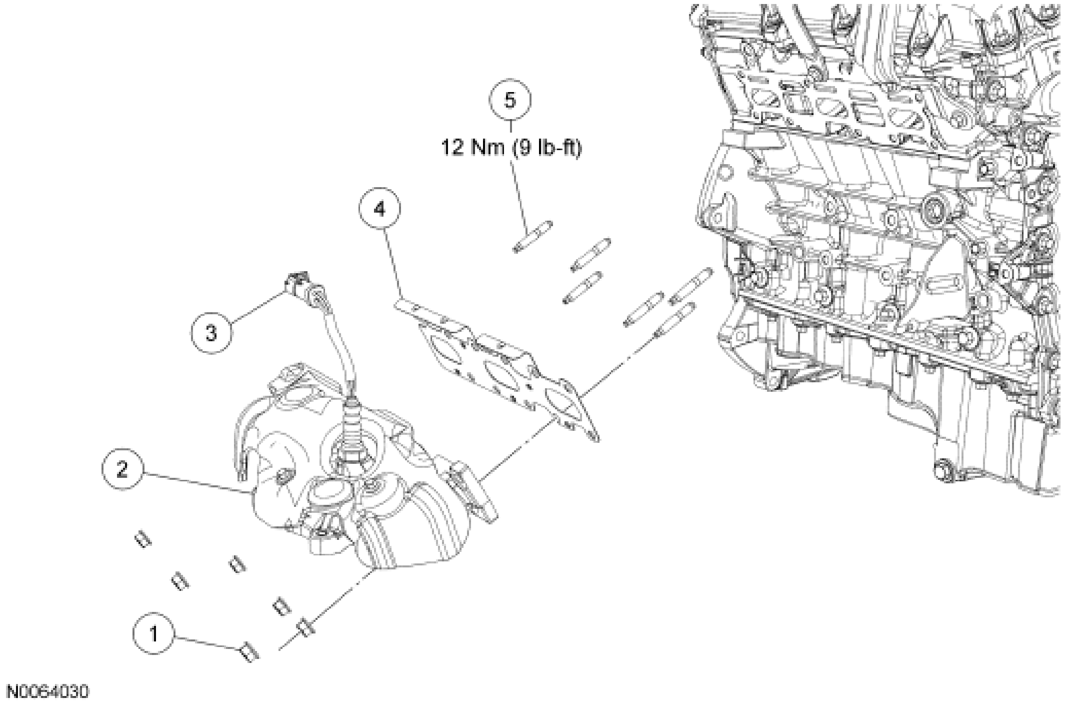

Fig. 44: Exploded View Of RH Exhaust Manifold With Torque Specification
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W701706	RH exhaust manifold nut (6 required)
2	9430	RH exhaust manifold
3	14A464	RH heated oxygen sensor (H02S) electrical connector
4	9448	RH exhaust manifold gasket
5	W701732	RH exhaust manifold stud (6 required)

REMOVAL

1. Remove the RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.
2. Disconnect the RH heated oxygen sensor (HO2S) electrical connector.
3. Remove the 6 nuts and the RH exhaust manifold.
    - Discard the nuts and gasket.
4. Clean and inspect the RH exhaust manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
5. Remove and discard the 6 RH exhaust manifold studs.

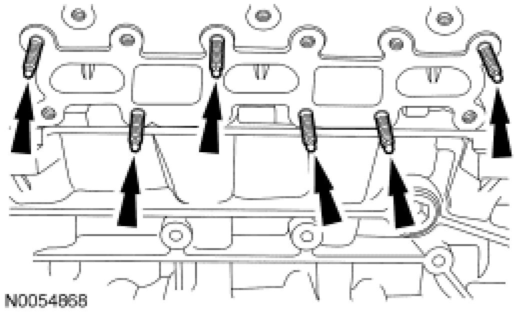

Fig. 45: Locating RH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These may cause scratches and gouges resulting in leak paths. Use a plastic scraper to clean the sealing surfaces.

6. Clean the exhaust manifold mating surface of the cylinder head with metal surface prep. Follow the directions on the packaging.

INSTALLATION

1. Install 6 new RH exhaust manifold studs.
    - Tighten to 12 Nm (9 lb-ft).

CAUTION: Failure to tighten the exhaust manifold nuts to specification a second time will cause the exhaust manifold to develop an exhaust leak.

2. Using a new gasket, install the RH exhaust manifold and 6 new nuts. Tighten in 2 stages in the sequence shown:
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten to 20 Nm (15 lb-ft).

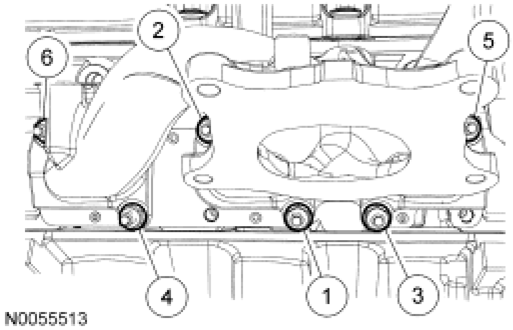

Fig. 46: Installing RH Exhaust Manifold Nuts In Sequence
Courtesy of FORD MOTOR CO.

3. Connect the RH HO2S electrical connector.
4. Install the RH catalytic converter. For additional information, refer to **EXHAUST SYSTEM** article.

ENGINE MOUNT

Special Tools

Illustration	Tool Name	Tool Number
	Oil Pan Holding Fixture	303-1295

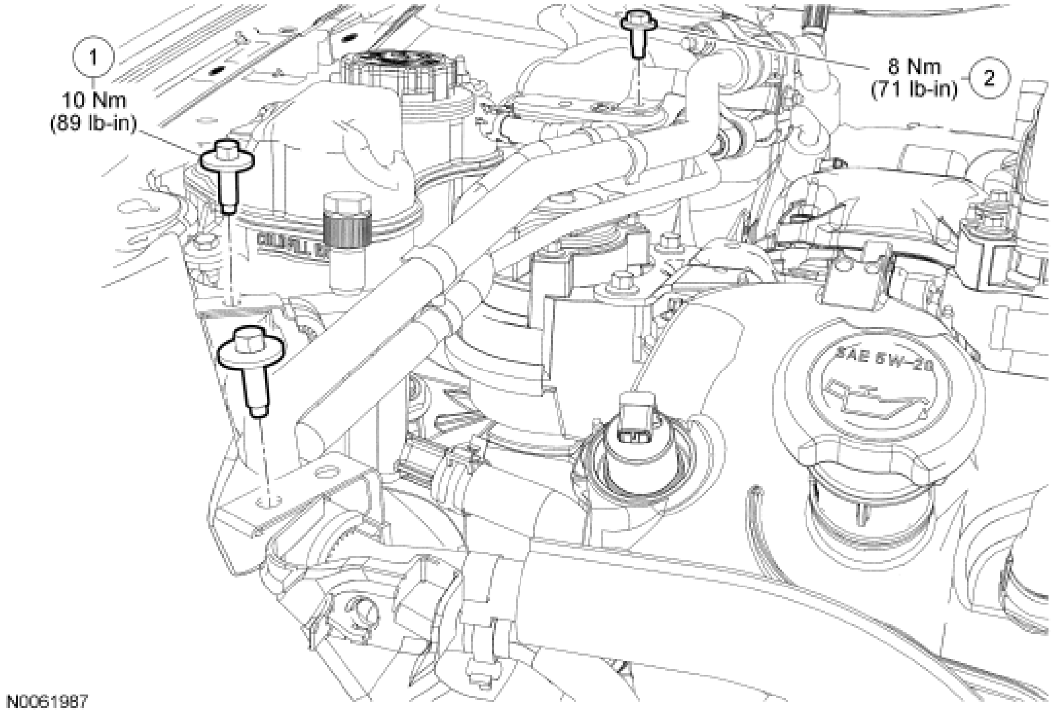

Fig. 47: Exploded View Of A/C Tube Retaining Clamp Bolt With Torque Specifications
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
1	W503924	A/C tube retaining clamp bolt (2 required)
2	W505422	A/C tube retaining clamp bolt

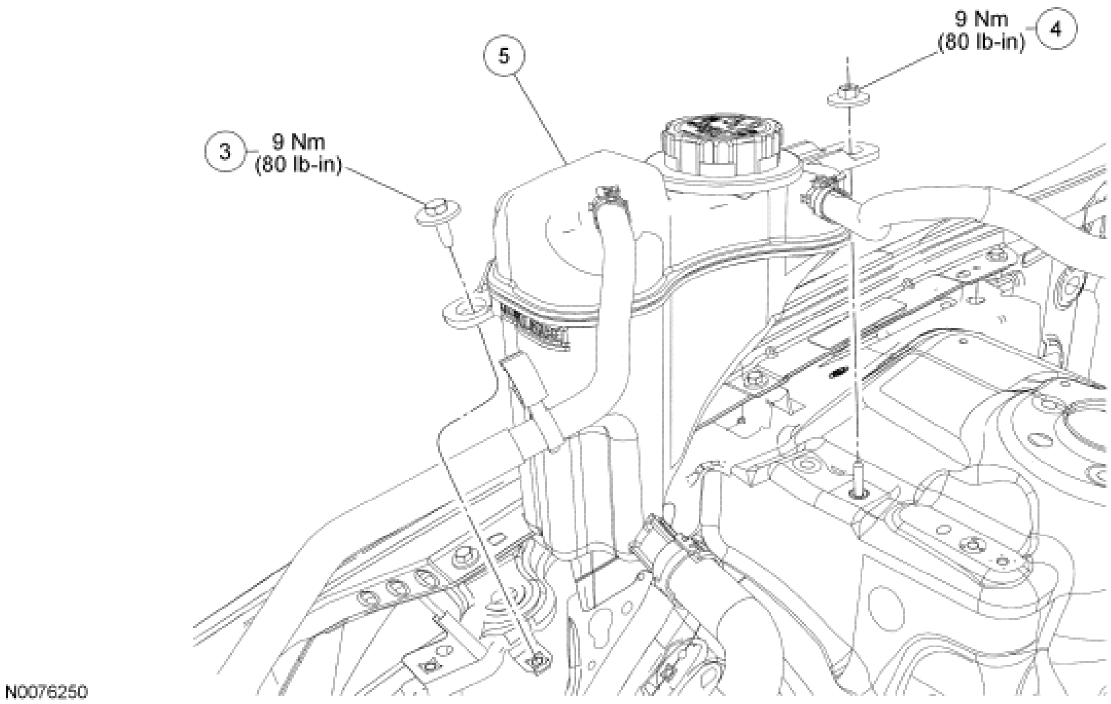

Fig. 48: Exploded View Of Engine Mount Components With Torque Specifications (1 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
3	W707398	Engine coolant degas bottle-to-fender bolt
4	W709603	Engine coolant degas bottle-to-fender nut
5	8A080	Engine coolant degas bottle

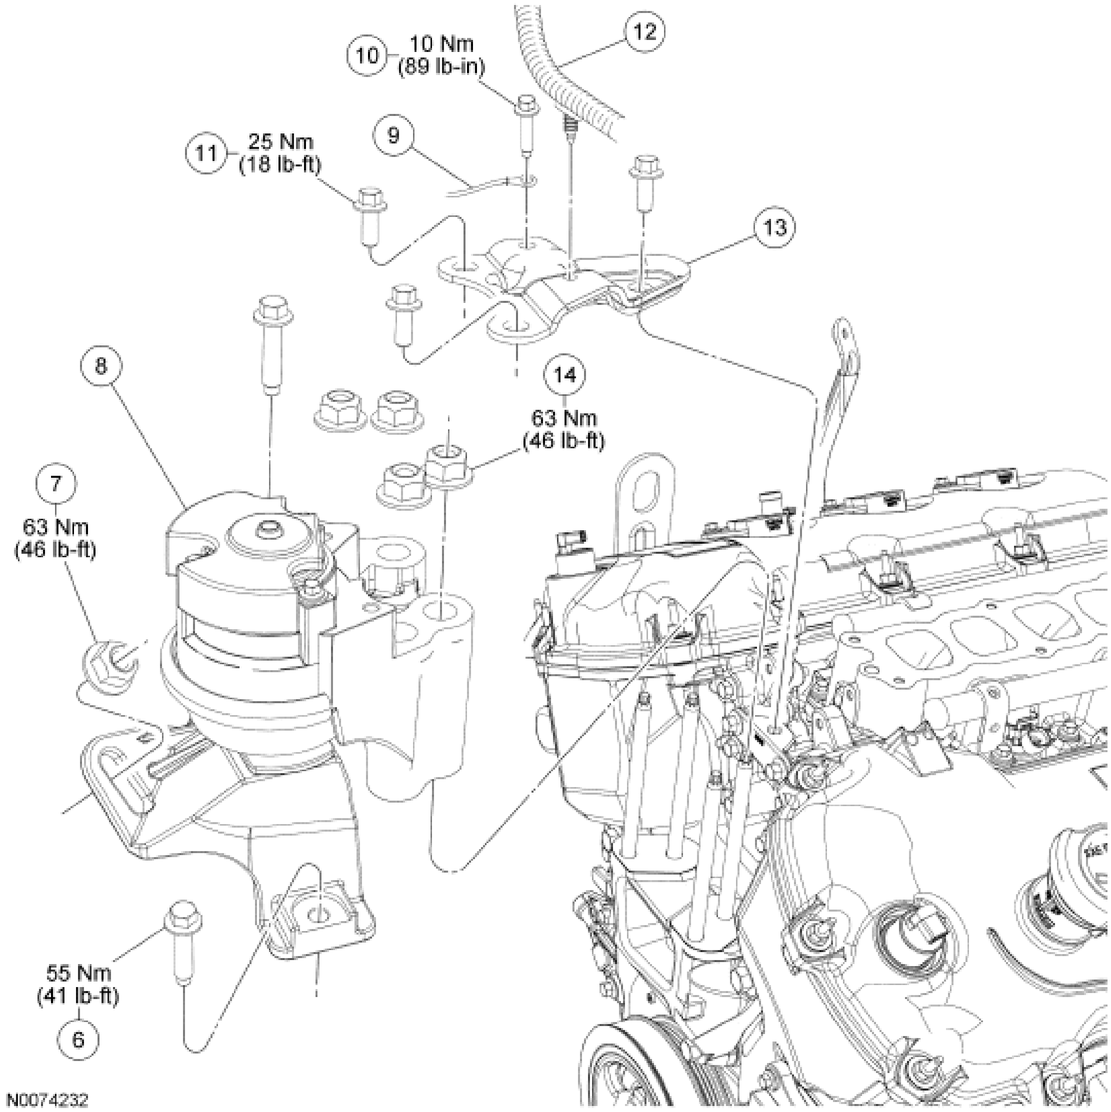

Fig. 49: Exploded View Of Engine Mount Components With Torque Specifications (2 Of 2)
Courtesy of FORD MOTOR CO.

Item	Part Number	Description
6	W500720	Engine mount-to-frame bolt (2 required)
7	W705891	Engine mount-to-frame nut
8	6F012	Engine mount
9	19A905	Ground wire
10	W705936	Ground wire bolt
11	W708764	Engine mount brace bolt (3 required)
12	3493	Power steering hose retainer
13	6K075	Engine mount brace
14	W705891	Engine mount-to-engine nut (4 required)

REMOVAL AND INSTALLATION

1. Remove the exhaust flexible pipe. For additional information, refer to **EXHAUST SYSTEM** article.

CAUTION: The special tool must be carefully aligned to the mounting bosses on the oil pan. Failure to follow these instructions may result in damage to the oil pan.

2. Position a floor jack and the special tool under the oil pan.

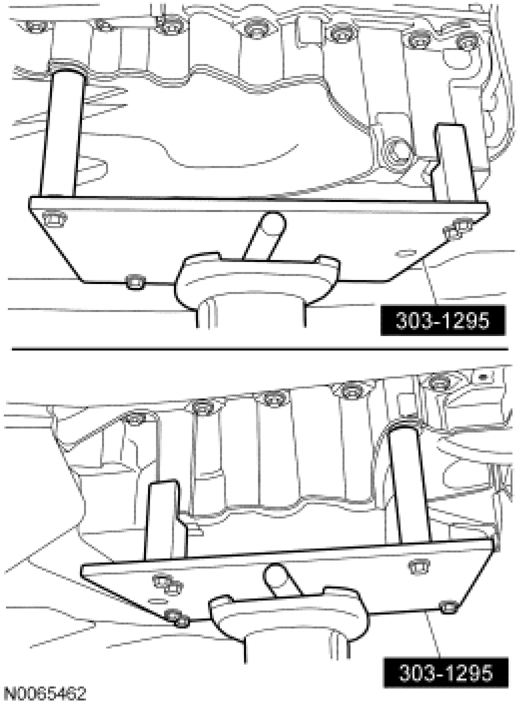

Fig. 50: Positioning Floor Jack & Special Tool (303-1295) Under Oil Pan
Courtesy of FORD MOTOR CO.

3. Remove the A/C tube retaining clamp bolt.
   - To install, tighten to 8 Nm (71 lb-in).
4. Remove the 2 A/C tube retaining clamp bolts.
   - To install, tighten to 10 Nm (89 lb-in).
5. Remove the nut, bolt and position the engine coolant degas bottle aside.
   - To install, tighten to 9 Nm (80 lb-in).
6. Detach the power steering hose retainer from the engine mount brace.
7. Remove the bolt and the ground wire from the engine mount brace.
   - To install, tighten to 10 Nm (89 lb-in).
8. Remove the 3 bolts and the engine mount brace.
   - To install, tighten to 25 Nm (18 lb-ft).

9. Remove the 4 engine mount-to-engine nuts.
   - To install, tighten the bolts to 55 Nm (41 lb-ft) and the nut to 63 Nm (46 lb-ft).
10. Using the special tool, lower the engine 25 mm (1 in).

NOTE: It is necessary to reposition the A/C tubes to remove the engine mount.

11. Remove the nut, the 2 bolts and the engine mount.
   - To install, tighten the bolts to 55 Nm (41 lb-ft) and the nut to 63 Nm (46 lb-ft).
12. To install, reverse the removal procedure.

7. Drain the cooling system. For additional information, refer to **ENGINE COOLING** article.
8. Remove the degas bottle. For additional information, refer to **ENGINE COOLING** article.
9. Remove the engine air cleaner and air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
10. Remove the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
11. Disconnect the 2 engine wiring harness electrical connectors.

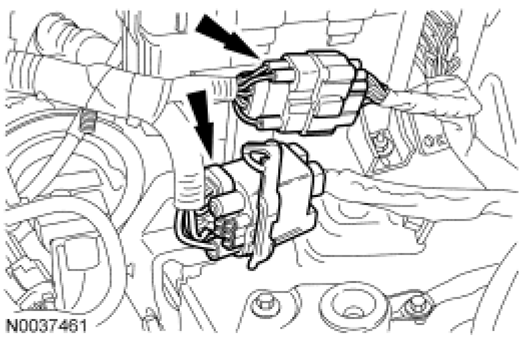

Fig. 53: Locating Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

12. Detach the 2 wiring harness retainers from the transmission mount and the battery tray bracket.

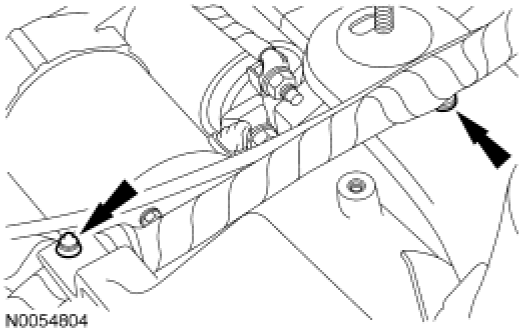

Fig. 54: Locating Wiring Harness Retainers From Transmission Mount & Battery Tray Bracket
Courtesy of FORD MOTOR CO.

13. Remove the nut and disconnect the power feed wire from the battery terminal.

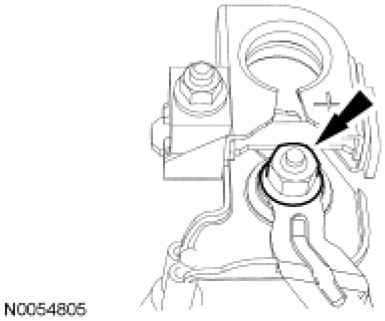

Fig. 55: Locating Power Feed To Battery Terminal And Nut
Courtesy of FORD MOTOR CO.

14. Remove the bolt and position aside the ground wire.

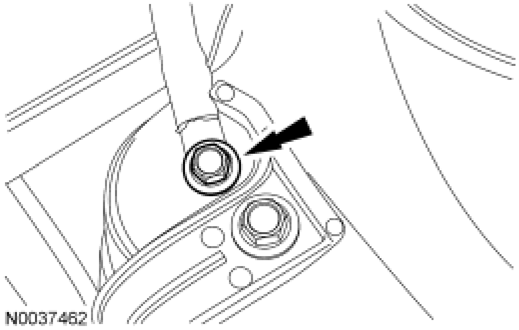

Fig. 56: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

15. Disconnect the vacuum hose and the evaporative emissions (EVAP) tube from the upper intake manifold.

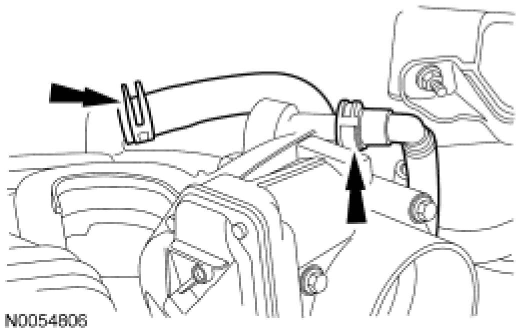

Fig. 57: Locating Vacuum Hose & Evaporative Emissions (EVAP) Tube From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

16. Disconnect the upper radiator hose, lower radiator hose and 2 heater hoses from the thermostat housing.

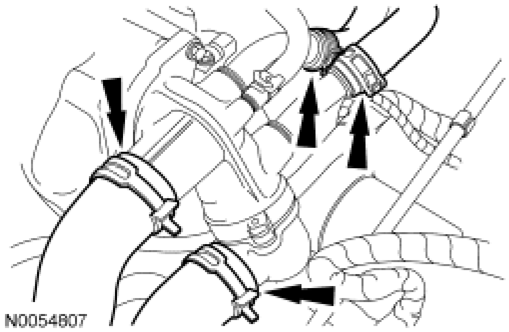

Fig. 58: Locating Upper Radiator Hose, Lower Radiator Hose & Heater Hoses From Thermostat Housing
Courtesy of FORD MOTOR CO.

17. Disconnect the transaxle control cable from the control lever.

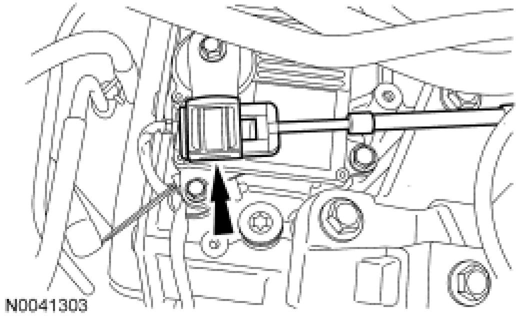

Fig. 59: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

18. Remove the 3 nuts and position the transaxle control cable bracket aside.

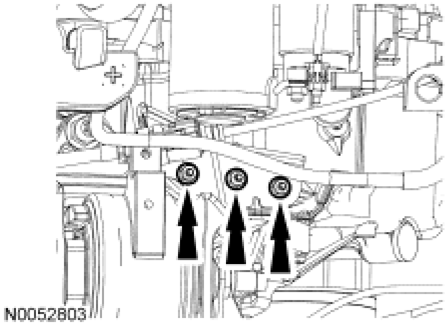

Fig. 60: Identifying Selector Lever Cable Bracket Bolts & Nuts
Courtesy of FORD MOTOR CO.

19. Remove the bolt and position the ground wire aside.

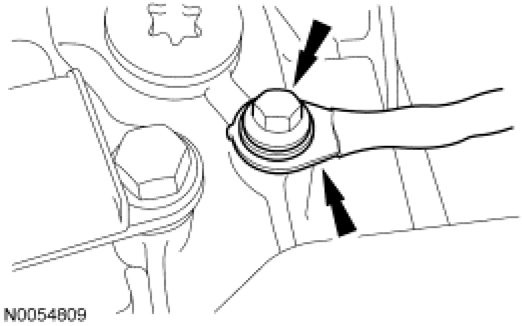

Fig. 61: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

20. If equipped, detach the engine block heater harness from the radiator support, power steering hose, A/C tube and the engine wiring harness.
21. Detach the coolant tube retainer clips from the A/C tube.

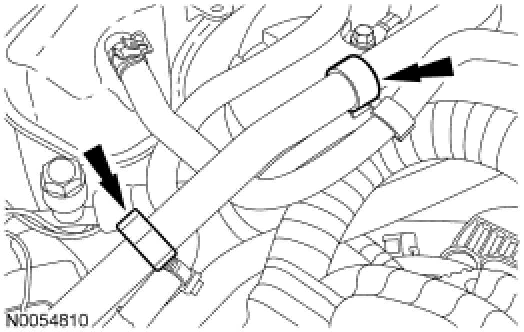

Fig. 62: Identifying Coolant Tube Retainer Clips
Courtesy of FORD MOTOR CO.

22. Remove the nut and disconnect the A/C tube from the condenser.
    - Discard the O-ring seal.

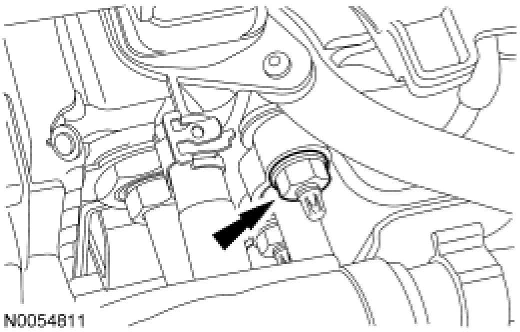

Fig. 63: Locating A/C Tube From Condenser
Courtesy of FORD MOTOR CO.

23. Remove the 2 A/C tube bracket bolts.

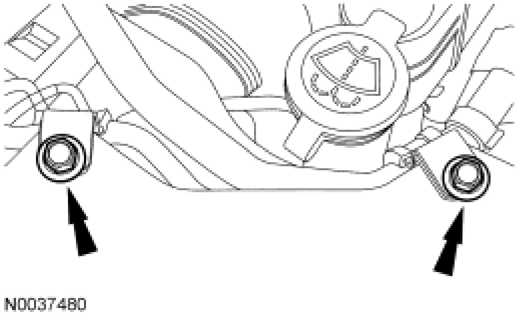

Fig. 64: Locating A/C Tube Bracket Bolts
Courtesy of FORD MOTOR CO.

24. Remove the A/C tube bracket bolt.

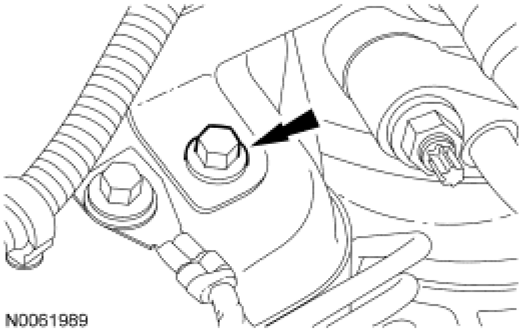

Fig. 65: Locating A/C Tube Bracket Bolt
Courtesy of FORD MOTOR CO.

25. Remove the 2 nuts and disconnect the A/C tubes.
    - Discard the O-ring seal.

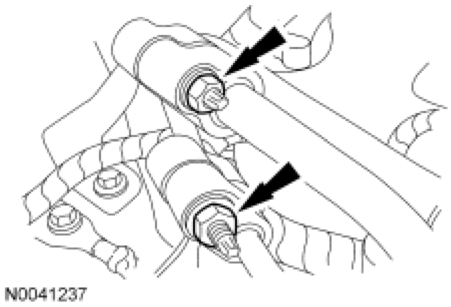

Fig. 66: Locating A/C Tubes And Nuts
Courtesy of FORD MOTOR CO.

26. Detach the 2 wiring harness retainers.

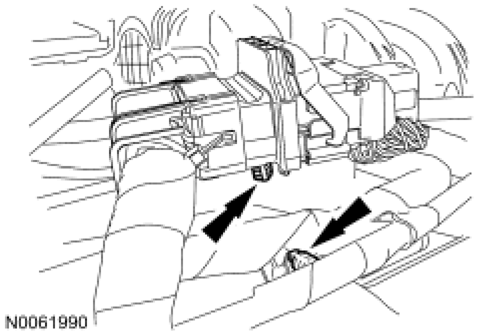

Fig. 67: Identifying Wiring Harness Retainers
Courtesy of FORD MOTOR CO.

27. Disconnect the 2 engine wiring harness electrical connectors.

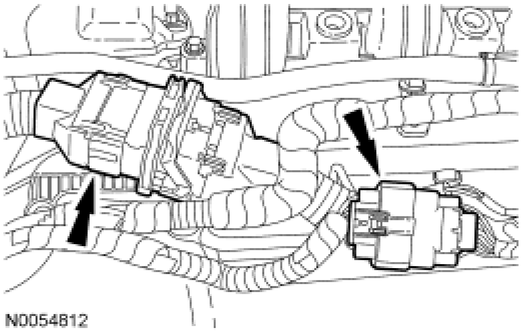

Fig. 68: Identifying Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

28. Remove the 2 wiring harness retainers from the LH valve cover stud bolts and position the wiring harness aside.

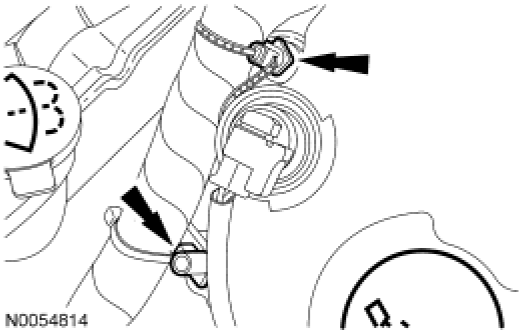

Fig. 69: Identifying Wiring Harness Retainers From LH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

29. Remove the oil level indicator.

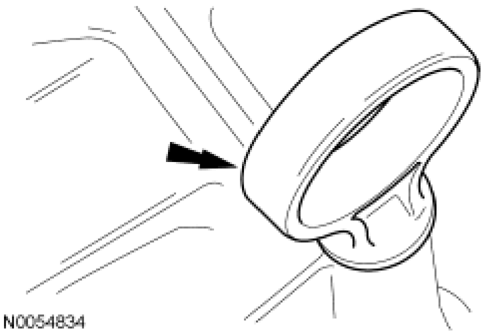

Fig. 70: Identifying Oil Level Indicator
Courtesy of FORD MOTOR CO.

30. Disconnect the hose from the power steering reservoir.
    - Detach the pin-type retainer from the engine mount brace.

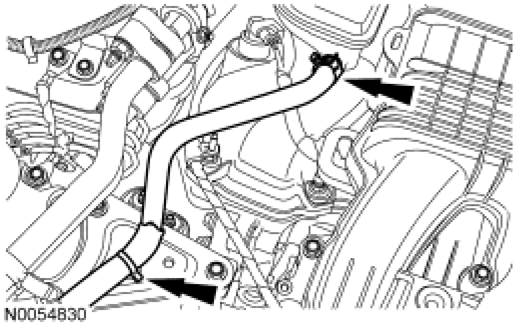

Fig. 71: Identifying Pin-Type Retainer From Engine Mount Brace
Courtesy of FORD MOTOR CO.

31. Using a small screwdriver, release the retaining clip and detach the power steering reservoir from the cowl.

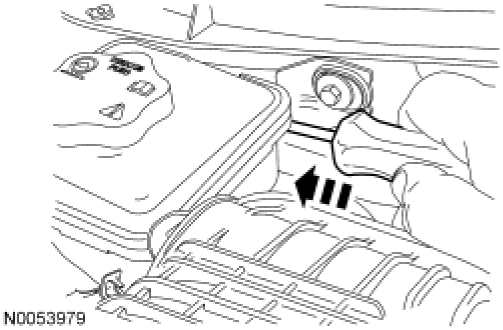

Fig. 72: Detaching Power Steering Reservoir From Bracket
Courtesy of FORD MOTOR CO.

32. Disconnect the fuel supply tube from the fuel rail. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

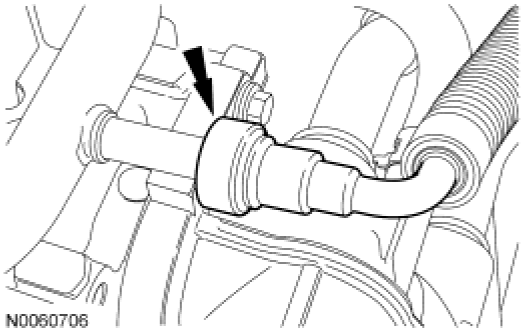

Fig. 73: Identifying Fuel Supply Tube From Fuel Rail
Courtesy of FORD MOTOR CO.

33. Remove the bolt and the ground wire from the engine mount brace.

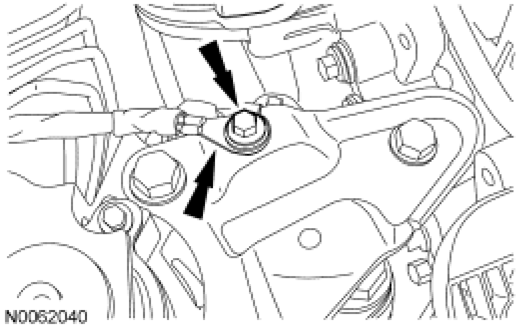

Fig. 74: Identifying Ground Wire Bolt From Engine Mount Brace
Courtesy of FORD MOTOR CO.

34. Remove the 3 bolts and the engine mount brace.

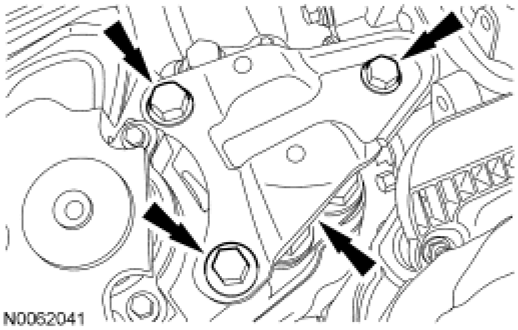

Fig. 75: Locating Engine Mount Brace Bolts
Courtesy of FORD MOTOR CO.

35. Disconnect the PCM electrical connectors and pin-type retainers.

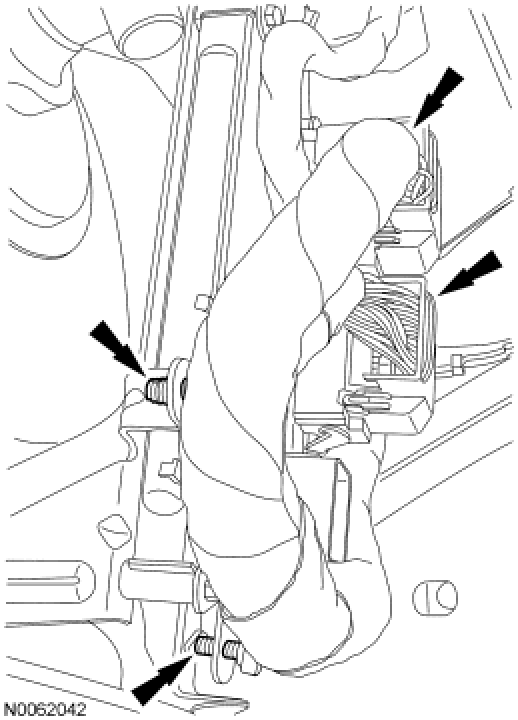

Fig. 76: Locating PCM Electrical Connectors & Pin-Type Retainers
Courtesy of FORD MOTOR CO.

36. Remove the power steering pressure (PSP) hose bracket bolt.

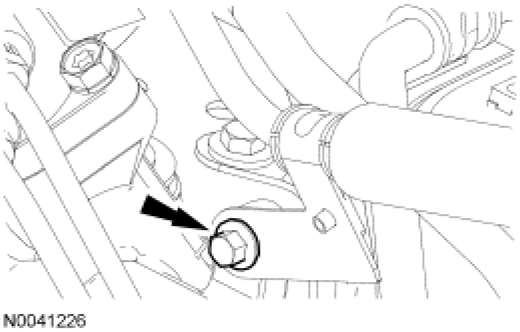

Fig. 77: Locating Power Steering Pressure (PSP) Hose Bracket Bolt
Courtesy of FORD MOTOR CO.

37. Remove and discard the PSP hose banjo bolt and the 2 seals from the steering gear.

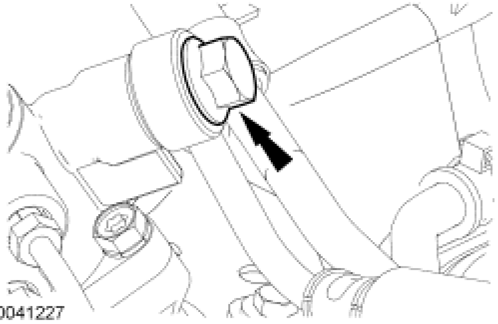

Fig. 78: Locating PSP Hose Banjo Bolt
Courtesy of FORD MOTOR CO.

38. Place the steering wheel in the straight-ahead position and the ignition key in the OFF position.
39. Remove the 2 nuts and the steering joint cover.

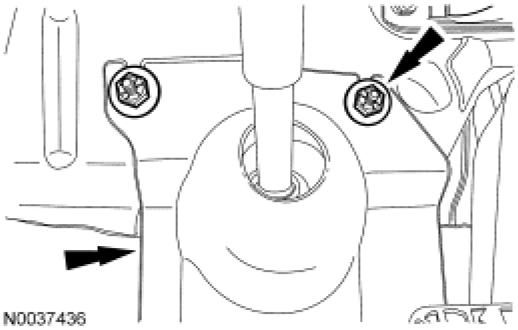

Fig. 79: Locating Steering Joint Cover And Nuts
Courtesy of FORD MOTOR CO.

CAUTION: Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring can occur. If there is evidence that the intermediate shaft has rotated, the clockspring

must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

NOTE: **Index-mark the steering column shaft position to the steering gear for reference during installation.**

40. Remove the bolt and disconnect the steering column shaft from the steering gear.
    - Discard the bolt.

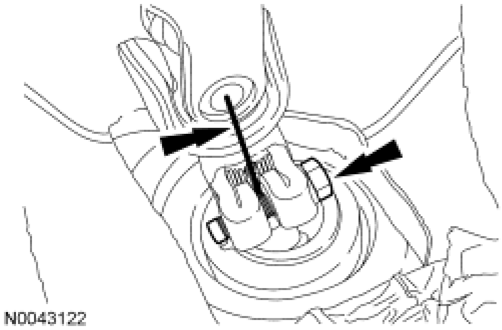

Fig. 80: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

41. Remove the 4 screws and position the LH fender splash shield aside.

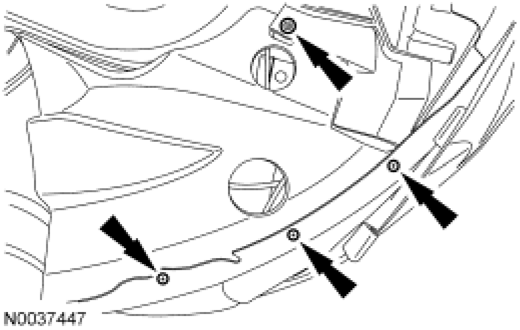

Fig. 81: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

42. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

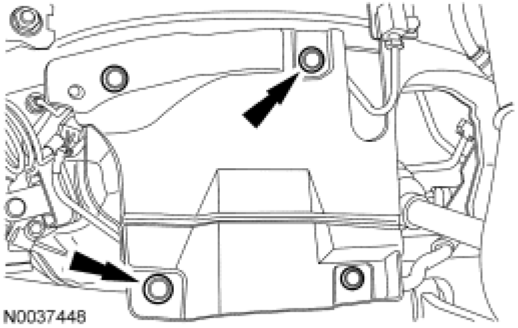

Fig. 82: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

CAUTION: The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.

43. Release the 4 clips and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.

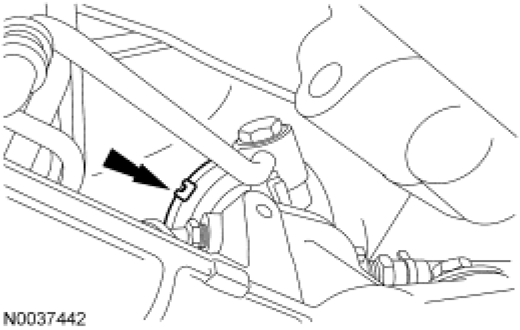

Fig. 83: Locating Steering Gear-To-Dash Seal Clips
Courtesy of FORD MOTOR CO.

44. Disconnect the transaxle cooler hoses.

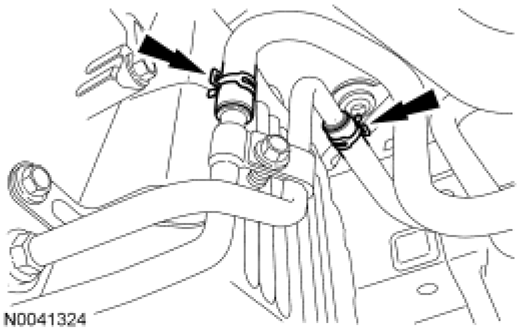

Fig. 84: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

45. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).

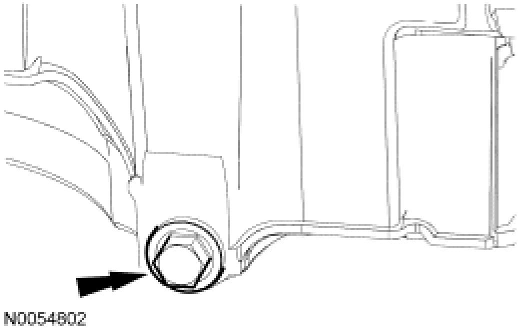

Fig. 85: Locating Drain Plug
Courtesy of FORD MOTOR CO.

46. Remove and discard the engine oil filter.

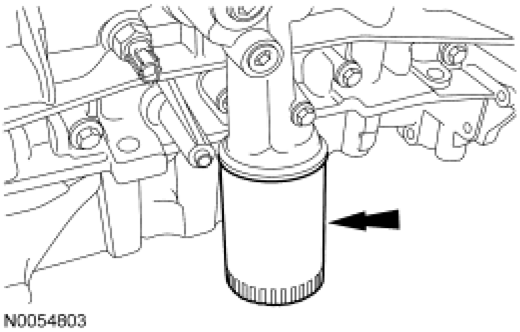

Fig. 86: Identifying Engine Oil Filter
Courtesy of FORD MOTOR CO.

47. Remove the 6 nuts and the Y-pipe assembly.
    - Discard the gaskets and nuts.

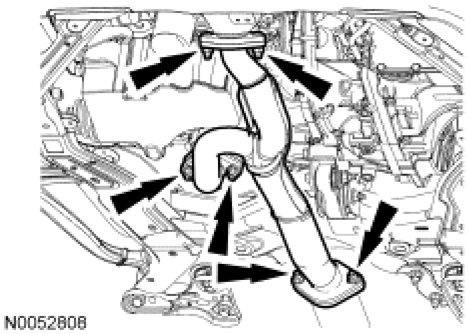

Fig. 87: Locating Y-Pipe Nuts & Y-Pipe Assembly
Courtesy of FORD MOTOR CO.

48. Remove the 4 oil pan-to-transaxle bolts.

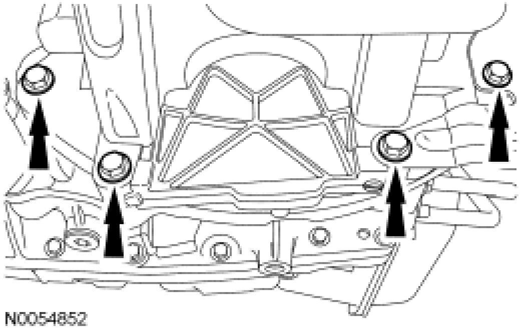

Fig. 88: Locating Oil Pan-To-Transaxle Bolts
Courtesy of FORD MOTOR CO.

49. Remove the 2 fasteners and the inspection cover.

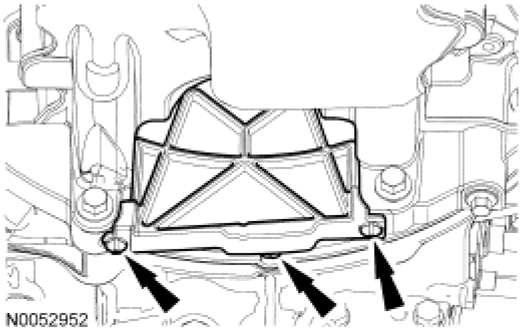

Fig. 89: Identifying Inspection Cover & Fasteners
Courtesy of FORD MOTOR CO.

50. Remove and discard the 4 torque converter nuts.

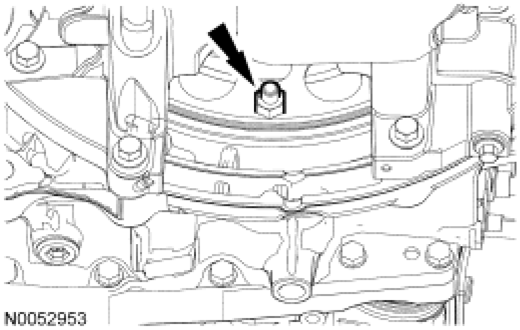

Fig. 90: Identifying Torque Converter Nuts
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

NOTE: Index-mark the driveshaft for installation.

51. Remove the 4 bolts (3 shown) and support the driveshaft with a length of mechanic's wire.

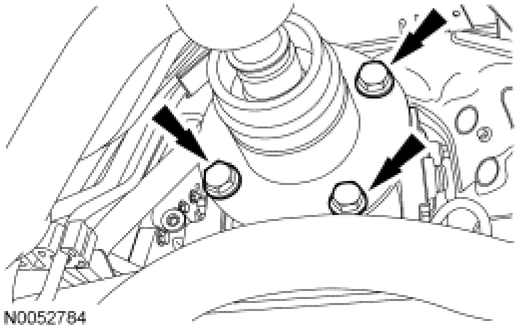

Fig. 91: Identifying Drive Shaft Bolts
Courtesy of FORD MOTOR CO.

All vehicles

52. Remove the engine roll restrictor-to-subframe through bolt.

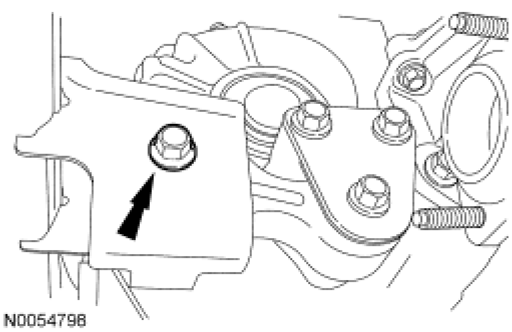

Fig. 92: Locating Roll Restrictor Bolt
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

53. Remove the cotter pins and nuts from the tie-rod ends.

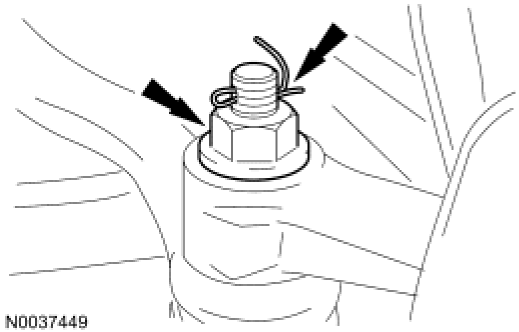

Fig. 93: Locating Tie-Rod Ends Nuts And Cotter Pin
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

54. Using the special tool, separate the tie-rod ends from the steering knuckles.

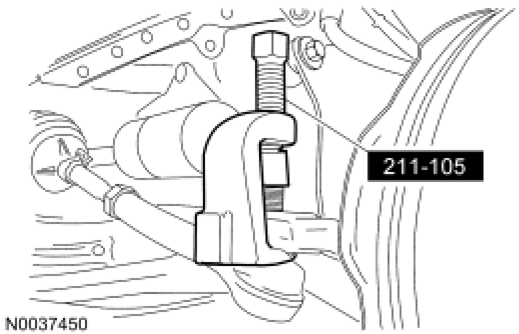

Fig. 94: Separating Tie-Rod Ends From Wheel Knuckles Using Special Tool (211-105)
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

55. Remove the nuts and separate the stabilizer bar links from the struts.

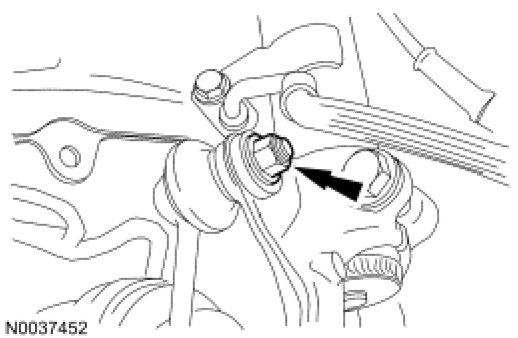

Fig. 95: Locating Stabilizer Bar Links Nut
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

56. Remove the 4 lower ball joint nuts.

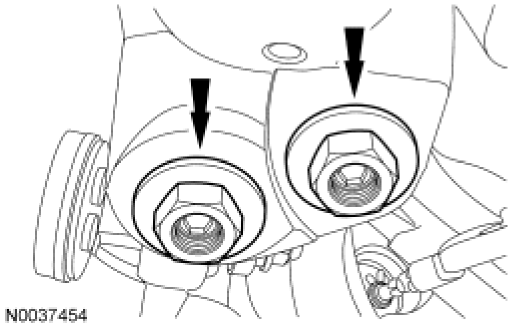

Fig. 96: Locating Lower Ball Joint Nuts
Courtesy of FORD MOTOR CO.

CAUTION: **When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.**

NOTE: **Once pressure is applied to the ball joint with the special tool, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.**

NOTE: **LH shown, RH similar.**

57. Using the special tools, separate the lower ball joints from the lower control arms.

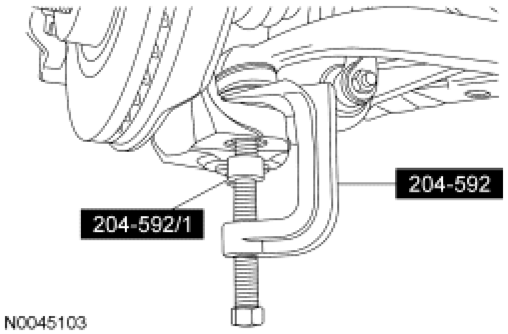

Fig. 97: Identifying Special Tools (204-592/1, 204-592)
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

58. Remove the through bolts from the lower control arms.

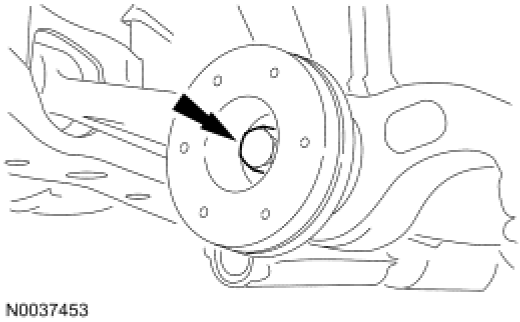

Fig. 98: Locating Lower Control Arms Through Bolt
Courtesy of FORD MOTOR CO.

59. Position the special tool under the subframe assembly.

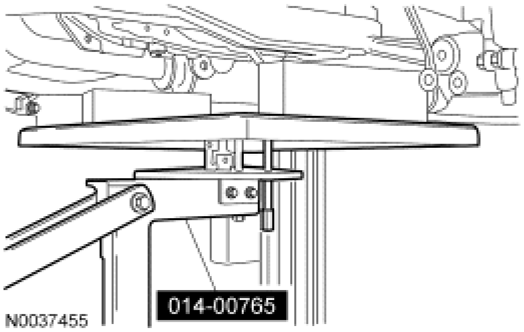

Fig. 99: Positioning Special Tool (014-00765) Under Subframe Assembly
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

60. Remove the 4 subframe bracket-to-body bolts.

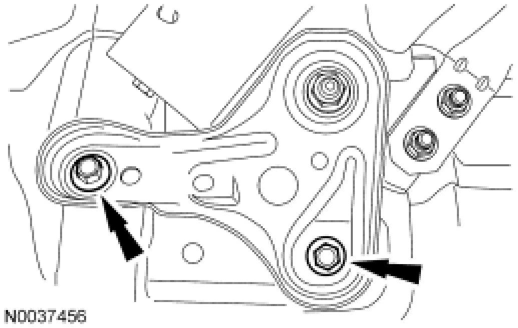

Fig. 100: Locating Subframe Bracket-To-Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

61. Remove the 2 rear subframe nuts and the 2 subframe brackets.

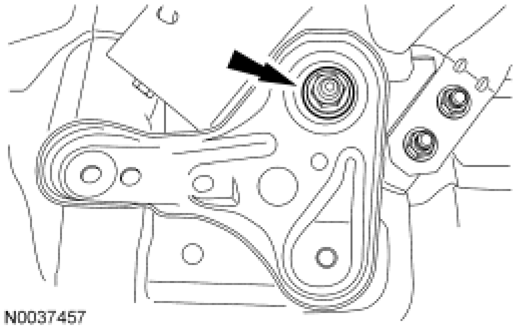

Fig. 101: Locating Subframe Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

62. Remove the 2 front subframe nuts.

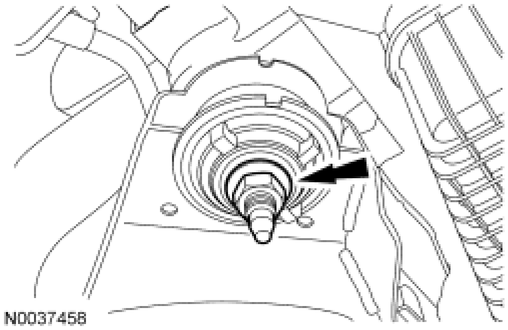

Fig. 102: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

63. Lower the subframe assembly from the vehicle.
64. Using the special tools, separate the LH halfshaft from the transaxle and support the halfshaft with a length of mechanic's wire.

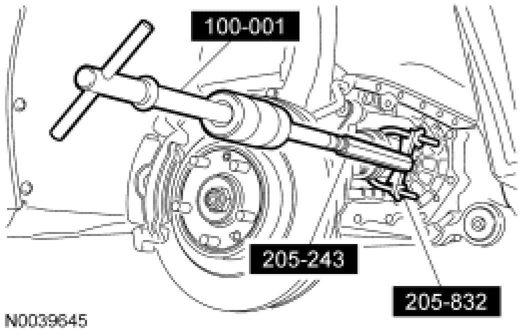

Fig. 103: Identifying Special Tools (100-001, 205-243 And 205-832)
Courtesy of FORD MOTOR CO.

65. Remove the 2 RH catalytic converter bracket bolts.

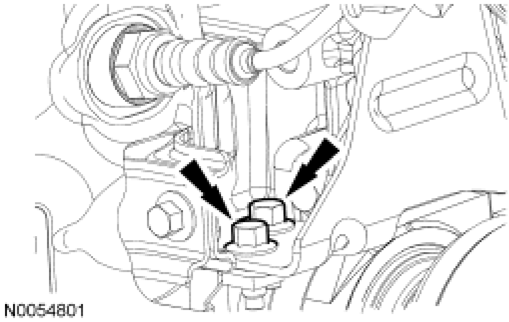

Fig. 104: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

66. Remove the 2 nuts and remove the RH catalytic converter bracket.

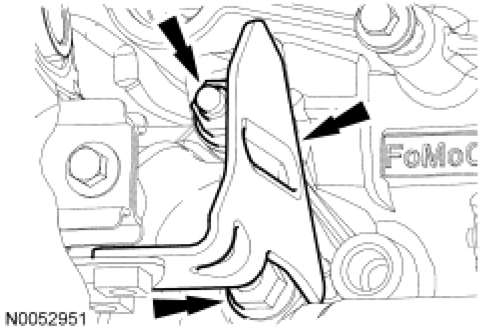

Fig. 105: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

67. Remove the RH halfshaft carrier bearing bolt and 2 stud bolts.
    - Separate the RH halfshaft from the transaxle and support the halfshaft with a length of mechanic's wire.

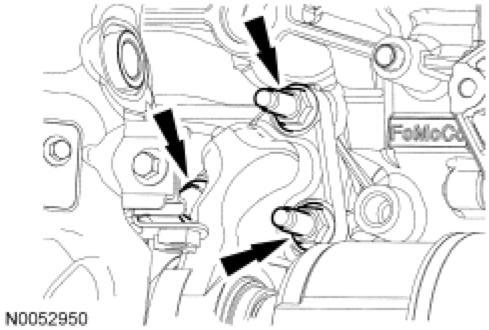

Fig. 106: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

AWD vehicles

68. Remove the 2 RH halfshaft carrier bearing bolts.
    - Separate the RH halfshaft from the transaxle and support the halfshaft with a length of mechanic's wire.

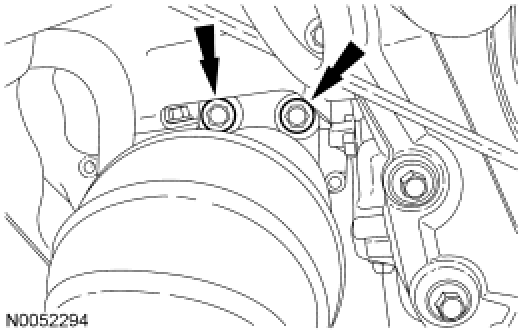

Fig. 107: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

69. Disconnect the RH catalyst monitor electrical connector.

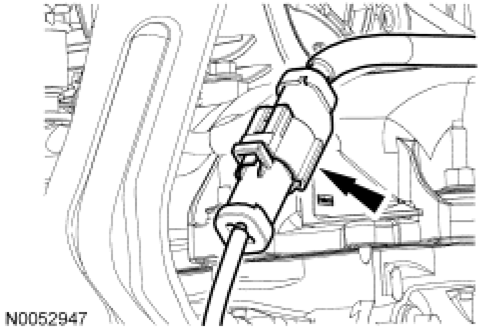

Fig. 108: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

70. Remove the 4 nuts and the RH catalytic converter.

- Discard the gasket.

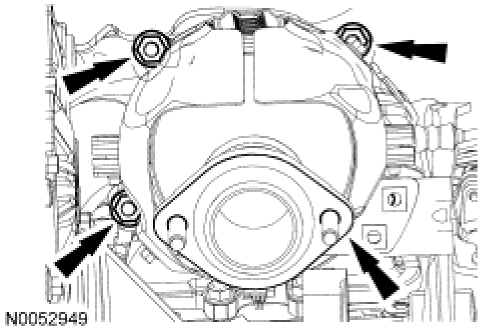

Fig. 109: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

71. Remove the 5 bolts and the power transfer unit (PTU) support bracket.

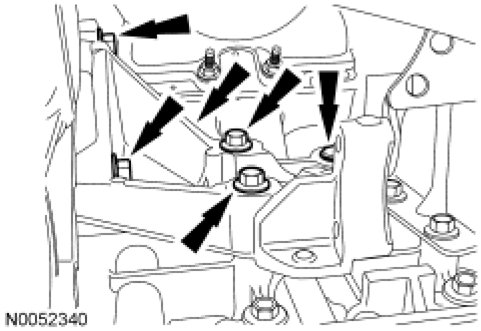

Fig. 110: Locating Power Transfer Unit (PTU) Support Bracket & Bolts
Courtesy of FORD MOTOR CO.

72. Remove the 5 bolts and the PTU.

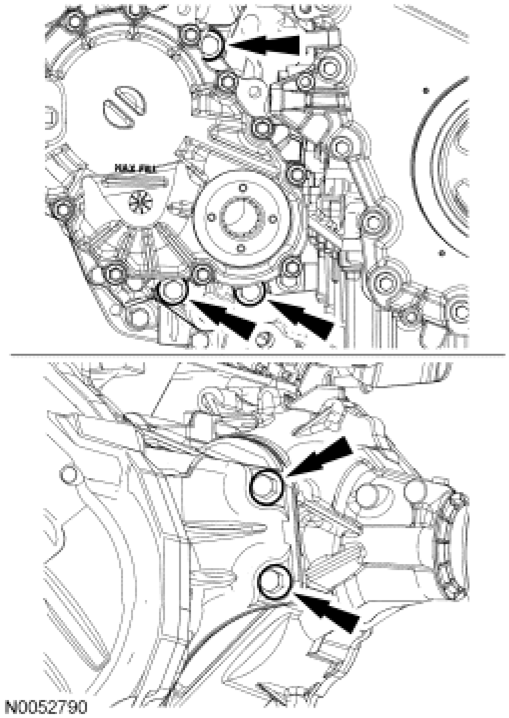

Fig. 111: Locating PTU Bolts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: Position a block of wood under the transaxle.

73. Install the special tools.

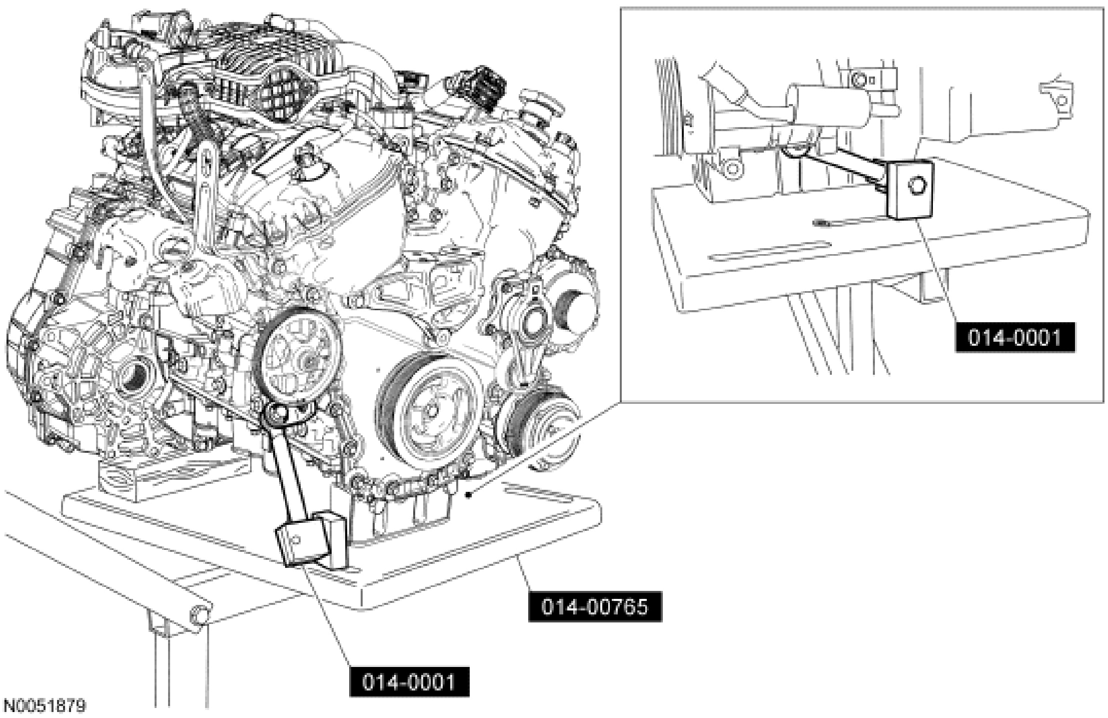

Fig. 112: Positioning Block Of Wood Under Transaxle Using Special Tools (014-0001) & (014-00765)
Courtesy of FORD MOTOR CO.

74. Remove the transaxle mount through bolt and nut.

Fig. 113: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

75. Remove the transaxle mount bracket bolt and the 2 nuts.

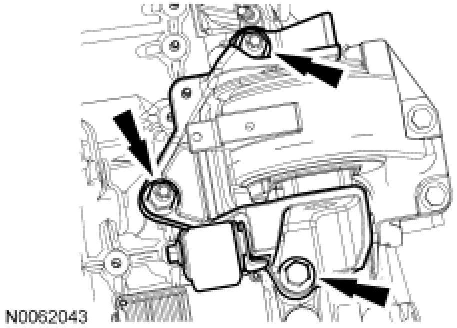

Fig. 114: Identifying Transaxle Mount Bracket Bolt
Courtesy of FORD MOTOR CO.

76. Remove the 4 engine mount nuts.

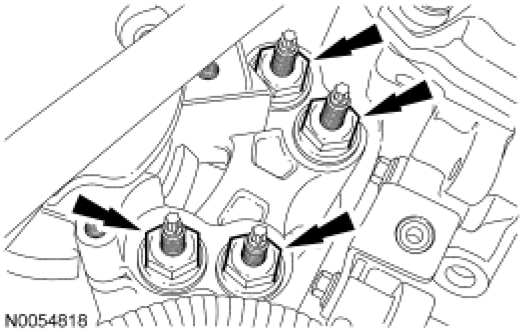

Fig. 115: Identifying Engine Mount Nuts
Courtesy of FORD MOTOR CO.

77. Remove the nut, 2 bolts and the engine mount.

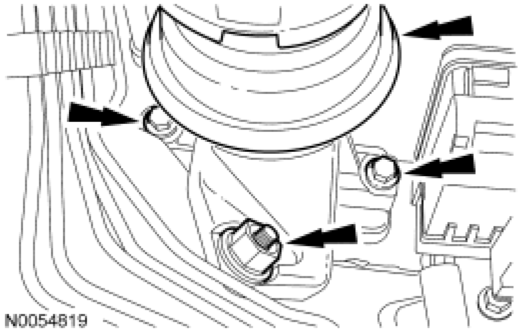

Fig. 116: Identifying Nut, Bolts & Engine Mount
Courtesy of FORD MOTOR CO.

78. Lower the engine and transaxle assembly from the vehicle.
79. Disconnect the wiring harness fasteners from the transaxle-to-engine stud bolt and the starter.

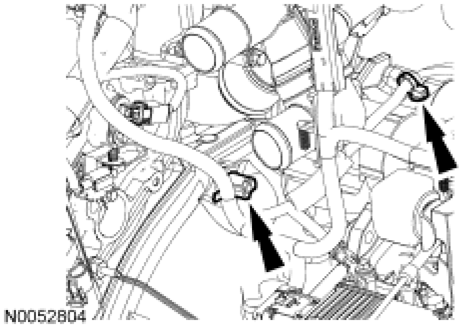

Fig. 117: Identifying Wiring Harness Fasteners & Torque Converter Housing Stud Bolt
Courtesy of FORD MOTOR CO.

80. Remove the bolt and ground wire.

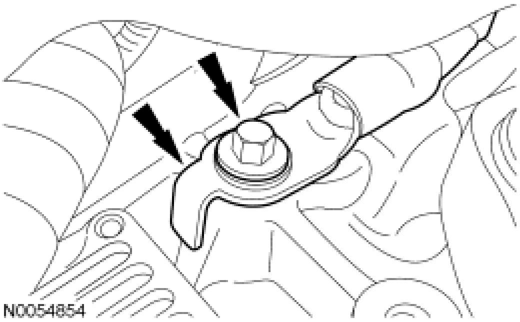

Fig. 118: Identifying Ground Wire & Bolt
Courtesy of FORD MOTOR CO.

81. Disconnect the transmission control module (TCM) electrical connector.

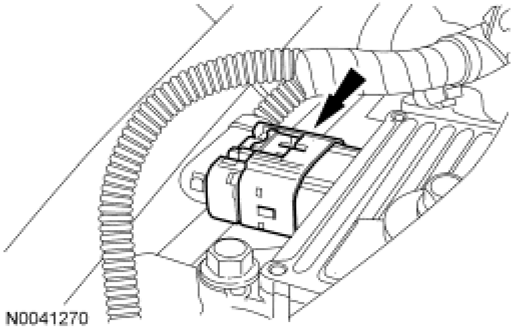

Fig. 119: Locating Transmission Control Module (TCM) Electrical Connector
Courtesy of FORD MOTOR CO.

82. Remove the 2 nuts and the starter motor wiring.

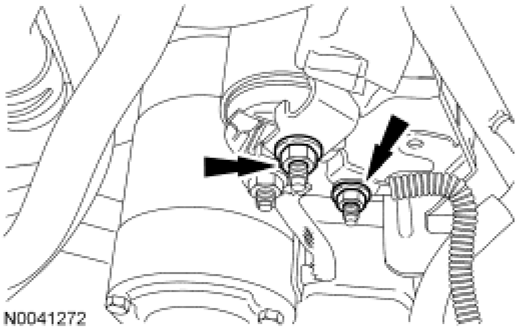

Fig. 120: Locating Starter Motor Wiring Nuts
Courtesy of FORD MOTOR CO.

83. Remove the 2 bolts and the starter.

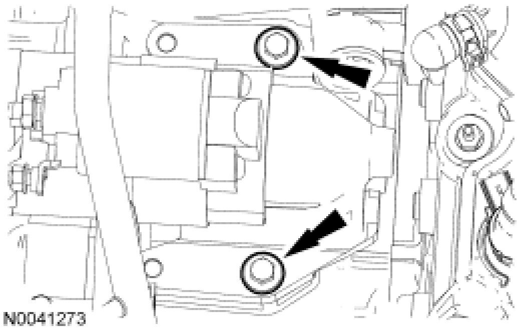

Fig. 121: Locating Starter Motor Bolts
Courtesy of FORD MOTOR CO.

84. Install the special tool on the LH cylinder head.

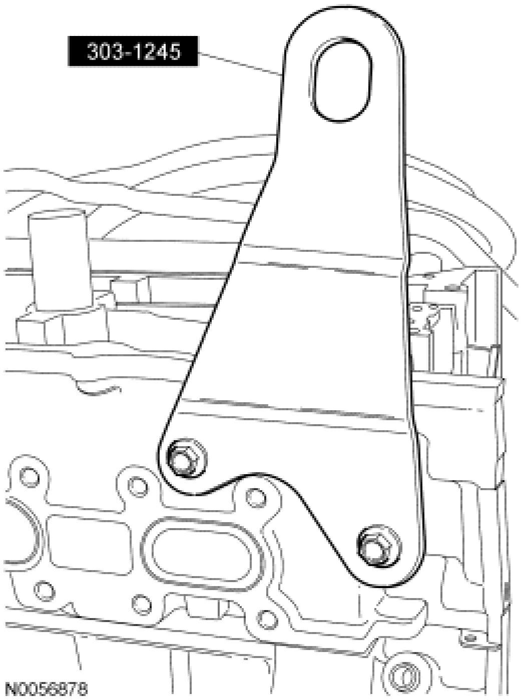

Fig. 122: Installing Special Tool (303-1245) On LH Cylinder Head
Courtesy of FORD MOTOR CO.

85. Using the special tools and a suitable engine crane, remove the engine and transaxle from the lift table.

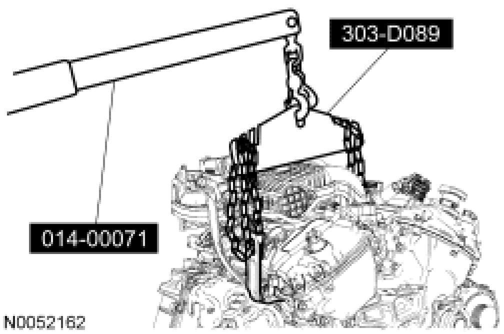

Fig. 123: Removing Engine & Transaxle From Lift Table Using Special Tools (303-D089, 014-00071) & Suitable Engine Crane
Courtesy of FORD MOTOR CO.

86. Remove the 2 engine-to-transaxle bolts.

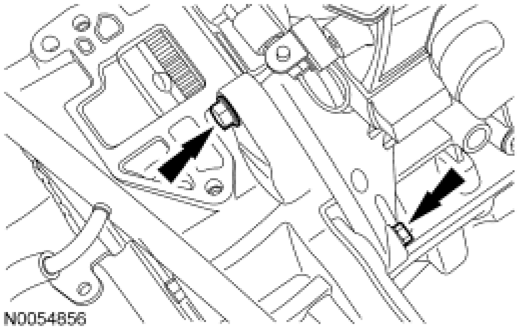

Fig. 124: Locating Engine-To-Transaxle Bolts
Courtesy of FORD MOTOR CO.

87. Remove the transaxle-to-engine stud bolt and the 4 transaxle-to-engine bolts.
    - Separate the transaxle from the engine.

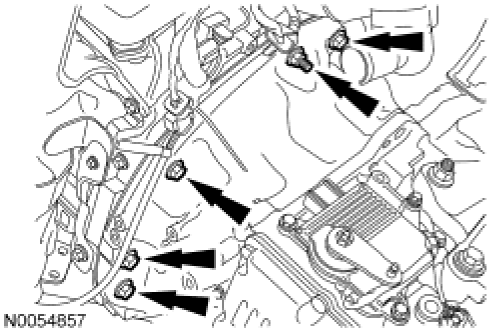

Fig. 125: Locating Transaxle-To-Engine Stud Bolt & Transaxle-To-Engine Bolts
Courtesy of FORD MOTOR CO.

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-
Silicone Gasket Remover ZC-30	-

WARNING: **Do not smoke, carry lighted tobacco or have an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in serious personal injury.**

CAUTION: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

All vehicles

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to **JACKING AND LIFTING** article.
2. Release the fuel system pressure. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.
3. Recover the A/C system. For additional information, refer to **CLIMATE CONTROL SYSTEM - GENERAL INFORMATION AND DIAGNOSTICS** article.
4. Remove the accessory drive belt and the power steering belt. For additional information, refer to **ACCESSORY DRIVE - 3.5L** article.
5. If equipped, remove the 6 screws and the underbody shield.

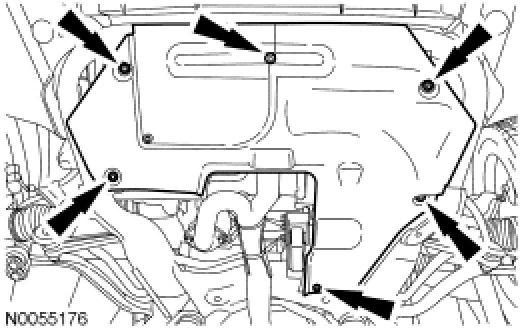

Fig. 126: Locating Underbody Shield Screws
Courtesy of FORD MOTOR CO.

6. Disconnect the power steering cooler tube and drain the power steering fluid into a suitable drain pan.

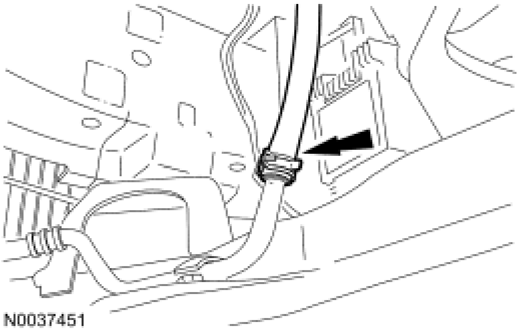

Fig. 127: Locating Power Steering Cooler Tube
Courtesy of FORD MOTOR CO.

7. Drain the cooling system. For additional information, refer to **ENGINE COOLING** article.
8. Remove the degas bottle. For additional information, refer to **ENGINE COOLING** article.
9. Remove the engine air cleaner and air cleaner outlet pipe. For additional information, refer to **INTAKE AIR DISTRIBUTION AND FILTERING - 3.5L** article.
10. Remove the battery tray. For additional information, refer to **BATTERY, MOUNTING AND CABLES** article.
11. Disconnect the 2 engine wiring harness electrical connectors.

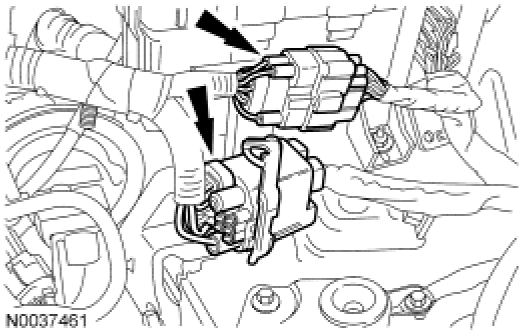

Fig. 128: Locating Engine Wiring Harness Electrical Connectors

Courtesy of FORD MOTOR CO.

12. Detach the 2 wiring harness retainers from transmission mount and the battery tray bracket.

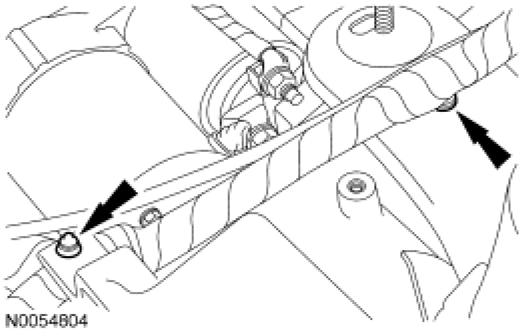

Fig. 129: Locating Wiring Harness Retainers From Transmission Mount & Battery Tray Bracket
Courtesy of FORD MOTOR CO.

13. Remove the nut and disconnect the power feed wire from the battery terminal.

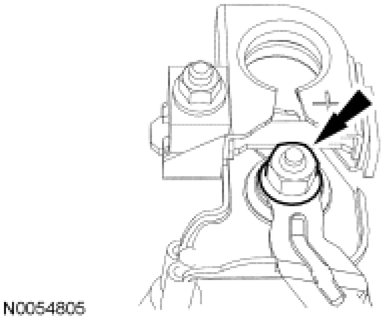

Fig. 130: Locating Power Feed To Battery Terminal And Nut
Courtesy of FORD MOTOR CO.

14. Remove the bolt and position aside the ground wire.

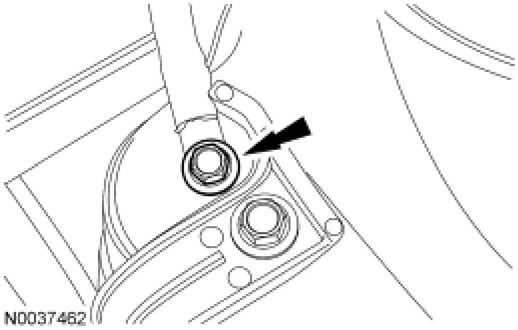

Fig. 131: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

15. Disconnect the vacuum hose and the evaporative emissions (EVAP) tube from the upper intake manifold.

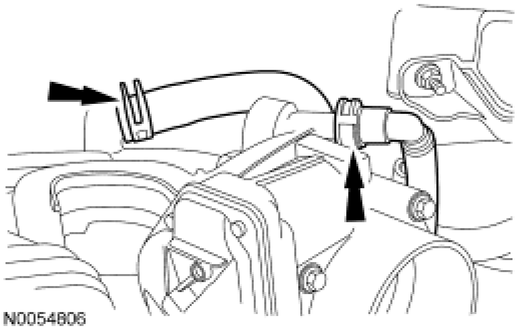

Fig. 132: Locating Vacuum Hose & Evaporative Emissions (EVAP) Tube From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

16. Disconnect the upper radiator hose, lower radiator hose and 2 heater hoses from the thermostat housing.

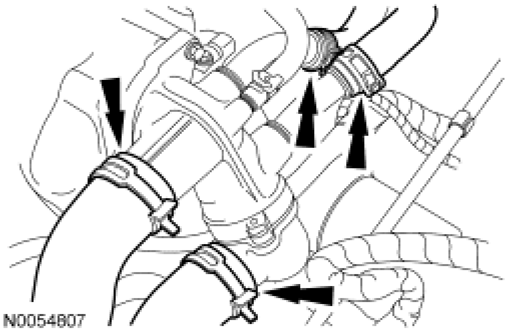

Fig. 133: Locating Upper Radiator Hose, Lower Radiator Hose & Heater Hoses From Thermostat Housing
Courtesy of FORD MOTOR CO.

17. Disconnect the transaxle control cable from the control lever.

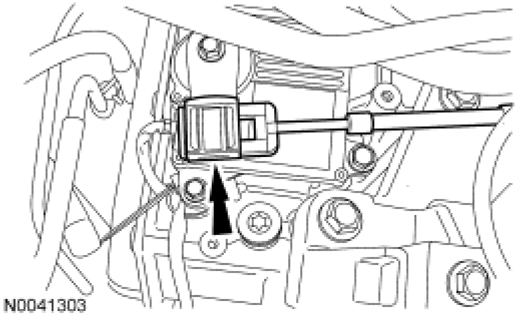

Fig. 134: Locating Selector Lever Cable End
Courtesy of FORD MOTOR CO.

18. Remove the 3 nuts and position the transaxle control cable bracket aside.

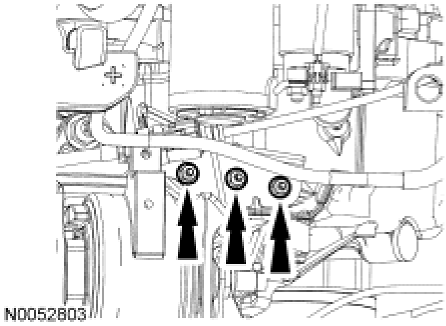

Fig. 135: Identifying Selector Lever Cable Bracket Bolts & Nuts
Courtesy of FORD MOTOR CO.

19. Remove the bolt and position the ground wire aside.

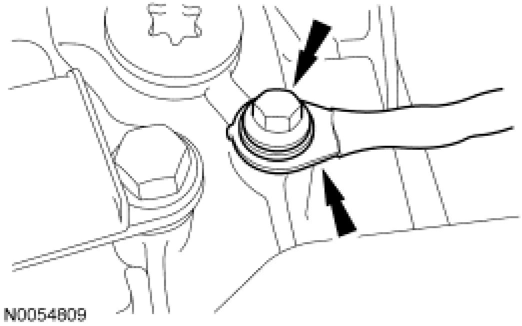

Fig. 136: Locating Ground Wire And Bolt
Courtesy of FORD MOTOR CO.

20. If equipped, detach the engine block heater harness from the radiator support, power steering hose, A/C tube and the engine wiring harness.
21. Detach the coolant tube retainer clips from the A/C tube.

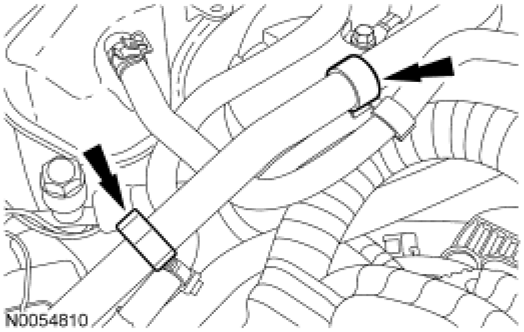

Fig. 137: Identifying Coolant Tube Retainer Clips
Courtesy of FORD MOTOR CO.

22. Remove the nut and disconnect the A/C tube from the condenser.
    - Discard the O-ring seals.

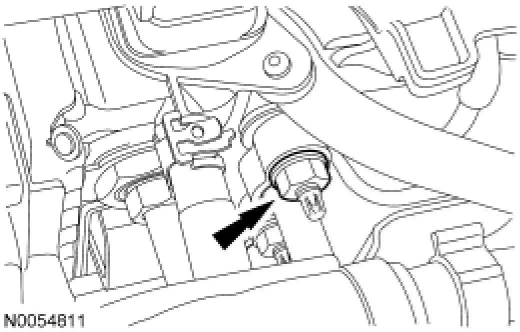

Fig. 138: Locating A/C Tube From Condenser
Courtesy of FORD MOTOR CO.

23. Remove the 2 A/C tube bracket bolts.

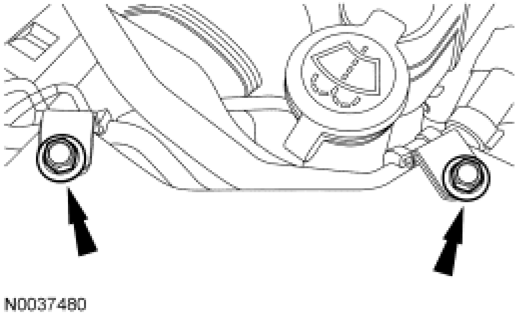

Fig. 139: Locating A/C Tube Bracket Bolts
Courtesy of FORD MOTOR CO.

24. Remove the A/C tube bracket bolt.

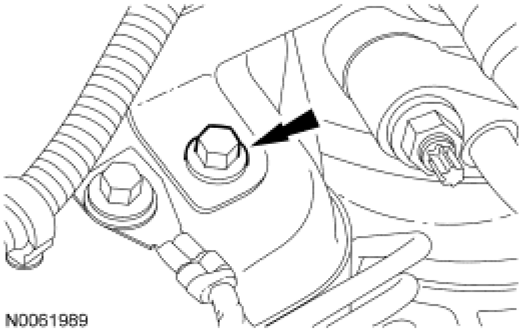

Fig. 140: Locating A/C Tube Bracket Bolt
Courtesy of FORD MOTOR CO.

25. Remove the 2 nuts and disconnect the A/C tubes.
    - Discard the O-ring seals.

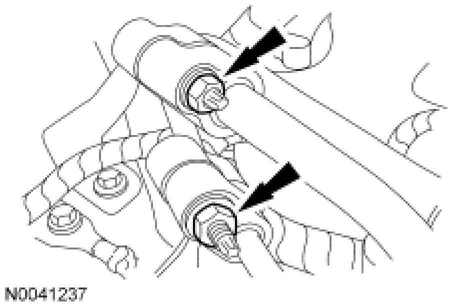

Fig. 141: Locating A/C Tubes And Nuts
Courtesy of FORD MOTOR CO.

26. Detach the 2 wiring harness retainers.

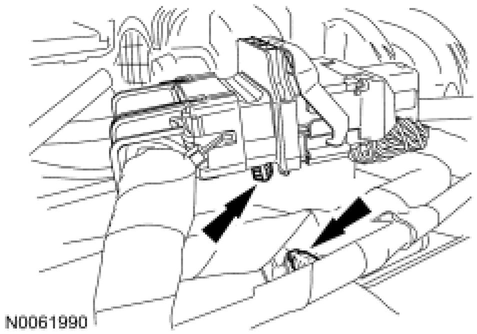

Fig. 142: Identifying Wiring Harness Retainers
Courtesy of FORD MOTOR CO.

27. Disconnect the 2 engine wiring harness electrical connectors.

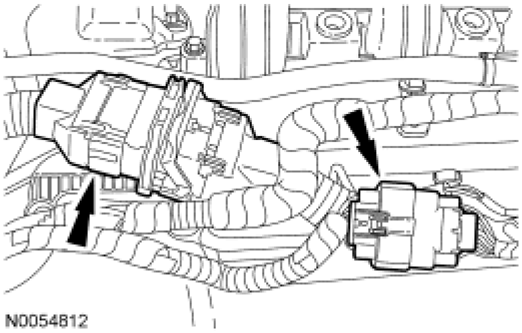

Fig. 143: Identifying Engine Wiring Harness Electrical Connectors
Courtesy of FORD MOTOR CO.

28. Remove the 2 wiring harness retainers from the LH valve cover stud bolts and position the wiring harness aside.

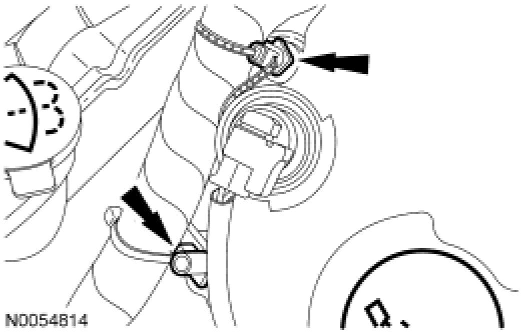

Fig. 144: Identifying Wiring Harness Retainers From LH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

29. Remove the oil level indicator.

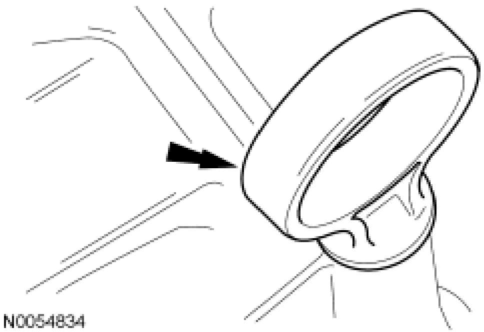

Fig. 145: Identifying Oil Level Indicator
Courtesy of FORD MOTOR CO.

30. Disconnect the hose from the power steering reservoir.
    - Detach the pin-type retainer from the engine mount brace.

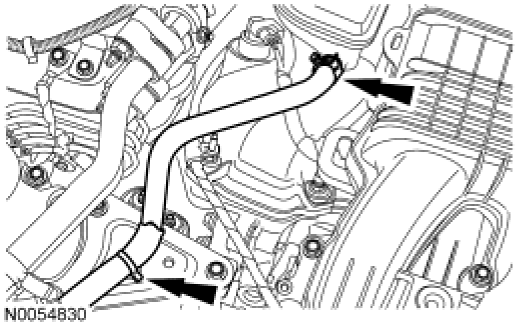

Fig. 146: Identifying Pin-Type Retainer From Engine Mount Brace
Courtesy of FORD MOTOR CO.

31. Using a small screwdriver, release the retaining clip and detach the power steering reservoir from the cowl.

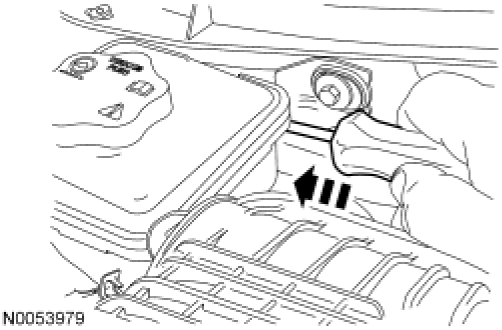

Fig. 147: Detaching Power Steering Reservoir From Bracket
Courtesy of FORD MOTOR CO.

32. Disconnect the fuel supply tube from the fuel rail. For additional information, refer to **FUEL SYSTEM - GENERAL INFORMATION** article.

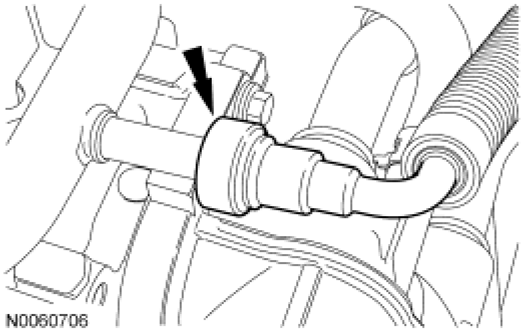

Fig. 148: Identifying Fuel Supply Tube From Fuel Rail
Courtesy of FORD MOTOR CO.

33. Remove the bolt and the ground wire from the engine mount brace.

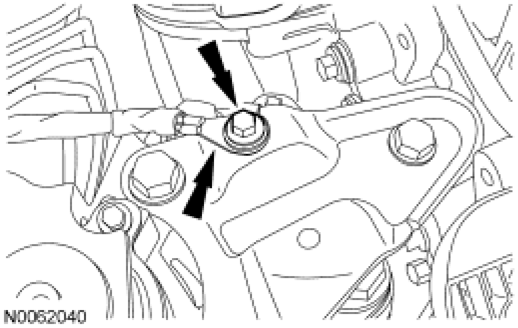

Fig. 149: Identifying Ground Wire Bolt From Engine Mount Brace
Courtesy of FORD MOTOR CO.

34. Remove the 3 bolts and the engine mount brace.

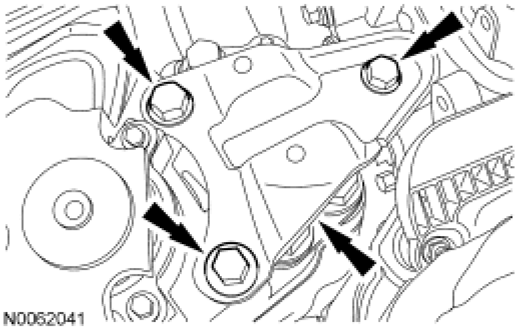

Fig. 150: Locating Engine Mount Brace Bolts
Courtesy of FORD MOTOR CO.

35. Disconnect the PCM electrical connectors and pin-type retainers.

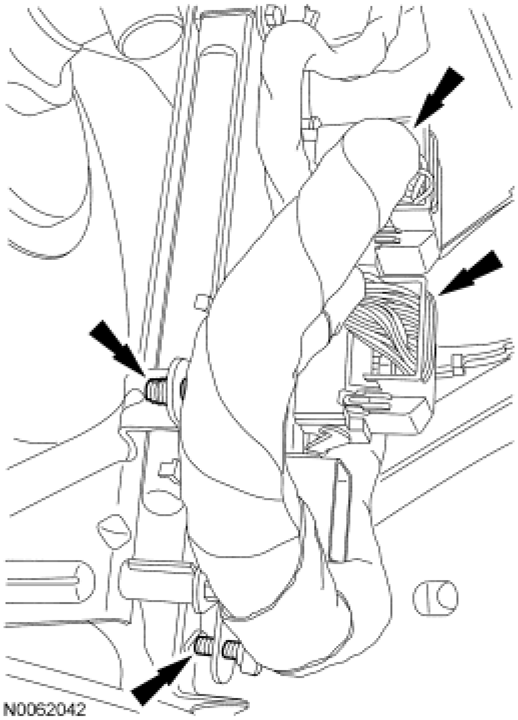

Fig. 151: Locating PCM Electrical Connectors & Pin-Type Retainers
Courtesy of FORD MOTOR CO.

36. Remove the power steering pressure (PSP) hose bracket bolt.

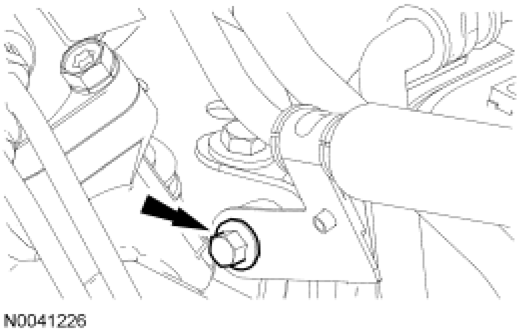

Fig. 152: Locating Power Steering Pressure (PSP) Hose Bracket Bolt
Courtesy of FORD MOTOR CO.

37. Remove and discard the PSP banjo bolt and the 2 seals from the steering gear.

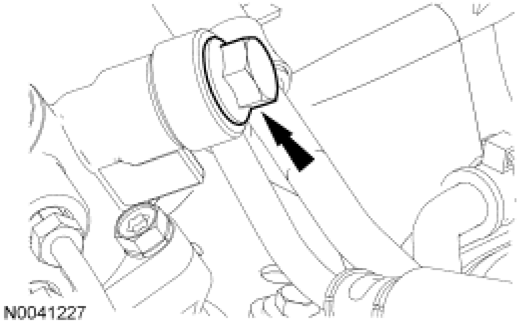

Fig. 153: Locating PSP Hose Banjo Bolt
Courtesy of FORD MOTOR CO.

38. Place the steering wheel in the straight-ahead position and the ignition key in the OFF position.
39. Remove the 2 nuts and the steering joint cover.

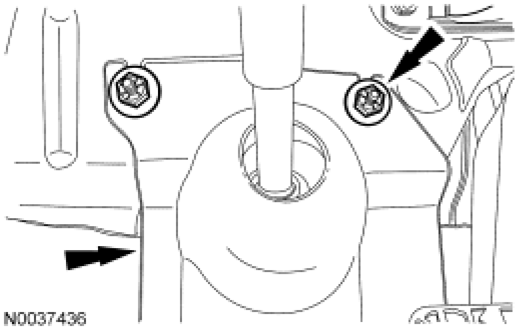

Fig. 154: Locating Steering Joint Cover And Nuts
Courtesy of FORD MOTOR CO.

CAUTION: Do not allow the intermediate shaft to rotate while it is disconnected from the gear or damage to the clockspring may occur. If there is evidence that the intermediate shaft has rotated, the clockspring

must be removed and recentered. For additional information, refer to SUPPLEMENTAL RESTRAINT SYSTEM article.

NOTE: **Index-mark the steering column shaft position to the steering gear for reference during installation.**

40. Remove the bolt and disconnect the steering column shaft from the steering gear.
    - Discard the bolt.

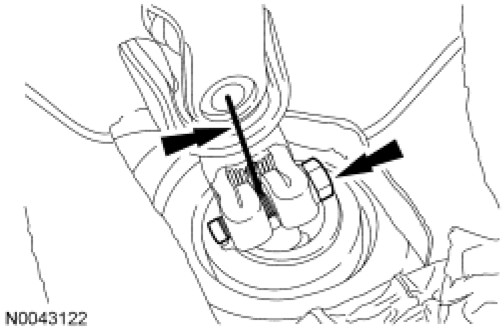

Fig. 155: Locating Steering Column Shaft Index Mark And Bolt
Courtesy of FORD MOTOR CO.

41. Remove the 4 screws and position the LH fender splash shield aside.

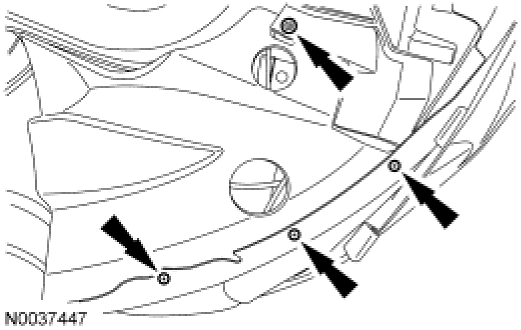

Fig. 156: Locating LH Fender Splash Shield Screws
Courtesy of FORD MOTOR CO.

42. Remove the 6 pin-type retainers (4 shown) and the LH splash shield.

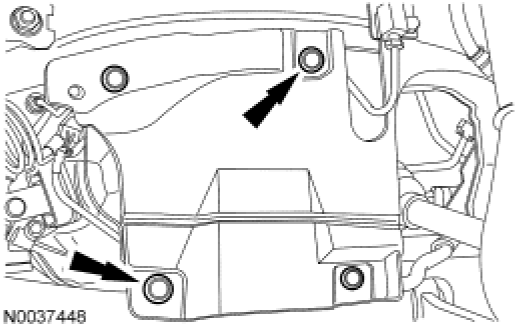

Fig. 157: Locating LH Splash Shield And Pin-Type Retainers
Courtesy of FORD MOTOR CO.

CAUTION: The steering gear-to-dash seal must be removed or it will be damaged when lowering the subframe.

43. Release the 4 clips and slide the steering gear-to-dash seal off of the steering gear and into the passenger compartment.

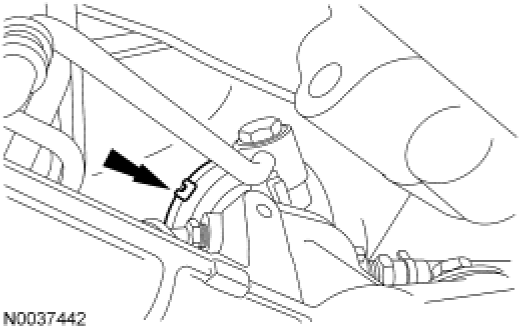

Fig. 158: Locating Steering Gear-To-Dash Seal Clips
Courtesy of FORD MOTOR CO.

44. Disconnect the transaxle cooler hoses.

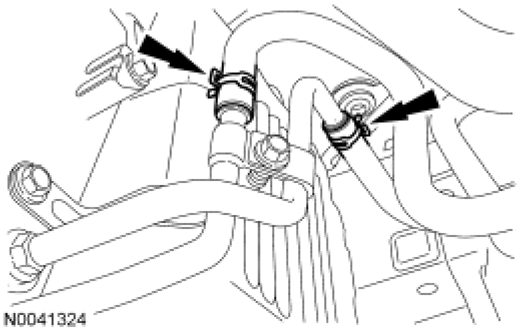

Fig. 159: Locating Transmission Fluid Cooler Hoses
Courtesy of FORD MOTOR CO.

45. Remove the drain plug and drain the engine oil.
    - Install the drain plug and tighten to 27 Nm (20 lb-ft).

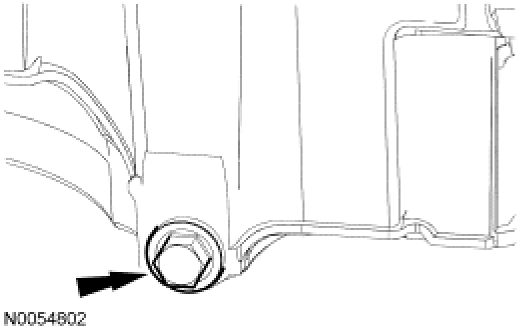

Fig. 160: Locating Drain Plug
Courtesy of FORD MOTOR CO.

46. Remove and discard the engine oil filter.

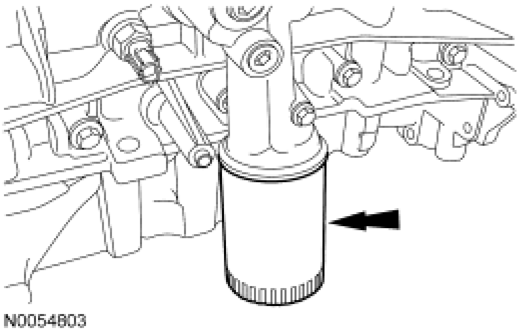

Fig. 161: Identifying Engine Oil Filter
Courtesy of FORD MOTOR CO.

47. Remove the 6 nuts and the Y-pipe assembly.
    - Discard the gaskets and nuts.

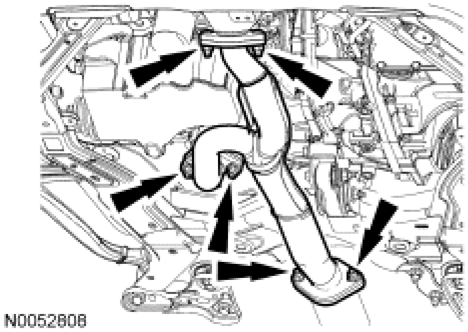

Fig. 162: Locating Y-Pipe Nuts & Y-Pipe Assembly
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

NOTE: Index-mark the driveshaft for installation.

48. Remove the 4 bolts (3 shown) and support the driveshaft with a length of mechanic's wire.

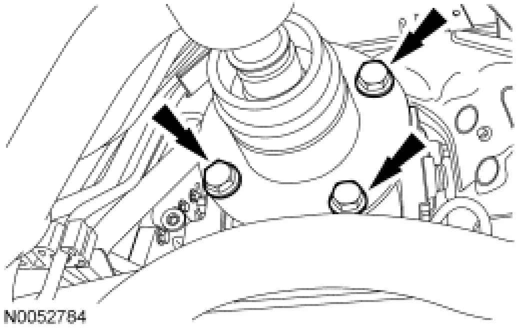

Fig. 163: Identifying Drive Shaft Bolts
Courtesy of FORD MOTOR CO.

All vehicles

49. Remove the engine roll restrictor-to-subframe through bolt.

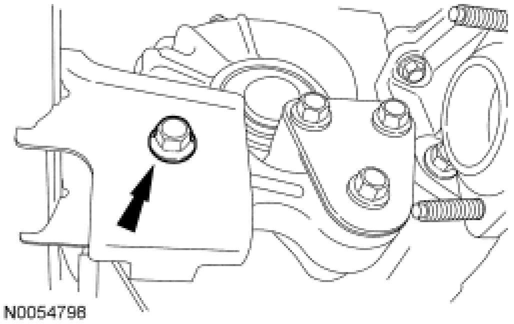

Fig. 164: Locating Roll Restrictor Bolt
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

50. Remove the cotter pins and nuts from the tie-rod ends.

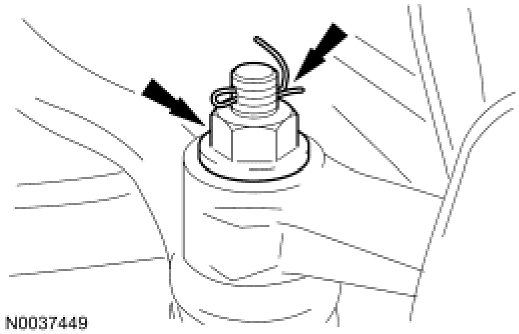

Fig. 165: Locating Tie-Rod Ends Nuts And Cotter Pin
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

51. Using the special tool, separate the tie-rod ends from the steering knuckles.

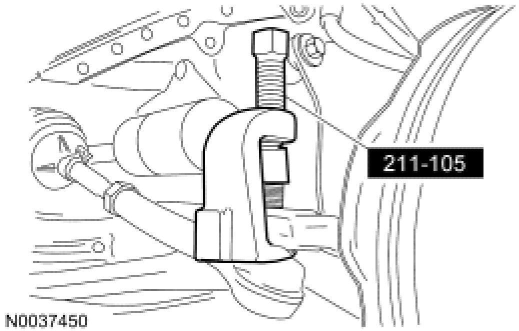

Fig. 166: Separating Tie-Rod Ends From Wheel Knuckles Using Special Tool (211-105)
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

52. Remove the nuts and separate the stabilizer bar links from the struts.

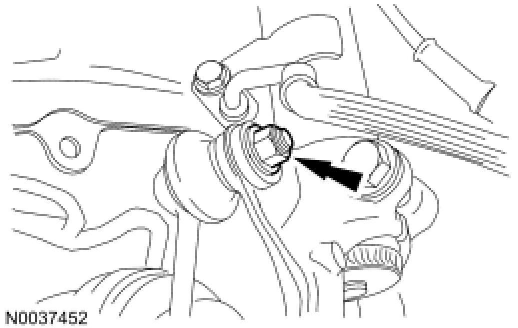

Fig. 167: Locating Stabilizer Bar Links Nut
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

53. Remove the 4 lower ball joint nuts.

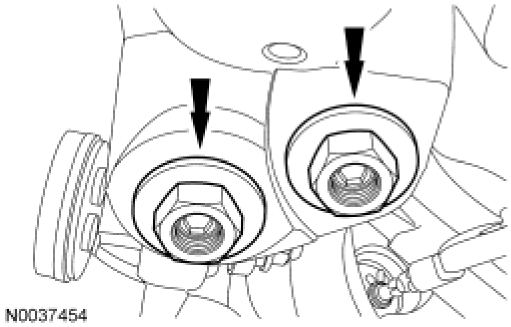

Fig. 168: Locating Lower Ball Joint Nuts
Courtesy of FORD MOTOR CO.

CAUTION: **When the lower ball joint is separated from the wheel knuckle, the lower arm may strike the outer constant velocity (CV) joint boot with enough force to damage the boot clamp. This will result in a loss of grease from the outer CV joint. Place a block of wood, or similar item, between the lower arm and the outer CV joint to prevent the lower arm from striking the outer CV joint.**

NOTE: **Once pressure is applied to the ball joint with the special tool, it may be necessary to tap the wheel knuckle at the ball joint area to separate the ball joint from the wheel knuckle.**

NOTE: **LH shown, RH similar.**

54. Using the special tools, separate the lower ball joints from the lower control arms.

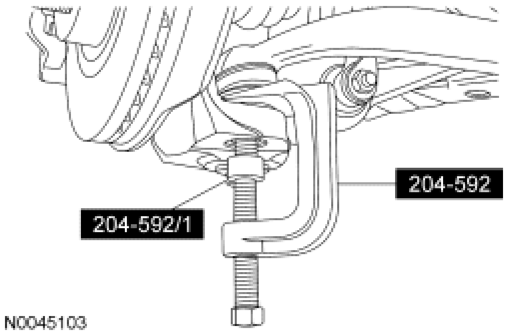

Fig. 169: Identifying Special Tools (204-592/1, 204-592)
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

55. Remove the through bolts from the lower control arms.

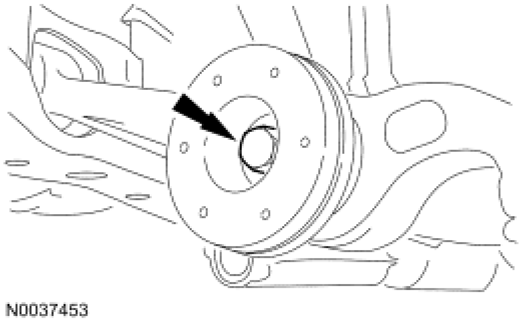

Fig. 170: Locating Lower Control Arms Through Bolt
Courtesy of FORD MOTOR CO.

56. Position the special tool under the subframe assembly.

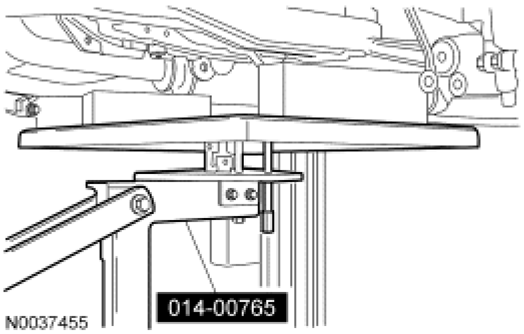

Fig. 171: Positioning Special Tool (014-00765) Under Subframe Assembly
Courtesy of FORD MOTOR CO.

NOTE: **LH shown, RH similar.**

57. Remove the 4 subframe bracket-to-body bolts.

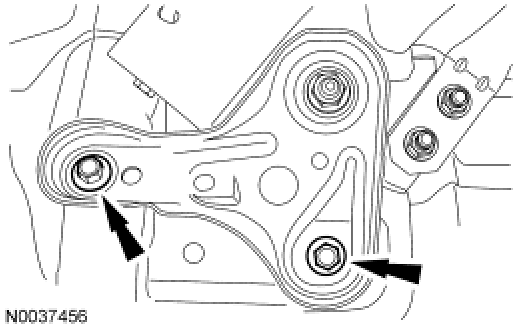

Fig. 172: Locating Subframe Bracket-To-Body Bolts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

58. Remove the 2 subframe nuts and the 2 subframe brackets.

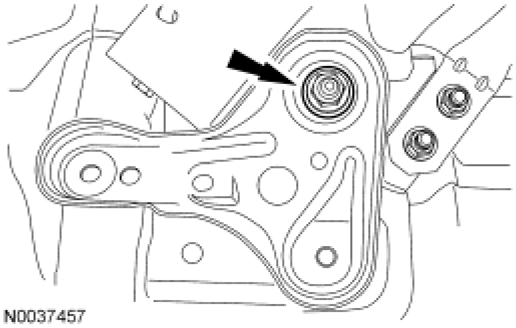

Fig. 173: Locating Subframe Nuts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

59. Remove the 2 front subframe nuts.

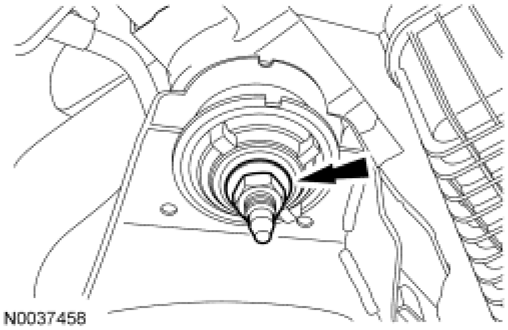

Fig. 174: Locating Front Subframe Nuts
Courtesy of FORD MOTOR CO.

60. Using the special tool, lower the subframe assembly from the vehicle.

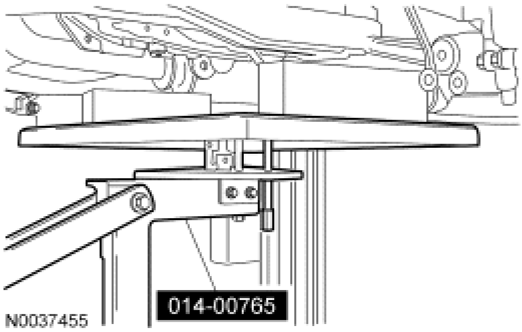

Fig. 175: Positioning Special Tool (014-00765) Under Subframe Assembly

Courtesy of FORD MOTOR CO.

61. Using the special tools, separate the LH halfshaft from the transaxle and support the halfshaft with a length of mechanic's wire.

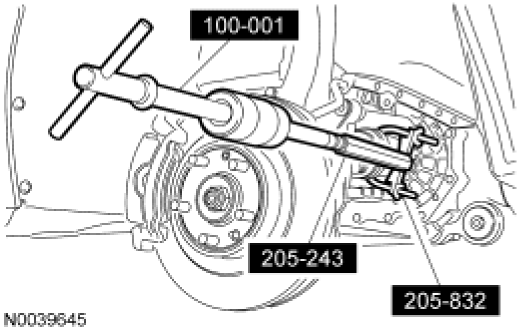

Fig. 176: Identifying Special Tools (100-001, 205-243 And 205-832)
Courtesy of FORD MOTOR CO.

AWD vehicles

62. Remove the 2 RH halfshaft carrier bearing bolts.
    - Separate the RH halfshaft from the transaxle and support the halfshaft with a length of mechanic's wire.

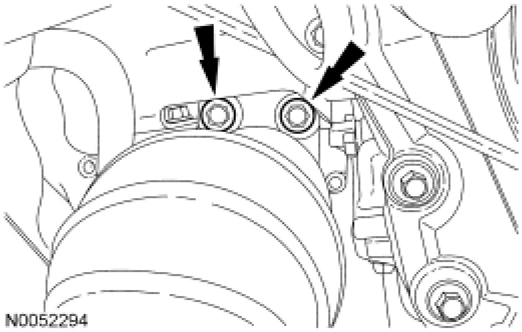

Fig. 177: Locating RH Halfshaft Bearing Support Bracket Bolts
Courtesy of FORD MOTOR CO.

Front wheel drive (FWD) vehicles

63. Remove the 2 RH catalytic converter bracket bolts.

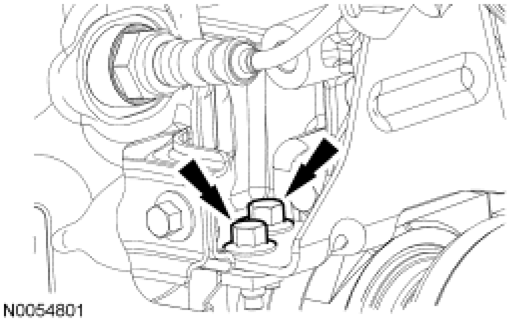

Fig. 178: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

64. Remove the 2 nuts and remove the RH catalytic converter bracket.

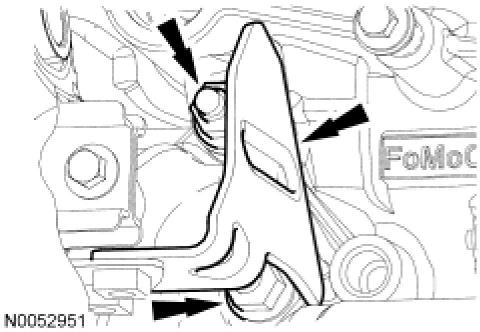

Fig. 179: Identifying Catalytic Converter Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

65. Remove the RH halfshaft carrier bearing bolt and the 2 stud bolts.
    - Separate the RH halfshaft from the transaxle and support the halfshaft with a length of mechanic's wire.

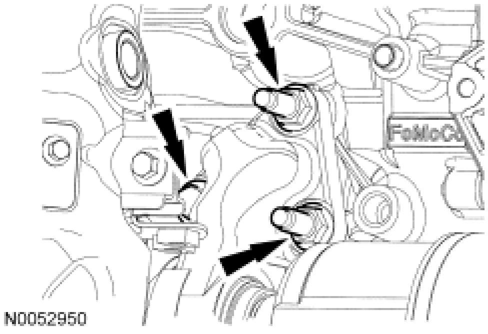

Fig. 180: Identifying Intermediate Shaft Bearing Support Bracket & Nuts
Courtesy of FORD MOTOR CO.

All vehicles

NOTE: Position a block of wood under the transaxle.

66. Install the special tools.

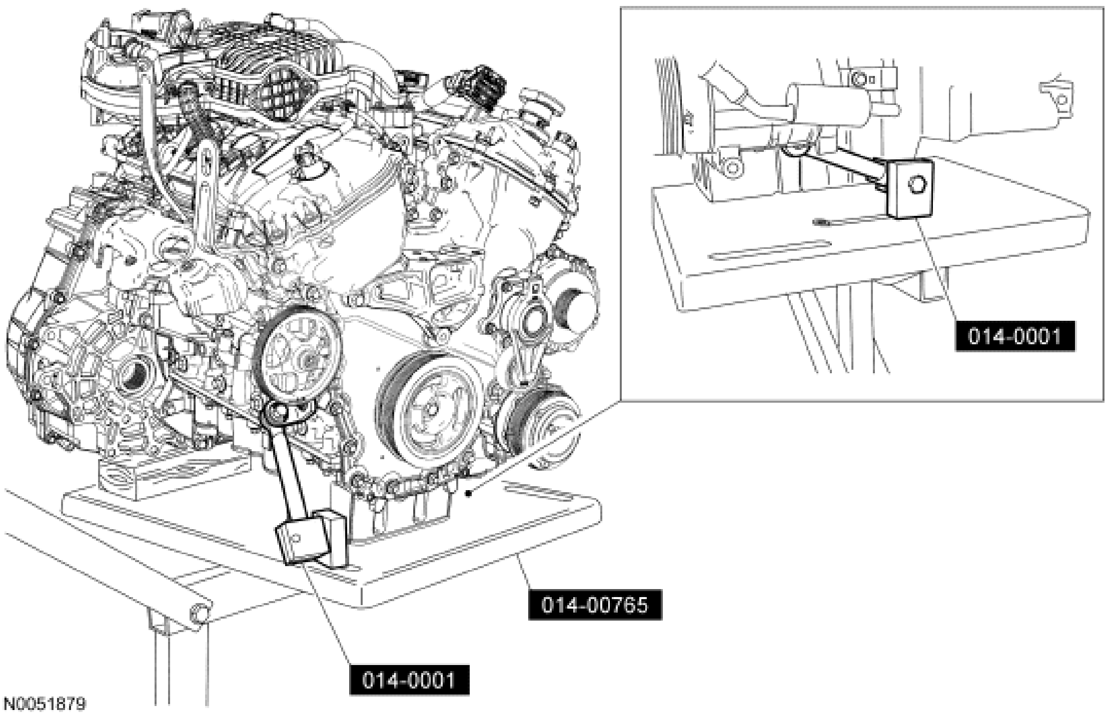

Fig. 181: Positioning Block Of Wood Under Transaxle Using Special Tools (014-0001) & (014-00765)
Courtesy of FORD MOTOR CO.

67. Remove the transaxle mount through bolt.

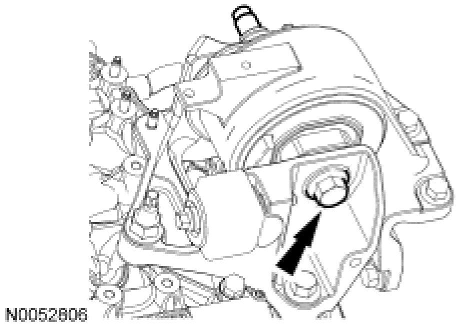

Fig. 182: Identifying Transaxle Support Insulator Through Bolt
Courtesy of FORD MOTOR CO.

68. Remove the transaxle mount bracket bolt and the 2 nuts.

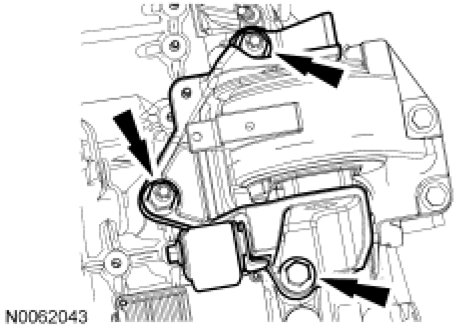

Fig. 183: Identifying Transaxle Mount Bracket Bolt
Courtesy of FORD MOTOR CO.

69. Remove the 4 engine mount nuts.

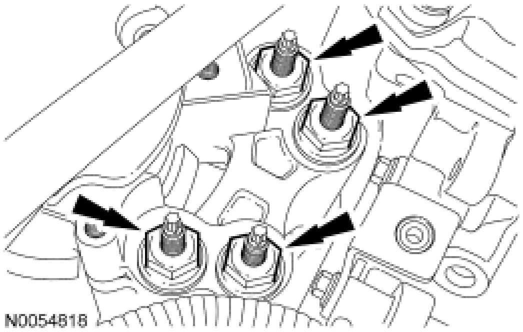

Fig. 184: Identifying Engine Mount Nuts
Courtesy of FORD MOTOR CO.

70. Remove the nut, 2 bolts and the engine mount.

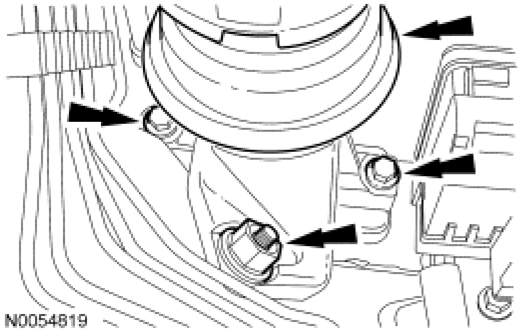

Fig. 185: Identifying Nut, Bolts & Engine Mount
Courtesy of FORD MOTOR CO.

71. Lower the engine and transaxle assembly from the vehicle.
72. If equipped, detach the block heater wiring harness retainer from the upper intake manifold.

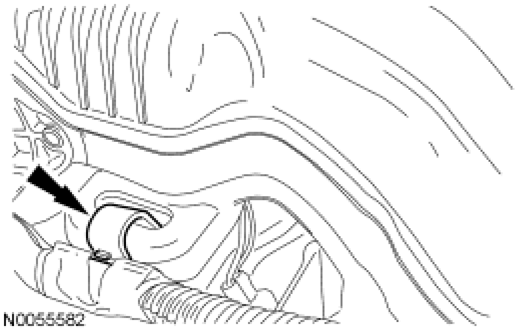

Fig. 186: Identifying Block Heater Wiring Harness Retainer From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

73. If equipped, detach the block heater wiring harness retainers from the PSP hose and the power steering reservoir hose.

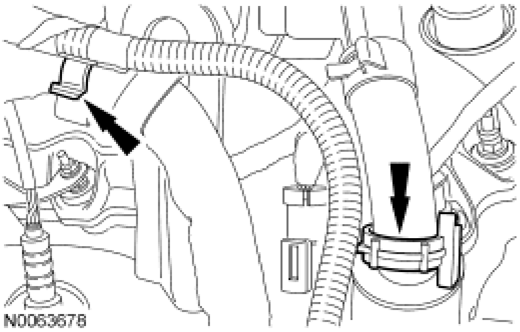

Fig. 187: Identifying Block Heater Wiring Harness From Engine
Courtesy of FORD MOTOR CO.

74. If equipped, disconnect the heated PCV electrical connector.

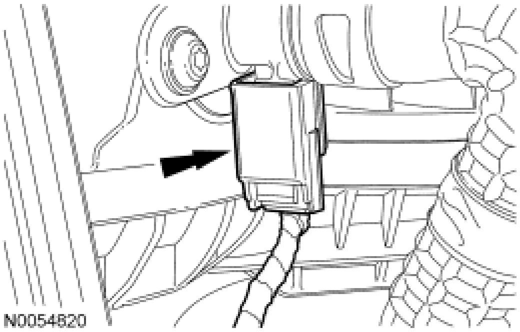

Fig. 188: Identifying Positive Crankcase Ventilation (PCV) Fitting Electrical Connector
Courtesy of FORD MOTOR CO.

75. Disconnect the PCV hose from the PCV valve.

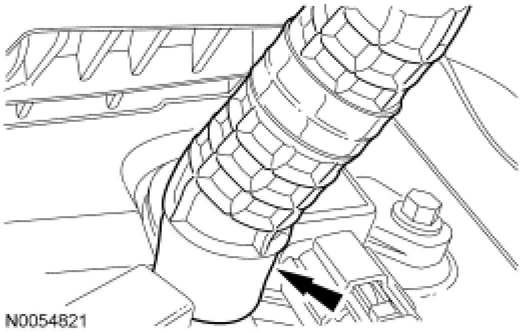

Fig. 189: Identifying PCV Hose From PCV Valve
Courtesy of FORD MOTOR CO.

76. Disconnect the throttle body (TB) electrical connector.

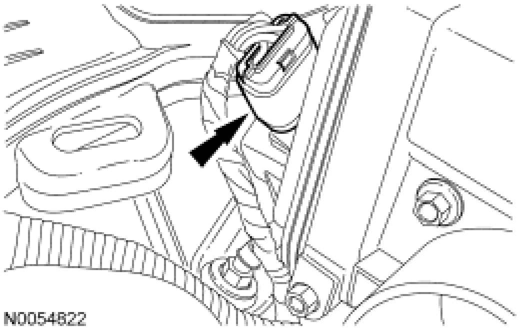

Fig. 190: Locating Throttle Body Electrical Connector
Courtesy of FORD MOTOR CO.

77. Detach the wiring harness retainers from the upper intake manifold.

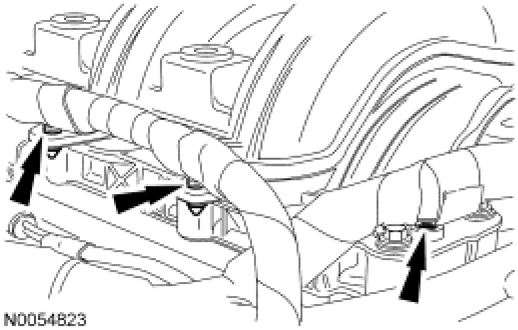

Fig. 191: Locating Wiring Harness Retainers From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

78. If equipped, remove the upper intake manifold long support bracket bolt.

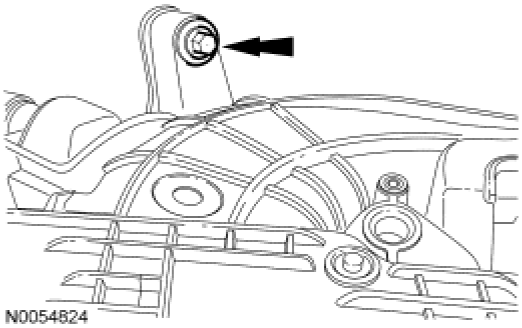

Fig. 192: Locating Upper Intake Manifold Support Bracket Bolt
Courtesy of FORD MOTOR CO.

79. Remove the upper intake manifold short support bracket bolt.

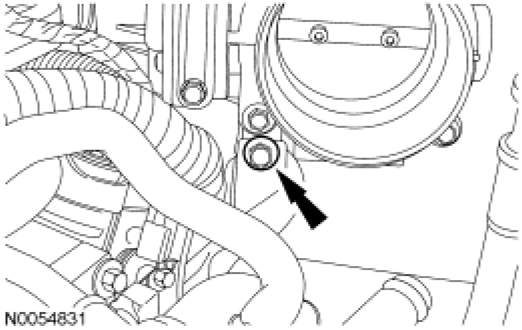

Fig. 193: Locating Upper Intake Manifold Support Bracket Bolt
Courtesy of FORD MOTOR CO.

80. Remove the 6 bolts and the upper intake manifold.
    - Discard the gaskets.

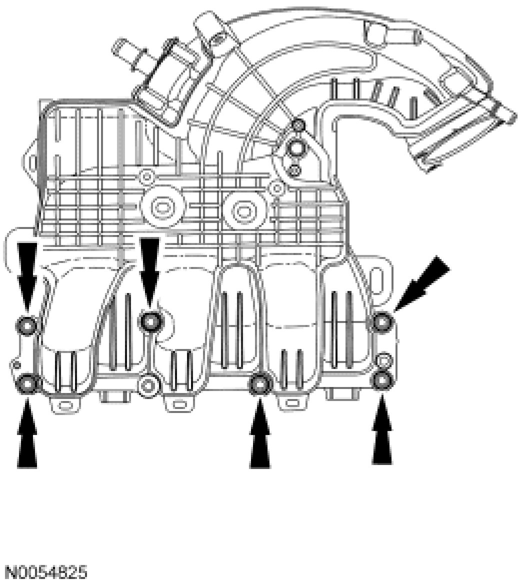

Fig. 194: Identifying Upper Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

81. Disconnect the RH catalyst monitor electrical connector.

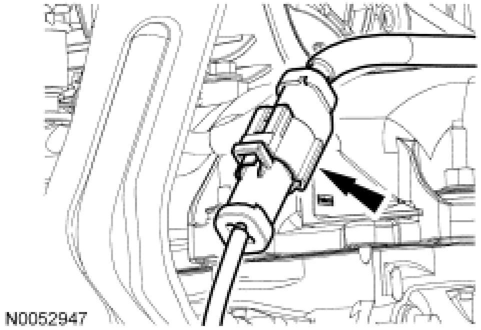

Fig. 195: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

82. Disconnect the PSP switch electrical connector.

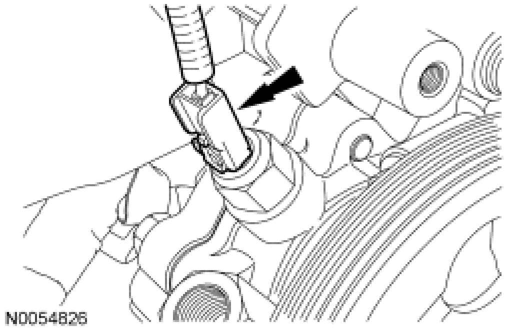

Fig. 196: Locating PSP Switch Electrical Connector
Courtesy of FORD MOTOR CO.

83. Disconnect the RH variable camshaft timing (VCT) solenoid electrical connector.

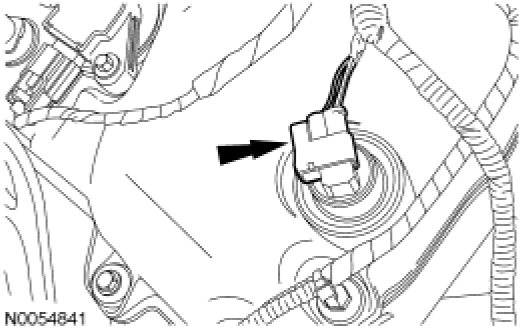

Fig. 197: Locating RH Variable Camshaft Timing (VCT) Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

84. Disconnect the 3 RH coil-on-plug electrical connectors.

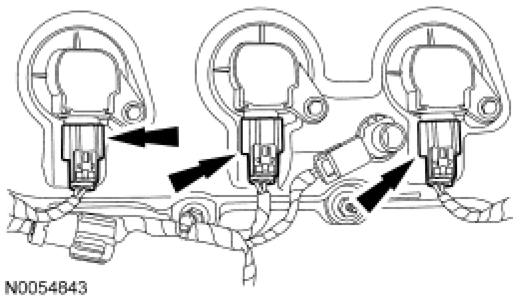

Fig. 198: Locating RH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

85. If equipped, disconnect the heated PCV valve electrical connector.

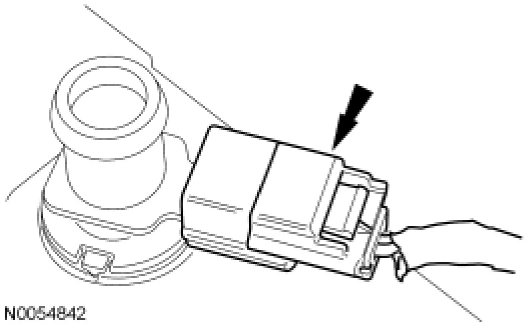

Fig. 199: Locating Heated PCV Valve Electrical Connector
Courtesy of FORD MOTOR CO.

86. Detach all of the wiring harness retainers from the RH valve cover and stud bolts.
87. Disconnect the LH VCT solenoid electrical connector.

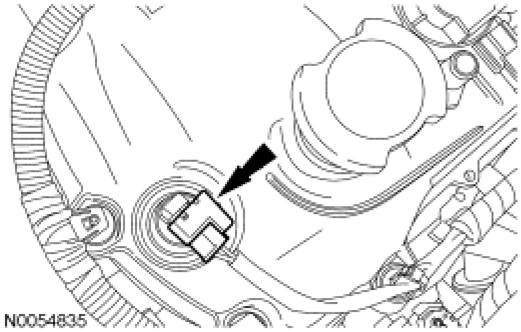

Fig. 200: Locating LH VCT Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

88. Disconnect the 3 LH coil-on-plug electrical connectors.

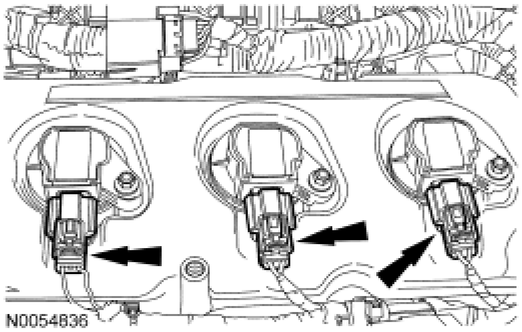

Fig. 201: Locating LH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

89. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.

NOTE: **LH shown, RH similar.**

90. Remove the 6 bolts and the 6 coil-on-plugs.

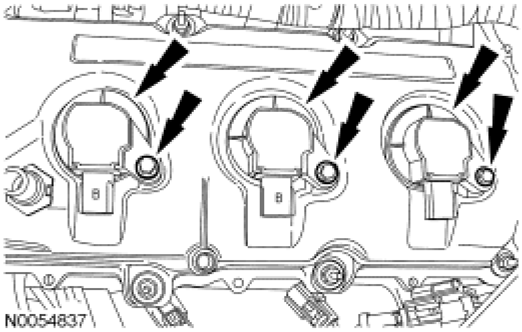

Fig. 202: Locating Coil-On-Plugs & Bolts
Courtesy of FORD MOTOR CO.

91. Detach the PSP hose retainer from the engine lifting eye.

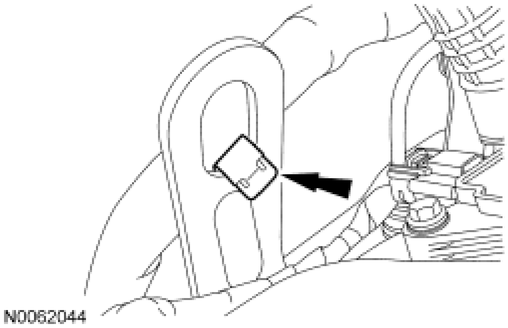

Fig. 203: Locating PSP Hose Retainer From Engine Lifting Eye
Courtesy of FORD MOTOR CO.

92. Remove the PSP hose bracket nut and position the PSP hose aside.

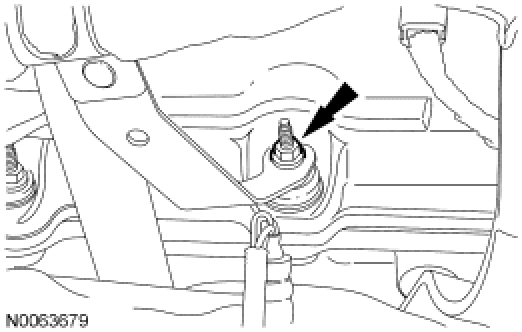

Fig. 204: Identifying PSP Hose Bracket Nut
Courtesy of FORD MOTOR CO.

93. Remove the 2 nuts and the wiring harness retaining bracket.

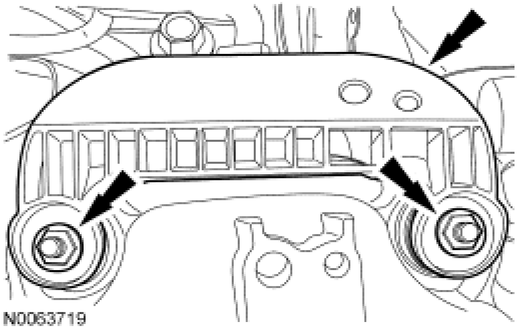

Fig. 205: Identifying Wiring Harness Retaining Bracket & Nuts
Courtesy of FORD MOTOR CO.

94. Remove the 11 stud bolts and the LH valve cover.
    - Discard the gasket.

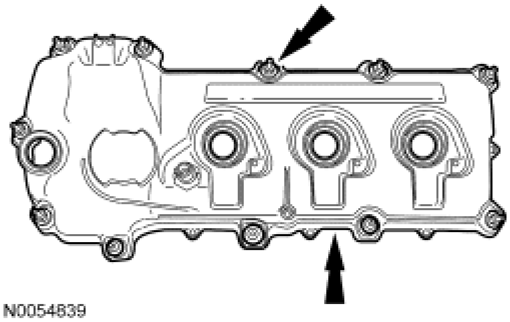

Fig. 206: Locating LH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

95. Remove the bolt, the 10 stud bolts and the RH valve cover.
    - Discard the gasket.

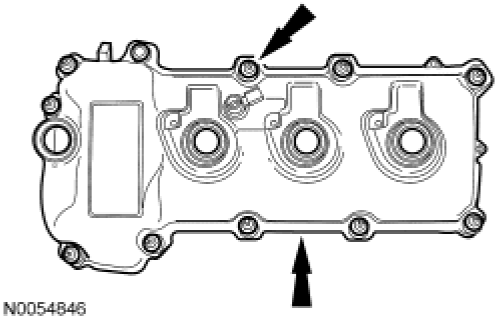

Fig. 207: Locating RH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

NOTE: **VCT solenoid seal removal shown, spark plug tube seal removal similar.**

96. Inspect the VCT solenoid seals and the spark plug tube seals. Install new seals if damaged.
    - Using the special tools, remove the seal(s).

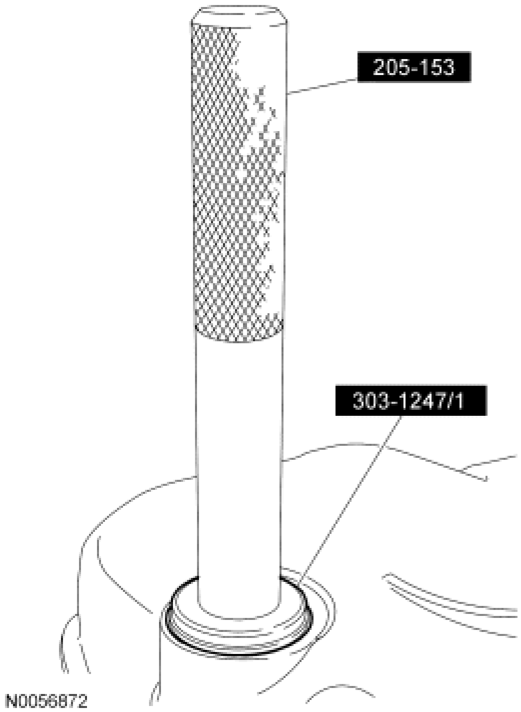

Fig. 208: Removing Seals Using Special Tools (205-153) & (303-1247/1)
Courtesy of FORD MOTOR CO.

97. Remove the 3 bolts and position the power steering pump aside.

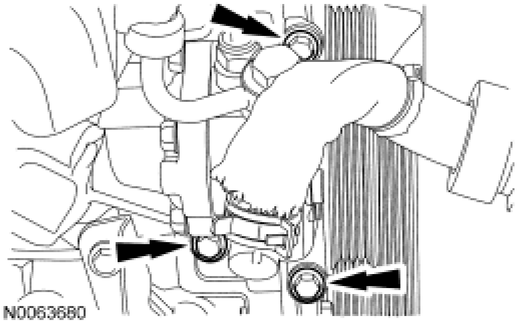

Fig. 209: Locating Power Steering Pump Bolts
Courtesy of FORD MOTOR CO.

98. Remove the 3 bolts and the accessory drive belt tensioner.

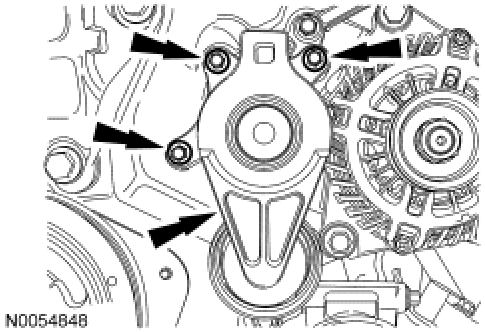

Fig. 210: Locating Accessory Drive Belt Tensioner Bolts
Courtesy of FORD MOTOR CO.

99. Using the special tool, remove the crankshaft bolt and washer.
    - Discard the bolt.

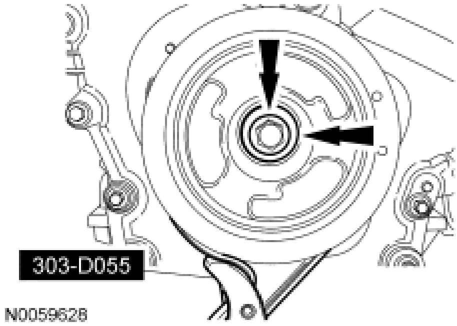

Fig. 211: Removing Crankshaft Bolt & Washer Using Special Tool (303-D055)
Courtesy of FORD MOTOR CO.

100. Using the special tool, remove the crankshaft pulley.

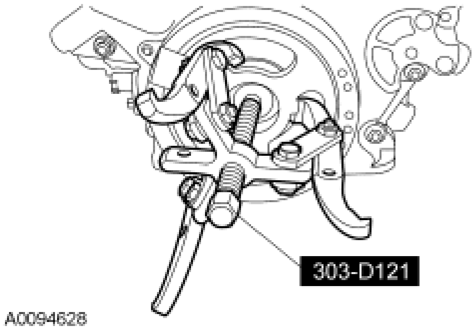

Fig. 212: Identifying Special Tools (303-D121) And Crankshaft Pulley
Courtesy of FORD MOTOR CO.

101. Using the special tool, remove and discard the crankshaft front seal.

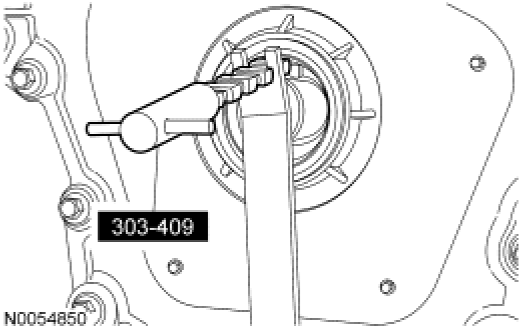

Fig. 213: Removing Crankshaft Front Seal Using Special Tool (303-409)
Courtesy of FORD MOTOR CO.

102. Remove the 2 bolts and the engine mount bracket.

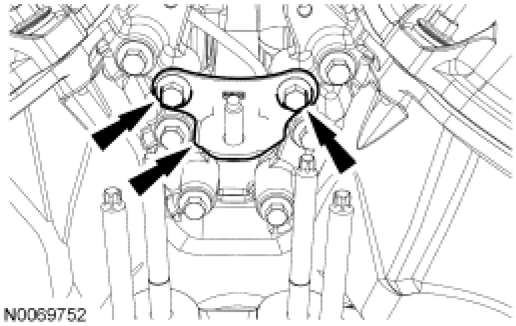

Fig. 214: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

103. Remove the 2 engine mount studs.

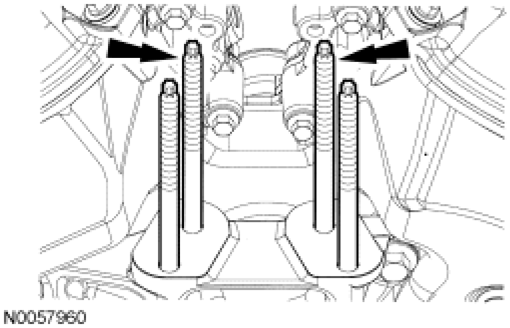

Fig. 215: Locating Engine Mount Studs
Courtesy of FORD MOTOR CO.

104. Remove the 3 bolts and the engine mount bracket.

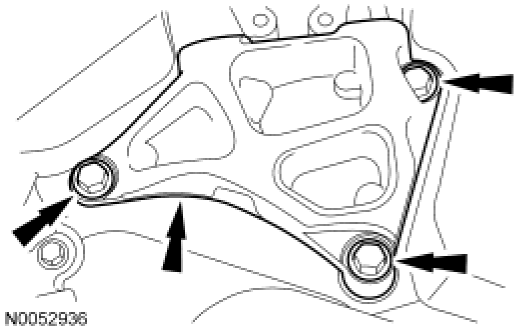

Fig. 216: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

105. Remove the 22 engine front cover bolts.

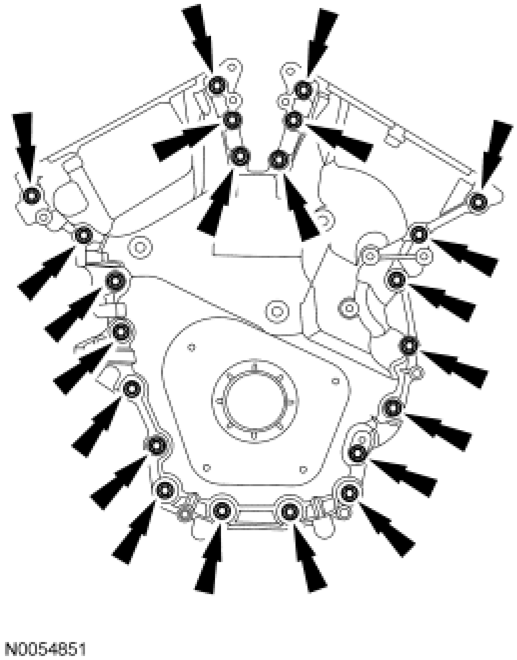

Fig. 217: Identifying Engine Front Cover Bolts
Courtesy of FORD MOTOR CO.

106. Install 6 of the engine front cover bolts (finger tight) into the 6 threaded holes in the engine front cover in the following sequence.
    1. Tighten the bolts one turn at a time in a criss-cross pattern until the engine front cover-to-cylinder block seal is released.
    2. Remove the engine front cover.

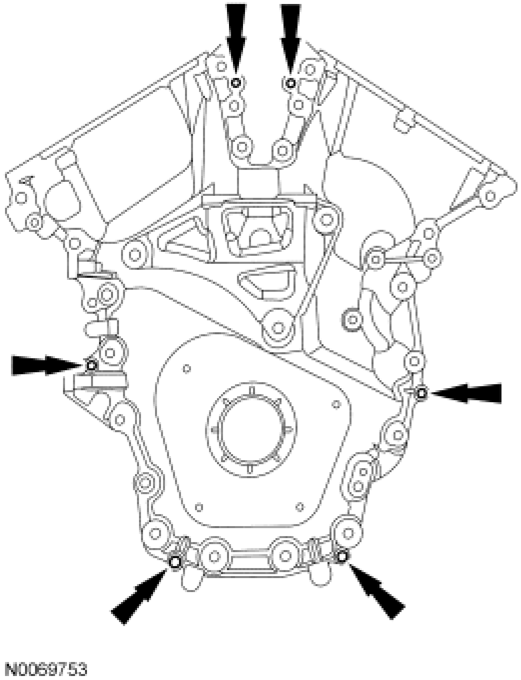

Fig. 218: Identifying Engine Front Cover Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Only use a 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the engine front cover. These tools cause scratches and gouges that make leak paths.

107. Clean the engine front cover using a 3M Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 RPM.
    - Thoroughly wash the engine front cover to remove any foreign material, including any abrasive particles created during the cleaning process.

CAUTION: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

CAUTION: Do not use wire brushes, power abrasive discs or 3M Roloc® Bristle Disk (2-in white part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.

108. Clean all engine sealing surfaces, including the cylinder heads, the oil pan and cylinder block in the

following sequence.

1. Remove any large deposits of silicone or gasket material.
2. Apply silicone gasket remover and allow to set for several minutes.
3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
4. Apply metal surface prep to remove any remaining traces of oil or coolant and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
5. Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

TIMING DRIVE COMPONENTS

Special Tools

Illustration	Tool Name	Tool Number
 ST2979-A	Tool, Camshaft Holding	303-1248

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

1. Remove the engine front cover. For additional information, refer to **Engine Front Cover**.
2. Rotate the crankshaft clockwise and align the timing marks on the Variable Camshaft Timing (VCT) assemblies as shown.

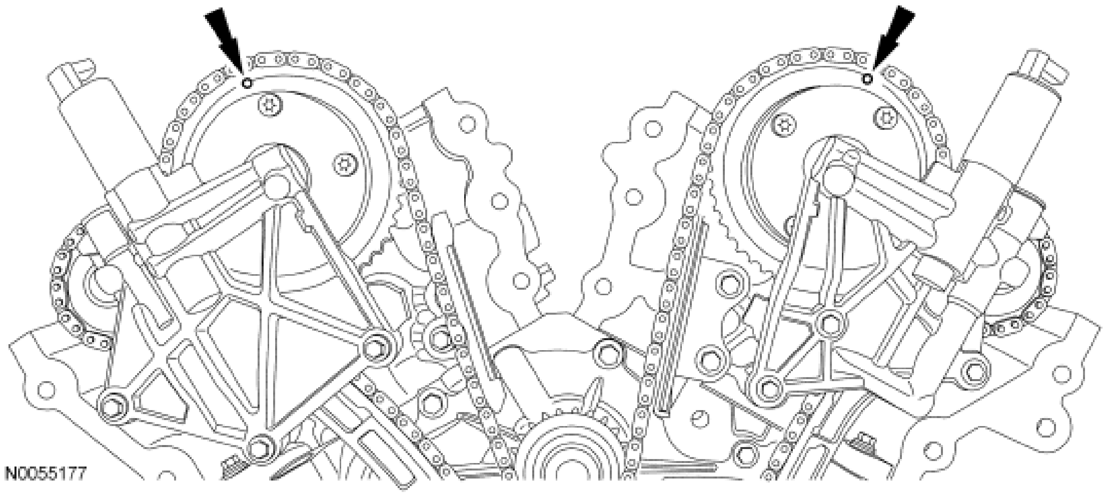

Fig. 219: Aligning Timing Marks On Variable Camshaft Timing (VCT) Assemblies
Courtesy of FORD MOTOR CO.

NOTE: The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

3. Install the Camshaft Holding Tool onto the flats of the LH camshafts.

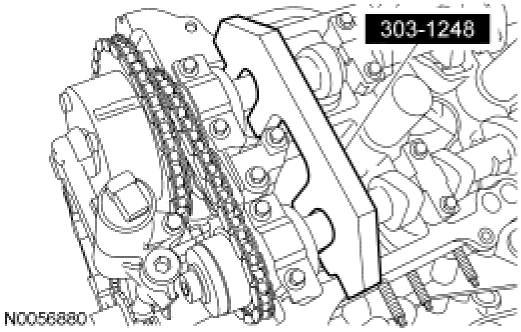

Fig. 220: Installing Special Tool (303-1248) Onto Flats Of LH Camshafts
Courtesy of FORD MOTOR CO.

NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

4. Install the Camshaft Holding Tool onto the flats of the RH camshafts.

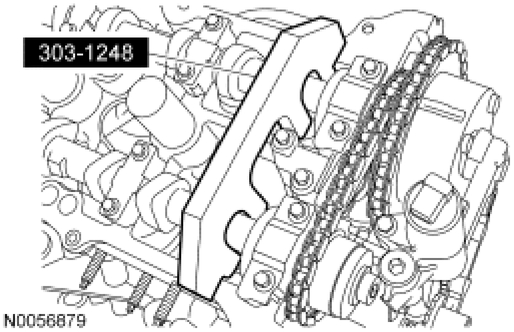

Fig. 221: Installing Special Tool (303-1248) Onto Flats Of RH Camshafts
Courtesy of FORD MOTOR CO.

5. Remove the 3 bolts and the RH VCT housing.

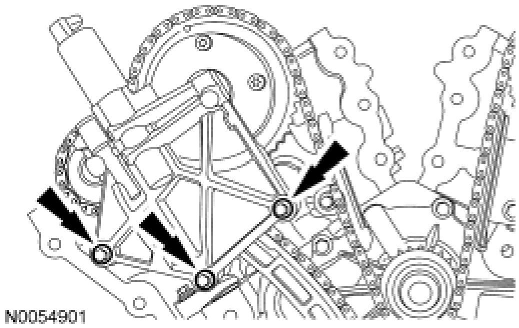

Fig. 222: Locating RH VCT Housing
Courtesy of FORD MOTOR CO.

6. Remove the 3 bolts and the LH VCT housing.

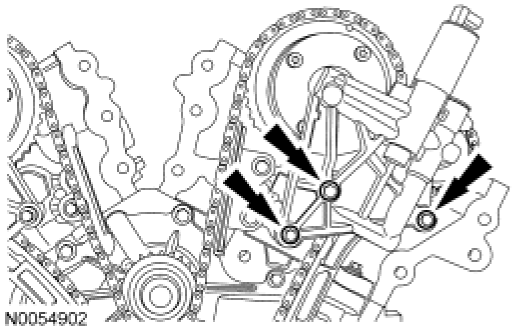

Fig. 223: Locating LH VCT Housing
Courtesy of FORD MOTOR CO.

7. Remove and discard the VCT housing seals.

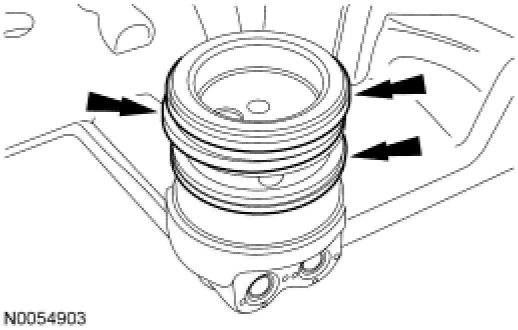

Fig. 224: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

8. Remove the 2 bolts and the primary timing chain tensioner.

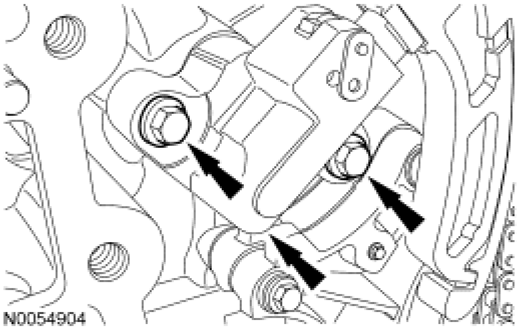

Fig. 225: Locating Primary Timing Chain Tensioner Bolts
Courtesy of FORD MOTOR CO.

9. Remove the primary timing chain tensioner arm.

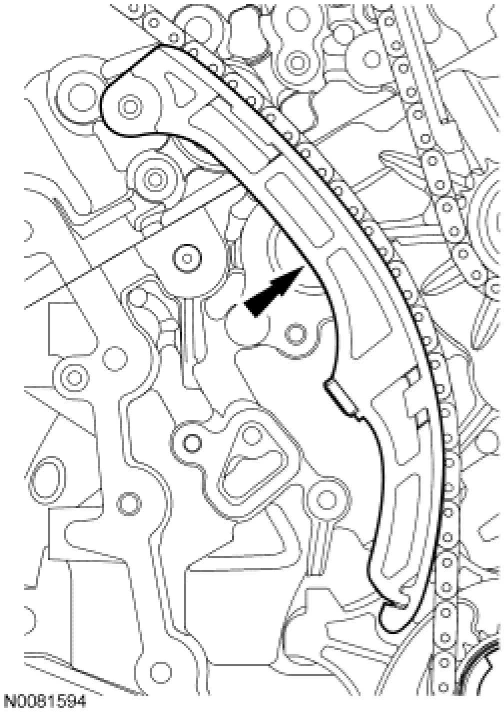

Fig. 226: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

10. Remove the 2 bolts and the lower LH primary timing chain guide.

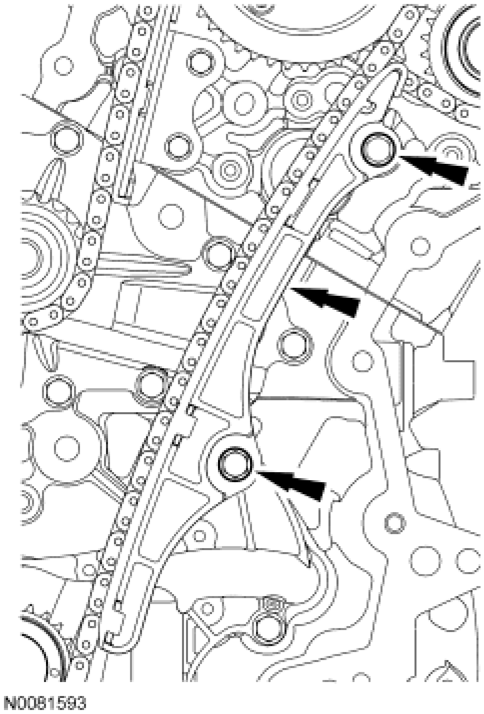

Fig. 227: Locating Lower LH Primary Timing Chain Guide & Bolts

Courtesy of FORD MOTOR CO.

11. Remove the primary timing chain.

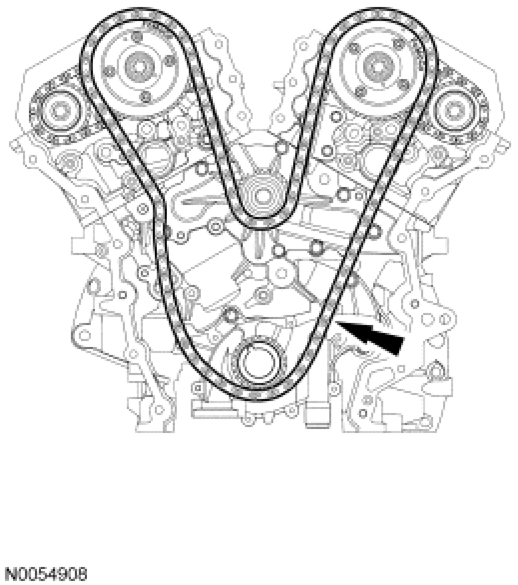

Fig. 228: Locating Primary Timing Chain
Courtesy of FORD MOTOR CO.

12. Remove the crankshaft timing chain sprocket.

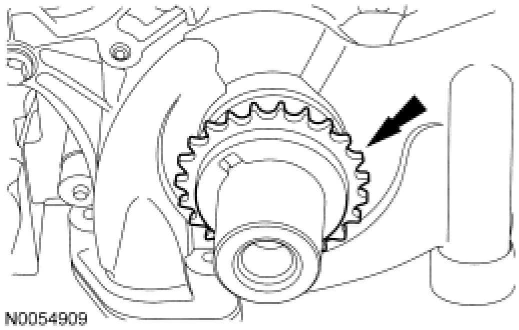

Fig. 229: Locating Crankshaft Timing Chain Sprocket
Courtesy of FORD MOTOR CO.

13. Remove the 2 bolts and the upper LH primary timing chain guide.

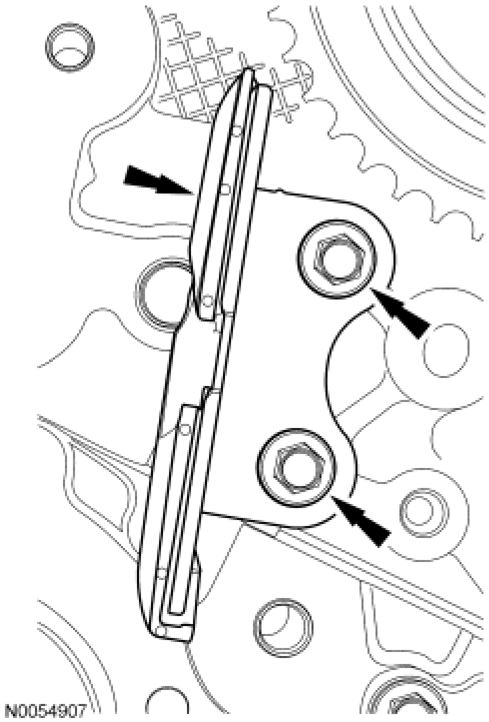

Fig. 230: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

14. Compress the LH secondary timing chain tensioner and install a suitable lock pin to retain the tensioner in the collapsed position.

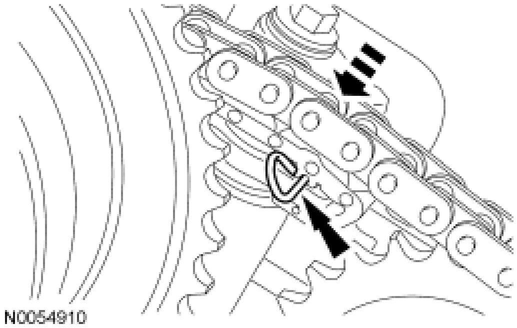

Fig. 231: Compressing LH Secondary Timing Chain Tensioner & Installing Suitable Lock Pin To Retain Tensioner In Collapsed Position
Courtesy of FORD MOTOR CO.

NOTE:	**The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.**

15. Remove and discard the LH VCT assembly bolt and the LH exhaust camshaft sprocket bolt.
    - Remove the LH VCT assembly, secondary timing chain and the LH exhaust camshaft sprocket as an assembly.

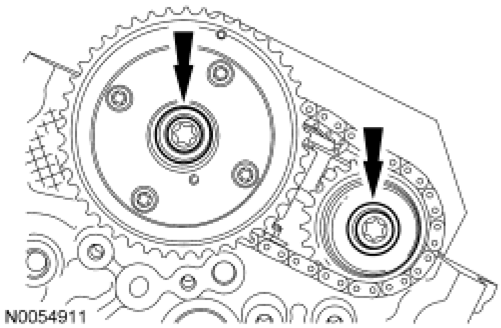

Fig. 232: Locating LH VCT Assembly Bolt & LH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

NOTE: It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.

16. Remove the 2 bolts and the LH secondary timing chain tensioner.

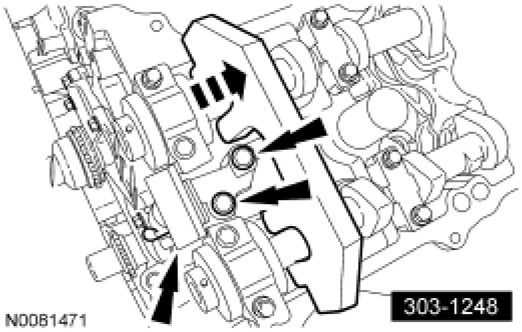

Fig. 233: Locating LH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

17. Compress the RH secondary timing chain tensioner and install a suitable lock pin to retain the tensioner in the collapsed position.

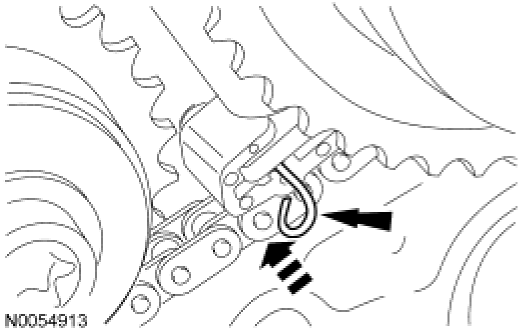

Fig. 234: Compressing RH Secondary Timing Chain Tensioner & Installing Suitable Lock Pin To Retain Tensioner In Collapsed Position
Courtesy of FORD MOTOR CO.

NOTE: The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

18. Remove and discard the RH VCT assembly bolt and the RH exhaust camshaft sprocket bolt.
    - Remove the RH VCT assembly, secondary timing chain and the RH exhaust camshaft sprocket as an assembly.

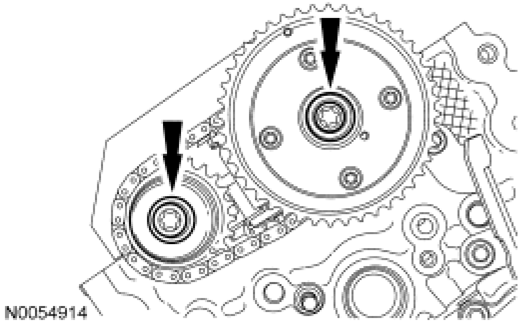

Fig. 235: Locating RH VCT Assembly Bolt & RH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

NOTE: It is necessary to tilt the Camshaft Holding Tool toward the rear of the engine to access the rearmost secondary timing chain tensioner bolt.

19. Remove the 2 bolts and the RH secondary timing chain tensioner.

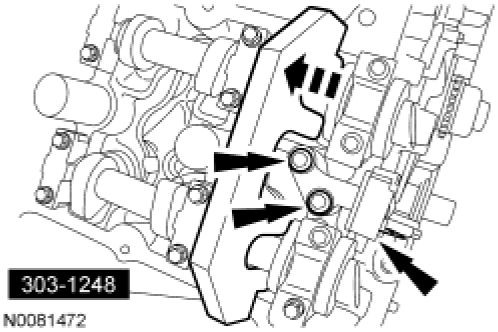

Fig. 236: Locating RH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

20. Remove the 2 bolts and the RH primary timing chain guide.

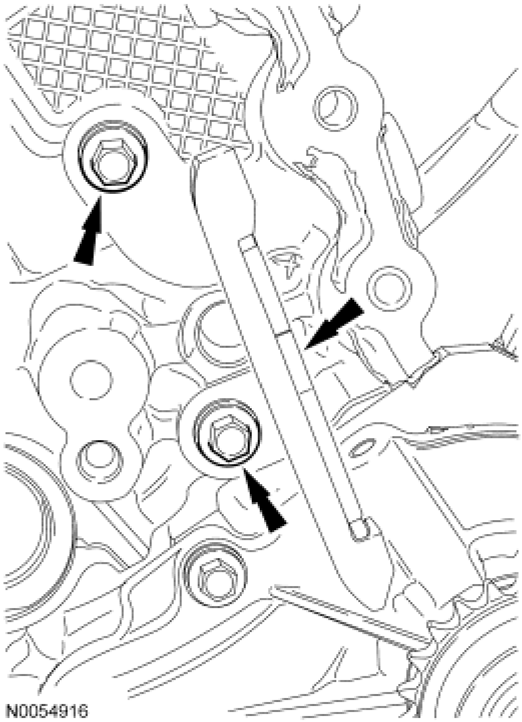

Fig. 237: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

CAMSHAFT

Special Tools

Illustration	Tool Name	Tool Number
	Tool, Camshaft Holding	303-1248

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine

failure.

All camshafts

1. Remove the engine front cover. For additional information, refer to **Engine Front Cover**.
2. Rotate the crankshaft clockwise and align the timing marks on the Variable Camshaft Timing (VCT) assemblies as shown.

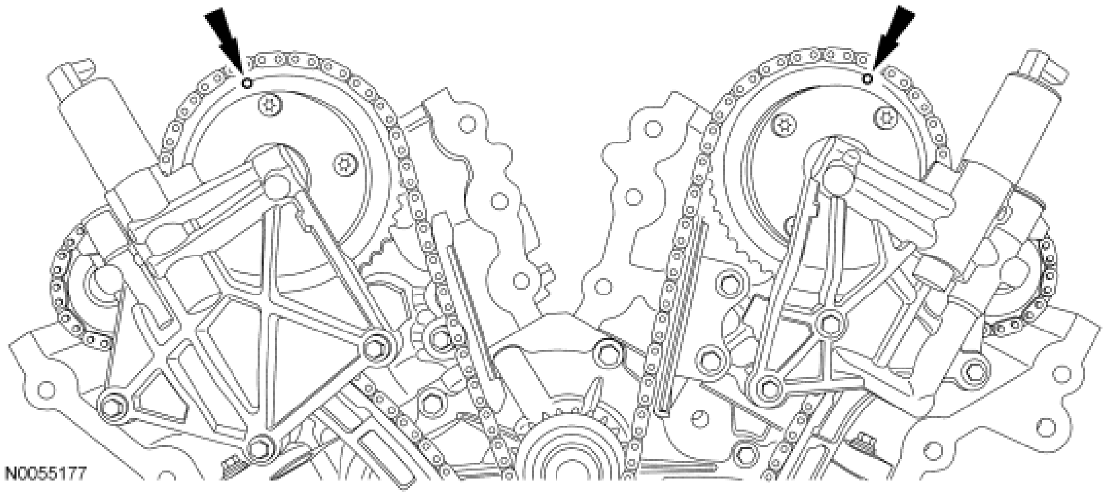

Fig. 238: Aligning Timing Marks On Variable Camshaft Timing (VCT) Assemblies
Courtesy of FORD MOTOR CO.

NOTE: The Camshaft Holding Tool will hold the camshafts in the Top Dead Center (TDC) position.

3. Install the Camshaft Holding Tool onto the flats of the LH camshafts.

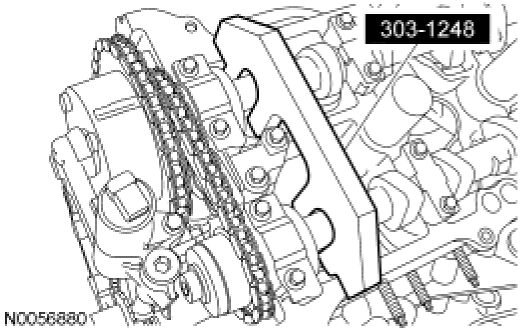

Fig. 239: Installing Special Tool (303-1248) Onto Flats Of LH Camshafts
Courtesy of FORD MOTOR CO.

NOTE: The Camshaft Holding Tool will hold the camshafts in the TDC position.

4. Install the Camshaft Holding Tool onto the flats of the RH camshafts.

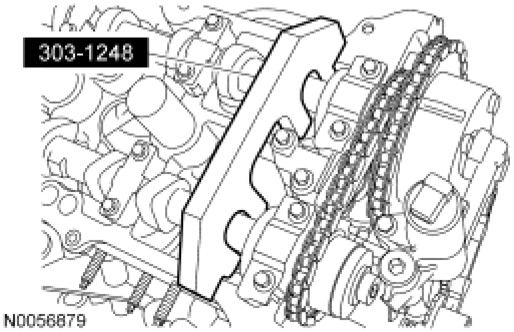

Fig. 240: Installing Special Tool (303-1248) Onto Flats Of RH Camshafts
Courtesy of FORD MOTOR CO.

5. Remove the 3 bolts and the RH VCT housing.

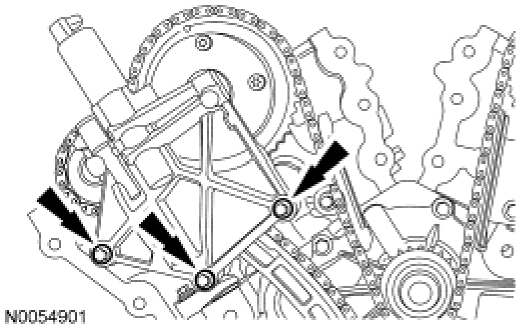

Fig. 241: Locating RH VCT Housing
Courtesy of FORD MOTOR CO.

6. Remove the 3 bolts and the LH VCT housing.

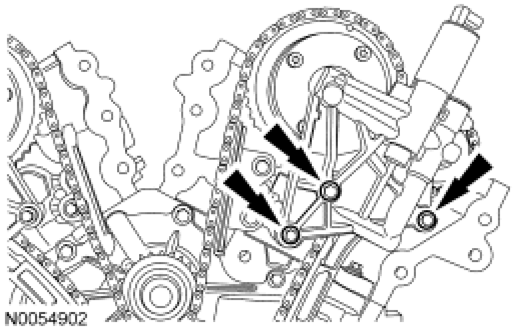

Fig. 242: Locating LH VCT Housing
Courtesy of FORD MOTOR CO.

7. Remove and discard the VCT housing seals.

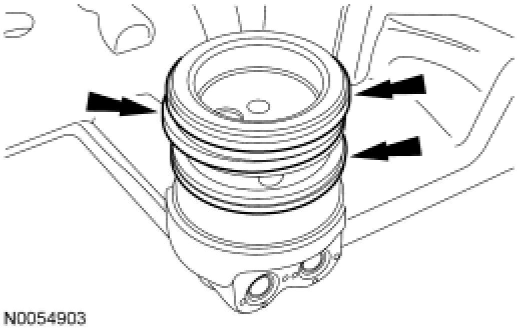

Fig. 243: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

8. Remove the 2 bolts and the primary timing chain tensioner.

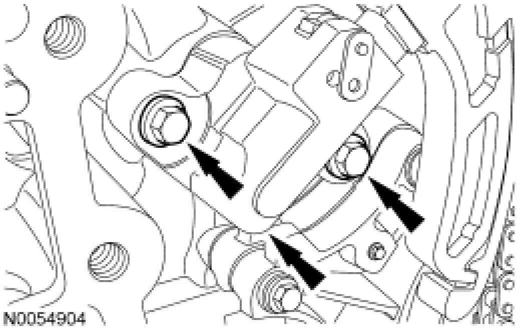

Fig. 244: Locating Primary Timing Chain Tensioner Bolts
Courtesy of FORD MOTOR CO.

9. Remove the primary timing chain tensioner arm.

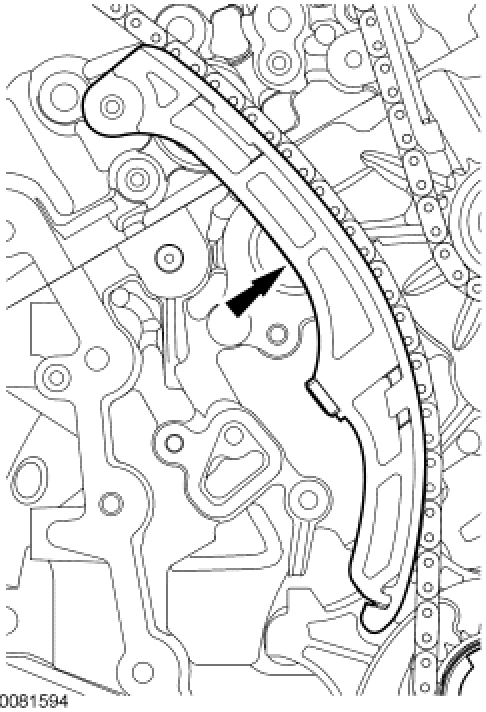

Fig. 245: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

10. Remove the 2 bolts and the lower LH primary timing chain guide.

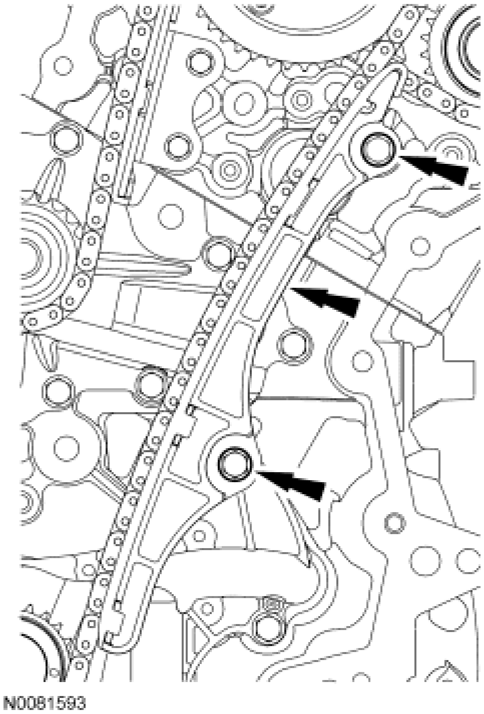

Fig. 246: Locating Lower LH Primary Timing Chain Guide & Bolts

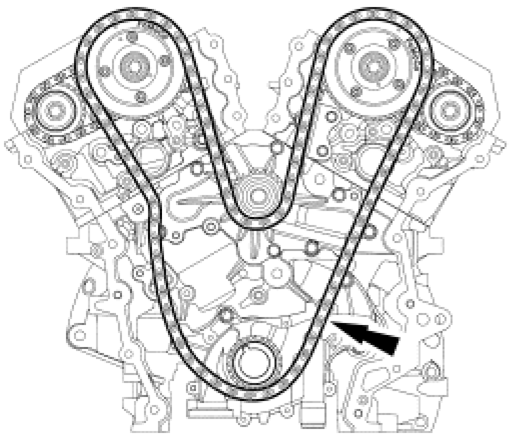
Courtesy of FORD MOTOR CO.

11. Remove the primary timing chain.

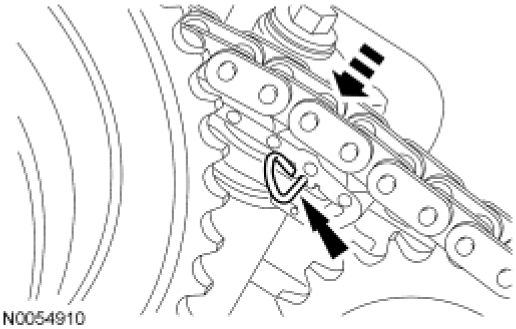


N0054908

Fig. 247: Locating Primary Timing Chain
Courtesy of FORD MOTOR CO.

LH camshafts

12. Compress the LH secondary timing chain tensioner and install a suitable lock pin to retain the tensioner in the collapsed position.



N0054910

Fig. 248: Compressing LH Secondary Timing Chain Tensioner & Installing Suitable Lock Pin To Retain Tensioner In Collapsed Position
Courtesy of FORD MOTOR CO.

NOTE: The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

13. Remove and discard the LH VCT assembly bolt and the LH exhaust camshaft sprocket bolt.
    - Remove the LH VCT assembly, secondary timing chain and the LH exhaust camshaft sprocket as an assembly.

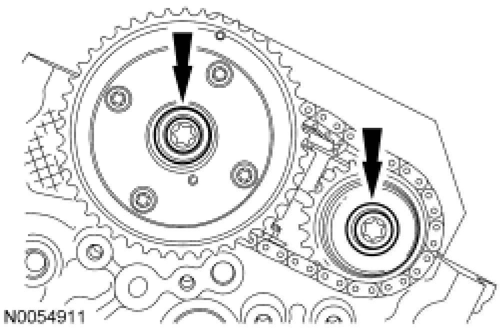


Fig. 249: Locating LH VCT Assembly Bolt & LH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

NOTE: When the Camshaft Holding Tool is removed, valve spring pressure will rotate the LH camshafts approximately 3 degrees to a neutral position.

14. Remove the Camshaft Holding Tool from the LH camshafts.

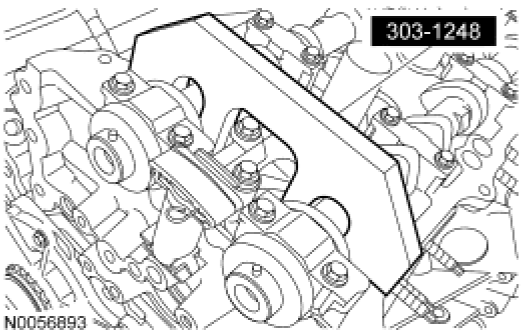

Fig. 250: Removing Special Tool (303-1248) From LH Camshafts
Courtesy of FORD MOTOR CO.

NOTE: The camshafts must remain in the neutral position during removal or engine damage may occur.

15. Verify the LH camshafts are in the neutral position.

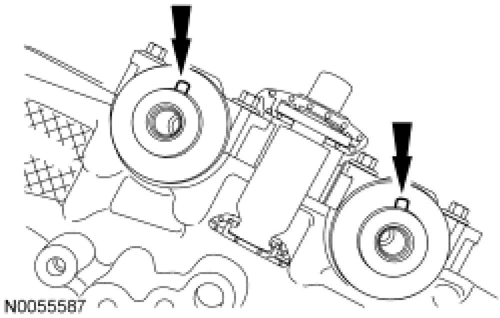

Fig. 251: Verifying LH Camshafts Are In Neutral Position
Courtesy of FORD MOTOR CO.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

16. Remove the bolts and the LH camshaft bearing caps.
    - Remove the LH camshafts.

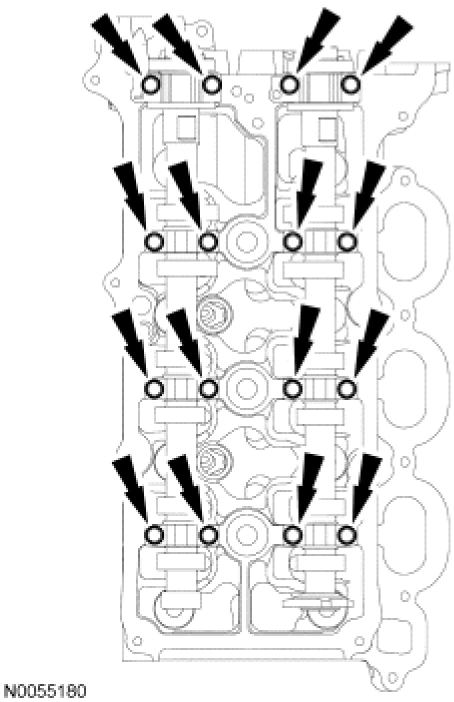

Fig. 252: Identifying LH Camshafts Bolts
Courtesy of FORD MOTOR CO.

RH camshafts

17. Compress the RH secondary timing chain tensioner and install a suitable lock pin to retain the tensioner in the collapsed position.

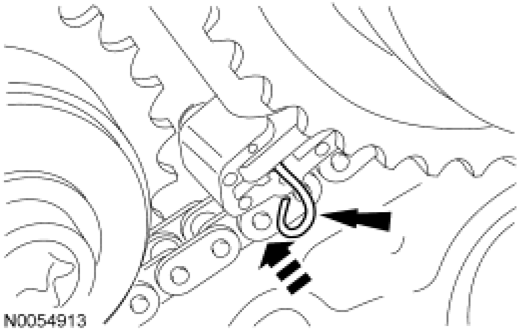

Fig. 253: Compressing RH Secondary Timing Chain Tensioner & Installing Suitable Lock Pin To Retain Tensioner In Collapsed Position
Courtesy of FORD MOTOR CO.

NOTE:	**The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.**

18. Remove and discard the RH VCT assembly bolt and the RH exhaust camshaft sprocket bolt.
    - Remove the RH VCT assembly, secondary timing chain and the RH exhaust camshaft sprocket as an assembly.

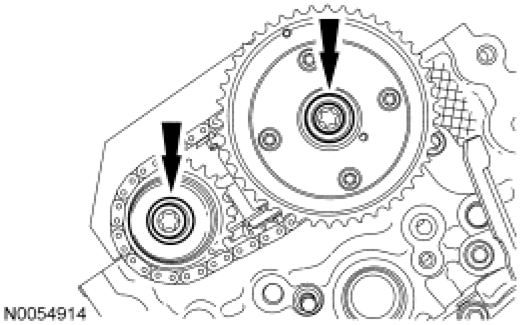

Fig. 254: Locating RH VCT Assembly Bolt & RH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

19. Remove the Camshaft Holding Tool from the RH camshafts.

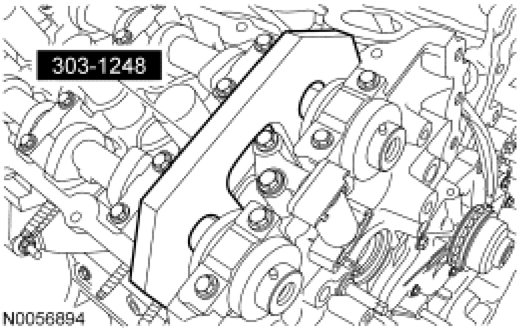

Fig. 255: Removing Special Tool (303-1248) From RH Camshafts

Courtesy of FORD MOTOR CO.

NOTE: The camshafts must remain in the neutral position during removal or engine damage may occur.

20. Rotate the RH camshafts counterclockwise to the neutral position.

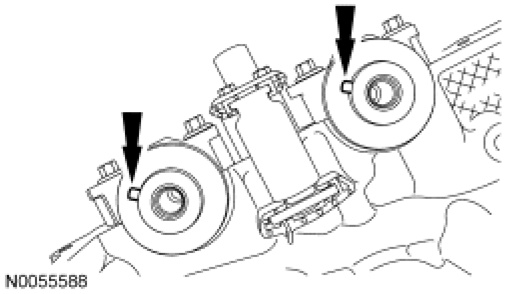

Fig. 256: Rotating RH Camshafts Counterclockwise To Neutral Position
Courtesy of FORD MOTOR CO.

NOTE: Cylinder head camshaft bearing caps are numbered to verify that they are assembled in their original positions.

21. Remove the bolts and the RH camshaft bearing caps.
    - Remove the RH camshafts.

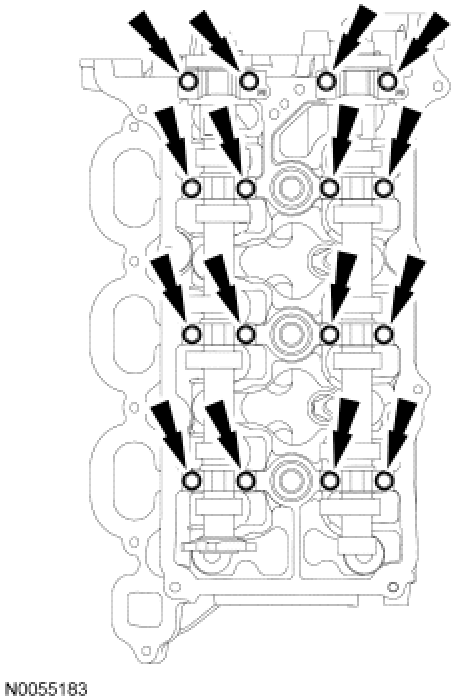

Fig. 257: Identifying RH Camshafts Bolts
Courtesy of FORD MOTOR CO.

VALVE TAPPETS

NOTE:	**During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

1. Depending on the valve tappets being serviced, remove the LH and/or the RH camshafts. For additional information, refer to **Camshaft**.

NOTE:	**If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.**

2. Remove the valve tappets from the cylinder head.

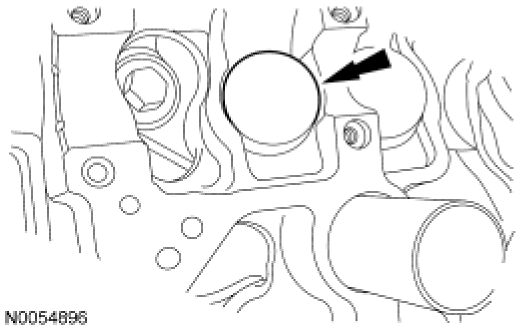

Fig. 258: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

VALVE SPRING, RETAINER AND SEAL

Special Tools

Illustration	Tool Name	Tool Number
	Compressor, Valve Spring	303-300 (T87C-6565-A)

 ST1981-A		
 ST1907-A	Compressor, Valve Spring	303-350 (T89P-6565-A)
 ST3028-A	Compressor, Valve Spring	303-1249

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

1. Remove the valve tappets from the cylinder being serviced. For additional information, refer to **Valve Tappets**.
2. Rotate the crankshaft until the piston for the valve being serviced is at the top of its stroke.

   NOTE: If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal or engine damage may occur.

   NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

   NOTE: If a valve drops into the cylinder, remove the cylinder head. For additional information, refer to Cylinder Head - RH or Cylinder Head - LH.

3. Pressurize the cylinder using compressed air.
4. Using the Valve Spring Compressors, remove the keys, retainer and spring.

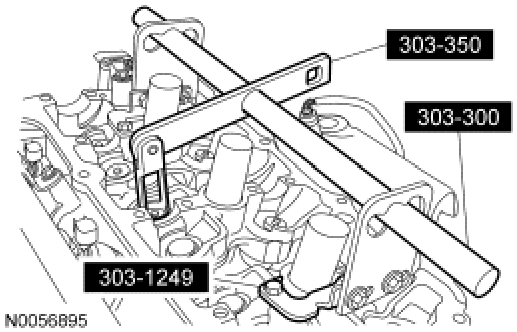

Fig. 259: Removing Keys, Retainer & Spring Using Special Tools (303-1249, 303-350, 303-300)
Courtesy of FORD MOTOR CO.

5. Remove and discard the valve stem seal.

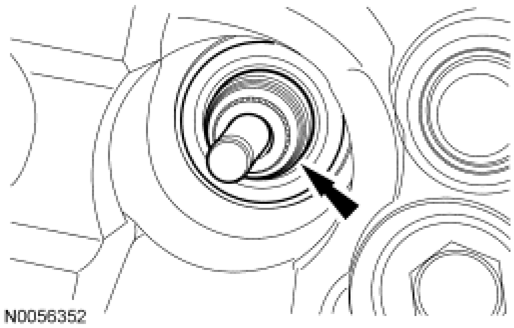

Fig. 260: Identifying Valve Stem Seal
Courtesy of FORD MOTOR CO.

CYLINDER HEAD - RH

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-
Silicone Gasket Remover ZC-30	-

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

All vehicles

1. Remove the RH camshafts. For additional information, refer to **Camshaft**.
2. If equipped, remove the heat shield and disconnect the block heater electrical connector.
   - Remove the block heater wiring harness from the engine.

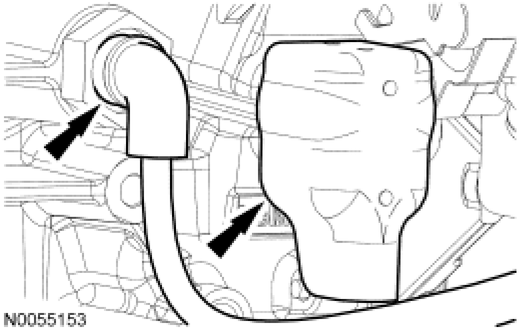

Fig. 261: Identifying Block Heater Wiring Harness
Courtesy of FORD MOTOR CO.

3. Disconnect the RH heated oxygen sensor (HO2S) electrical connector.

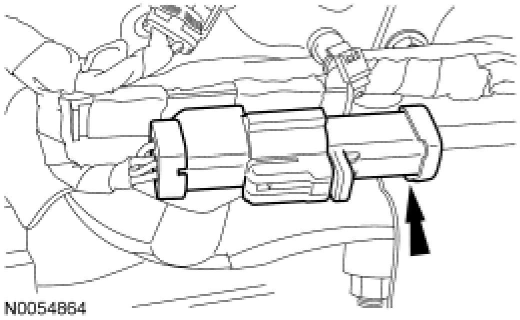

Fig. 262: Locating RH Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

4. Disconnect the RH camshaft position (CMP) sensor electrical connector.

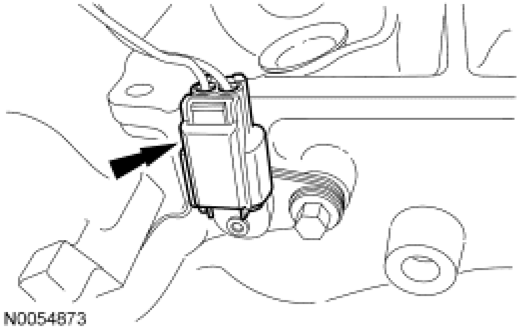

Fig. 263: Locating RH Camshaft Position (CMP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

5. Remove the bolt and the power steering pressure (PSP) tube and bracket assembly.

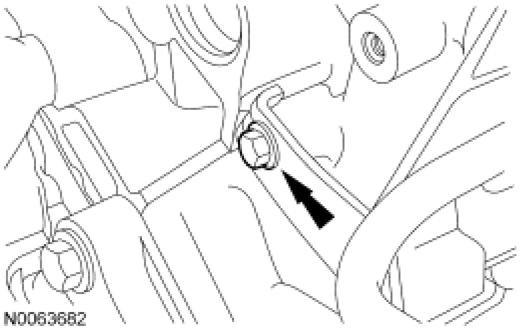

Fig. 264: Identifying Power Steering Pressure (PSP) Tube & Bracket Assembly
Courtesy of FORD MOTOR CO.

6. Disconnect the 6 fuel injector electrical connectors (3 shown).

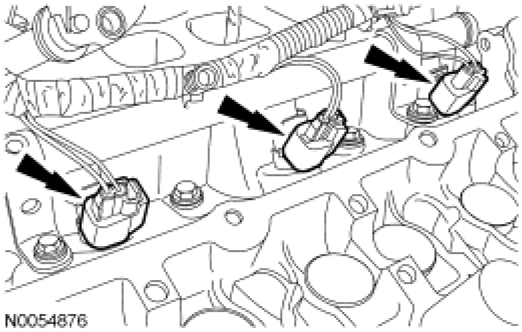

Fig. 265: Locating Fuel Injector Electrical Connectors
Courtesy of FORD MOTOR CO.

7. Disconnect the cylinder head temperature (CHT) sensor electrical connector.

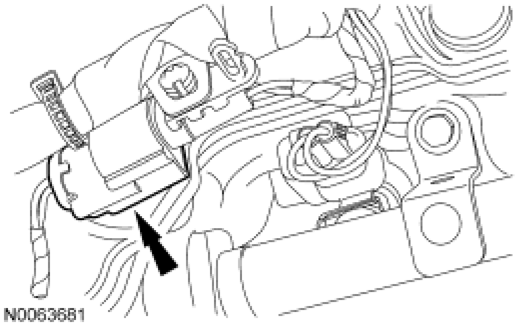

Fig. 266: Locating Cylinder Head Temperature (CHT) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

8. Disconnect the LH catalyst monitor sensor electrical connector.

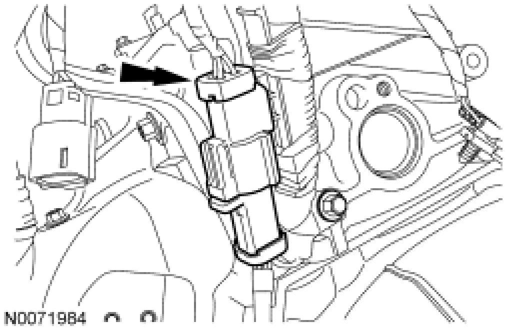

Fig. 267: Identifying LH Catalyst Monitor Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

9. Remove the 2 LH catalytic converter bracket bolts.

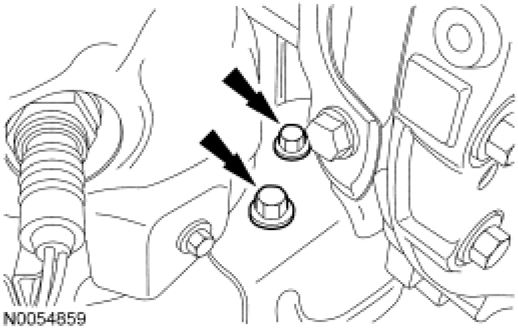

Fig. 268: Locating LH Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

10. Remove the 4 nuts (3 shown) and the LH catalytic converter.
    - Discard the nuts and the gasket.

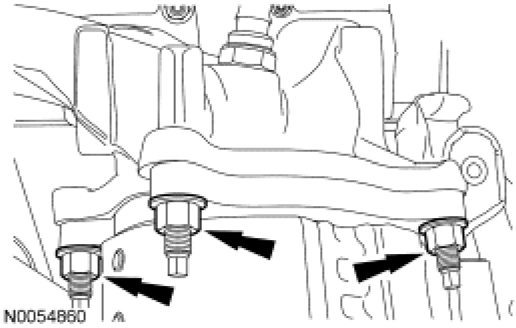

Fig. 269: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

11. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

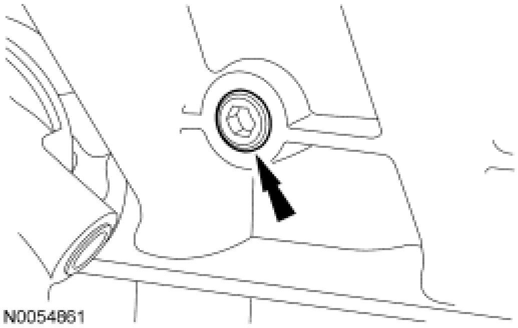

Fig. 270: Locating LH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

12. Remove the 2 RH catalytic converter bracket bolts.

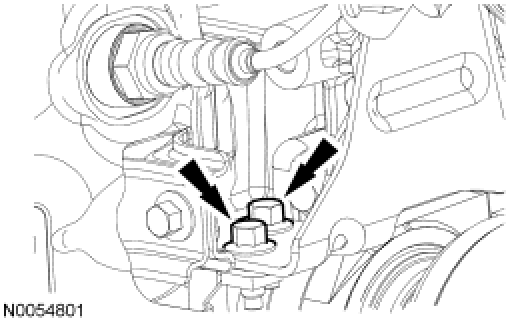

Fig. 271: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

All vehicles

13. Remove the 4 nuts and the RH catalytic converter.
    - Discard the nuts and the gasket.

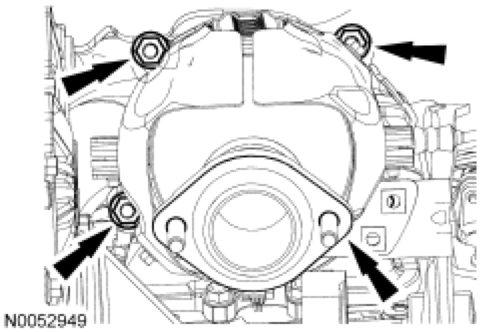

Fig. 272: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

14. Remove the RH cylinder block drain plug or, if equipped, the block heater.
    - Allow coolant to drain from the cylinder block.

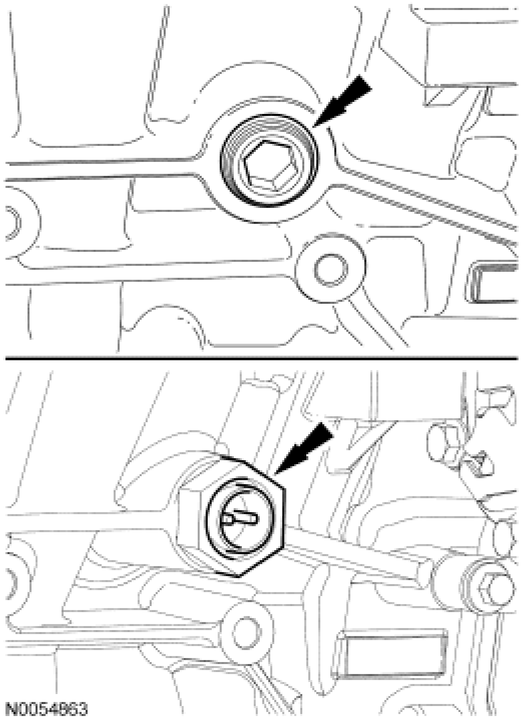

Fig. 273: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

15. Remove the 3 bolts and the RH exhaust manifold heat shield.

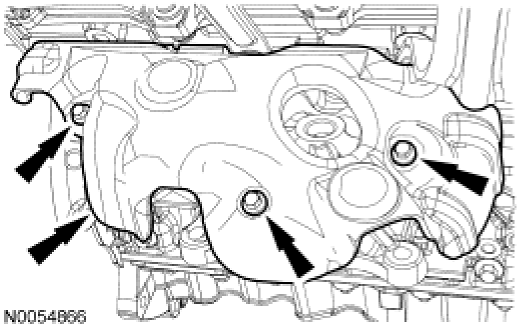

Fig. 274: Locating RH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

16. Remove the 6 nuts and the RH exhaust manifold.
    - Discard the nuts and exhaust manifold gaskets.

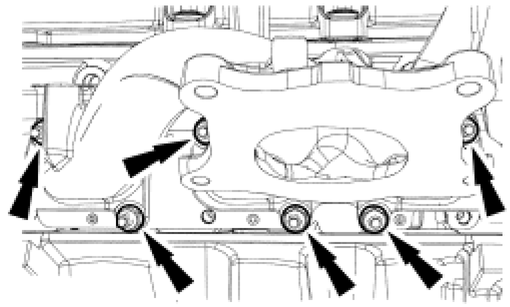

Fig. 275: Locating RH Exhaust Manifold & Nuts
Courtesy of FORD MOTOR CO.

17. Clean and inspect the RH exhaust manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
18. Remove and discard the 6 RH exhaust manifold studs.

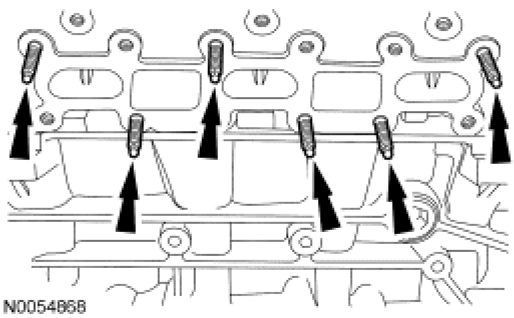

Fig. 276: Locating RH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

19. Remove the 2 bolts and the RH primary timing chain guide.

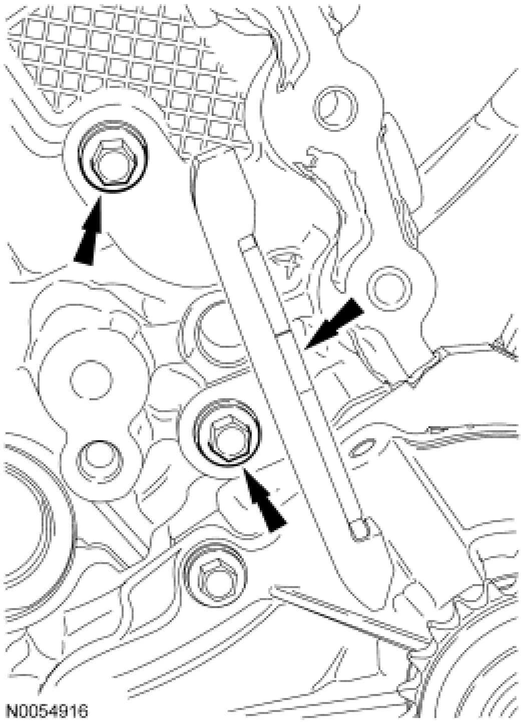

Fig. 277: Locating RH Primary Timing Chain Guide Lower Bolt
Courtesy of FORD MOTOR CO.

20. Remove the 2 bolts and the RH secondary timing chain tensioner.

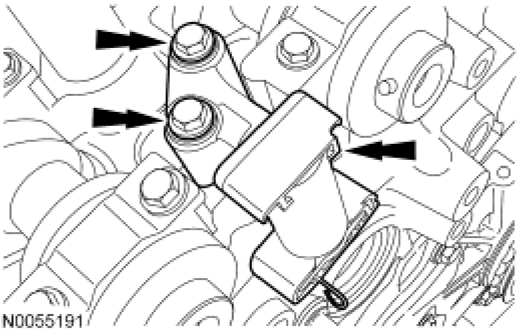

Fig. 278: Locating RH Secondary Timing Chain Tensioner & Bolts
Courtesy of FORD MOTOR CO.

21. Remove the 2 bolts and the engine lifting eye.

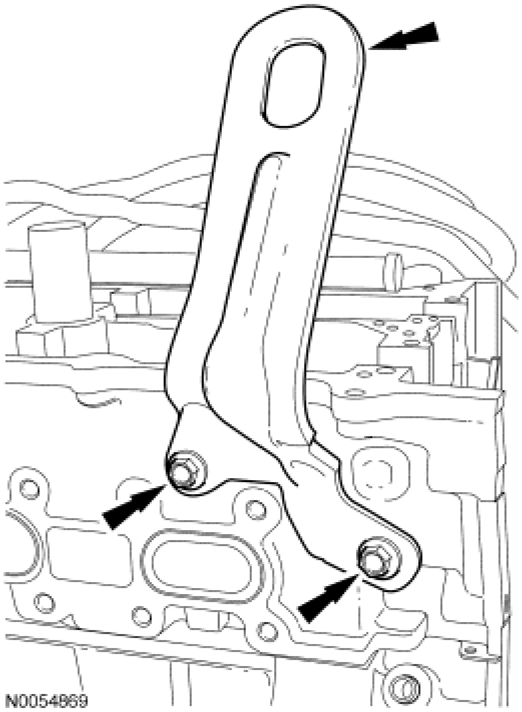

Fig. 279: Locating Engine Lifting Eye & Bolts
Courtesy of FORD MOTOR CO.

NOTE: Index-mark the location of the bracket on the cylinder head for installation.

22. If equipped, remove the bolt and the upper intake manifold long support bracket.

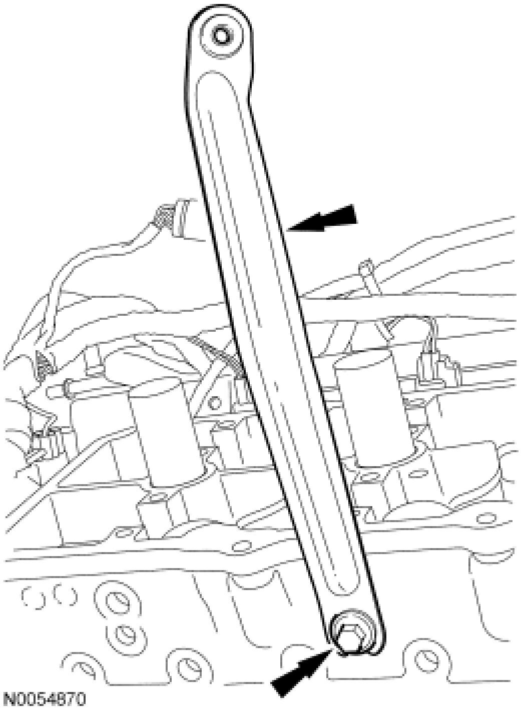

Fig. 280: Locating Upper Intake Manifold Bracket & Bolt
Courtesy of FORD MOTOR CO.

NOTE: Index-mark the location of the bracket on the cylinder head for installation.

23. Remove the bolt and the upper intake manifold short support bracket.

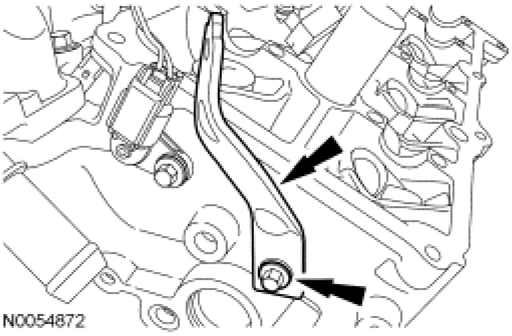

Fig. 281: Locating Upper Intake Manifold Bracket & Bolt
Courtesy of FORD MOTOR CO.

24. Remove the bolt and the RH CMP sensor.

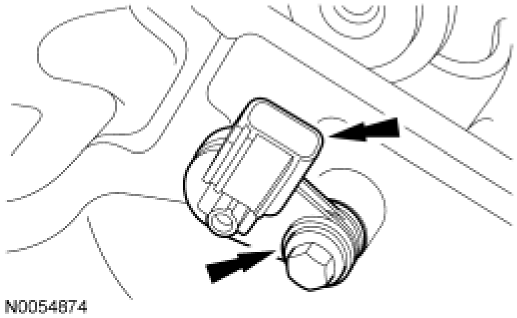

Fig. 282: Locating RH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

25. Remove the 4 bolts and the fuel rail and injectors as an assembly.

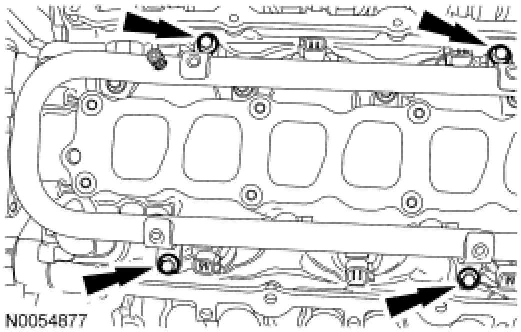

Fig. 283: Locating Fuel Rail And Injectors & Bolts
Courtesy of FORD MOTOR CO.

26. Disconnect the coolant bypass hose from the thermostat housing.

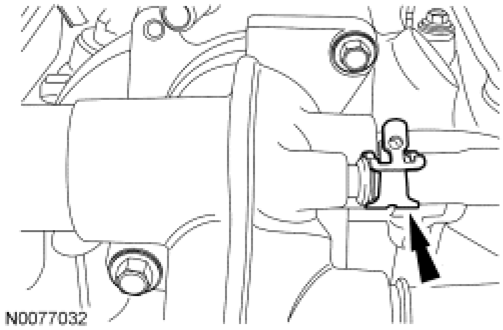

Fig. 284: Identifying Coolant Bypass Hose From Thermostat Housing
Courtesy of FORD MOTOR CO.

27. Remove the 2 thermostat housing-to-lower intake manifold bolts.
    - Remove the thermostat housing and discard the gasket and O-ring seal.

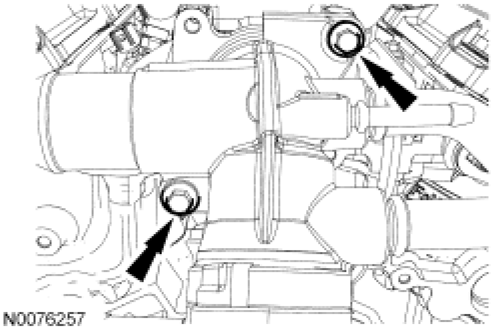

Fig. 285: Locating Thermostat Housing-To-Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

28. Remove the 10 bolts and the lower intake manifold.
    - Discard the gaskets.

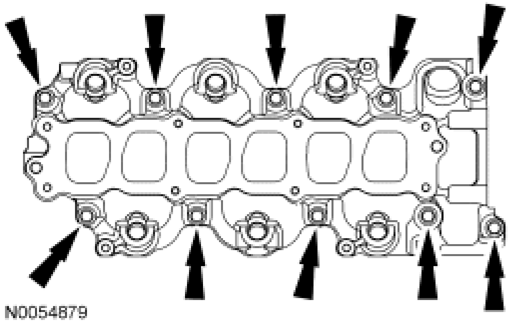

Fig. 286: Locating Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

29. Disconnect and remove the CHT sensor jumper harness.

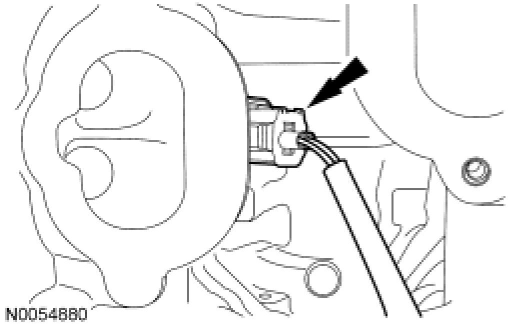

Fig. 287: Identifying CHT Sensor Jumper Harness
Courtesy of FORD MOTOR CO.

NOTE: If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.

30. Remove the valve tappets from the cylinder head.

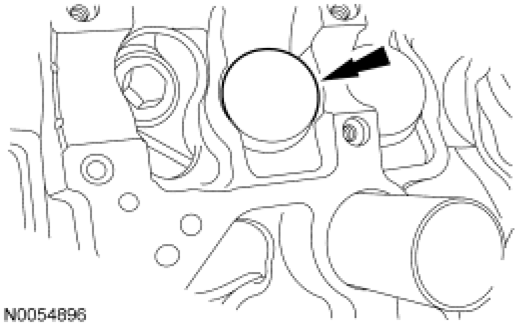

Fig. 288: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

31. Remove and discard the M6 bolt.

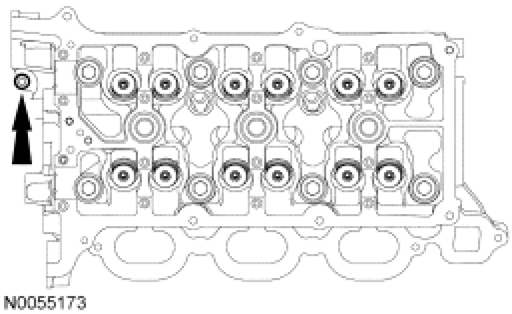

Fig. 289: Identifying M6 Bolt
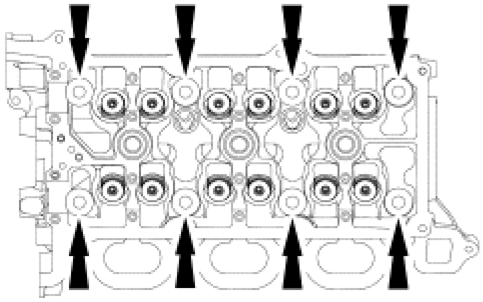
Courtesy of FORD MOTOR CO.

CAUTION: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

CAUTION: Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

NOTE: The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield design and cannot be reused.

32. Remove and discard the 8 bolts from the cylinder head.
    - Remove the cylinder head.
    - Discard the cylinder head gasket.



N0057856

Fig. 290: Identifying Cylinder Head Bolts
Courtesy of FORD MOTOR CO.

CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

NOTE: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

33. Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
34. Support the cylinder head on a bench with the head gasket side up.

NOTE: The straightedge used must be flat within 0.0051 mm (0.0002 in) per foot of tool length.

35. Inspect all areas of the deck face with a straightedge and feeler gauge. The cylinder head must not have depressions deeper than 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area, or scratches more than 0.0254 mm (0.001 in).

CYLINDER HEAD - LH

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-
Silicone Gasket Remover ZC-30	-

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, can cause engine failure.

All vehicles

1. Remove the LH camshafts. For additional information, refer to **Camshaft**.
2. If equipped, remove the heat shield and disconnect the block heater electrical connector.
    - Remove the block heater wiring harness from the engine.

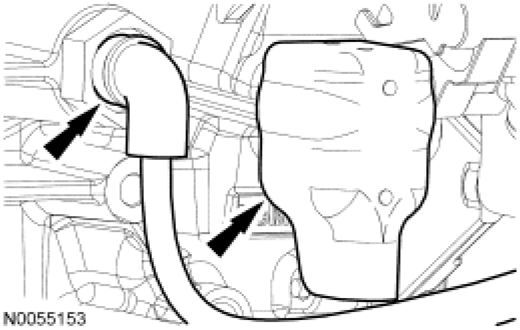


Fig. 291: Identifying Block Heater Wiring Harness

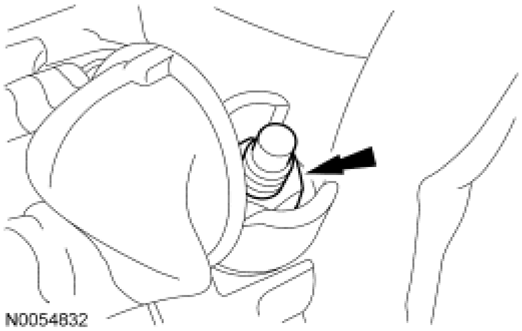

Fig. 293: Identifying Generator B+ Cable & Nut
Courtesy of FORD MOTOR CO.

5. Disconnect the generator electrical connector.

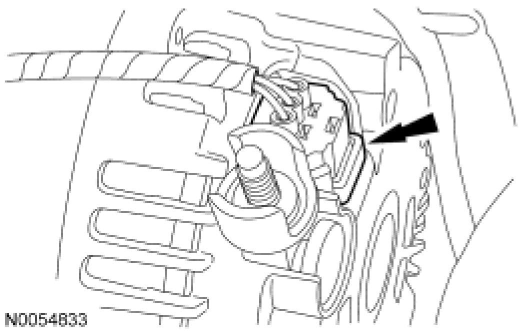

Fig. 294: Identifying Generator Electrical Connector
Courtesy of FORD MOTOR CO.

6. Detach the wiring harness retainer from the generator.

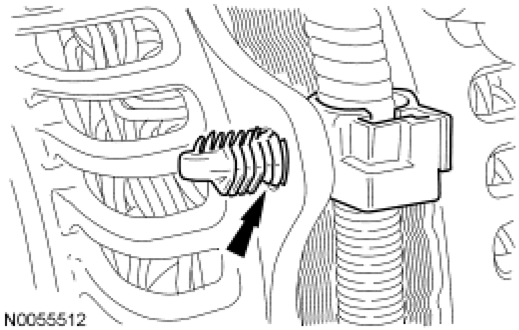

Fig. 295: Identifying Wiring Harness Retainer From Generator
Courtesy of FORD MOTOR CO.

7. Remove the nut, bolt and the generator.

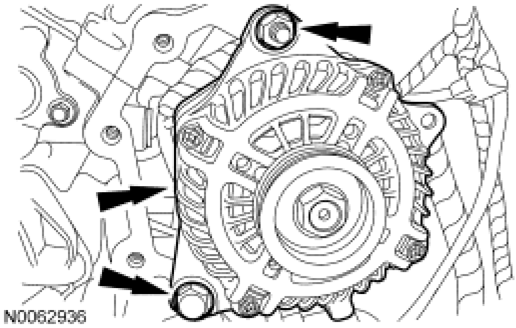

Fig. 296: Locating Generator, Bolts & Nuts
Courtesy of FORD MOTOR CO.

8. Detach the wiring harness pin-type retainer.

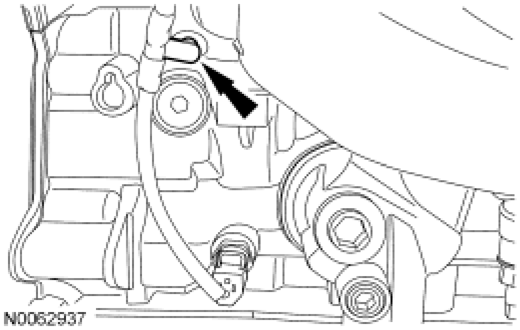

Fig. 297: Identifying Wiring Harness Pin-Type Retainer
Courtesy of FORD MOTOR CO.

9. Disconnect the 6 fuel injector electrical connectors (3 shown).

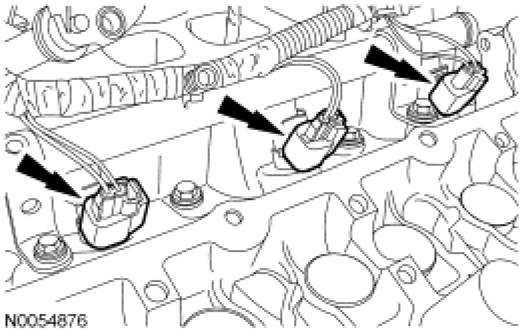

Fig. 298: Locating Fuel Injector Electrical Connectors
Courtesy of FORD MOTOR CO.

10. Disconnect the Cylinder Head Temperature (CHT) sensor electrical connector.

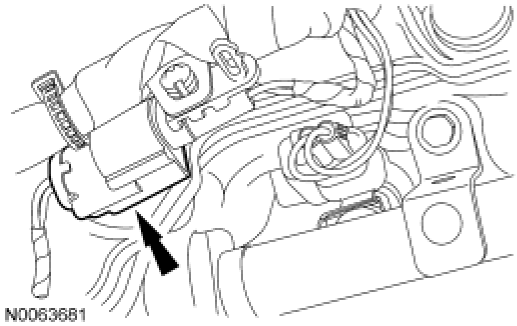

Fig. 299: Locating Cylinder Head Temperature (CHT) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

11. Disconnect the LH Camshaft Position (CMP) sensor electrical connector.

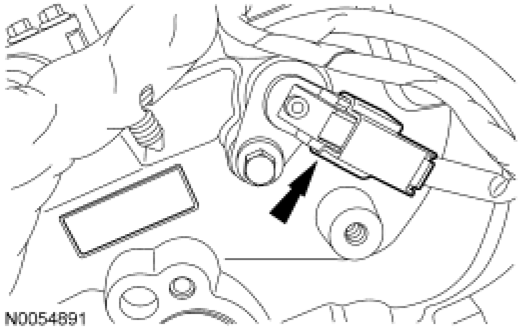

Fig. 300: Locating LH CMP Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

12. Disconnect the LH heated oxygen sensor (HO2S) electrical connector.

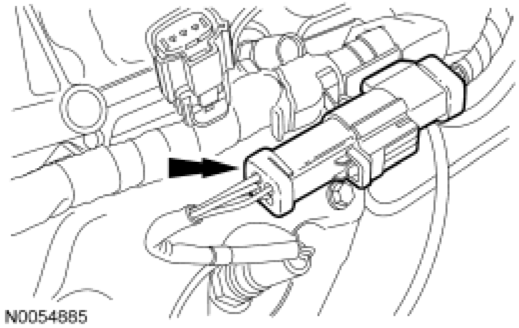

Fig. 301: Locating LH Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

13. Disconnect the LH catalyst monitor sensor electrical connector.

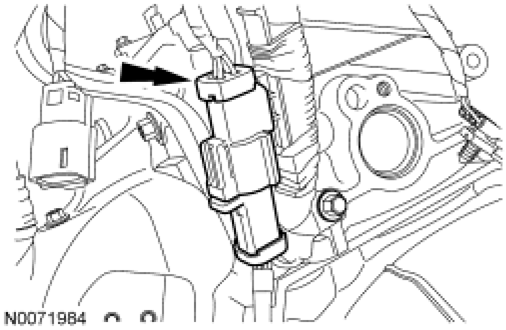

Fig. 302: Identifying LH Catalyst Monitor Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

14. Remove the wiring harness retainer bolt from the rear of the LH cylinder head.

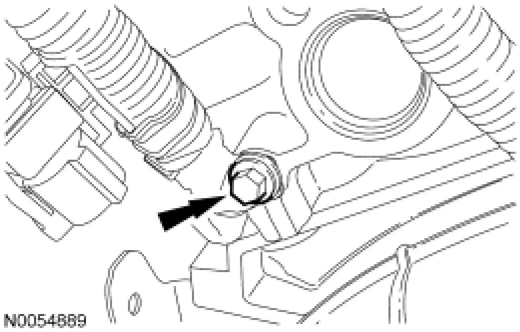

Fig. 303: Identifying Wiring Harness Retainer Bolt From Rear Of LH Cylinder Head
Courtesy of FORD MOTOR CO.

15. Remove the 2 LH catalytic converter bracket bolts.

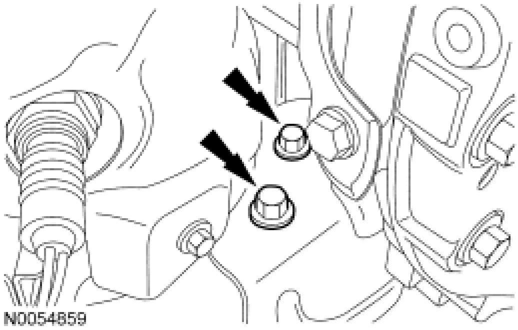

Fig. 304: Locating LH Catalytic Converter Bracket Bolts
Courtesy of FORD MOTOR CO.

16. Remove the 4 nuts (3 shown) and the LH catalytic converter.
    - Discard the nuts and the gasket.

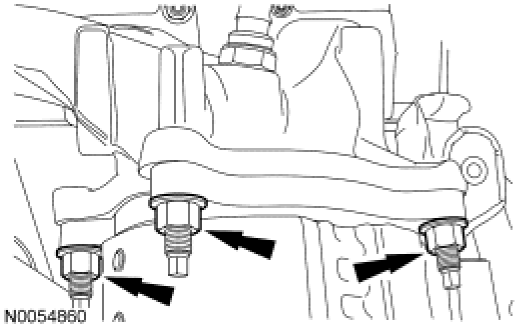

Fig. 305: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

17. Remove the 3 bolts and the LH exhaust manifold heat shield.

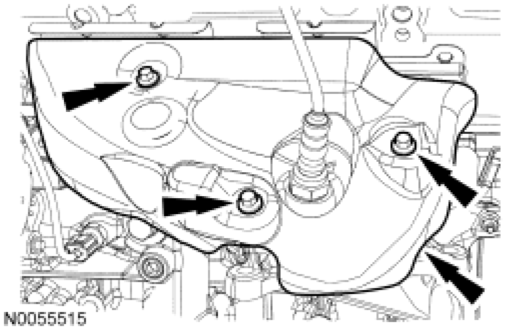

Fig. 306: Locating LH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

18. Remove the 6 nuts and the LH exhaust manifold.
    - Discard the nuts and the exhaust manifold gasket.

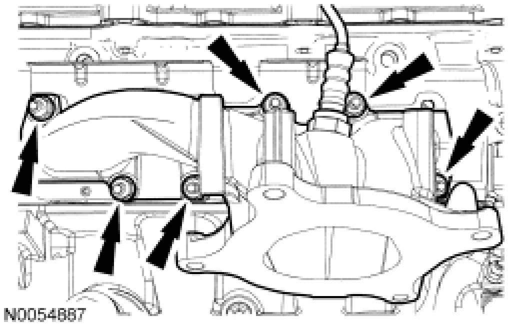

Fig. 307: Locating LH Exhaust Manifold Nuts
Courtesy of FORD MOTOR CO.

19. Clean and inspect the LH exhaust manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
20. Remove and discard the 6 LH exhaust manifold studs.

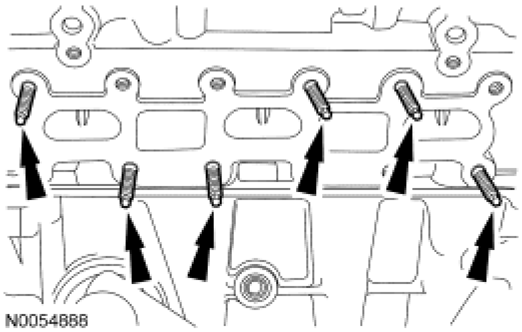

Fig. 308: Locating LH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

21. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

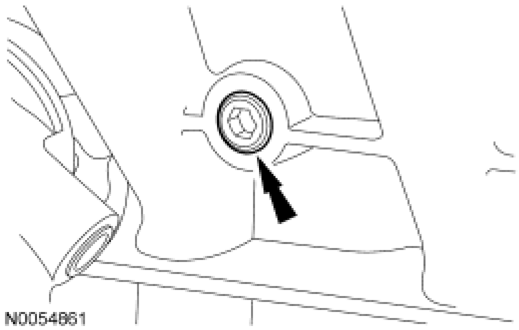

Fig. 309: Locating LH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

All-Wheel Drive (AWD) vehicles

22. Remove the 2 RH catalytic converter bracket bolts.

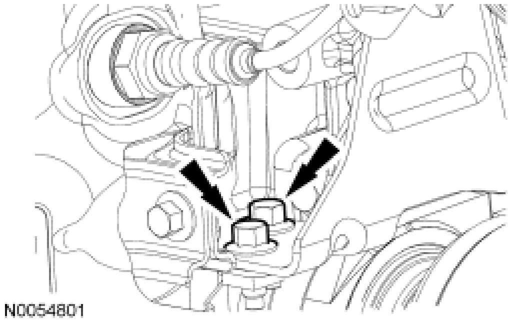

Fig. 310: Identifying RH Catalytic Converter Support Bracket Bolts
Courtesy of FORD MOTOR CO.

All vehicles

23. Remove the 4 nuts and the RH catalytic converter.
    - Discard the nuts and the gasket.

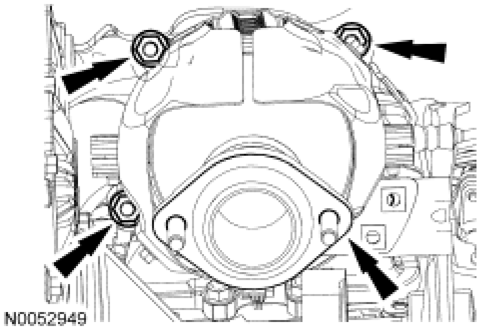

Fig. 311: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

24. Remove the RH cylinder block drain plug or, if equipped, the block heater.
    - Allow coolant to drain from the cylinder block.

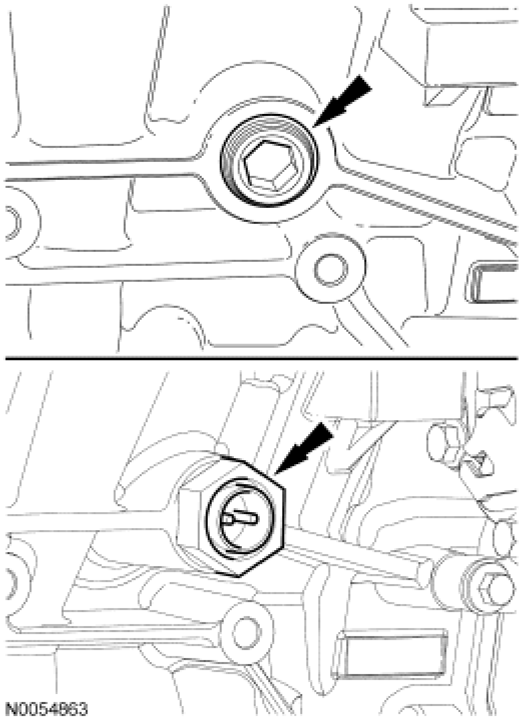

Fig. 312: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

25. Remove the 4 bolts and the fuel rail and injectors as an assembly.

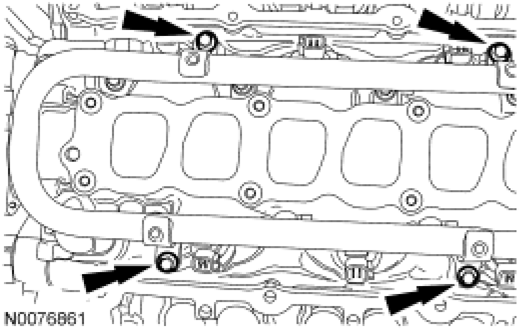

Fig. 313: Identifying Bolts & Fuel Rail
Courtesy of FORD MOTOR CO.

26. Disconnect the coolant bypass hose from the thermostat housing.

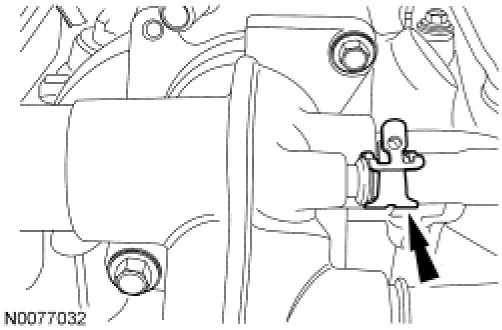

Fig. 314: Identifying Coolant Bypass Hose From Thermostat Housing
Courtesy of FORD MOTOR CO.

27. Remove the 2 thermostat housing-to-lower intake manifold bolts.
    - Remove the thermostat housing and discard the gasket and O-ring seal.

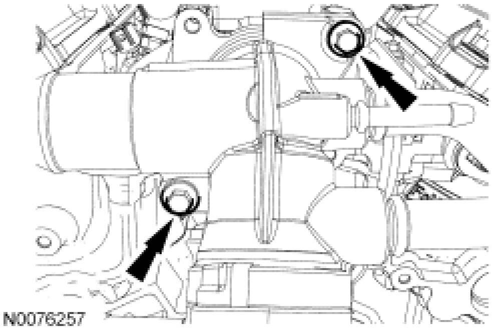

Fig. 315: Locating Thermostat Housing-To-Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

28. Remove the 10 bolts and the lower intake manifold.
    - Discard the gaskets.

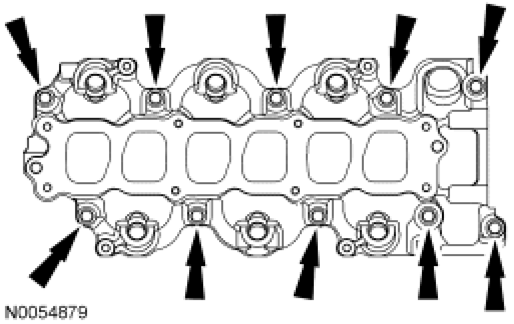

Fig. 316: Locating Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

29. Remove the bolt and the LH CMP sensor.

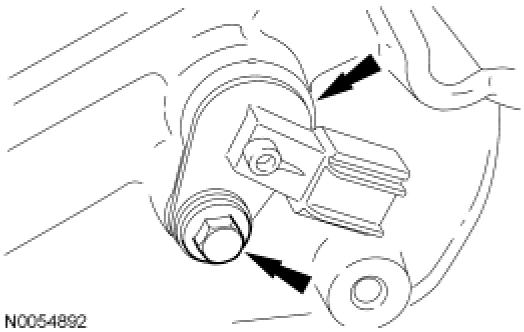

Fig. 317: Locating LH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

30. Remove the 2 bolts and the upper LH primary timing chain guide.

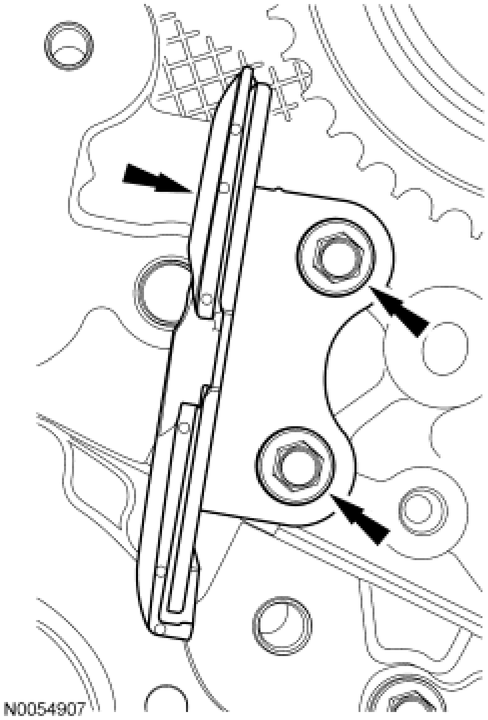

Fig. 318: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

31. Remove the 2 bolts and the LH secondary timing chain tensioner.

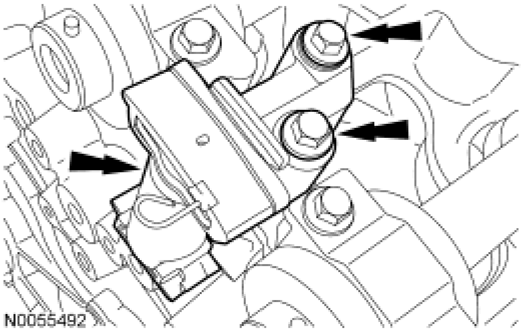

Fig. 319: Locating LH Secondary Timing Chain Tensioner & Bolt
Courtesy of FORD MOTOR CO.

NOTE: **If the components are to be reinstalled, they must be installed in the same positions. Mark the components for installation into their original locations.**

32. Remove the valve tappets from the cylinder head.

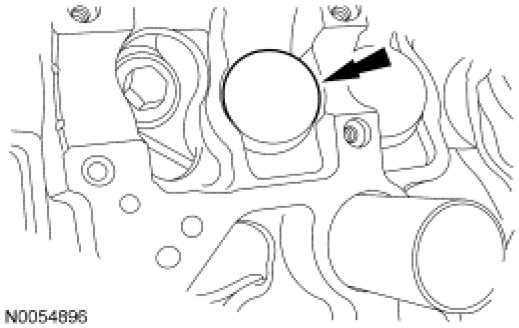

Fig. 320: Identifying Valve Tappets From Cylinder Head
Courtesy of FORD MOTOR CO.

33. Remove and discard the M6 bolt.

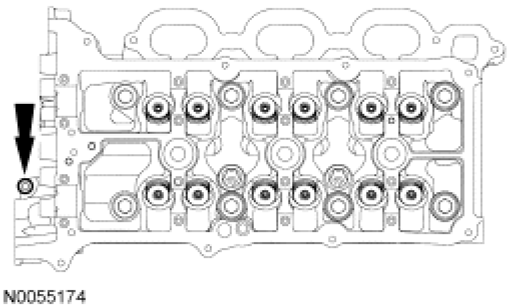

Fig. 321: Identifying M6 Bolt
Courtesy of FORD MOTOR CO.

NOTE:	**Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.**
NOTE:	**Aluminum surfaces are soft and may be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.**
NOTE:	**The cylinder head bolts must be discarded and new bolts must be installed. They are tighten-to-yield design and cannot be reused.**

34. Remove and discard the 8 bolts from the cylinder head.
    - Remove the cylinder head.
    - Discard the cylinder head gasket.

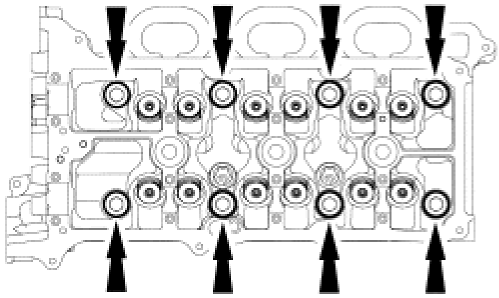

Fig. 322: Identifying Cylinder Head Bolts
Courtesy of FORD MOTOR CO.

NOTE: **Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.**

NOTE: **Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.**

NOTE: **If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.**

35. Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder heads and the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
36. Support the cylinder head on a bench with the head gasket side up.

NOTE: **The straightedge used must be flat within 0.0051 mm (0.0002 in) per foot of tool length.**

37. Inspect all areas of the deck face with a straightedge and feeler gauge. The cylinder head must not have depressions deeper than 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area, or scratches more than 0.0254 mm (0.001 in).

OIL PAN

Special Tools

Illustration	Tool Name	Tool Number
	3-Jaw Puller	303-D121
	Handle	205-153 (T80T-4000-W)
	Remover, Oil Seal	303-409 (T92C-6700CH)

 ST1438-A	Strap Wrench	303-D055 (D85L-6000-A)

Material

Item	Specification
Motorcraft Metal Surface Prep ZC-31-A	-
Silicone Gasket Remover ZC-30	-

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

All vehicles

1. Remove the engine from the vehicle. For additional information, refer to **Engine**.
2. Remove the 8 bolts and the flywheel.

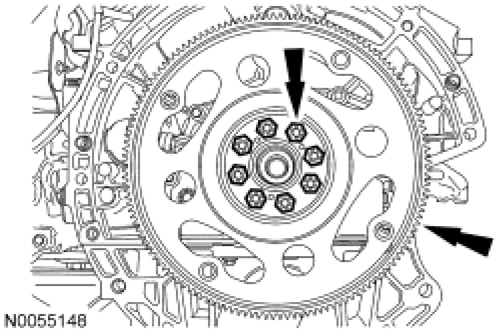

Fig. 323: Identifying Flexplate & Bolts
Courtesy of FORD MOTOR CO.

3. Remove the crankshaft sensor ring.

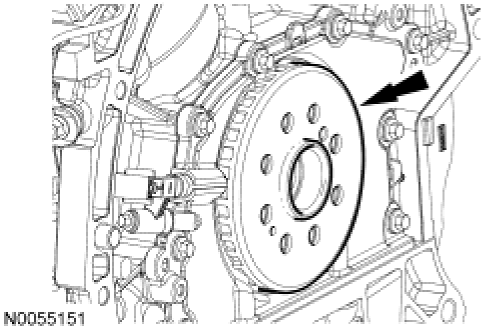

Fig. 324: Identifying Crankshaft Sensor Ring
Courtesy of FORD MOTOR CO.

NOTE: Install the engine stand bolts into the cylinder block only. Do not install

the bolts into the oil pan.

4. Mount the engine on a suitable engine stand.
5. If equipped, detach the block heater wiring harness retainer from the upper intake manifold.

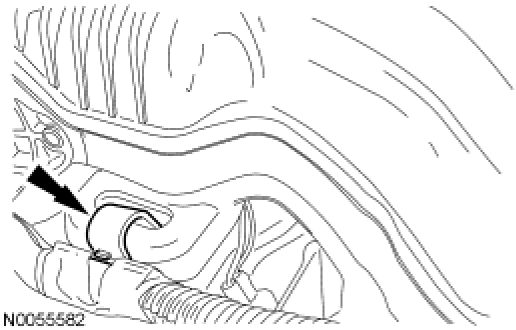

Fig. 325: Identifying Block Heater Wiring Harness Retainer From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

6. If equipped, remove the heat shield and disconnect the block heater electrical connector.

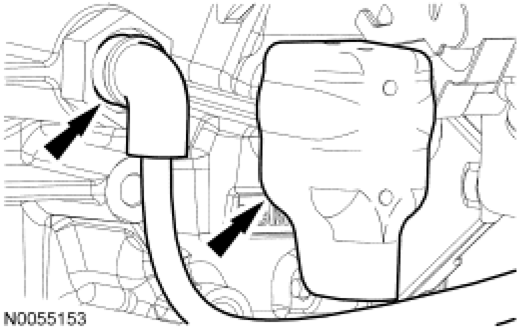

Fig. 326: Identifying Block Heater Wiring Harness
Courtesy of FORD MOTOR CO.

7. If equipped, detach the block heater wiring harness retainer from the power steering reservoir hose and the Power Steering Pressure (PSP) hose.
   - Remove the block heater wiring harness from the engine.

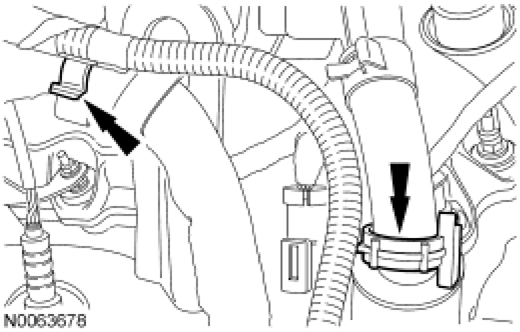

Fig. 327: Identifying Block Heater Wiring Harness From Engine
Courtesy of FORD MOTOR CO.

8. Disconnect the PCV hose from the PCV valve.

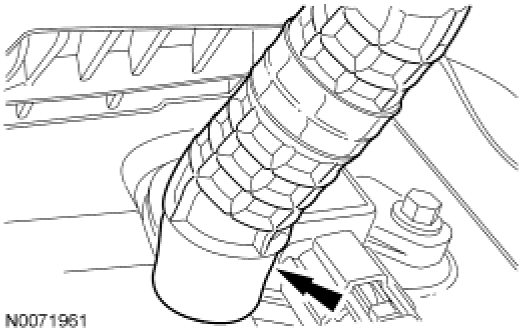

Fig. 328: Identifying PCV Hose
Courtesy of FORD MOTOR CO.

9. Disconnect the Throttle Body (TB) electrical connector.

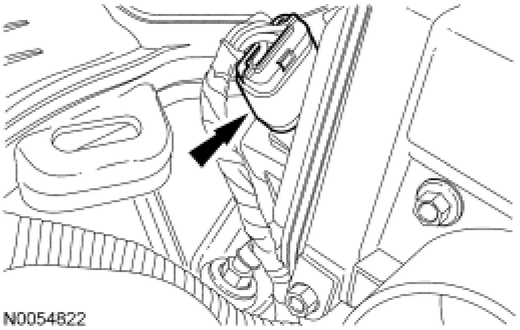

Fig. 329: Locating Throttle Body Electrical Connector
Courtesy of FORD MOTOR CO.

10. Detach the wiring harness retainers from the upper intake manifold.

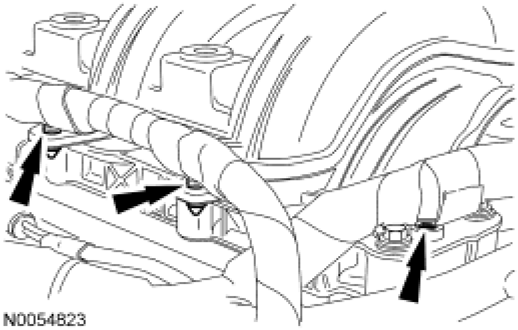

Fig. 330: Locating Wiring Harness Retainers From Upper Intake Manifold
Courtesy of FORD MOTOR CO.

11. Remove the upper intake manifold support bracket bolt.

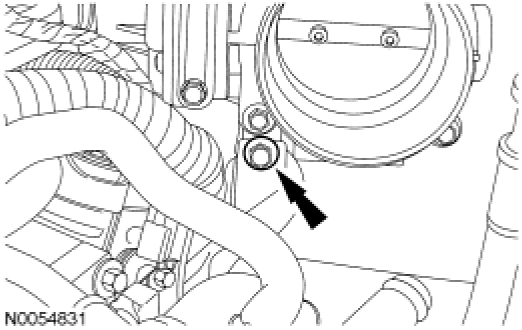

Fig. 331: Locating Upper Intake Manifold Support Bracket Bolt
Courtesy of FORD MOTOR CO.

12. Remove the 6 bolts and the upper intake manifold.
    - Discard the gaskets.

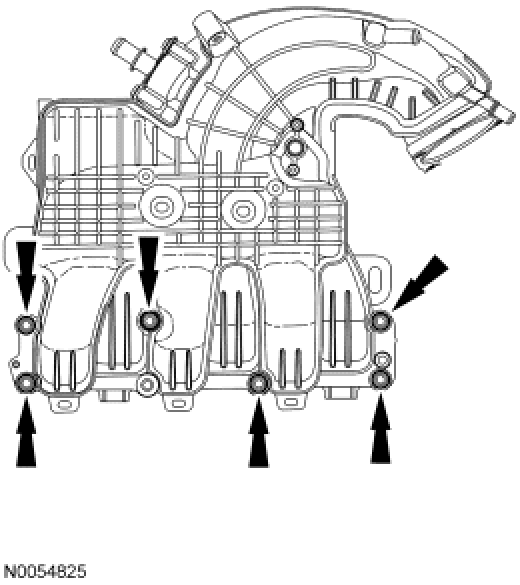

Fig. 332: Identifying Upper Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

13. Disconnect the PSP switch electrical connector.

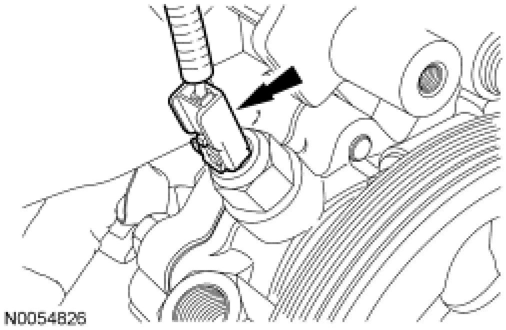

Fig. 333: Locating PSP Switch Electrical Connector
Courtesy of FORD MOTOR CO.

Front Wheel Drive (FWD) vehicles

14. Disconnect the RH catalyst monitor sensor electrical connector.

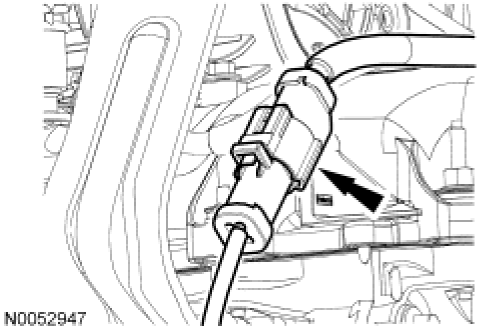

Fig. 334: Locating RH Catalyst Monitor Electrical Connector
Courtesy of FORD MOTOR CO.

All vehicles

15. Disconnect the RH Variable Camshaft Timing (VCT) solenoid electrical connector.

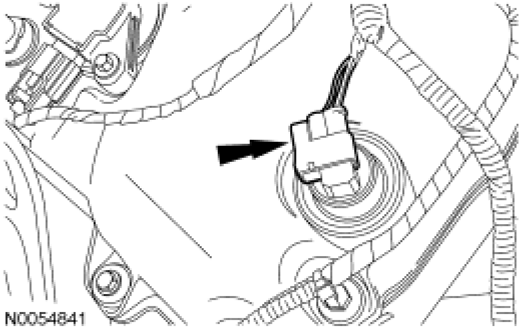

Fig. 335: Locating RH Variable Camshaft Timing (VCT) Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

16. Disconnect the 3 RH coil-on-plug electrical connectors.

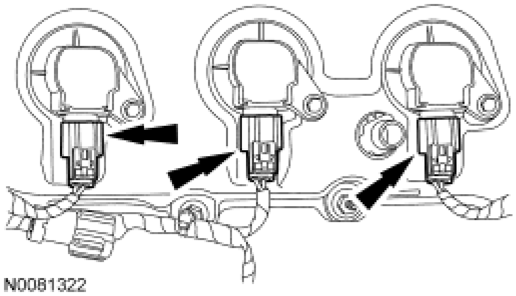

Fig. 336: Locating RH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

17. Detach all of the wiring harness retainers from the RH valve cover and stud bolts.
18. Disconnect the LH catalyst monitor sensor electrical connector.

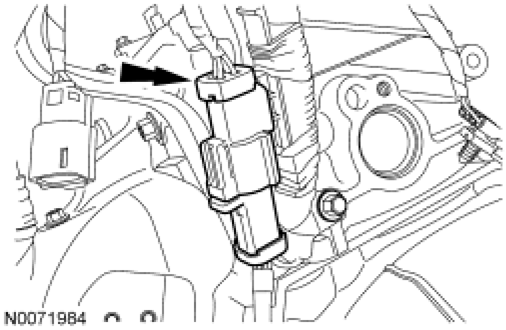

Fig. 337: Identifying LH Catalyst Monitor Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

19. Disconnect the LH VCT solenoid electrical connector.

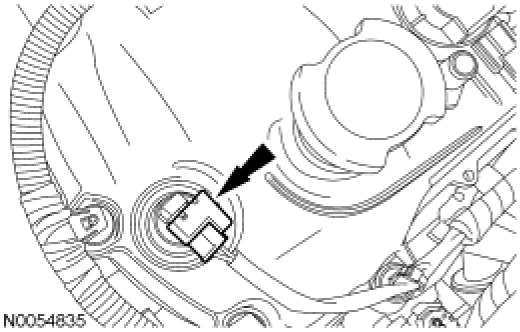

Fig. 338: Locating LH VCT Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

20. Disconnect the 3 LH coil-on-plug electrical connectors.

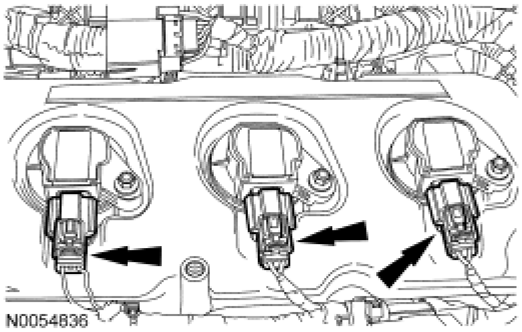

Fig. 339: Locating LH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

21. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.

NOTE: The A/C compressor must remain bolted to the cylinder block prior to installing the oil pan.

22. Remove the A/C compressor nut and stud.

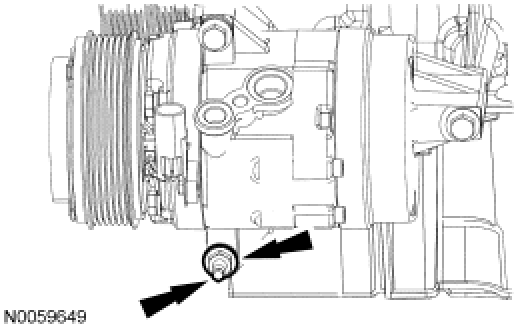

Fig. 340: Identifying A/C Compressor Nut & Stud
Courtesy of FORD MOTOR CO.

23. Detach the PSP hose retainer from the engine lifting eye.

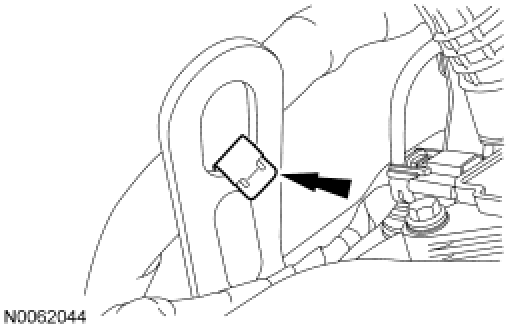

Fig. 341: Locating PSP Hose Retainer From Engine Lifting Eye
Courtesy of FORD MOTOR CO.

24. Remove the PSP hose bracket nut.

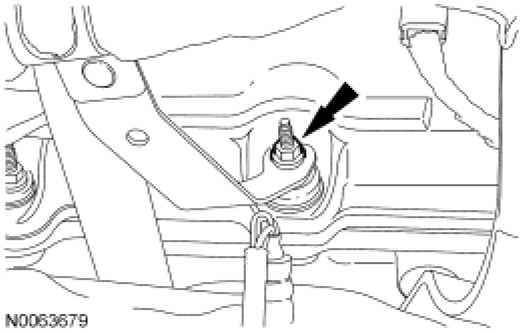

Fig. 342: Identifying PSP Hose Bracket Nut
Courtesy of FORD MOTOR CO.

25. Remove the 3 bolts and position the power steering pump aside.

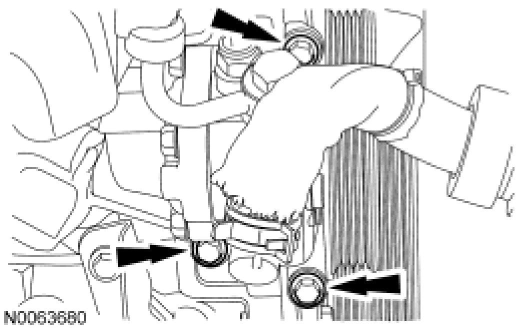

Fig. 343: Locating Power Steering Pump Bolts
Courtesy of FORD MOTOR CO.

26. Remove the 3 bolts and the accessory drive belt tensioner.

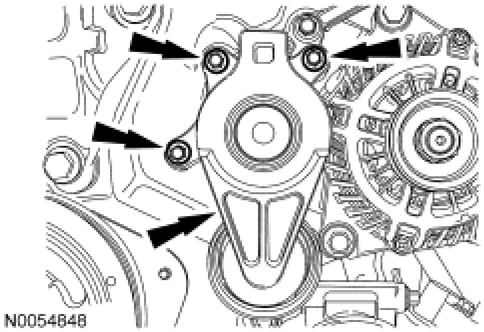

Fig. 344: Locating Accessory Drive Belt Tensioner Bolts
Courtesy of FORD MOTOR CO.

27. Remove the 4 nuts (3 shown) and the LH catalytic converter.
    - Discard the nuts and the gasket.

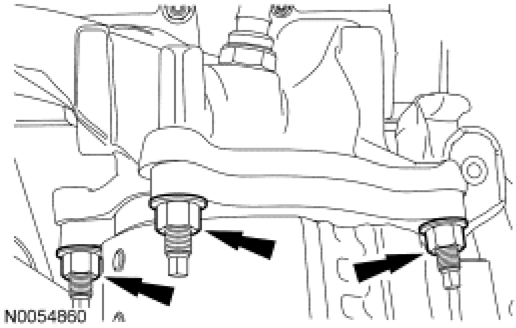

Fig. 345: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

FWD vehicles

28. Remove the 4 nuts and the RH catalytic converter.
    - Discard the nuts and the gasket.

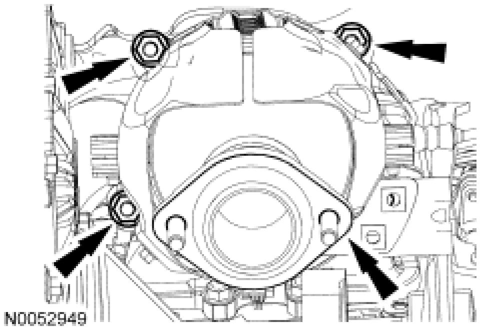

Fig. 346: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

All vehicles

29. Remove the RH cylinder block drain plug or, if equipped, the block heater.
    - Allow coolant to drain from the cylinder block.

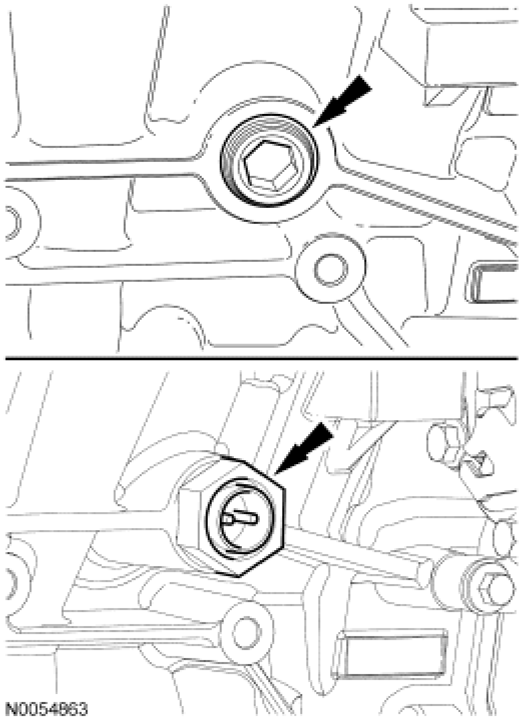

Fig. 347: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

30. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

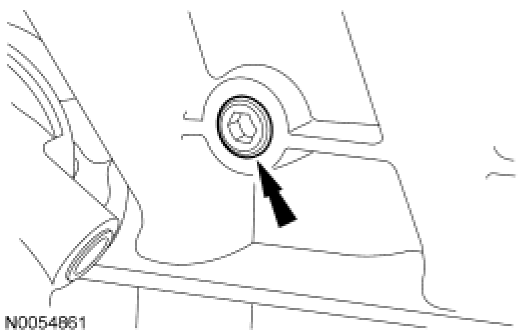

Fig. 348: Locating LH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

31. Remove the 6 bolts and the 6 coil-on-plugs.

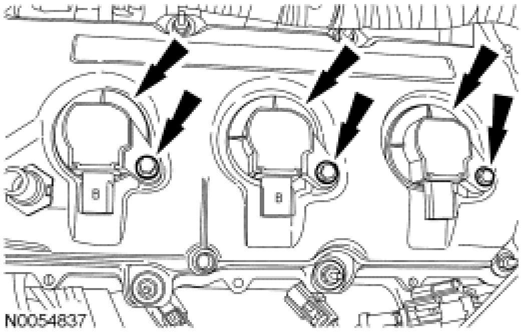

Fig. 349: Locating Coil-On-Plugs & Bolts
Courtesy of FORD MOTOR CO.

32. Remove the 2 nuts and the wiring harness retaining bracket.

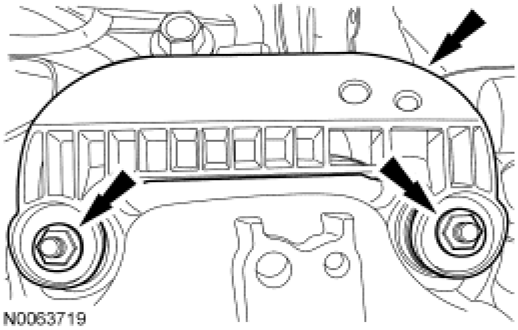

Fig. 350: Identifying Wiring Harness Retaining Bracket & Nuts
Courtesy of FORD MOTOR CO.

33. Loosen the 11 stud bolts and remove the LH valve cover.
    - Discard the gasket.

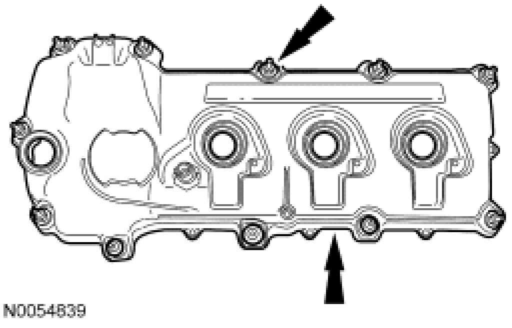

Fig. 351: Locating LH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

34. Loosen the bolt, the 10 stud bolts and remove the RH valve cover.
    - Discard the gasket.

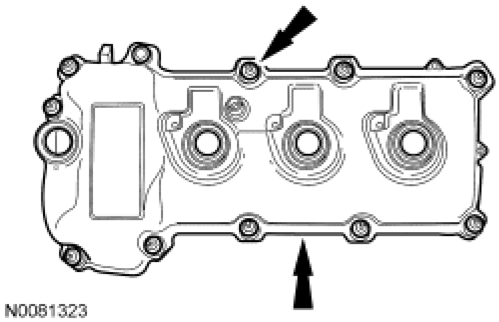

Fig. 352: Locating Stud Bolts On RH Valve Cover
Courtesy of FORD MOTOR CO.

NOTE: VCT solenoid seal removal shown, spark plug tube seal removal similar.

35. Inspect the VCT solenoid seals and the spark plug tube seals. Remove any damaged seals.
    - Using the VCT Spark Plug Tube Seal Remover and Handle, remove the seal(s).

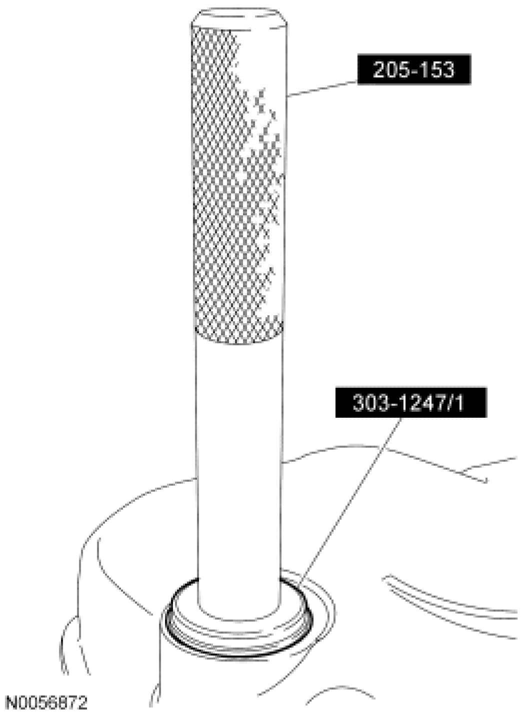

Fig. 353: Removing Seals Using Special Tools (205-153) & (303-1247/1)
Courtesy of FORD MOTOR CO.

36. Using the Strap Wrench, remove the crankshaft bolt and washer.
    - Discard the bolt.

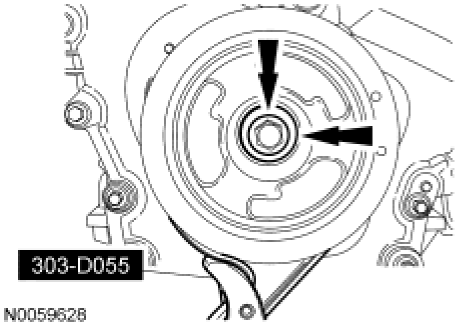

Fig. 354: Removing Crankshaft Bolt & Washer Using Special Tool (303-D055)
Courtesy of FORD MOTOR CO.

37. Using the 3-Jaw Puller, remove the crankshaft pulley.

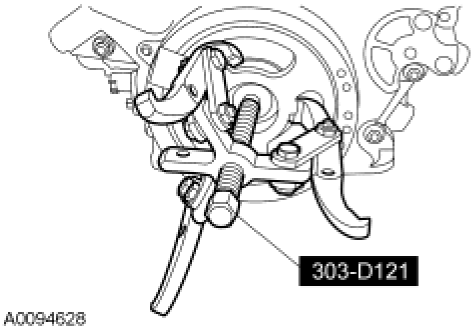

Fig. 355: Identifying Special Tools (303-D121) And Crankshaft Pulley
Courtesy of FORD MOTOR CO.

38. Using the Oil Seal Remover, remove and discard the crankshaft front seal.

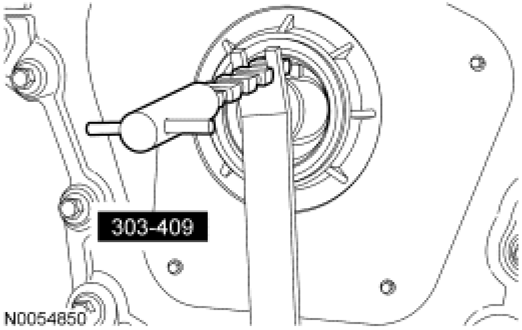

Fig. 356: Removing Crankshaft Front Seal Using Special Tool (303-409)
Courtesy of FORD MOTOR CO.

39. Remove the 2 bolts and the engine mount bracket.

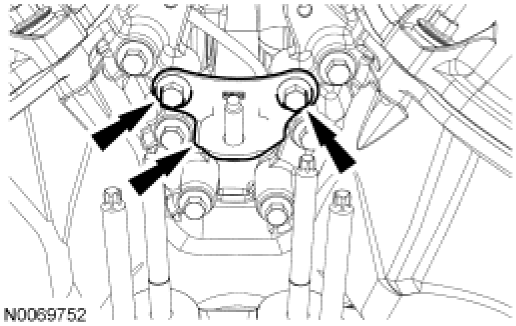

Fig. 357: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

NOTE: **Only use hand tools to remove the studs.**

40. Remove the 2 engine mount studs.

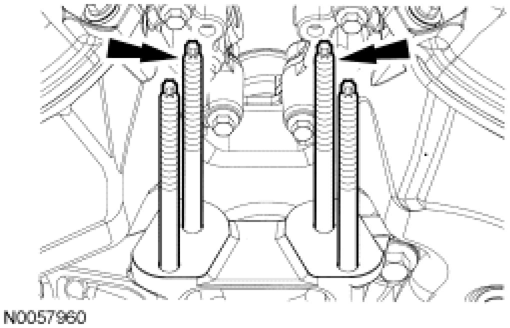

Fig. 358: Locating Engine Mount Studs
Courtesy of FORD MOTOR CO.

41. Remove the 3 bolts and the engine mount bracket.

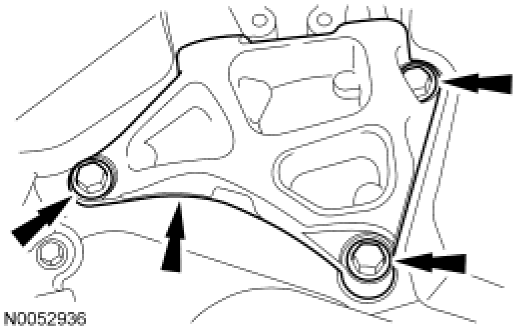

Fig. 359: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

42. Remove the 22 engine front cover bolts.

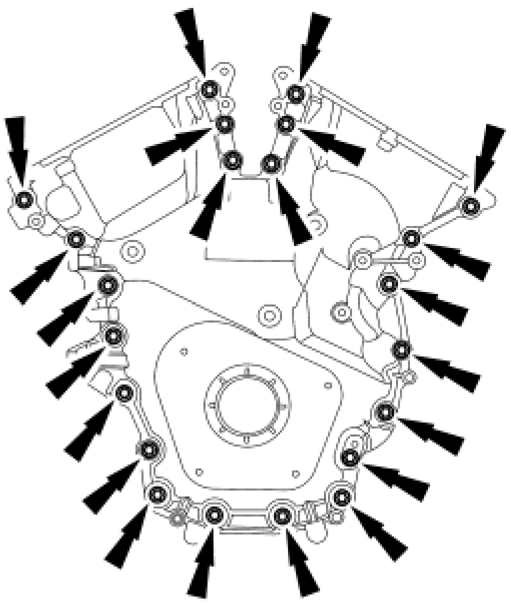

Fig. 360: Identifying Engine Front Cover Bolts
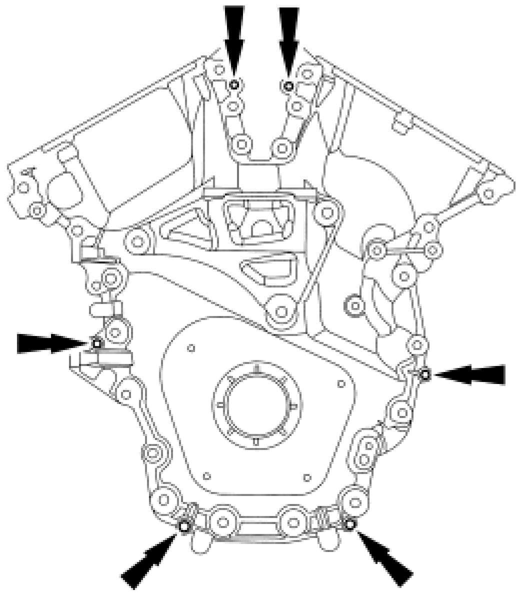
Courtesy of FORD MOTOR CO.

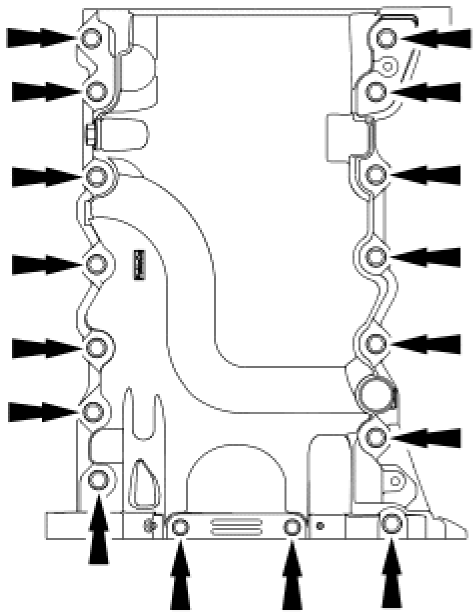
43. Install 6 of the engine front cover bolts (finger tight) into the 6 threaded holes in the engine front cover in the following sequence.
    1. Tighten the bolts one turn at a time in a criss-cross pattern until the engine front cover-to-cylinder block seal is released.
    2. Remove the engine front cover.



N0082530

Fig. 361: Tightening Bolts One Turn At A Time In A Criss-Cross Pattern Until Engine Front Cover-To-Cylinder Block Seal Is Released
Courtesy of FORD MOTOR CO.

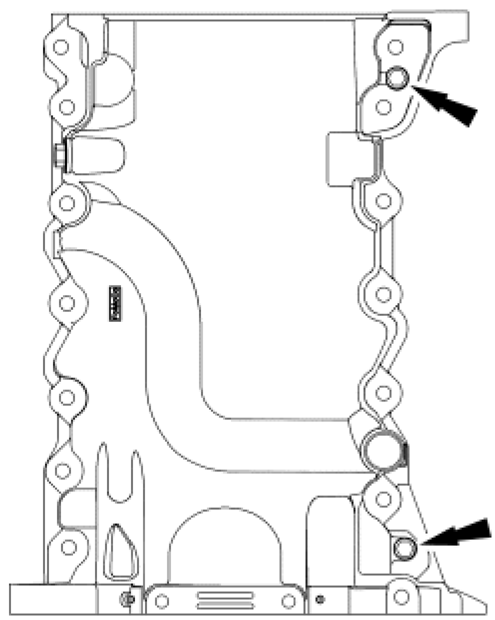
44. Remove the 16 oil pan bolts.



N0055163

Fig. 362: Identifying Oil Pan Bolts
Courtesy of FORD MOTOR CO.

45. Install 2 of the oil pan bolts (finger tight) into the 2 threaded holes in the oil pan in the following sequence.
    1. Alternately tighten the 2 bolts one turn at a time until the oil pan-to-cylinder block seal is released.
    2. Remove the oil pan.



N0055164

Fig. 363: Installing 2 Of Oil Pan Bolts (Finger Tight) Into 2 Threaded Holes In Oil Pan
Courtesy of FORD MOTOR CO.

NOTE:	**Only use a 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the engine front cover and oil pan. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the crankshaft rear seal retainer plate. These tools cause scratches and gouges that make leak paths.**

46. Clean the engine front cover and oil pan using a 3M Roloc® Bristle Disk (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 RPM.
    - Thoroughly wash the engine front cover and oil pan to remove any foreign material, including any abrasive particles created during the cleaning process.

NOTE:	**Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any foreign material (including any material created while cleaning gasket**

surfaces) that enters the oil passages or the oil pan, can cause engine failure.

NOTE: Do not use wire brushes, power abrasive discs or 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.

47. Clean all engine sealing surfaces of the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil or coolant and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.
    5. Make sure the 2 locating dowel pins are seated correctly in the cylinder block.

OIL PUMP SCREEN AND PICKUP TUBE

NOTE: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.

1. Remove the oil pan. For additional information, refer to **Oil Pan**.
2. Remove the 3 bolts and the oil pump screen and pickup tube.
    - Discard the O-ring seal.

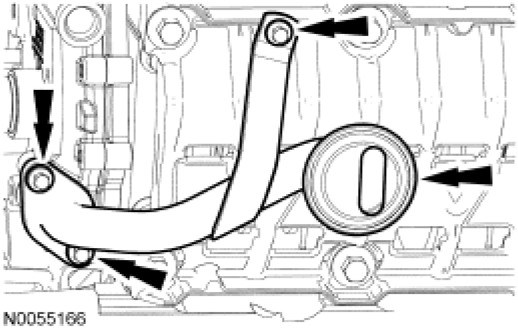


Fig. 364: Identifying Oil Pump Screen, Pickup Tube & Bolts
Courtesy of FORD MOTOR CO.

OIL PUMP

Special Tools

Illustration	Tool Name	Tool Number
 ST2979-A	Camshaft Alignment Tool	303-1248

CAUTION: During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces, that enters the oil passages, coolant passages or the oil pan can cause engine failure.

1. Remove the engine front cover. For additional information, refer to **Engine Front Cover**.
2. Rotate the crankshaft clockwise and align the timing marks on the variable camshaft timing (VCT) assemblies as shown.

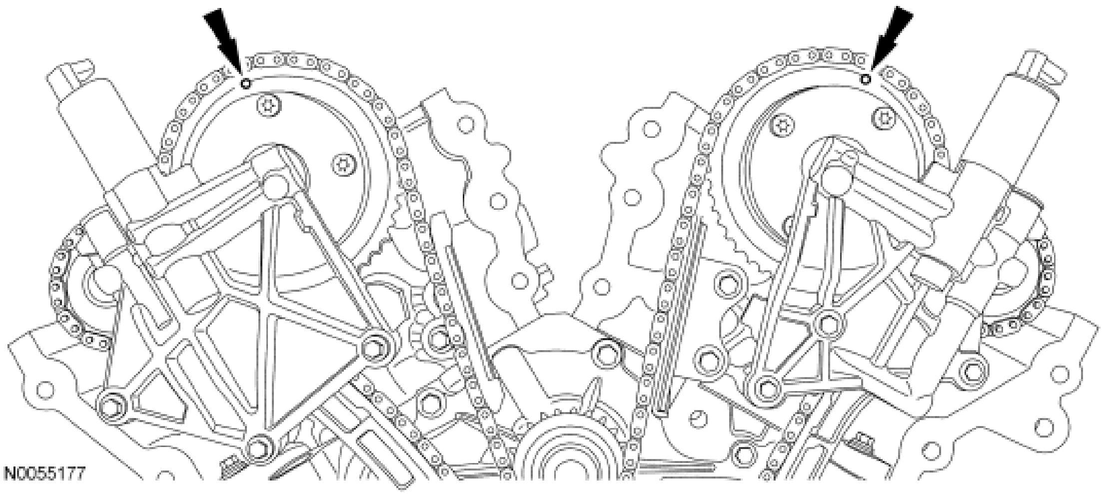

Fig. 365: Aligning Timing Marks On Variable Camshaft Timing (VCT) Assemblies
Courtesy of FORD MOTOR CO.

NOTE: The special tool will hold the camshafts in the top dead center (TDC)

position.

3. Install the special tool onto the flats of the LH camshafts.

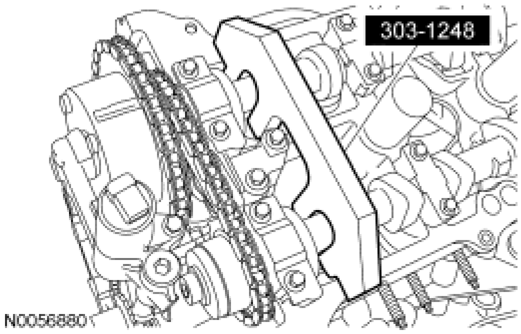

Fig. 366: Installing Special Tool (303-1248) Onto Flats Of LH Camshafts
Courtesy of FORD MOTOR CO.

NOTE: The special tool will hold the camshafts in the TDC position.

4. Install the special tool onto the flats of the RH camshafts.

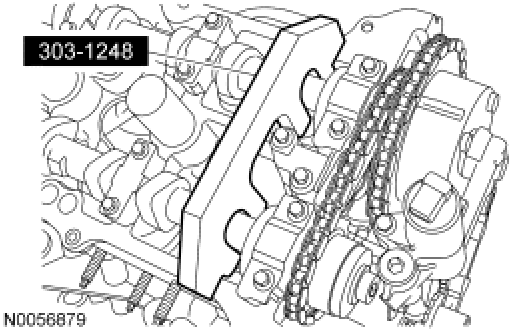

Fig. 367: Installing Special Tool (303-1248) Onto Flats Of RH Camshafts
Courtesy of FORD MOTOR CO.

5. Remove the 3 bolts and the RH VCT housing.

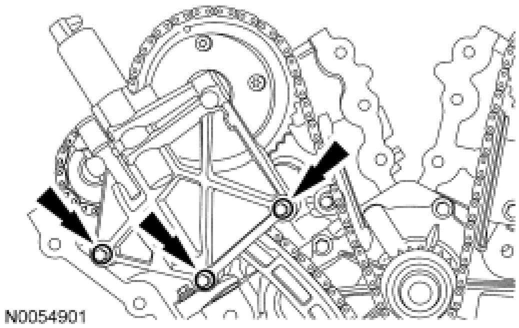

Fig. 368: Locating RH VCT Housing

Courtesy of FORD MOTOR CO.

6. Remove the 3 bolts and the LH VCT housing.

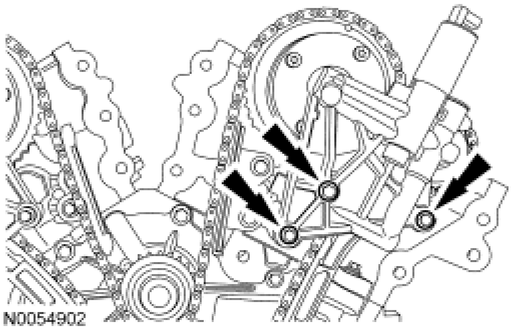

Fig. 369: Locating LH VCT Housing
Courtesy of FORD MOTOR CO.

7. Remove and discard the VCT housing seals.

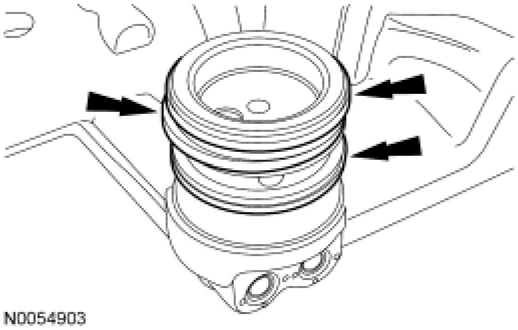

Fig. 370: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

8. Remove the 2 bolts and the primary timing chain tensioner.

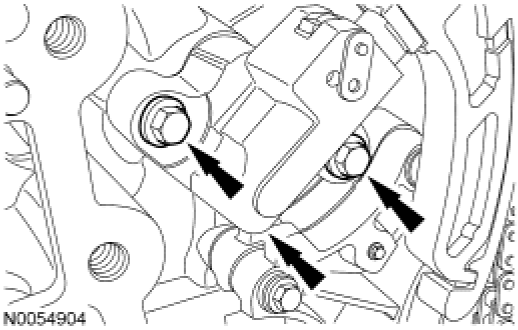

Fig. 371: Locating Primary Timing Chain Tensioner Bolts
Courtesy of FORD MOTOR CO.

9. Remove the primary timing chain tensioner arm.

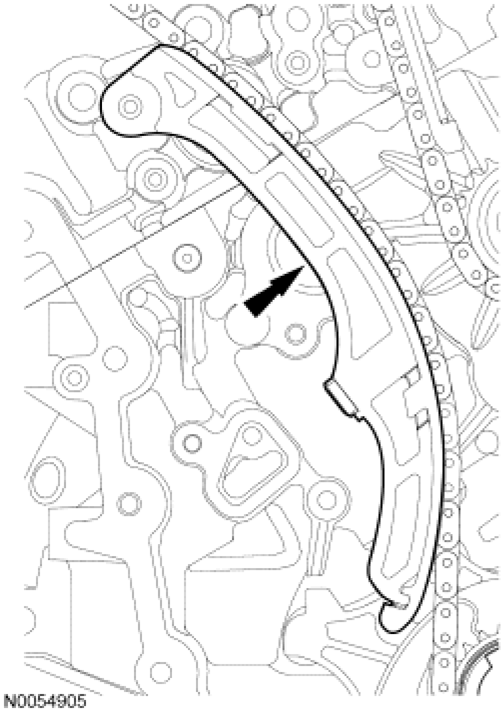

Fig. 372: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

10. Remove the 2 bolts and the lower LH primary timing chain guide.

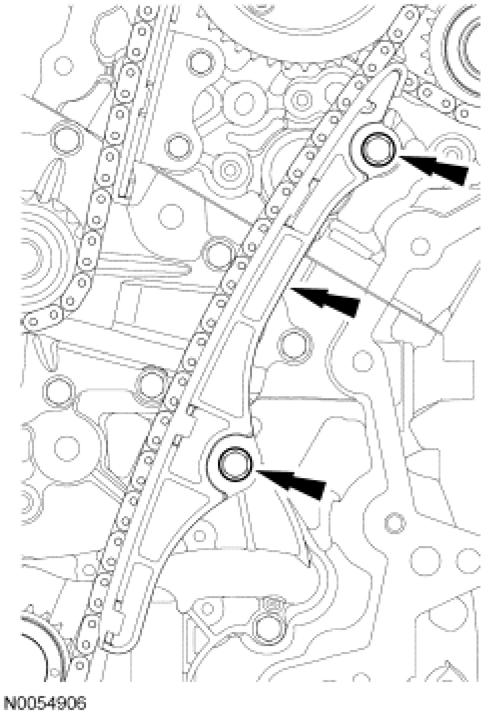

Fig. 373: Locating Lower LH Primary Timing Chain Guide Bolts

Courtesy of FORD MOTOR CO.

11. Remove the primary timing chain.

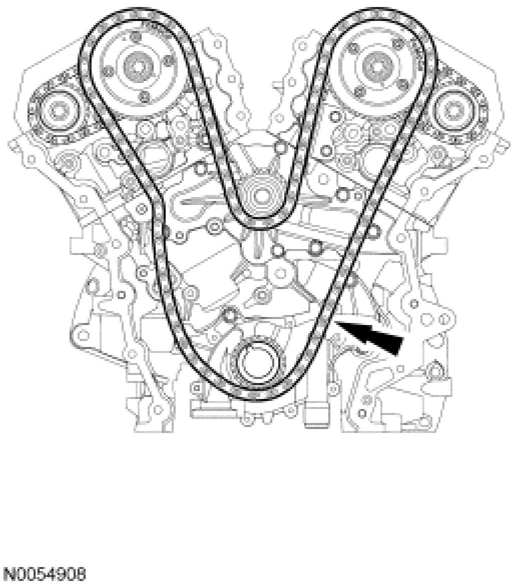

Fig. 374: Locating Primary Timing Chain
Courtesy of FORD MOTOR CO.

12. Remove the crankshaft timing chain sprocket.

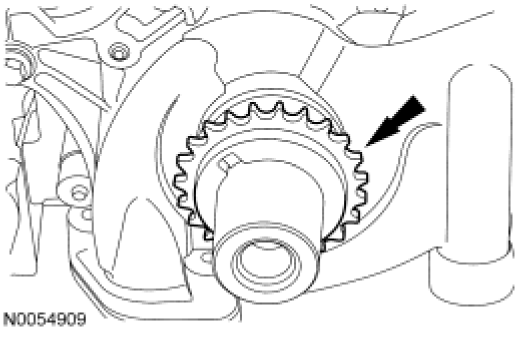

Fig. 375: Locating Crankshaft Timing Chain Sprocket
Courtesy of FORD MOTOR CO.

13. Remove the 2 oil pump screen and pickup tube bolts.

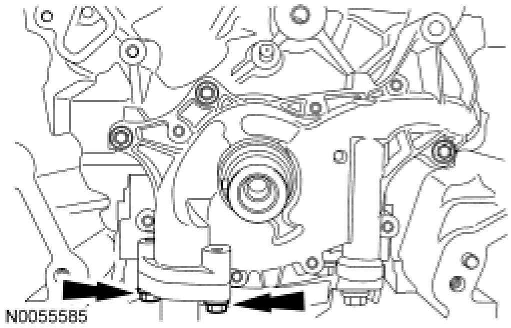

Fig. 376: Locating Oil Pump Bolts
Courtesy of FORD MOTOR CO.

14. Remove the 3 oil pump bolts.
    - Rotate the oil pump clockwise and separate the oil pump from the oil pump screen and pickup tube.
    - Remove the oil pump.
    - Discard the oil pump screen and pickup tube O-ring seal.

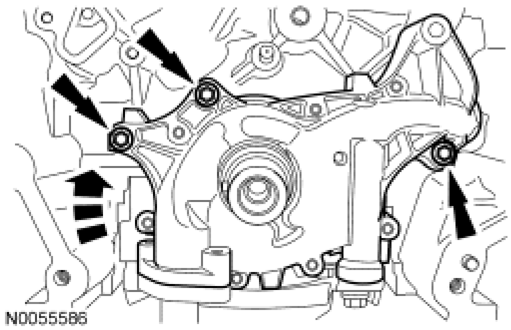

Fig. 377: Locating Oil Pump Bolts
Courtesy of FORD MOTOR CO.

Silicone Gasket Remover ZC-30	-

NOTE: **During engine repair procedures, cleanliness is extremely important. Any foreign material, including any material created while cleaning gasket surfaces that enters the oil passages, coolant passages or the oil pan, may cause engine failure.**

NOTE: **This procedure is for removal of the crankshaft rear seal and retainer plate and requires removal of the oil pan. If only removing the crankshaft rear seal, refer to Crankshaft Rear Seal.**

1. Remove the oil pan. For additional information, refer to **Oil Pan**.
2. Using the Heavy Duty Floor Crane and Spreader Bar, remove the engine from the stand.

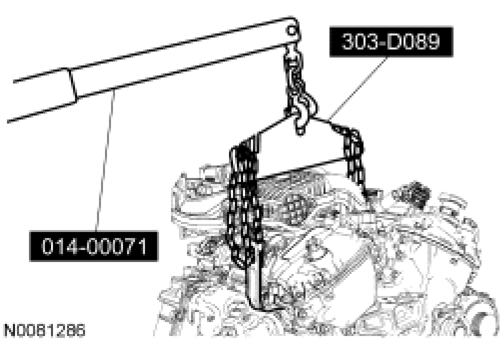

Fig. 378: Identifying Heavy Duty Floor Crane and Spreader Bar
Courtesy of FORD MOTOR CO.

3. Disconnect the Crankshaft Position (CKP) sensor electrical connector.

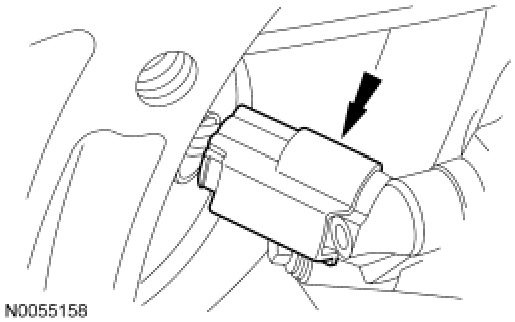

Fig. 379: Identifying Crankshaft Position (CKP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

4. Remove the bolt and the CKP sensor.

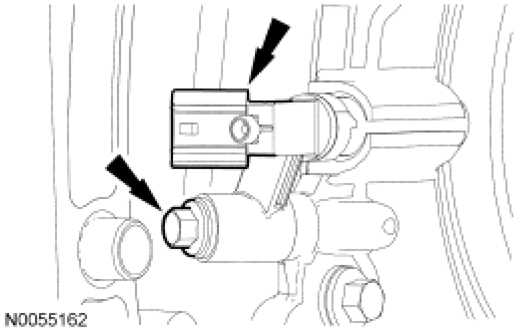

Fig. 380: Identifying CKP Sensor & Bolt
Courtesy of FORD MOTOR CO.

5. Using the Crankshaft Rear Oil Seal Remover and Slide Hammer, remove and discard the rear crankshaft seal.

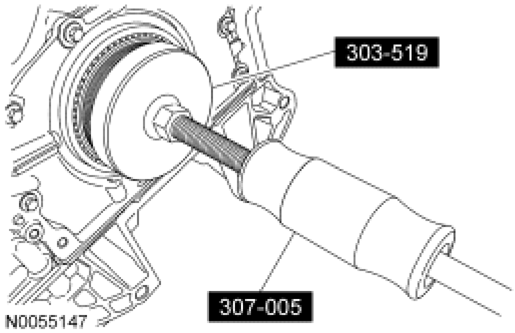

Fig. 381: Removing Crankshaft Rear Seal Using Special Tools (303-519) & (307-005)
Courtesy of FORD MOTOR CO.

6. Remove the 8 crankshaft rear seal retainer bolts.

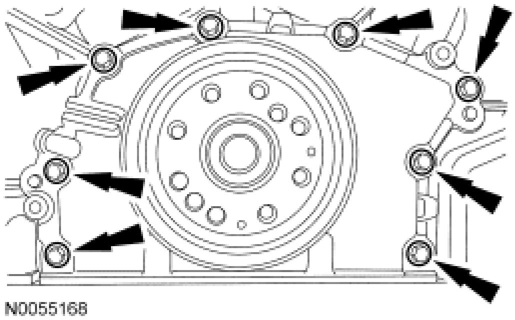

Fig. 382: Locating Crankshaft Rear Seal Retainer Bolts
Courtesy of FORD MOTOR CO.

7. Install the 2 M6 oil pan bolts (finger tight) into the 2 threaded holes in the crankshaft rear seal retainer.
   - Alternately tighten the 2 bolts one turn at a time until the crankshaft rear seal retainer-to-cylinder block seal is released.
     - Remove the crankshaft rear seal retainer.

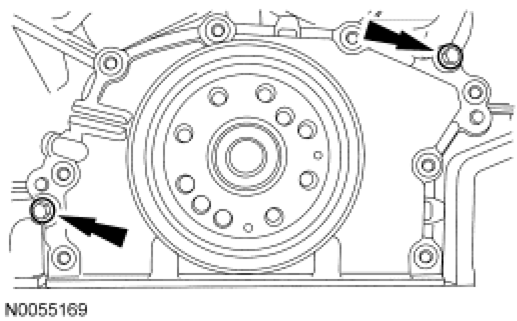

Fig. 383: Identifying M6 Oil Pan Bolts
Courtesy of FORD MOTOR CO.

NOTE: Only use a 3M Roloc® Bristle Disk, (2-in white, part number 07528) to clean the crankshaft rear seal retainer plate. Do not use metal scrapers, wire brushes or any other power abrasive disk to clean the crankshaft rear seal retainer plate. These tools cause scratches and gouges that make leak paths.

8. Clean the crankshaft rear seal retainer plate using a 3M Roloc® Bristle Disk, (2-in white, part number 07528) in a suitable tool turning at the recommended speed of 15,000 RPM.
   - Thoroughly wash the crankshaft rear seal retainer plate to remove any foreign material, including any abrasive particles created during the cleaning process.

NOTE: Place clean, lint-free shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine. Any

foreign material (including any material created while cleaning gasket surfaces) that enters the oil passages or the oil pan, may cause engine failure.

NOTE: **Do not use wire brushes, power abrasive discs or 3M Roloc® Bristle Disk (2-in white, part number 07528) to clean the sealing surfaces. These tools cause scratches and gouges that make leak paths. They also cause contamination that will cause premature engine failure. Remove all traces of the gasket.**

9. Clean the sealing surfaces of the cylinder block in the following sequence.
    1. Remove any large deposits of silicone or gasket material.
    2. Apply silicone gasket remover and allow to set for several minutes.
    3. Remove the silicone gasket remover. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep to remove any remaining traces of oil or coolant and to prepare the surfaces to bond. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

20. If equipped, disconnect the heated PCV valve electrical connector.

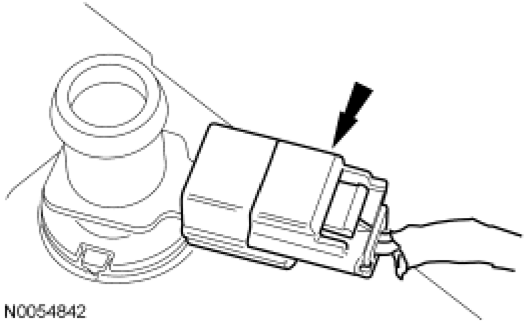

Fig. 402: Locating Heated PCV Valve Electrical Connector
Courtesy of FORD MOTOR CO.

21. Detach all of the wiring harness retainers from the RH valve cover and stud bolts.
22. Disconnect the coolant bypass hose from the thermostat housing.

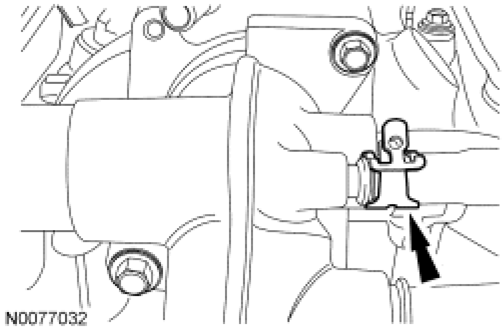

Fig. 403: Identifying Coolant Bypass Hose From Thermostat Housing
Courtesy of FORD MOTOR CO.

23. Disconnect the RH camshaft position (CMP) sensor electrical connector.

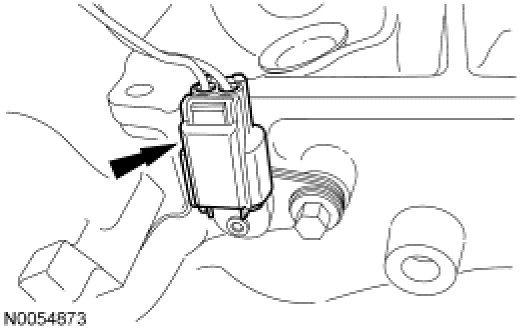

Fig. 404: Locating RH Camshaft Position (CMP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

24. Disconnect the knock sensor (KS) electrical connector.

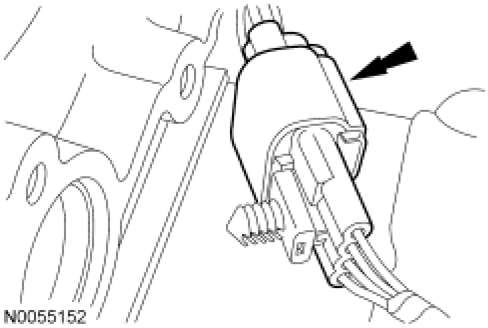

Fig. 405: Locating Knock Sensor (KS) Electrical Connector
Courtesy of FORD MOTOR CO.

25. Disconnect the 6 fuel injector electrical connectors (3 shown).

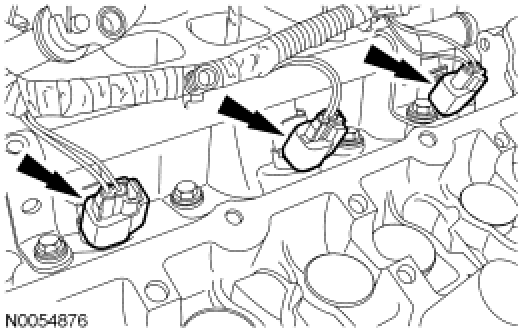

Fig. 406: Locating Fuel Injector Electrical Connectors
Courtesy of FORD MOTOR CO.

26. Disconnect the cylinder head temperature (CHT) sensor electrical connector.

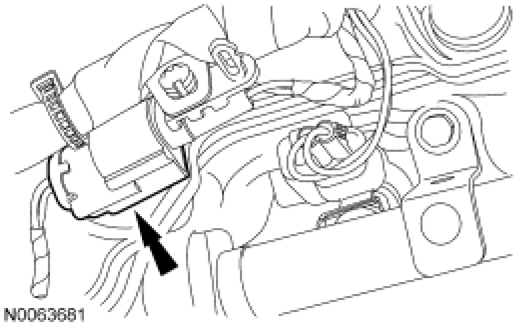

Fig. 407: Locating Cylinder Head Temperature (CHT) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

27. Disconnect the LH CMP sensor electrical connector.

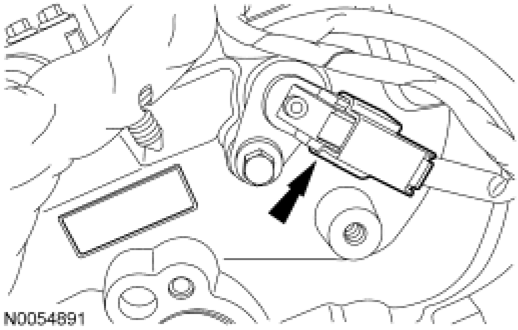

Fig. 408: Locating LH CMP Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

28. Disconnect the LH catalyst monitor sensor electrical connector.

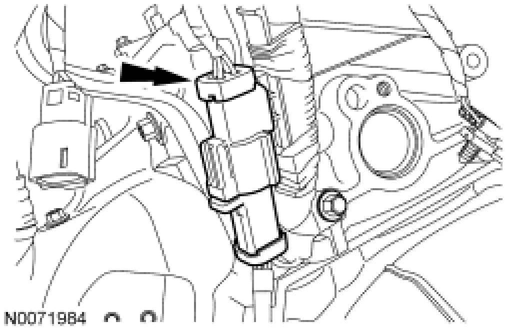

Fig. 409: Identifying LH Catalyst Monitor Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

29. Disconnect the LH HO2S electrical connector.

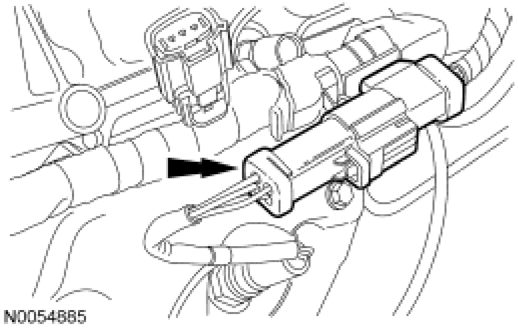

Fig. 410: Locating LH Heated Oxygen Sensor (HO2S) Electrical Connector
Courtesy of FORD MOTOR CO.

30. Disconnect the 3 LH coil-on-plug electrical connectors.

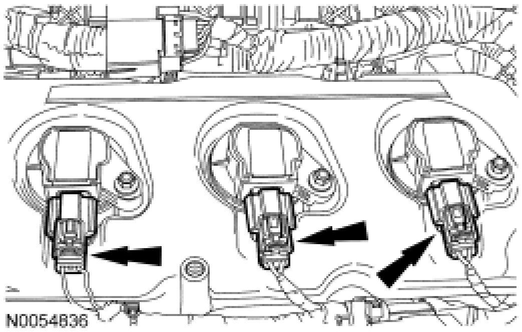

Fig. 411: Locating LH Coil-On-Plug Electrical Connectors
Courtesy of FORD MOTOR CO.

31. Disconnect the LH VCT solenoid electrical connector.

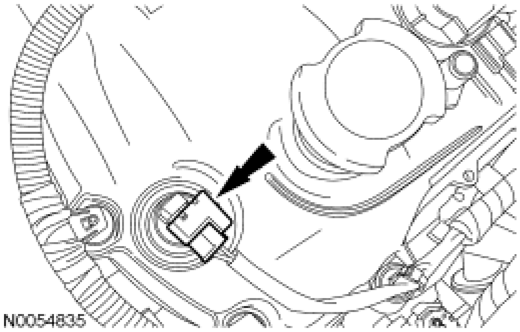

Fig. 412: Locating LH VCT Solenoid Electrical Connector
Courtesy of FORD MOTOR CO.

32. Detach all of the wiring harness retainers from the LH valve cover and stud bolts.
33. Remove the wiring harness retainer bolt from the rear of the LH cylinder head.

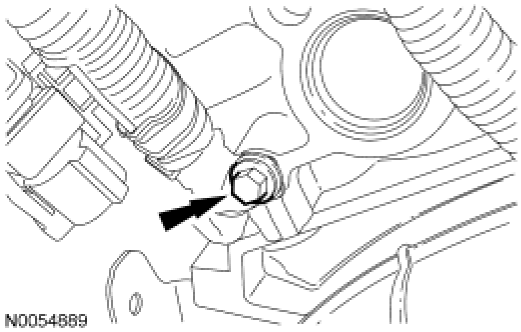

Fig. 413: Identifying Wiring Harness Retainer Bolt From Rear Of LH Cylinder Head
Courtesy of FORD MOTOR CO.

34. Remove the nut, the bolt and the heat shield.

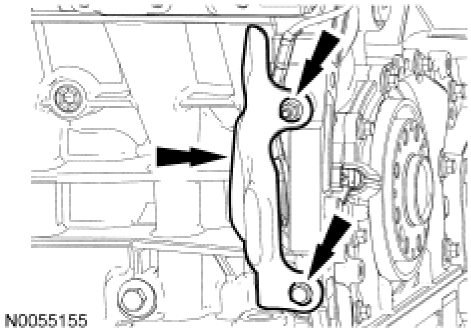

Fig. 414: Identifying Heat Shield, Nut & Bolt
Courtesy of FORD MOTOR CO.

35. Remove the wiring harness retainer stud bolt.

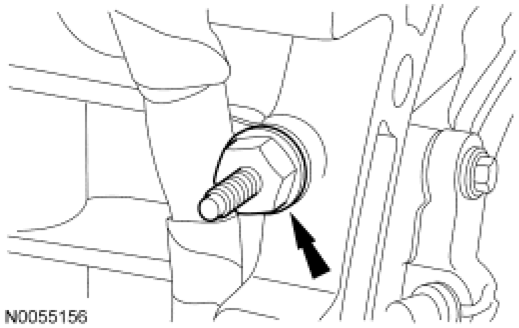

Fig. 415: Identifying Wiring Harness Retainer Stud Bolt
Courtesy of FORD MOTOR CO.

36. Remove the wiring harness grommet.

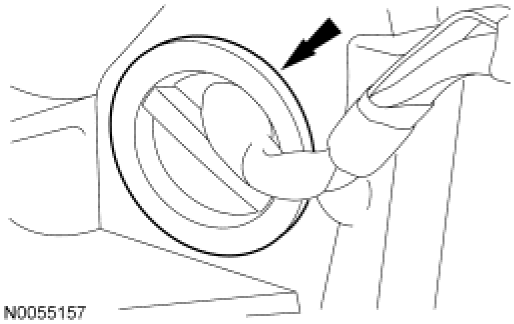

Fig. 416: Identifying Wiring Harness Grommet
Courtesy of FORD MOTOR CO.

37. Disconnect the crankshaft position (CKP) sensor electrical connector.

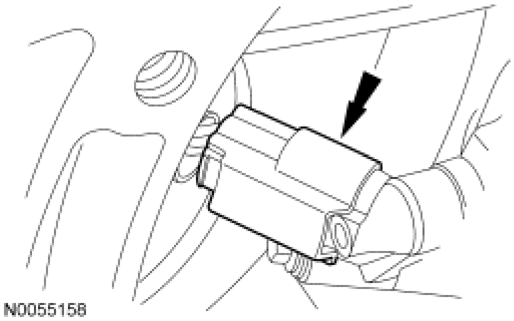

Fig. 417: Identifying Crankshaft Position (CKP) Sensor Electrical Connector
Courtesy of FORD MOTOR CO.

38. Disconnect the A/C compressor electrical connector.

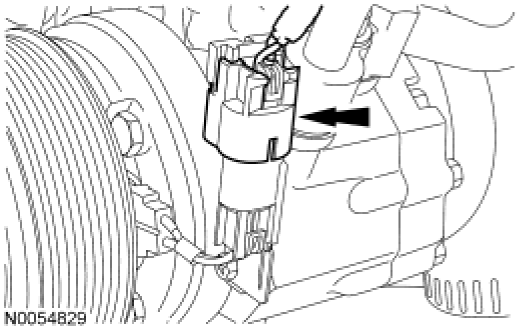

Fig. 418: Identifying A/C Compressor Electrical Connector
Courtesy of FORD MOTOR CO.

39. Remove the nut and disconnect the generator B+ cable.

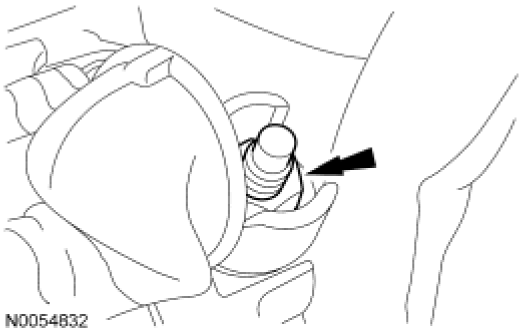

Fig. 419: Identifying Generator B+ Cable & Nut
Courtesy of FORD MOTOR CO.

40. Disconnect the generator electrical connector.

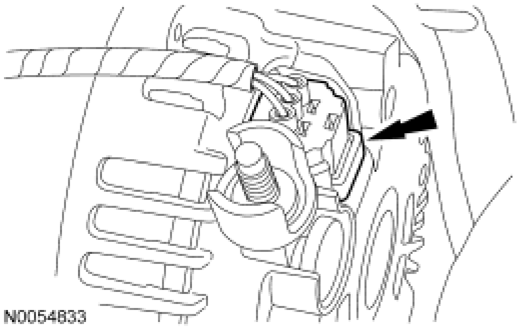

Fig. 420: Identifying Generator Electrical Connector
Courtesy of FORD MOTOR CO.

41. Detach the wiring harness retainer from the generator.

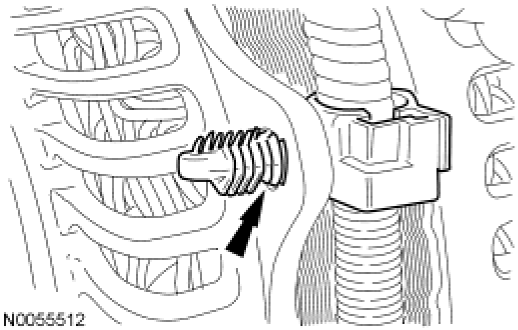

Fig. 421: Identifying Wiring Harness Retainer From Generator
Courtesy of FORD MOTOR CO.

42. Disconnect the engine oil pressure (EOP) switch electrical connector and the wiring harness pin-type retainer.
    - Remove the wiring harness from the engine.

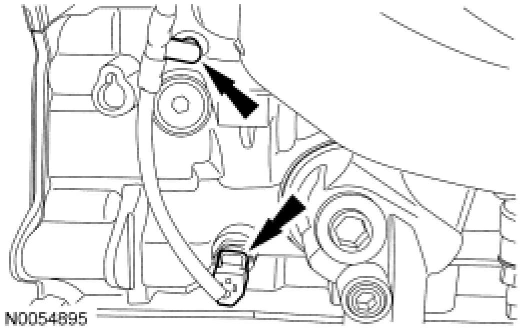

Fig. 422: Locating Engine Oil Pressure (EOP) Switch Electrical Connector & Wiring Harness Pin-Type Retainer
Courtesy of FORD MOTOR CO.

43. Remove the bolt and the A/C manifold.
    - Discard the O-ring seals.

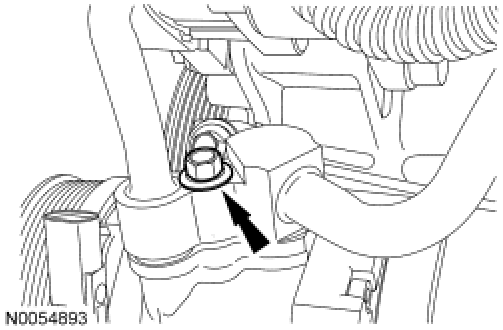

Fig. 423: Locating A/C Manifold Bolt
Courtesy of FORD MOTOR CO.

44. Remove the nut, 2 bolts and the A/C compressor.

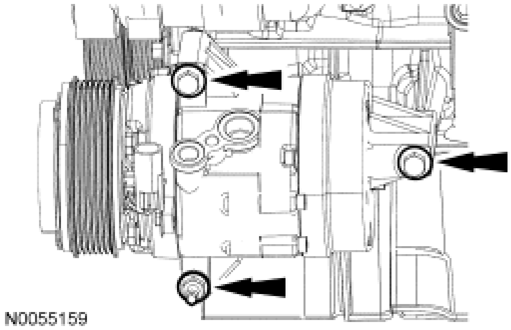

Fig. 424: Identifying A/C Compressor Nut & Bolts
Courtesy of FORD MOTOR CO.

45. Remove the A/C compressor mounting stud from the oil pan.

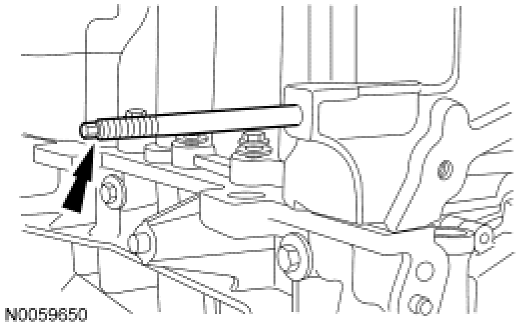

Fig. 425: Locating A/C Compressor Mounting Stud
Courtesy of FORD MOTOR CO.

46. Remove the bolt, nut and the generator.

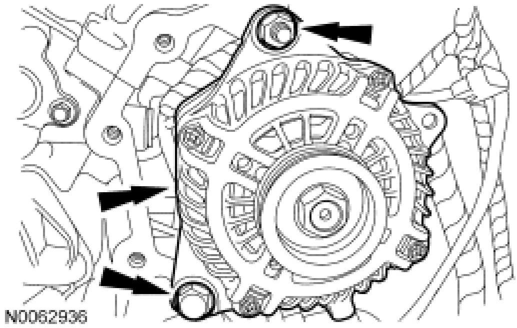

Fig. 426: Locating Generator, Bolts & Nuts
Courtesy of FORD MOTOR CO.

47. Detach the PSP hose retainer from the engine lifting eye.

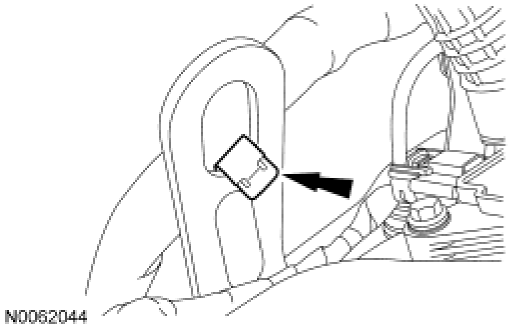

Fig. 427: Locating PSP Hose Retainer From Engine Lifting Eye
Courtesy of FORD MOTOR CO.

48. Remove the PSP hose bracket nut.

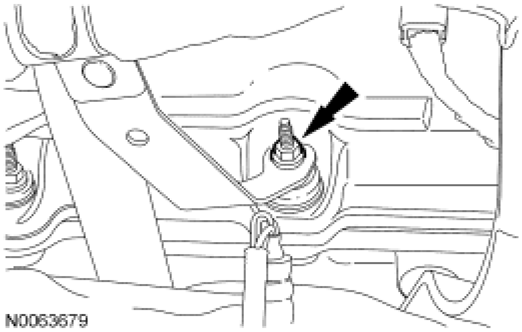

Fig. 428: Identifying PSP Hose Bracket Nut
Courtesy of FORD MOTOR CO.

49. Remove the PSP tube bracket bolt from the RH cylinder head.

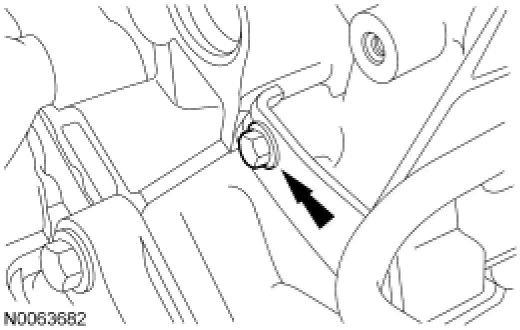

Fig. 429: Identifying Power Steering Pressure (PSP) Tube & Bracket Assembly
Courtesy of FORD MOTOR CO.

50. Remove the 3 bolts and the power steering pump.

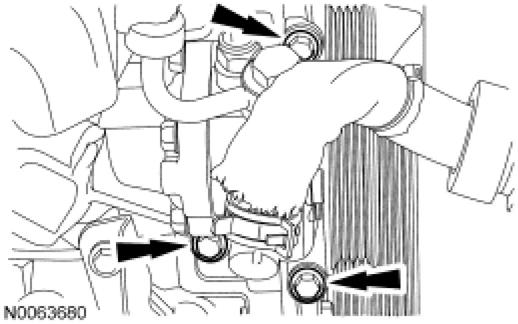

Fig. 430: Locating Power Steering Pump Bolts
Courtesy of FORD MOTOR CO.

51. Remove the 3 bolts and the accessory drive belt tensioner.

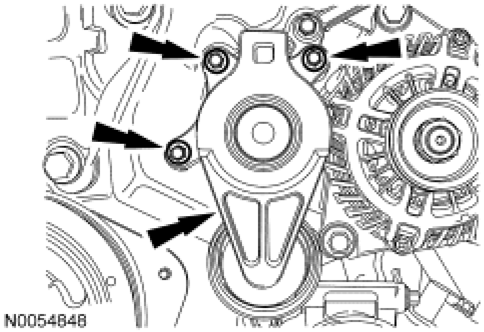

Fig. 431: Locating Accessory Drive Belt Tensioner Bolts
Courtesy of FORD MOTOR CO.

52. Remove the 4 nuts (3 shown) and the LH catalytic converter.
    - Discard the nuts and the gasket.

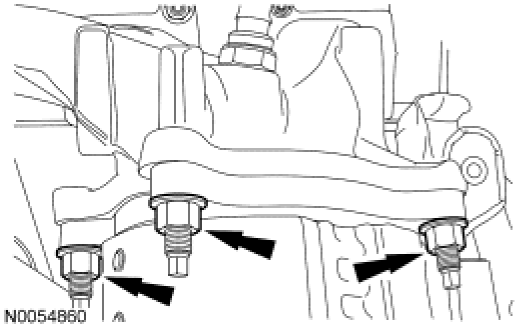

Fig. 432: Locating LH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

53. Remove the 3 bolts and the LH exhaust manifold heat shield.

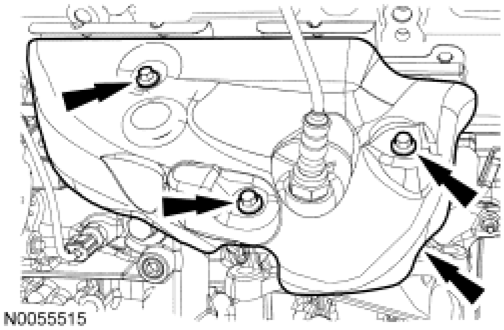

Fig. 433: Locating LH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

54. Remove the 6 nuts and the LH exhaust manifold.
    - Discard the nuts and the exhaust manifold gasket.

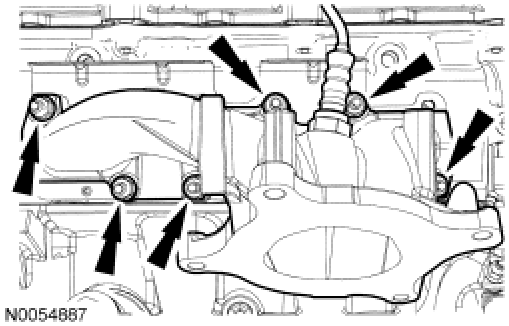

Fig. 434: Locating LH Exhaust Manifold Nuts
Courtesy of FORD MOTOR CO.

55. Clean and inspect the LH exhaust manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
56. Remove and discard the 6 LH exhaust manifold studs.

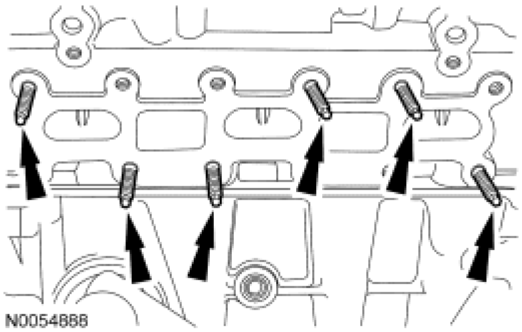

Fig. 435: Locating LH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

FWD vehicles

57. Remove the 4 nuts and the RH catalytic converter.
    - Discard the nuts and the gasket.

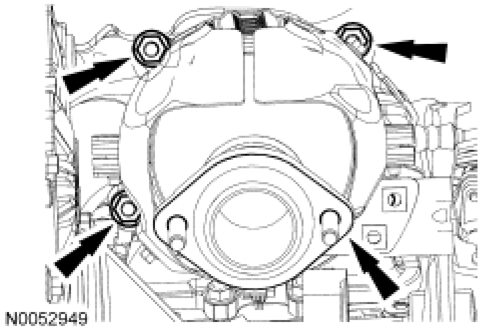

Fig. 436: Locating RH Catalytic Converter Nuts
Courtesy of FORD MOTOR CO.

All vehicles

58. Remove the 3 bolts and the RH exhaust manifold heat shield.

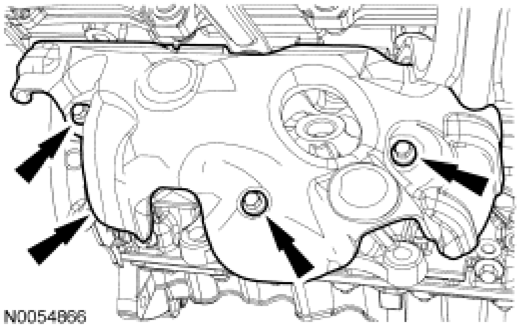

Fig. 437: Locating RH Exhaust Manifold Heat Shield & Nuts
Courtesy of FORD MOTOR CO.

59. Remove the 6 nuts and the RH exhaust manifold.
    - Discard the nuts and the exhaust manifold gasket.

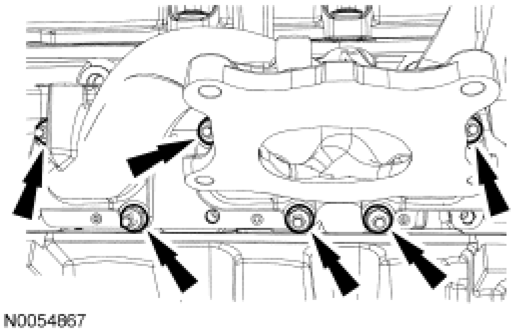

Fig. 438: Locating RH Exhaust Manifold & Nuts
Courtesy of FORD MOTOR CO.

60. Clean and inspect the RH exhaust manifold. For additional information, refer to **ENGINE SYSTEM - GENERAL INFORMATION** article.
61. Remove and discard the 6 RH exhaust manifold studs.

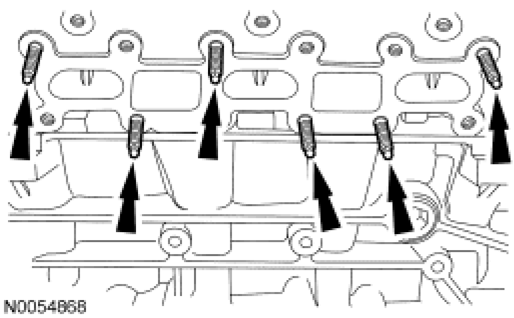

Fig. 439: Locating RH Exhaust Manifold Studs
Courtesy of FORD MOTOR CO.

62. Remove the RH cylinder block drain plug or, if equipped, the block heater.
    - Allow coolant to drain from the cylinder block.

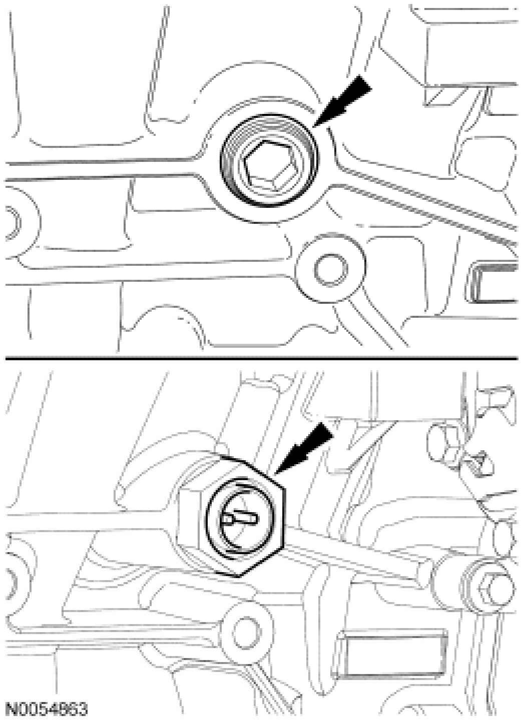

Fig. 440: Locating RH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

63. Remove the LH cylinder block drain plug.
    - Allow coolant to drain from the cylinder block.

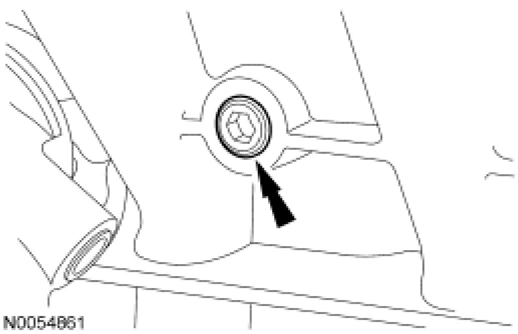

Fig. 441: Locating LH Cylinder Block Drain Plug
Courtesy of FORD MOTOR CO.

64. Remove the pin-type retainer and the cover.

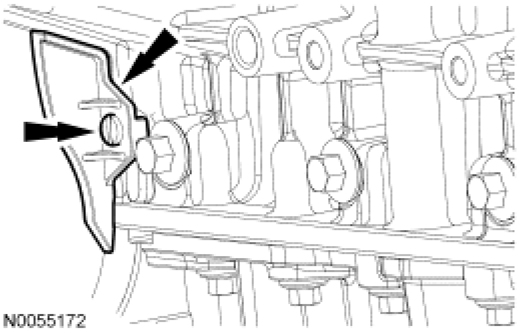

Fig. 442: Locating Pin-Type Retainer & Cover
Courtesy of FORD MOTOR CO.

65. Remove the 2 bolts and the engine lifting eye.

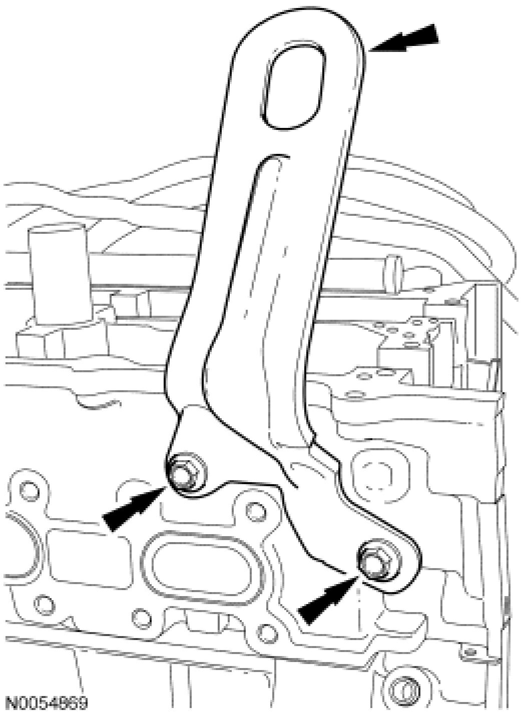

Fig. 443: Locating Engine Lifting Eye & Bolts
Courtesy of FORD MOTOR CO.

66. If equipped, remove the bolt and the upper intake manifold long support bracket.

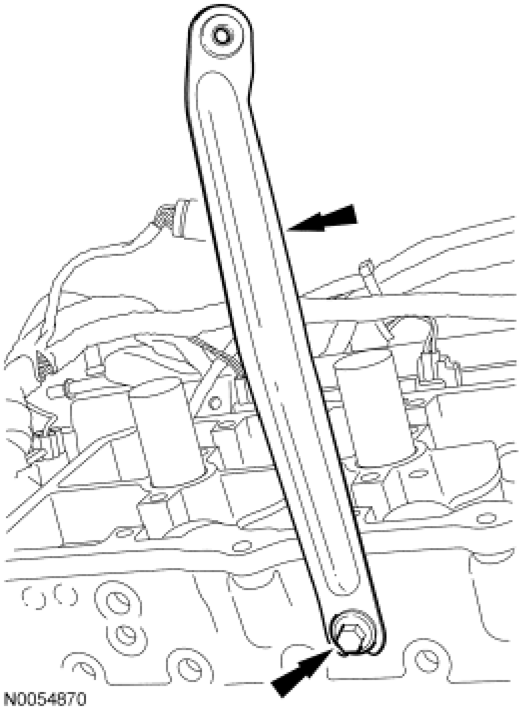

Fig. 444: Locating Upper Intake Manifold Bracket & Bolt
Courtesy of FORD MOTOR CO.

67. Remove the bolt and the upper intake manifold short support bracket.

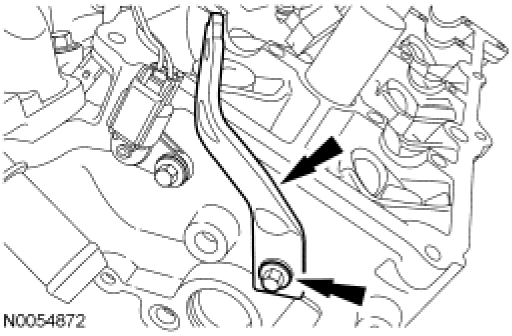

Fig. 445: Locating Upper Intake Manifold Bracket & Bolt
Courtesy of FORD MOTOR CO.

68. Remove the bolt and the RH CMP sensor.

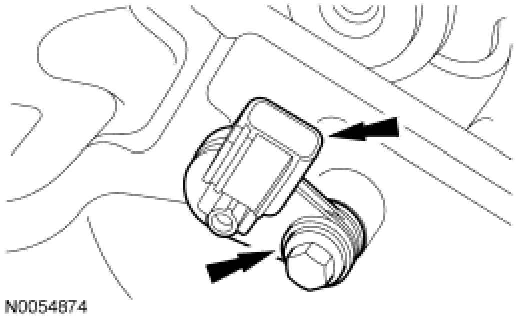

Fig. 446: Locating RH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

All wheel drive (AWD) vehicles

69. Remove the 2 bolts and the catalytic converter bracket.

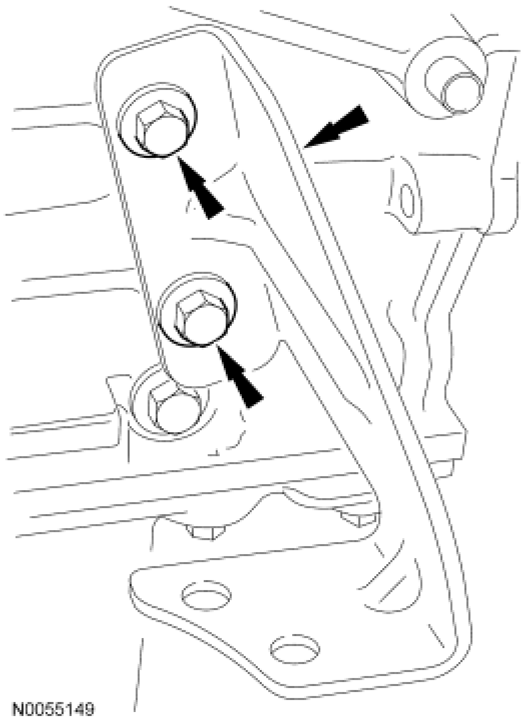

Fig. 447: Locating Catalytic Converter Bracket & Bolts
Courtesy of FORD MOTOR CO.

All vehicles

70. Remove the 4 bolts and the fuel rail and injectors as an assembly.

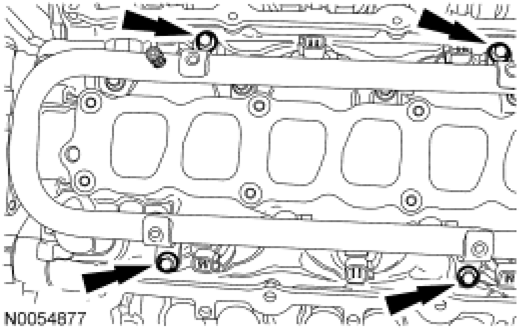

Fig. 448: Locating Fuel Rail And Injectors & Bolts
Courtesy of FORD MOTOR CO.

71. Remove the 2 thermostat housing-to-lower intake manifold bolts.
    - Remove the thermostat housing and discard the gasket.

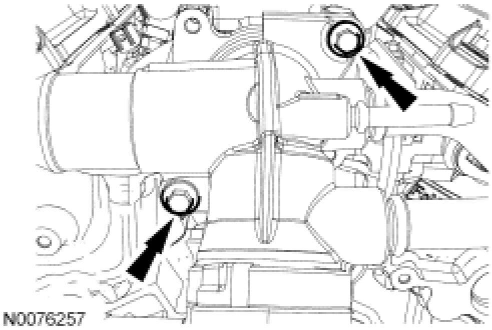

Fig. 449: Locating Thermostat Housing-To-Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

72. Remove the 10 bolts and the lower intake manifold.
    - Discard the gaskets.

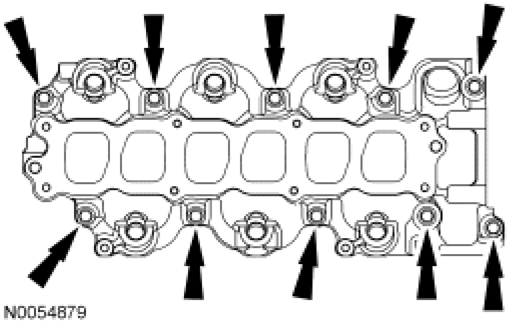

Fig. 450: Locating Lower Intake Manifold Bolts
Courtesy of FORD MOTOR CO.

73. Disconnect and remove the CHT sensor jumper harness.

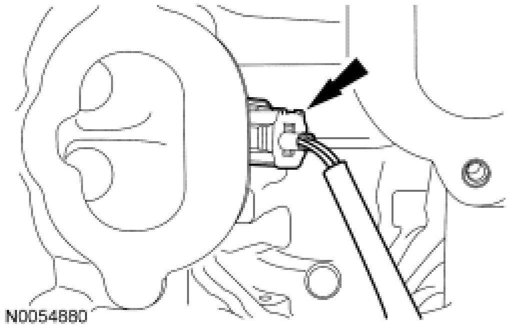

Fig. 451: Identifying CHT Sensor Jumper Harness
Courtesy of FORD MOTOR CO.

74. Remove the bolt and the LH CMP sensor.

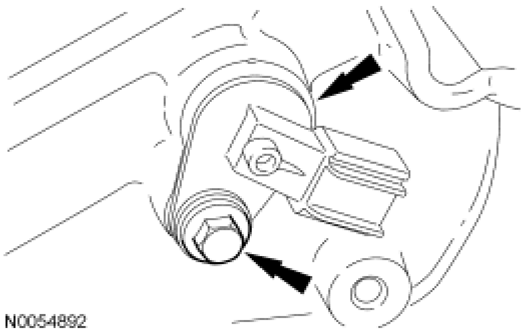

Fig. 452: Locating LH CMP Sensor & Bolt
Courtesy of FORD MOTOR CO.

75. Remove the bolt and the CKP sensor.

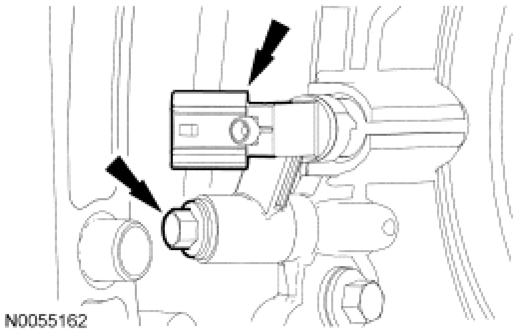

Fig. 453: Identifying CKP Sensor & Bolt
Courtesy of FORD MOTOR CO.

76. Remove the EOP switch.

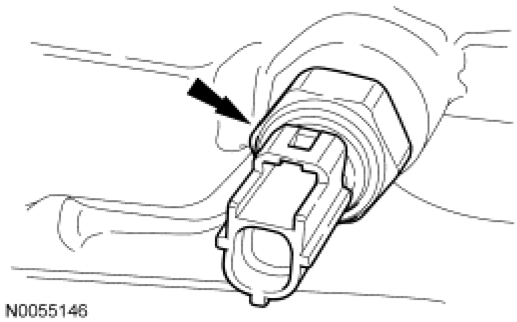

Fig. 454: Identifying EOP Switch
Courtesy of FORD MOTOR CO.

77. Remove the 2 bolts and the oil filter adapter.
    - Discard the gasket and the O-ring seal.

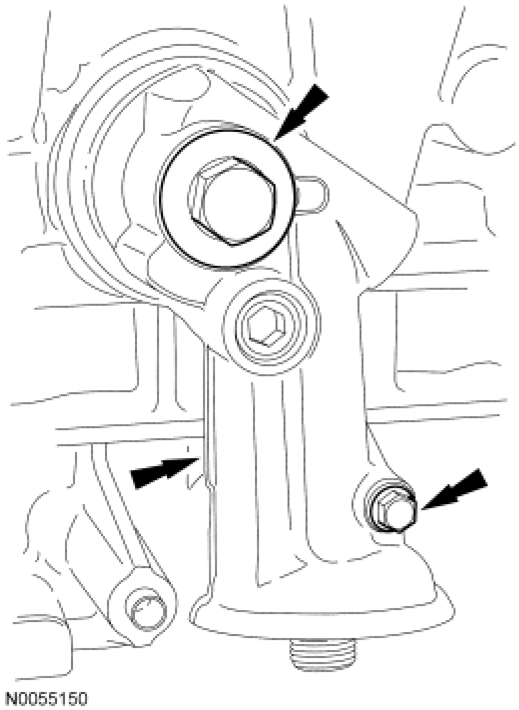

Fig. 455: Locating Oil Filter Adapter & Bolts
Courtesy of FORD MOTOR CO.

NOTE: LH shown, RH similar.

78. Remove the 6 bolts and the 6 coil-on-plugs.

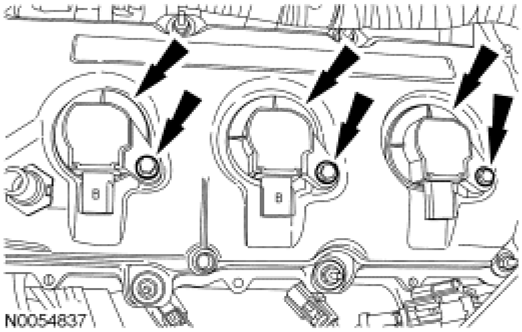

Fig. 456: Locating Coil-On-Plugs & Bolts
Courtesy of FORD MOTOR CO.

79. Remove the 2 nuts and the wiring harness retaining bracket.

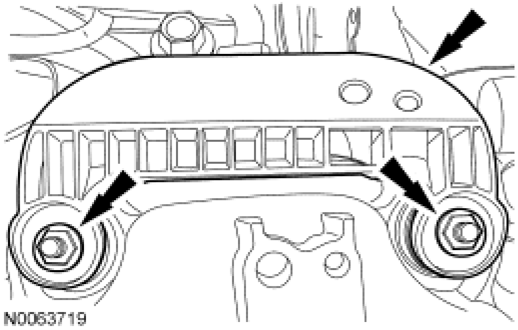

Fig. 457: Identifying Wiring Harness Retaining Bracket & Nuts
Courtesy of FORD MOTOR CO.

80. Remove the 11 stud bolts and the LH valve cover.
    - Discard the gasket.

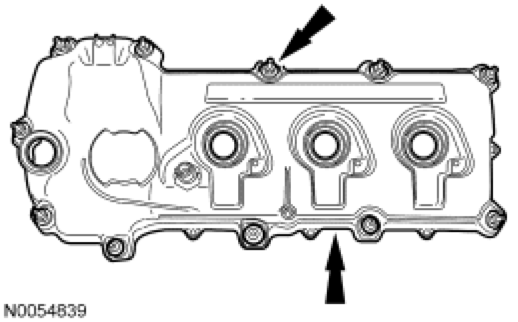

Fig. 458: Locating LH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

81. Remove the bolt, the 10 stud bolts and the RH valve cover.
    - Discard the gasket.

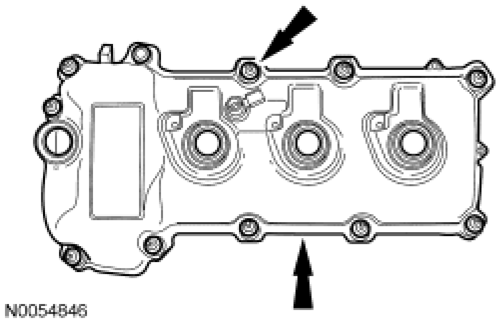

Fig. 459: Locating RH Valve Cover Stud Bolts
Courtesy of FORD MOTOR CO.

NOTE: VCT solenoid seal removal shown, spark plug tube seal removal similar.

82. Inspect the VCT solenoid seals and the spark plug tube seals. Remove any damaged seals.
    - Using the special tools, remove the seal(s).

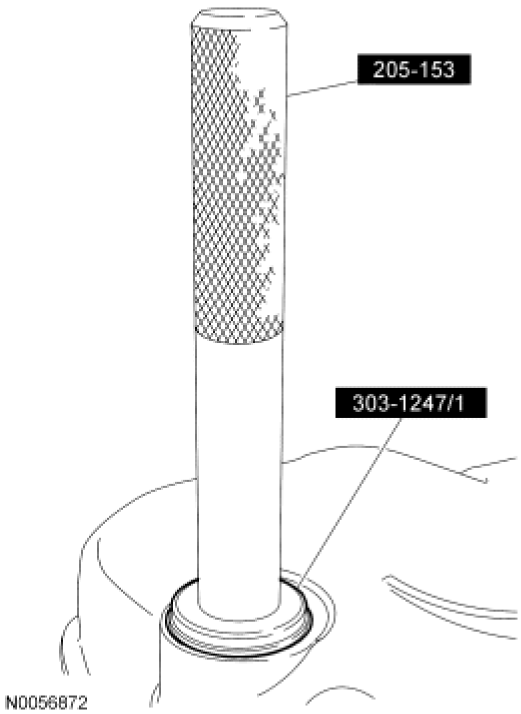

Fig. 460: Removing Seals Using Special Tools (205-153) & (303-1247/1)
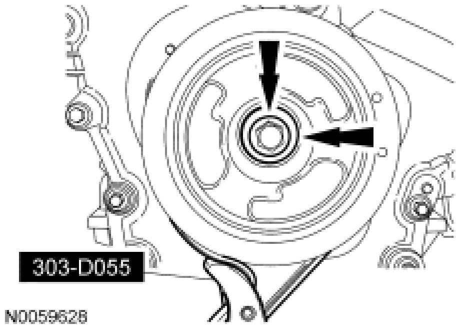
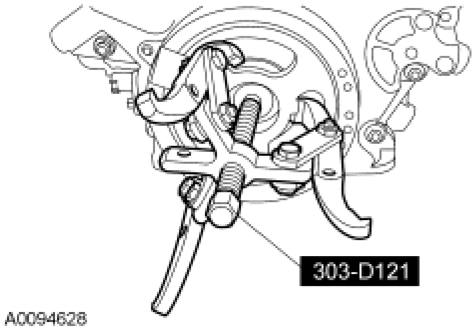
Courtesy of FORD MOTOR CO.

83. Remove the crankshaft bolt and washer.
    - Discard the bolt.



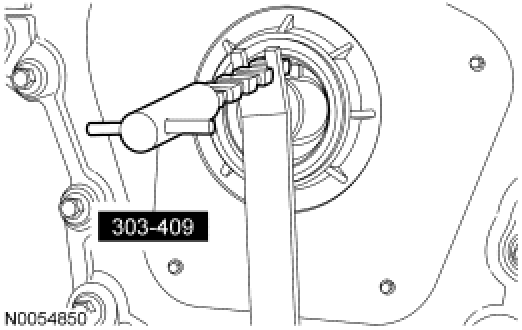
<u>Fig. 461: Removing Crankshaft Bolt & Washer Using Special Tool (303-D055)</u>
Courtesy of FORD MOTOR CO.

84. Using the special tool, remove the crankshaft pulley.



<u>Fig. 462: Identifying Special Tools (303-D121) And Crankshaft Pulley</u>
Courtesy of FORD MOTOR CO.

85. Using the special tool, remove and discard the crankshaft front seal.



<u>Fig. 463: Removing Crankshaft Front Seal Using Special Tool (303-409)</u>
Courtesy of FORD MOTOR CO.

86. Remove the 2 bolts and the engine mount bracket.

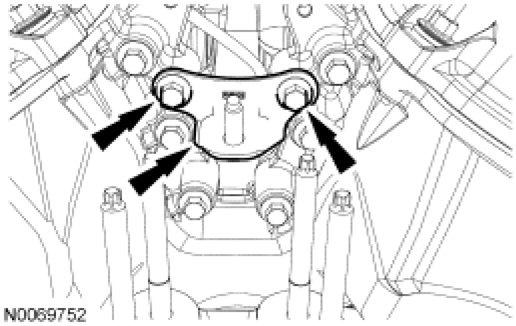


Fig. 464: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

87. Remove the 2 engine mount studs.

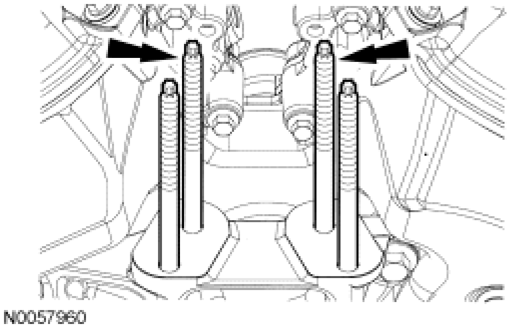

Fig. 465: Locating Engine Mount Studs
Courtesy of FORD MOTOR CO.

88. Remove the 3 bolts and the engine mount bracket.

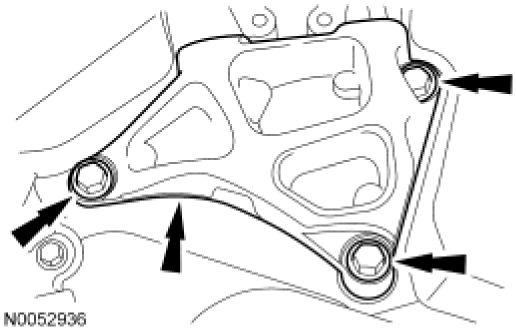

Fig. 466: Locating Engine Mount Bracket & Bolts
Courtesy of FORD MOTOR CO.

89. Remove the 22 engine front cover bolts.

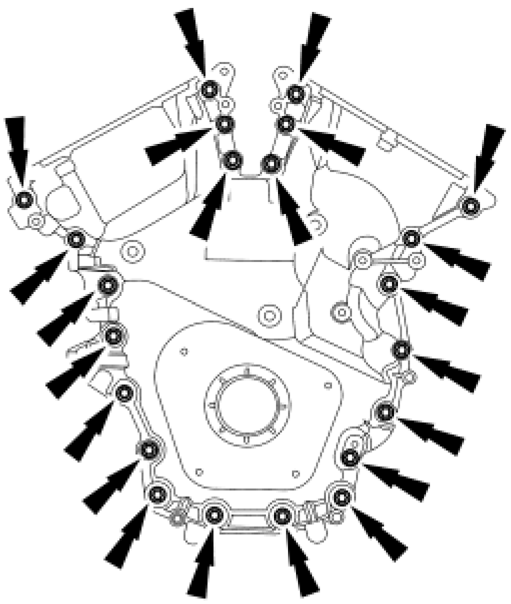

Fig. 467: Identifying Engine Front Cover Bolts
Courtesy of FORD MOTOR CO.

90. Install 6 of the engine front cover bolts (finger tight) into the 6 threaded holes in the engine front cover in the following sequence.
    1. Tighten the bolts one turn at a time in a criss-cross pattern until the engine front cover-to-cylinder block seal is released.
    2. Remove the engine front cover.

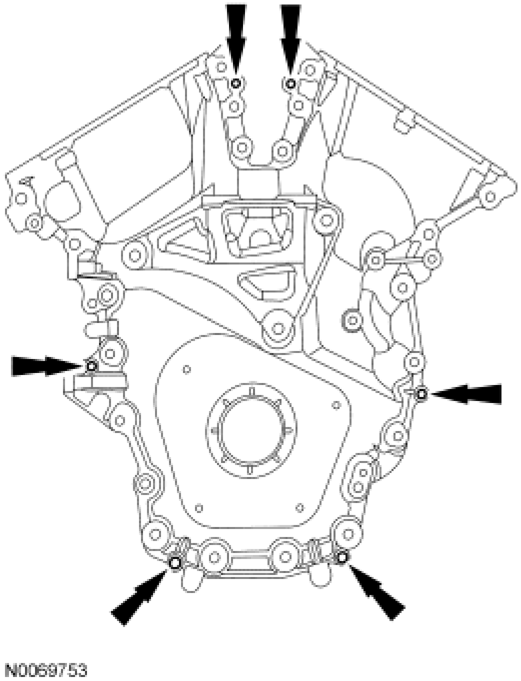

Fig. 468: Identifying Engine Front Cover Bolts
Courtesy of FORD MOTOR CO.

91. Rotate the crankshaft clockwise and align the timing marks on the VCT assemblies as shown.

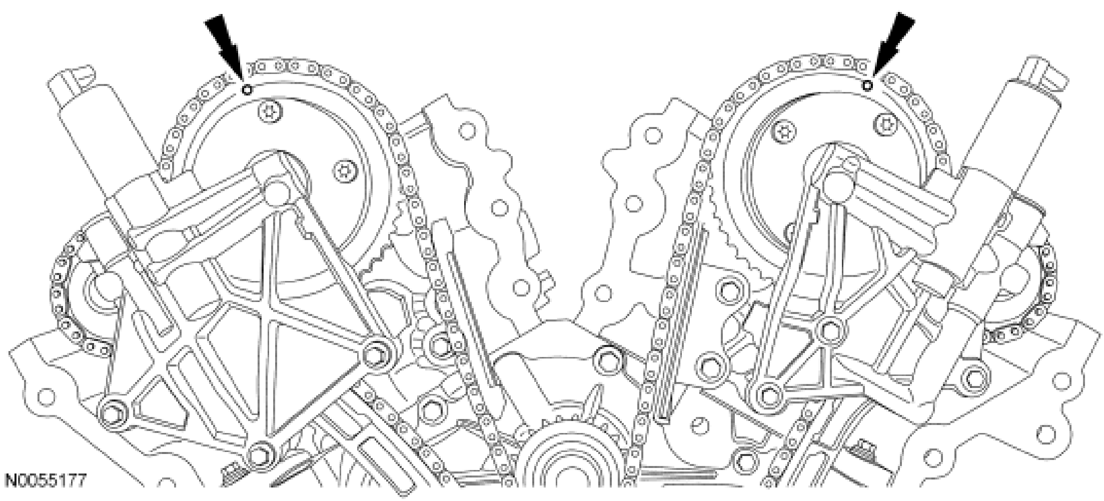

Fig. 469: Aligning Timing Marks On Variable Camshaft Timing (VCT) Assemblies
Courtesy of FORD MOTOR CO.

NOTE: The special tool will hold the camshafts in the top dead center (TDC) position.

92. Install the special tool onto the flats of the LH camshafts.

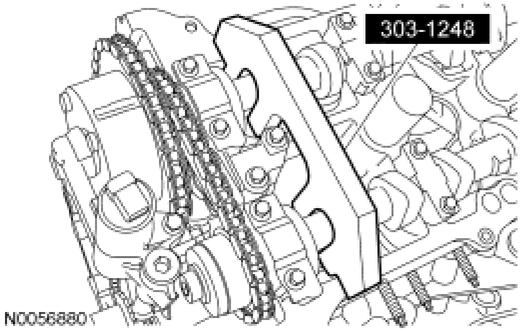

Fig. 470: Installing Special Tool (303-1248) Onto Flats Of LH Camshafts
Courtesy of FORD MOTOR CO.

NOTE: The special tool will hold the camshafts in the TDC position.

93. Install the special tool onto the flats of the RH camshafts.

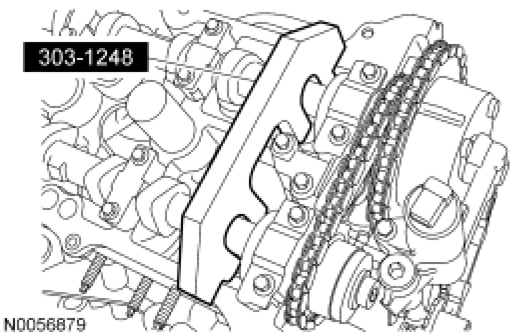

Fig. 471: Installing Special Tool (303-1248) Onto Flats Of RH Camshafts
Courtesy of FORD MOTOR CO.

94. Remove the 3 bolts and the RH VCT housing.

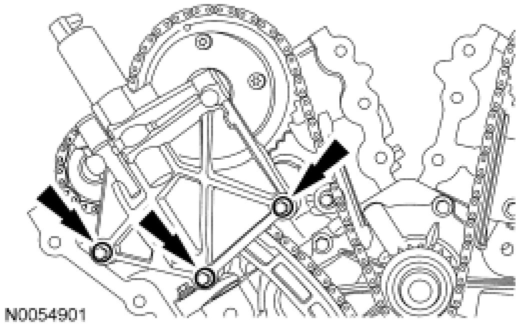

Fig. 472: Locating RH VCT Housing
Courtesy of FORD MOTOR CO.

95. Remove the 3 bolts and the LH VCT housing.

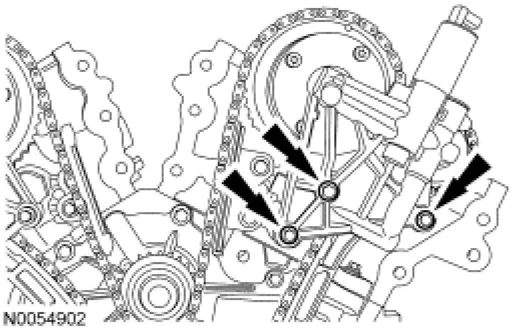

Fig. 473: Locating LH VCT Housing
Courtesy of FORD MOTOR CO.

96. Remove and discard the VCT housing seals.

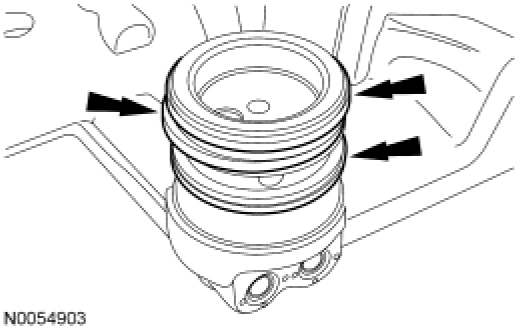

Fig. 474: Locating VCT Housing Seals
Courtesy of FORD MOTOR CO.

97. Remove the 2 bolts and the primary timing chain tensioner.

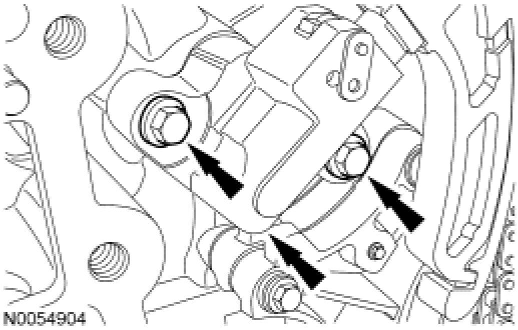

Fig. 475: Locating Primary Timing Chain Tensioner Bolts
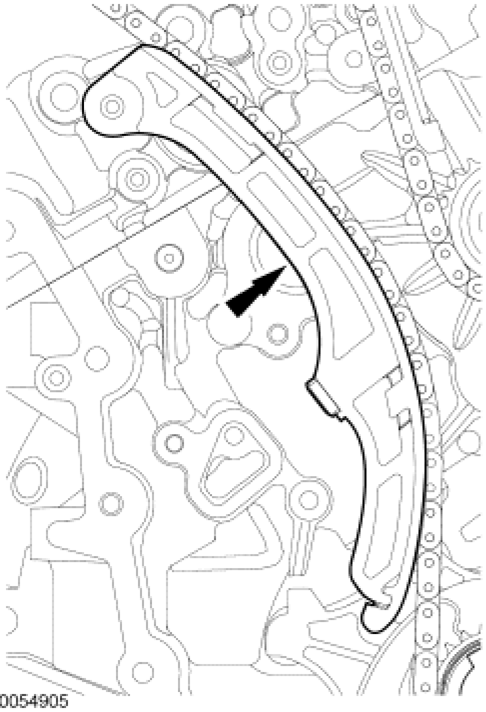
Courtesy of FORD MOTOR CO.

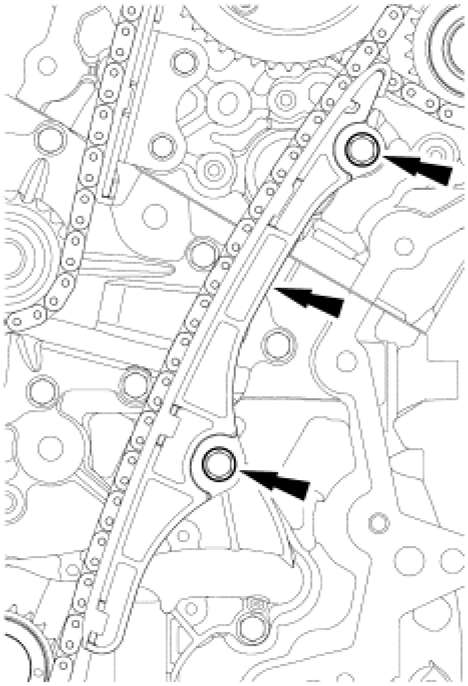
98. Remove the primary timing chain tensioner arm.



N0054905

Fig. 476: Locating Primary Timing Chain Tensioner Arm
Courtesy of FORD MOTOR CO.

99. Remove the 2 bolts and the lower LH primary timing chain guide.

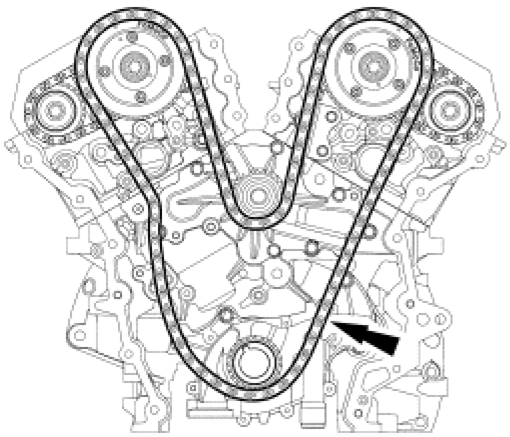


N0054906

Fig. 477: Locating Lower LH Primary Timing Chain Guide Bolts

Courtesy of FORD MOTOR CO.

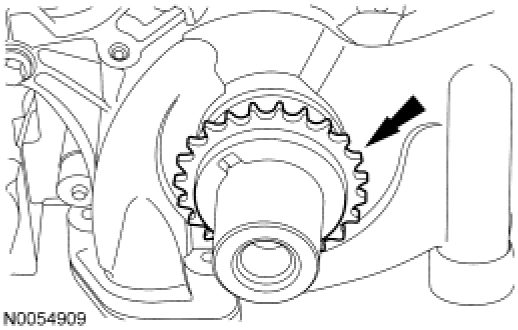
100. Remove the primary timing chain.



N0054908

Fig. 478: Locating Primary Timing Chain
Courtesy of FORD MOTOR CO.

101. Remove the crankshaft timing chain sprocket.



N0054909

Fig. 479: Locating Crankshaft Timing Chain Sprocket
Courtesy of FORD MOTOR CO.

102. Remove the 2 bolts and the upper LH primary timing chain guide.

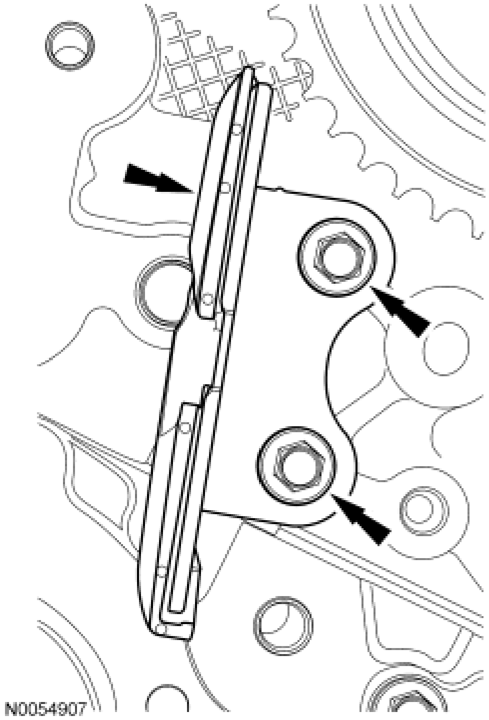


Fig. 480: Locating Upper LH Primary Timing Chain Guide Bolts
Courtesy of FORD MOTOR CO.

103. Compress the LH secondary timing chain tensioner and install a suitable lock pin to retain the tensioner in the collapsed position.

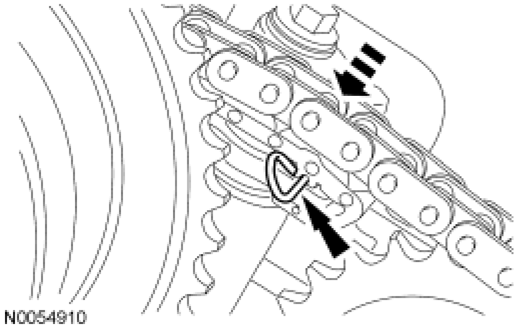

Fig. 481: Compressing LH Secondary Timing Chain Tensioner & Installing Suitable Lock Pin To Retain Tensioner In Collapsed Position
Courtesy of FORD MOTOR CO.

NOTE: The VCT bolt and the exhaust camshaft bolt must be discarded and new ones installed. However, the exhaust camshaft washer is reusable.

104. Remove and discard the LH VCT assembly bolt and the LH exhaust camshaft sprocket bolt.
    - Remove the LH VCT assembly, secondary timing chain and the LH exhaust camshaft sprocket as an assembly.

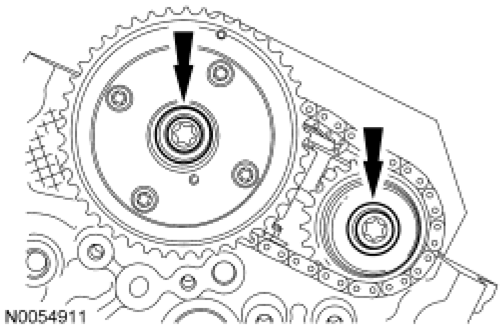

Fig. 482: Locating LH VCT Assembly Bolt & LH Exhaust Camshaft Sprocket Bolt
Courtesy of FORD MOTOR CO.

NOTE: **When the special tool is removed, valve spring pressure will rotate the LH camshafts approximately 3 degrees to a neutral position.**

105. Remove the special tool from the LH camshafts.
